## K I L N.

KILN, in Agriculture, a kitd of oven or flove for admitting heat, in order to dry fubltances of various kinds, as corn, nalt, hops, \&c. It alfo fignifies a fabric or building conftructed for the purpole of burning lime-ftone, chalk, and other calcareous ftones, into lime. Kilns are of different kinds, and formed in different ways, according to the purpofes for which they are defigned.

KilN-Afpes, the afhes made in kilns where wood, ftraw, furze, \&cc. are burnt. Thefe athes are ufeful as manure for almoft any kind of foil, but efpecially fuch as poffefs much vegetable matter. In the weftern dill ricts, the farmers fift them over their corn and grafs; but this muft not be done in windy weather, becaufe they are fo very light, that they would eafily be blown away and loft. They are found to fucceed beit when laid on jutt before rain falls.' See Asies.

## Kila, Brick. See Brick-Kiln and Brick.

Kilv, Hop, a flove or kiln conftructed for the purpofe of drying or ftoving hops. See Hop and Oast.

Kilx, Lime, a fort of kiln conftructed for the purpofe of burning varions kinds of calcareous fubtances, fuch as lime-ftone, chalk, fhells, \&c. into lime. They are built of different forms or fhapes, according to the manner in which they are to be wrought, and the kinds of fuel which are to be employed. It has been remarked, in a work on landed property, that, in places where materials are dear, from their being fetched from a dittance, and where the fuel is coals, and alfo expenfive, the form of a kiln is moftly that of an inverted cone, a form which has its inconveniencies; but in diftricts where the art of burning lime is practifed with fuperior attention and correctnefs, the form has of late years been gradually changing from conical to elliptical. But, in his opinion, "the beft form of a lime furnace, in Vol. XX.
the eftablifhed practice of the prefent day, is that of the egg placed upon its narrower end, having part of its broader end ftruck off, and its fides fomewhat compreffed, efpecially towards the lower extremity ; the ground plot or bottom of the kiln being nearly an oval, with an eye, or draft-hole, toward each end of it.". It is fuppofed that "two advantages are gained, by this form, over that of the cone. By the upper part of the kiln being contracted, the heat does not fly off fo frecly as it does out of a fpreading cone. On the contrary, it thereby receives a degree of reverberation, which adds to its intenfity." But the other, and itill more valuable effe: is this: "when the cooled lime is drawn out at the bottom of the furnace, the ignited mafs, in the upper parts of it, fettles down, freely and evenly, into the central parts of the kiln; whereas, in a conical furnace, the regular contraction of its width, in the upper as well as the lower parts of it, prevents the burning materials from fettling uniformly, and levelling downward. They "bang" upon the fides of the kiln, and either form a dome at the bottom of the burning mafs, with a void fpace beneath it, thereby endangering the fructure, if not the workmen employed; or, breaking down in the centre, form a funnel, down which the under-burnt ftones find their way to the draft-holes." And "the contraction of the lower part of the kiln has not the fame effect; for, aftee the fuel is exhautted, the adhefion ceaies, the mafs boofens, and, as the lime cools, the lefs room it reauires: It therefore runs down freely to the draft-holes, notwithltanding the quick contraction of the bottom of the kiln or furnace."

And, laftly, that, " with refpect to the lime-furnace (which is, he thinks, entitled to the mof fedulous attention of agricultural chemitry), the fire requires to be furnifhed B with.
with a regular fupply of air. When a kiln is firf lighted, the draft-holes afford the required fupply. But after the fire becomes ftationary, in the middle, or towards the upper part of the kiln (efpecially of a tall kiln), while the fpace below is occupied by burnt lime, the fupply from ordinary draft-holes becomes infufficient. If the walls of the kiln have been carried up dry or without mortar, the air finds its way through them to the fire. In large deep kilns that are built with air-tight walls, it is common to form airholes in their fides, efpecially in front, over the draft-loles. But thefe convey the air, in partial currents, to one lide of the kiln only, whereas that which is admitted at the draftholes paffes regularly upward to the centre, as well as to every fide of the burning mals; and, morcover, tends to cool the burnt lime in its paffage downward, thereby contributing to the cafe and health of the workmen. Hence he is of opinion, that the fize of the draft-holes ought to be proportionate to that of the kiln, and the fize of the ttones taken jointly (air paffing more freely among large than among fmall flones), and that the required fupply of air fhould be wholly admitted at the draft-holes. By a fliding or a thifting valve, the fupply might be regulated, and the degree of heat be encreafed or diminihed, at pleafure, " according to circumftances.

The molt ancient kind of lime-kiln is probably that which is made by excavating the earth in the form of a cone, of fuch a fize as may be neceffary; and afterwards building up the fides, or not, according to the circumflances of the cafe: the materials being then laid in, in alternate layers of fuel and flone, properly broken, until the whole is filled up. The top is then covered with fods, in order that the heat may be prevented from efcaping; and the fire lighted at the bottom, and the whole of the contents burnt, in a greater or lefs fpace of time, in proportion to the nature of the flone, and the quantity that is contained in the kiln. From the circumflance of the top parts of thefe kilns, in fome diftricts, being covered over, and the fides fometimes built up with fods, they are termed fod-kilns, in order to diftinguifh them from the other forts. When the whole of the contents of fuch kilns are grown cold, they are drawn or taken out from the bottom; and the kiln again filled, if neceffary. Thefe kilns are obvioufly intended for burning only one kiln-full at a time. But as the burning of lime in this way is tedious and uneconomical, other methods and forms of kilns have been had recourfe to. Where lime is much wanted, either for agriculture or other purpofes, they therefore ufe perpetual kilns, or what are more generally known by the name of drasw-kilus. Thefe, as all lime-kilns ought to be, are, the author of Modern Agriculture fays, fituated by the fide of a rifing bank, or fheltered by an artificial mound of earth. They are generally built either of ftone or brick; but the latter, as being better adapted to ftand exceffive degrees of heat, is confidered as preferable. The outfide form of fuch kilns is fometimes cylindrical, bat more generally fquare. The infide fhould be formed in the thape of a hogthead, or an egg, opened a little at borh ends, and fet on the fmalleft; being fmall in circumference at the bottom, gradually wider towards the middle, and then contracting again towards the top. In kilns confructed in this way, it is obferved, fewer coals are neceffary, in confequence of the great degree of reverberation which is created, above that which takes place in kilns formed in the fhape of a fugar-luaf reverfed. Near the botton, in large kilus, two or more apertures are made : thefe are fmall at the infide of the kiln, but are floped wider, both at the fides and the top, as they extend towards the outfide of the building. The
ufes of thefe apertures are for admitting the air neceffary for fupplying the fire, and alfo for permitting the labourers to approach with a drag and Govel, to draw out the calcined lime. from the bottom of the kiln within, in fome cafés, a fmall building, called a horfe, is raifed in the form of a wedge, and fo conilructed as to accelerate the operation of drawing out the burned lime.ftone, by forcing it to fall into the apertures which have been mentioned above. In other kilns of this kind, in place of this building, there is an iron grate near the bottom, which comes clofe to the infide wall, except at the apertures where the lime is drawn out. When the kiln is to be filled, a parcel of furze or faggots is laid at the bottom; over this a layer of coals; then a layer of lime-fone, which is previoully broken into pieces, about the fize of a man's fift ; and fo on alternately, ending with a layer of coals, which is fometimes, though feldom, covered with fods or turf, in order to keep the heat as intenfe as poffible. The fire is then lighted in the apertures; and when the lime-tlone towards the bottom is completely calcined, the fuel being confiderably exhaulted, the lime-fone at the top fubfides. The labourers then put in an addition of limethone and coal at top, and draw out at bottom as much as they find thoroughly burned ; and thus go on, till any quantity required be calcined. When lime-tone is burned with coals from $2 \frac{1}{2}$ to $3 \frac{1}{2}$ bufhels, on a medium, 3 bufhels of calcined lime-ftone are produced for every buftel of coals ufed in the procefs.

A lime-kiln of this fort is defcribed in count Rumford's Effays, which is in poffeffion of the Dublin Society, as well as the principal objects that ought to be had in view in conftrueting of the kiln pointed out : the firlt of which is, "to caufe the fuel to burn in fuch a manner as to confume the finoke, which has here been done by obliging the fmoke to defcend and pafs through the fire, in order that as much heat as poffible might be generated. Secondly, to caufe the flame and hot vapour, which rife from the fire, to come in contact with the lime-ftone by a very large furface, in order to economize the heat, and prevent its going off into the atmofphere ; which was done by making the body of the kiln in the form of a hollow truncated cone, and very high in proportion to its diameter; and by filling it quite up to the top with lime-flone, the fire being made to enter near the bottom of the cone.
" Thirdly, to make the procefs of burning lime perpetual, in order to prevent the wafte of heat which unavoidably attends the cooling of the kiln, in emptying and filling it, when, to perform that operation, it is neceffary to put out the fire.
"And, fourthly, to contrive matters fo, that the lime in which the procefs of burning is juft finifhed, and which of courfe is fill intenfely hot, may, in cooling, be made to give off its heat in fuch a manner, as to affift in heating the frefh quantity of cold lime-ftone with which the kiln is replenifhed, as often as a portion of lime is taken out of it.
"To effectuate thefe purpofes, the fuel is not mixed with the lime-ftone, but is purned in a clofe fire-place, which opens into one fide of the kiln, fome diftance above the bottom of it. For large lime-kilns on thefe principles, there may be feveral fira-places all opening into the fame cone, and fituated on different fides of it; which fire-places may be conitructed and regulated like the fire-places of the furnaces ufed for burning porcelain.
"At the bottom of the kiln there is a door, which is occafionally opened to take out the lime.
"When, in confequence of a portion of lime being drawn out of the kiln, its contents fettle down or fublide,

## K I L N.

the empty fpace in the upper part of the kilh, which is occafioned by this fubtraction of the burned time, is immediately filled up with fref lime-itone.
"As foon as a portion of lime is taken away, the door by" which it is removed mult be immediately fhut, and the joinings well clofed with moift clay, to prevent a draft of cold air through the kiln. A fmall opening, however, mult be left, for reafons which are explained below.
"As the fire enters the kiln at fome diftance from the bottom of it, and as the flame rifes as foon as it comes into this cavity, the lower part of the kiln (that below the level of the bottom of the fire-place) is occupied by lime already barned; and as this lime is intenfely hot, when, on a portion of lime from below being removed, it defcends into this part of the kiln, and as the air in the kiln, to which it communicates its heat, nwuft arife upwards in confequence of its being heated, and pafs off through the top of the kiln, this lime, in cooling, is by this contrivance made to affift in heating the frefh portion of cold limeoflone, with which the kiln is charged. To facilitate this communication of heat from the red-hot lime juft burned to the lime-ftone above in the upper part of the kiln, a gentle draft of air through the kiln, frem the bottom to the top of it, mult be eltablifhed, by leaving an opening in the door below, by which the cold air from without may be fuffered to enter the kiln. This opening (which thould be furnifhed with fome kind of a regifter) mult be very fmall, otherwife it will occafion too ftrong a draft of cold air into the kiln, and do more harm than good; and it will probably be found bell to clofe it entirely, after the lime in the lower part of the kiln has parted with a certain proportion of its heat."

The height of the kiln, which is reprefented in Plate (Kiln) Agriculture, fig. I. is on a fcale of 15 feet: its internal diameter below, two feet; and above, nifie inches. In order more effectually to confine the heat, its walls, which are of brick, and very thin, are double, and the cavity between them is filled with dry wood-athes. To give greater ftrength to the fabric, thefe two walls are connected in different places by horizontal layers of brick, which unite them firmly: $a$ is the opening by which the fuel is put into the fire-place: through this opening the air defcends which feeds the fire. The fire-place is reprefented nearly full of coals, and the flame pafling off laterally into the cavity of the kiln, by an opening made for that purpofe at the bottom of the fireplace. The opening above, by which the fuel is introduced into the fire-place, is covered by a plate of iron, moveable on hinges; which plate, by being lifted up more or lefs by means of a chain, ferves as a regitter for regulating the fire. A fection of this plate, and of the chain by which it is fupported, are fhewn in the figure: $b$ is an opening in the front wall of the fire-place, which ferves occafionally for cleanfing out the fire-place, and the opening by which the flame paffes from the fire-place into the kiln. This opening, which muft never be quite clofed, ferves likewife for admitting a fmall quantity of air to pafs horizontally into the fire-place. A imall proportion of air, admitted in this manner, has been found to be ufeful and even neceffiary in fire-places, in which, in order to confume the fmoke, the flame is made to defcend. Several fmall holes for this purpofe, fitted with conical ftoppers, may be made in different parts of the front wall of the fire-place.

The bottom of the firc-place is a grate conftructed of bricks placed edgeways, and under this grate there is an afhpit; but as no air mult be permitted to pafs up through this grate into the fire-place, the allh-pit door, $c$, is kept cualtantly clofed, being only opened occafionally to remove the aftes $:^{\circ} d$ ' is the opening by which the lime is taken out
of the kiln; which opening muft be kept well clofed, in order to prevent a draught of cold air through the kiln. As only as much lime muft be removed at once as is contained in that part of the kiln which lies below the level of the bottom of the fire-place, to be able to afcertain when the proper quantity is taken away, the lime, as it comes out of the kiln, may be directed into a pit funk irto the ground in front of the opening by which the lime is removed; this pit being made of a proper fize to ferve as a meafure for it. And while the lime is removing from the bottom of the kiln, frefh lime-ftone fhould be put into it above; and dure ing this operation, the fire may be damped by clofing the top of the fire-place with its iron-plate. Should it be found neceffary, the fire, and the diftribution of the heat may, in burning the lime, be further regulated by clofing more or lefs the opening at the top of the lime-kiln with a flat piece of fire-ltone, or a plate of caft-iron. The double wallis of the kiln, and the void fpace between them, as alfo the horizontal layers of bricks by which they are united, are clearly and diftinctly expreffed in the figure in the plates.

This method of conftructing lime-kilns, though ingenious and philofophical, is probably much too expenfive for general ufe.

It is a common practice to burn lime-fone with furze in fome places. The kilns which are made ufe of in thefe cafes are commonly known by the denomination of fame-kilas, and are built of brick; the walls from four to five feet thick, when they are not fupported by a bank or mound of earth. The infide is nearly fquare, being twelve feet by thirteen, and eleven or twelve feet high. In the front wall there are three arches, each about one foot ten inches wide, by three feet nine inches in height. When the kiln is to be filled, three arches are formed of the largeft pieces of limeflone, the whole breadth of the kiln, and oppofite to the arches in the front wall. When thefe arches are formed, the lime-ftone is thrown promifcuoufly into the kiln to the height of feven or eight feet, over which are frequently laid fifteen or twenty thoufand bricks, which are burned at the fame time with the lime-ftone. When the filling of the kiln is completed, the three arches in the front wall-are filled up with bricks almoft to the top, room being left in each fufficient only for putting in the furze, which is done in fmal! quantities, the object being to keep up a conitant and regular flame. In the fpace of thirty-fix or forty hours, the whole lime-flone, about one hundred and twenty, or one hundred and thirty quarters, together with the fifteen or twenty thoufand bricks, are thoroughly calcined. Kilns confructed in this way may be feen near Wellingborough, in Northamptonfhire, and other places in the northern parts of the kingdom. And in many of the northern counties of Scotland, which are fituated at a great diftance from coal, it is alfo a common practice to burn lime-ftone with peat; and, confidering the rude ill-conftructed kilns which are ufed for he purpofe, it is aftonifhing with what fuccefs the operations are performed. In fome of thefe diftricts, it is ftated that lime-flone is fufficiently calcined with peats, laid fratum fuper firatum, in kilns formed of turf; but, owing to the quantity of afhes which fall from the peat, the quality of the lime is confiderably injured; and from the open and expofed fituation of many of thefe kilns, the wafte of fuel is immenfe. But the moft common method of burning lime-ftone with peat, is in kilns conltructed fomewhat fimilar to thofe in the diftricts where furze is ufed as the only fuel: There are in general only two arches, or fire-places, and the peats are thrown into the bottom of thefe arclise, the fronts of which are feldom clofed up, by which means thie wind has.

- fren great influence in retarding the operation, and frequently prevents the complete calcination of the lime-ltone. An improvement might, it is fuppofed, be made on thefe $^{2}$ kilus at a very trifing expence: if an iron grate were laid acrofs the bottom of the arch, with a place below for the afhes to fall down, and the front of the arch clofed up by a door made of calt-metal, one-third of the fuel might be faved, and the operation performed in a fhorter time, and with a much greater certainty, than by the method now practifed in fuch kilns.

In the Communications to the Board of Agriculture, Mr. Rawfon afferts, that he has produced a confiderable faving in the burning of lime, by conftructing his kiln in the mannuer fhewn at fig. 2. "It is made twenty feet in height ; at the bottom a metal plate is placed one foot in height, intended to give air to the fire; over this plate the fhovel that draws the lime runs. The floped fides are fix feet in height, the breadth at the top of the flope is eight feet, the fides are carried up perpendicular fourteen feet, fo as that every part of the infide, for fourteen feet, to the mouth, is exadty of the fame dimenfions. On the mouth of the kiln a cap is placed, built of long flones, and expeditioufly contracted, about feven or cight fcet high. In the building of the cap, on one fide of the Rope, the mafon is over the centre of the kiln, fo that any thing dropping down will fall perpendicularly to the eye beneath. He is here to place an iron door of eighteen inches fquare, and the remainder of the building of the cap is to be carried up, until the hole at the top be contracted to fourteen inches. The kiln is to be fed through the iron door, and when filled, the door clofe fhut. The outfide wall mult be three feet at the bottom to batter up to two feet at top, and made at fuch a diflance from the infide wall of the kiln, that two feet of yellow clay may be well packed in between the walls, as every kiln built without this precaution will certainly fplit, and the ftrength of the fire be thereby exhautted. At eight feet high from the eye of the kiln, two flues flould be carried through the front wall, through the packed clay, and to the oppofite fides of the kiln, to give power to the fire." It is obferved, that with this kiln, he has produced one-third more lime from a given quantity of fuel; and fones of bad quality will be here reduced into powder, and may be put into the kiln without the neceffity of being broken fo fmall as is ufual. As many fituations will not admit of building a kiln twenty feet high, while other fituations may allow of its being built thirty or even forty feet (for it cannot be made too high), the diameter of the kiln thould be proportioned to the height to which it is carried up.

And it is further ftated, as another application of this for: of coatrivance, that "for feveral years he has made nfe of a fmall kiln in an outfide kitchen, the height nine feet, the dimeter three feet and a half. In the fide of the kiln next the fire, he had three fquare boilers placed, one of them large, containing half a barrel, with a cook, which fupplied the family with conftant boiling water; for the two others, he had tin veffels made to fit the infide with clofe covers, in which meat and vegetables with water were placed and put into the two fmaller boilers, which never had any water, but hud clofe covers. The tin boilers were heated fooner than on the Atrongeit fire, and when the meat, \&cc. were fulficiently dreffed, the whole was taken out of the metal boilers. At one frete he had an oven placed for roafting and hoiling meat; the bottom was metal of twenty-fix inches diameter, and ore inch and a half thick, a flue from the fire went underneath. Even with the bottom of the oven, a grating nine inches fquare was placed, which opened a
communication between the oven and the hot fire of the kiln. The height of the oven was fourteen inches, fhut clofe by a metal door of eighteen inches fquare, and the top, level with the mouth of the kiln, was covered by another metal plate of half an inch thick, on which was placed a fecond oven; the heat which efcaped through the half-inch plate, though not near the fire, was fufficient to do all fmall puddings, pies, breakfaft-cakes, \&c. \&c. The meat in the large oven was placed on an iron frame which turned on a pivot and ftood on a dripping-pan, and was turned by the cook each half hour. And over the kiln he had a tiled ftage for drying corn, and a chimney at one fide, with a cawl on the top, which carried off all fteam and fulphur: a large granary was altached to the building. It is added, that the lime, if fold, would more than pay for fuel and attendance; and he has frequently had dinner dreit for fifty men, without interfering with his family bufinefs in any great degree.

There is another form of lime-kiln, which anfwers extremely well for general ufe, reprefented at fig. 3. in the fame plate. This is capable of being built without any very confiderable expence.

It has been found, by experience, in fome of the northern diftricts, that lime-kilns are rendered much lefs liable to crack and burt by having the outfide walls carried up in a fquare manner, than on the ufual circular plan.

Kiln, Malt, a fort of kiln contrived for the purpofe of drying malt or any kind of grain upon. In the confruction of kilns of this fort many improvements have lately been made. A defcription of a kiln of this kind by Mr. Pepper, of Newcaftle-under-Line, has been given, in which fig. 4 . is the ground plan, fuppofed to be twenty feet fquare, but, if requires larger or finaller, by following the fame proportion, it may be made to any fize or fituation. The dark fhaded walls rife four feet high, to put the reflector upon over the fire, and alfo what the fide arches Itand upon, the brick piers, that carry the fpark-ftone, and bearcrs that the tiles lie upon. Letter $a$, the fire-grate, which lies nine inches below the bottom edge of the reffector; $b_{\text {, }}$, bottom edge of the reflector; $c, c, c, c$, brick pillars nine inches fquare, that carry the fpark-fone ; $d, d, d, d, d, d$, brick pillars nine in lies fquare, that carry the bearers for the floor tiles to lie upon; $e$, fhews the bottom of the fide arches on each fide of the kiln; $f$, exhibits the fpace between the fire-place and the fide arches, for the man to go round to clean the kiln; $g$, the wall on each fide of the kiln, that the fide arches ftand upon. For. 5 . is a fection of it; $g$, fhews the fection of the wall which the fide arches ftand upon ; $b$, the door to go to the fire-place; $i$, the reflector of calt iron that covers the fire; $k$, fnall door in the reflector to feed the fire; $l, l$, the ears of the reflector that the iron pipes are fitted upon, which convey the fmoke, \&cc. from the reflector round the kiln, to the chimney; $m$, what is commonly called the fpark-ltone; it prevents the kilm from being too hot in the middle, and affilts in fpreadmg the heat to the outfides; $n$, bearers of callimon or wood, that carry the kiln floor; 0,0 , thew the ends of the ribs that carry the tiles ; $p$, the kiln tiles, that the malt lies upon; $q$, the fteam-pipe that conveys the fteam from the malt; $c, c$, brick pillars nine inches fquare, that carry the fpark-ftore; $d, d$, brick pillars nine inches fquare, that carry the bearers for the floor tiles to lie upon ; e, e, fhew the arches on each fide the kiln; $u u$, denotes the fituation of the pipes under the floor. And fig. 6. is a plan of the kiln floor, and fhews the ribs that the kiln-tiles lie upon: 0,0 , the calt iron or wood ribs that the tiles lie upon; $n, n$, the bearers that carry the ribs; $d, d$, the tops of the brick
pillars
pillars that carry the bearers, \&ce; B, the reflector that covers the fire, which is of caft iron, about an inch thick, hollow, and on a femicircular plan, as fhewn in the figures; $r, r$, the iron pipes that convey the fmoke and heat from the reflector, round the kiln, to the chimney, which lies about three feet under the kiln floor, and about the fame diftance from the fide walls, which are fupported by iron ftays from the fide arches; $f, f$, the ends of the iron pipes that go into the chimney; $t, t$, regifters to regulate the draught and heat of the kiln; and fig. 7 . is a fection of the chimney.

It is noticed that in the plate the pillars, bearers, \&c. that belong to the fame thing, are marked with the fame letters in all the different figures.

Another kiln of the fame fort, invented by Mr. Jofeph Coppinger, of Harbour View, near Cove, Ireland, is reprefented at fog. 8. This is Itated to be particularly adapted to the ufe of farmers, who, in wet feafons, often lofe quantities of grain for want of fuch convenience. The advantages it appears to poffefs above the kilns now in common iife, are many ; firft, it may be erected for one-tenth of the expence, if the value of the feparate buildings be taken in, which are now almolt invariably allotted for this purpofe; ficondly, any kind of fucl may be ufed without prejudice to the malt or corn to be dried in it : thirdly, the heat (by the conftruction of the flues) will be more regularly and evenly diftributed without any waite, as at prefent: fourthly, the health of the people attending, will not, as at prefent, be expofed to certain injury, by always breathing and fleeping in a heated and unwholefome atmofphere, as their beds will be placed in a fhed on the outfide of the building. This, in his mind, is the mont important part of the plan, and highly worthy the attention of every humane and confiderate employer in this way: fifthly, this conitruction of a kiln may be erected on a loft or ground floor. If in the latter fituation, fufficient clevation fhould be given to the fre-place, fo as not to impede the draught. Thefe are the principal advantages that occur to the writer. If the experience of others confirm them, he will be highly gratified: $a$, the main walls; $b$, the flues; $c$, the chimnies; in each of which may be placed a metal damper to regulate the heat. It is recommended, in the cafe of a new building, to carry up the flues of the chimnies in the thicknefs of the walls. In a houfe already built, they may be carried up either infide or outfide the building: $d$, the fire-place, which may be divided, or in one, jult as defired, by which the half or the whole may be heated, as is moft convenient.

It is fated that kiln tiles eighteen inches fquare, and two inches thack in the folid, with a lapping of half an inch broad and one inch deep round the edge of each tile, are propofed for covering the flues, which, if fairly calt, may be laid dry, without mortar. If it thould be difficult, or too expenfive, to procure tiles of eighteen inches, nine inches can be made to anfwer. The flues are propofed to be divided by a brick, on edge, fo as that every eighteen-inch tile will covet two flues. The breadth of the flees may be fix inches and a half, and ten inches high. This proportion, it is hoped, will be found to anfwer in moft cafes; but it may be varied according to the better judgment of the party erecting. The fides and bottoms of the flues fhould be plaitered. The platform of this kiln fhould, in all cafes, be well rammed with earth, aud made perfectly level before lay ing out the fues. Iron grate-doors are intended to be hung on hinges, in a recels, at the mouth of each flue, to prevent them being choked with large pieces of cinder, or other fubftances. It is alfo intended that thefe doors fhould fhut and open at pleafure, as may be found neceflary in carrying on the bulinefs.

Kiln Tiles, in Rural Economy, the name of that fort of tiles which are employed in malt and other fimilar forts of kilns.

Kiln for tin-ore. The place where the tin-ore is roafted in order to burn away the mundic, and other fulphureous matters that are mixed with it, is called the tin-kiln. 'I'his is of a very plain ftructure ; its hearth or floor is made of one large ftone, and this is covered with another, fupported at fix inches height above it. The uppermoit has a hole is the middle, through which the ore is poured on the under one; and when it is diftributed over it in a bed of three or fout inches thick, it is burnt by means of a fire of furze buthes kept underneath, and communicating with the fpace betwern the two ftomes by an aperture bebind; the lower ftone nu: reaching the wall by fix inches.

When the fulphur is all burnt away by the fire, and the flame is no longer blue, the whole bed of roated ore is thruft off the flone by the rake into the aperture behind, through which it falls into the open fire. The fire is kept up with new bufhes, and there is a new bed of ore thrown in at the hole above. Thus the fire is kept up day and night, and fup. plics of frefh ore made through the hole by the black tin brought from the buddles of wafhing troughs. When the lower part of the furnace is filed up with the ore thrown into it, there is a hole behind the kiln, through which this ore, and the coals and afhes, are all raked out together, and left in the open air to cool; and the whole mafs thus faked out, will fometimes be feveral days in cooling, the mixture of coals among it keeping it red-hot for a confiderable time. When it is taken away from behind the furnace, it is wafled again before it is put into the melting furnace. It is obferved, that the different ores require for this laft operation a different proportion, and different fort of fuel. The moortin, that is, fuch ore as is dug up in the moory countries. melts beit with moor-charcoal charred; but that dug on the hills is found to run beft with a mixture of charcoal and peat in equal quantities. The ftones ufed for the kilns are always moor-ftone. Phil. Tranf. Ne 69.

Krla, in Ship Building, a convenience for boiling or Atcaming planks to make them pliable. A boiler-kıln is either made of fheet-copper, bottom and fides rivetted tugether, or the bottom of theet-copper and the fides of lead, rivetted and foldered together. This is fixed in a body of brick-work, and under each end, or in the middle, are furnaces to caufe the water to boil after the planks are in. The upper part, to preferve the fteam and facilitate the boiling, is inclofed by thutters, opening by hinges and fmall tackles.

|  |  | feet. in. |  |

| 3 |  |  |  |
| Deep - middle | - | - | 6 |
| 0 |  |  |  |

And weighed 53 cwt . 3 tt . $44^{\mathrm{lb}}$.
A fteam-kiln is a trunk compofed of deals grooved and tongued together edgeways, and is from three to four feet fquare, and from 40 to 60 feet long, and has a door' at each end. It is confined together by bolts driven through the fides at certain diftances, which anfwer the purpofe of bearers, whereon the planks relt while fteaming. It is fupported, about four feet above the ground, upon a ftrong framing of wood. Underneath it, in the middle, is fixed, in brick-work, a large copper or iron boiler, or, which is better, one towards each end; the iteam from the boilers, iffuing into the trunk wherein it is confined, enters into the pores of the plank, and renders it very pliable.

BII.ONDA:

KILONDA, in Geography, a town of Africa, in the kingdom of Benguela; 15 miles $S$. of Benguela.

KILONGO, a province of Loango, the foil of which is fertile. It was formerly an independent kingdom: the governor is abfolute, and is elected by the people, without confulting the king of Loango. The chief article of trade is clephants' teeth. Kelingo, the capital, is fituated on the coait; 30 miles N.W. of Loango. S. lat. $4^{\circ} 25^{\prime \prime}$.

KILPATRICK, Old and New, two parimes in the weft of Scotland, and county of Dumbarton. Old Kilpatrick is fituated on the banks of the river Clyde, about five miles caft from Dumbarton, and within one mile of Bowling bay, where the great canal, or Forth and Clyde navigation, falls into the Clyde. It is one of the molt pleafantly fituated villages in Scotland, being directly oppofite to the pleafure grounds of Erfkine-houfe, the refidence of lord Blantyre, the fuperior of the parifh. The parochial Itipend being paid in grain is confidered to be one of the bett in Scotland. The church is a very ancient building of the Gothic kind, and here are faid to be depofited the remains of the tutelar faint of Ireland, from whence the village takes its name. There is an extenfive manufactory of rolled and malleable iron conducted here, and there are two large cotton mills in the neighbourhood. The fpinning of woollen by machinery was attempted, but did not fucceed. Thofe engaged in the cotton manufacture are employed from Glafgow and Pailey. New Kilpatrick is about four miles dittant from Old Kilpatrick. There is no manufacture of any importance about it, excepting fome large flour mills upon the river Kelvin, which are the property of fir Ilay Campbell, of Garfcule, bart. lord prefident of the Court of Seffion.
KILSYTH, a town of Dumbartonfhire, bordering on Stirling fhire, in Scotland, about thirteen miles north-eatt from Glafgow, upon the old or north road from Edin. burgh to Glafgow, and near the banks of the great canal; or Forth and Clyde navigation. The country about Kilfyth is level to the fouth, eaft, and weft, but very mountainous to the north. The valley is in general fine arable land, and the cultivation is now extremely good and moit rapidly improving, for which there are the greatelt facilities afforded by the inexhaultible fupplies of coal and lime, which are found in every part of the neighbourhood. Kilfyth is of no importance as a commercial or manufacturing place, its chief manufacturing trade being confined to the labour of operative tradefpeople in weaving, tambouring, and fewing muflins for the manufacturers of Glafgow. There are, however, fome extenfive printfields at no great ditance. Kilfyth gave the title of an earl to an ancient and noble family of Scotland, but the title and eitate were forfeited by the rebellion, in the jear 1715. Cumbernauldhoufe, in the neighbourhood, is the refidence of lord Elphinftone, the chief perfon of rank in this quarter, and lord lieutenant of the county. A very great proportion of the adjoining lands, formerly attached to the earldom; now beloag to fir Charles Edmonftone, of Dunleath.

KILTZESTI, a town of Walachia, on the Tifmana ; 12 miles S.S.W. of Tergofyl.

KILWARA, a town of Hindoottan, in the circar of Rantampour; 32 miles S. of Suifopour.

KILWINNING, a fmall town and parih in Ayrfire, upon the coaft, about two or three miles from Irvine. It contains but little population, and is not remarkable for any particular ant or manufacture. The lands around it are chictly the property of the earl of Eglintown, whofe fuperb caltle is in the inmediate vicinity. Kilwinning is chiefly remark. able for the attention paid in it to the order of freemafonry, the lodge of Kilwinning claiming precedency, in peist of
antiquity, to every other lodge in Scotland, which, in their turns, affert their antiquity to be greater than thofe of England; the Scottilh mafons affuming the title of ancient as a mark of their priority, and refufing to acknowledge or receive thofe whom they denominate modern mafons until they have qualified themfelves to be reccived, by undergoing certain ceremonies of initiation only known to the brethren. The claim of the Kilwinning mafons is fo far admitted, that many of the lodges of Scotland receive charters of conflitution from them in place of the grand lodge of Scotland. Thefe lodges generally diftinguifh themfelves by adding the word Kilwinning to the title which they have affumed. They are numerous through every part of the country, and the circumltance alluded to creates no kind of rivalry or diffention between them and thofe conftituted by the authority of the grand lodge.

KILY Harrour, a bay on the W. coaft of the ifland of Celebes. S. lat. $1^{\circ} 33^{\prime}$. E. long. $119^{\prime \prime}$ 20.

KIMALISHA, an ifland of Ruffian Lapland, lying between the mouths of the rivers Shuya and Soroka, off the coaft of the White fea; where the granite veins of micaceous earth are richly mixed with a beautiful brown, frequently glandulous, with granites and green tranfparent fhorl.

KIMBOLTON, a fmall market town in the hundred of Leightonftone and county of Huntingdon, England, is fituated 10 miles from Huntingdon, and $\sigma_{3}$ from London. In the population return of 1800 , the number of houfes was itated to be 252 ; of inhabitants 1266. A weekly market is held on Fridays; and here are two annual fairs. The only object in the town of particular import is Kim-bolton-caftle, a feat of the duke of Manchetter, which is of unknown, but very remote origin. Leland fays, "the caftle is double diked, and the building of it metely ftrong: it longed to the Mandevilles, erles of Effex. Sir Richard Wingtield built new, fair lodgyns and galleries upon the old foundation of the caftle. There is a plotte now clene defolated, not a mile by weft from Kimbolton, called Caftlehill, where appear ditches and tokens of old buildings." This caitle was the jointure, and became the retirement, of queen Catherine, after her divorce from Henry VIII. Henry, firit earl of Manchetter, expended large fums in making it a comfortable refidence; and his grandfon Robert, the third earl, made very confiderable alterations and many additions. It is a quadrangular building; the infide is moft fuperbly fitted up, and decorated with numerous paintings. Beauties of England, vol. viii.

KIMBULA, in Zoology, the name of a fpecies of crocodile found in the inand of Ceylon, and of a very beautiful variegation of colours, being mottled all over with extremely elegant black foots fhining with the glofs of black velver.

KIMCHI, David, in Biograpby, a learned rabbi, who acquired high reputation as a fcripture commentator, was a native of Spain, and flourifhed in the twelfth ard thirtcenth centuries. His father, Jofeph, was a bitter enemy to Chriftians, and wrote fome fevere treatifes againft them, but the fubject of the prefent article fpeaks of Chrillians with moderation, and he is highly celebrated for his philological labours, which reflect luftre on his name. His works are hold in the higheft eftimation by the Jews, who maintain that there is no true fcience without Kimchi. Moft of his commentaries have been incorporated in the great bibles of Venice and Batil ; and Pfeiffer, in the "Critica Sacra," remarks, that his grammar is like- the Trojan horfe, from which crowds of Chriltian grammarians have iffued forth, of whom thofe have fhewn themfelves moll learned who
have been moft perfectly acquainted with Kimchj. He took a decided part in the controverfy concerning the writings of Maimonides, and fo far moderated the temper of the contending parties, as to produce a revocation of the fentences of excommunication on both fides. It is not known at what particular period he died. His commentaries extend to the greater number of the books of the Old Teftament, and from the bibles of Venice and Bafil have beens tranfplanted into the labours of Catholic and Proteftant commentators, and have unqueitionably afforded much valuable affitance in illuftrating the true fenfe and meaning of the Hebrew text. Kimchi's philological works confitt of a Hebrew Grammar, called "The Book of Perfection ;" and of a Hebrew Dictionary, intitled "The Book of the Roots." They were firt publifhed at Cullfantinople, but have been feveral times reprinted. Buxtorf made thefe works the foundation of his "Thefaurus Linguæ Hebrexe," and his "Lexicon Linguæ Hebrææ." Several of Kimehi's letters may be found in a volume of "The Letters of Maimonides," publifhed at Venice in the ycar 1545.

KIMEDY, in Geography, a town of Hindooftan, in the circar of Cicacole; 30 miles N.W. of Cicacole.

KIMI. See Kemi.
KIMITO, a town of Sweden, in the government of Abo; 23 miles S.E. of Abo.

KIMKIM, a town of Walachia; 55 miles N. of Buchareft.

KIMLASSA, a town of Hindooftan, in the country of Malwa; 35 miles S. of Chanderee. N. lat. $24^{\circ} 15^{\prime}$. E. long. $75^{3} 4^{2}$.

KIMMOO. See Kemmoo.
KIMMOUL, a town of Hindooftan, in Oriffa; five miles N . of Sonepour.

KIMNIK, a town of Walachia, on the Alaut; 44 miles E.S.E. of Tergovifta.

KLMOS, a lake of Ruffia, in the gevernment of Olonetz; eight miles N.W from lake Nuk, with which it communicates by a fmallifiver. N. lat. $64^{\circ} 45^{\prime}$. E. long. $30^{\circ}{ }^{1} 4^{\prime}$.

KIMOSSES, or Qumosses, a name given in the language of Madagafcar to a race of pigmies, or human beings of a diminutive fize, who inhabit the interior parts of the illand, and there form a confiderable national body. M. de Commerfon, cited by M. Rochon in his "Voyage to Madagafcar," gives the following account of themp. "The natural and dirtinctive character of thefe little men is to be white, or, at leaft, of a pa'er complexion than all the different blacks ever known, to have very long arms, fo that their hands reach below the knee, without bending the body; and that of the women, to have fcarcely any breaits, except when they nurfe their infant offspring; fo that many of them are obliged to have recourfe to cow's milk, for feeding their new-born infants. As to intellectual faculties, the Kimofles furpafs all the relt of the Malegafhes, who are known to be very ingenious and adroit, though abandoned to the greateft indolence; but the Kinoffes are more active, and alfo more warlike; fo that their courage being, as it were, double in proportion to their fize, their neighbours have not been able to opprefs them, they have attacked them by a fuperiority of number amounting to 10 to I. Attacked as they have been by unequal weapons, (for they do not ufe gunpowder and mulkets, like their enemies, ) they have always fought courageouly, and fupported their independence among their rocks, which being difficult of accefs, have, without doubt, contributed to their prefervation. There they live upon rice, different fruits, vegetables, and roots, and rear great number of cattle, (bullocks with hunches on
their backs, and fheep with long, broad, fat tails,) whiche ferve them as part of their food. They have no intercourfe with the different tribes of Malegafhes, who furround them, neiticer by trade, nor by any other method, becaufe they derive all they want from the territory they inhabit. As all the little Rkirmifhes or wars which take place between them and the other inhabitants of the ifland, have no other object than to carry off fome cattle or flaves, the diminutive fize of the Kimofles exempts them from the latter injury. In order to compromife the former, they contrive, when from the fummits of their mountains they perceive preparations for war in the plain, to take all the fuperfluous cattle they can fpare, and tie thern to the openings of the defiles which mult be pafled by the cnemy in penetrating into their mountains, of which, they fay, they make a voluntary facritice to the indigence of their elder brethren; but they proteft, at the fame time, to fight to the laft drop of blood, if they fhould penetrate further into their territories by force of arms. 'Their arms are the lance and the arrow, which they dart in the moft mafterly manner. At three days march from fort Dauphin, the natives fhew, with great complaifance, little elevations of ground refembling graves, which owe their origin, as they affirm, to a great maflacre of the Kimoffes, who were defeated in the open field by their anceftors." M. de Commerfon fays further, that he is able to certify, as an ocular witnefs, that in the voyage which he made to fort Dauphin, about the latter end of the year 1770 , count de Modeve, the late governor, who communicated to him part of the preceding obfervations, gave him the fatisfaction of fhewing to him, among his flaves, a Kimofs woman, about 30 years of age, three feet feven inches high, whofe complexion was one of the cleareft and brightelt he ever faw among the natives of the ifland. He remarked, that notwithtanding her low fize, fhe was very ftrong-limbed, not refembling a flender diminutive perfon, but rather a woman of common proportion, her defect of height excepted; her arms were long, and reached, without ftooping, the kneepan ; her hair was fhort and woolly; her phyfiognomy tolerably good, and more like that of the Europeans than of the people of Madagafcar. She feemed conftantly to fmile, her temper was fweet and complaifant, and fhe feemed, from the tenor of hef conduct, to be poffeffed of much good fenfe. Her breafts were flat; but this circumftance of itfelf is far from being fufficient to eftablifh an exception from the general law of nature. The defire of recovering her liberty, as much as the fear of inflant embarkation, made the little flave efcape by running away into the woods. This fhortnefs of fize, as Commerfon farther obferves, compared with that of the Laplander, is almolt graduated in both; the Laplander and the Kimofs inhabiting the moft frigid zones, and the moft elevated mountains on the globe. Thofe which form the retreat of the Kimoffes at Madagaicar, are from 16 to 18 hundred fathoms above the level of the fea. The productions of the vegetable kingdom, which naturally grow on thefe high mountains, feem to be abortive : e.g. the pine, the birch, and many other trees, appear like creeping bufhes or hrrabs. M. de Modeve alfo gives an account of this race of beings, who juhabit the centre of the ifland, in the 22d degree of latitude. The middling fize of the men, he fays, is three feet five inches, and they have a long round beard; the fize of the women is fomewhat fhorter than that of the men. The Kimoffes are thick and ftrong-limbed; the colour of their fkin is lefs tawny than that of the other natives, and their hair fhort and woolly. They forge iron and fteel, of which they make lances and arrows; which are the only arms they ufe. In other particulars he confirms the account already given of their mode of felf-defence.

## K I N

From other reports, he informs us, that the valley of the Kinoufes is rich in cattle and other provifions. Thefe dwarfs are laborious, and very good hufbandmen. Their chief has an authority more abfolute and more refpected than that of the other chiefs of the different diftriets of Mada. gafcar. The extent of the valley which they inhabit he was not able to afcertain but he knew, that it was furrounded by very high momntains, and that its fituation is 60 leagues N, IV. from fort Dauphin, and weftward it is bounded by the country of Mantanata. Their villages are erected on little eminences, whofe feep fides are the more inacceffible, fince they have multiplied the obitacles which forbid approach to them.

KIMOZERSKAIA, a town of Ruffia, in the government of Olonetz, on the lake Kimos; 88 miles N. of Kemi.

KIMPINA, a town of Walachia; 36 miles S. of Cronfladt.

KIMPOLUNG, a town of European Turkey, in Moldavia; 116 miles W.N.W. of Jafly. N. lat. $47^{\circ} 42^{\prime}$. E. long. $25^{\circ} 8^{\prime}$.

KIMPOUR, a town of Bengal; 27 miles E.N.E. of Purneah.

KIMSLA, a town of Sweden, in Eaft Gothland ; feven miles S.S.W. of Nordkioping.

KIM-TCHA, a town of Thibet; is miles W.N.W. of Tchafircong.

KIM-TCHEOU, a town of Chinefe Tartary. N. lat. $44^{\prime \prime}$. E long. $126^{\circ} 26^{\prime}$.

KIN, a town of Pesfia, in the province of Segeitan, fituated at the foot of a chain of mountains near the lake Zurrah ; the air is pure, and the foil of the environs fertile, efpecially in fruit; 127 miles W. of Candahar.-Alfo, a town of A rabia, in the province of Nedsjed; 153 miles N.E. of Hajar.

Kin-bote, compenfation for the flaughter of a kinfman. See Bote.

KINAKINA Anomatica, in the Materia Medica, a name by which fome authors have called the cortex eleutherii.

KINASKA, in Geography, a town of Ruflia, in the government of Irkutfk; 28 miles W. of Nertchink.

KINASSO, a town of Africa, in Congo ; 30 miles S.E. of Pango.

KINATJURA, a town of Japan, in the ifland of Niphon; 94 miles S.IW. of Meaco.

KINBURN, a fortrefs of Ruffia, in the government ' of Ekaterinollaf, on a bay of the Black fea, at the mouth of the Dnieper. It itands clofe to the frontiers, oppofite the Turkifh fortrefs Otchakov, which being a place of fuperior ftrength, mult, while it continues in the hands of the Turks, obftruct, in cafe of a rupture, the navigation of the Dnieper. Kinburn was intended for the principal corporation of the merchandize fent from the provinces bordering on the Dnieper; but as the harbour, on account of its quick-fand, affords no fecurity for anchorage, the town of Kherfon or Cherfon is at prefent the great emporium for trade; 16 miles S.E. of Otchakov N. lat. $46^{3} 35^{\prime}$. E. long. $3 \mathrm{I}^{\circ} 36^{\circ}$.

KINCARDINE, a town of Perthfhire, Scotland, is feated on the banks of the river Forth, in a fmall tract of the county, which is nearly furrounded by Clackmannanhire. It was formerly called Weft-Pans, from the number of falt-pans ufed here. 1 n 1780 , there were 15 , but at prefent thefe are reduced to two or three. The foufes are moftly well built, and the ftreets affume a regular appearance. Here are two weekly markets, and feveral annual fairs. A valuable falmon-fifhery is eftablifhed on the Forth, at this place; and here is a commodious harbour: rearly oppofite the town is an excellent roadtead, where 100
veffels, or more, may be anchored in fafety. Ship building is carried on to a confiderable extent, and veffels from 200 to 300 tons burden are often built herc. In the year 1792, there were 75 veffels belonging to this port, to which were annexed 300 failors. In 1793, the town contained about 900 inhabitants.

KINCARDINESHIRE, or the county of Mearns, a diftrict of. Scotland, is furrounded by the counties of Aberdeen, Angus, and the Britifh ocean. The area thus enclofed is nearly of a triangular form, and extends along the coalt from the bay of A berdeen, to the North-Efk river, an extent of about thirty miles ; and from Dumnottar cafle; to mount Battack, nearly 20 miles. The fuperficial contents of lands, are 191,575 Scottifl, or $243,4+4$ Englifh miles. The fea-coait is partly flat, and partly rocky ; at the northeaftern corner of the county, terminates the chain of Grampian hills. Here they run into the fea, and form what is called the Girdle-Nefs, which prefent to the fea a bold face of rock, from 60 to 80 feet high. The northern part of this county conlifts of a mountainous territory formed by the tract of the Grampians, on the fouth of which is a low diftriet, provincially termed the How or Hollow of the Mearns. On the fouthern fide of the county, the furface is much diverfified with hill and dale, particulariy on the banks of the North-Efk, which feparates this county from that of Angus, on the fouth. Here the continuation of the Sidlaw kills runs under different names, from the banks of the NorthEfk, to the neighbourhood of Stonehaven, and bounds Strathmore on the fouth, or fouth-eaft. The line or valley of Strathmore, was the tract formerly purfued by all the invaders of Scotland, who, on account of the mountainous ridge between the two kingdoms, mult either have entered by Berwick on the eaft, or by Dumfries on the weft, where the mountains terminate before reaching the fea.

Among the Grampians, fome are of very confiderable height. That of the greateft altitude is mount Battack, in the parifh of Strachan, which is faid to be 1150 yards above the level of the fea. Kerlock, in the fame parifh, is 1890 feet high, and Kloachnabane 2370 feet. To the northward of the Grampians, only a fmall ftripe, or fpots and glens, of no great extent of cultivated land, are to be found in this county. The Grampian hills are either covered with heath or mofs, and afford but very little patturage. In the glacis and vallies, and on the fides and towards the bottoms of the hills, where cultivation has taken place, the foil is either light or gravelly, and full of fmall fones; buz on the banks of the brooks and ftreams, loam commonly prevails. In the level part of the county, the foil is generally clay. That ftripe of fine fertile land, lying along the fea-coalt-from North-Efk river, to Stonehaven, is chiefly a deep ftrong loam on a clay bottom, but in fome places obltinate clays occur. The foil in the valley of Strathmore is fimilar to that along the coaft : but in practice it is found, that the clays in Strathmore do not carry beans, even after being properly limed; although the lands along the coaft, when manured with lime, fea-weeds, or dung from the fifhing towns, produce abundant crops; the reafon of which feems to be, that in the interior part of the county the land is of a lighter nature, lying upon a cold clay. The coalt land is a rich loam, fit for wheat and beans.

The mineralogy of this county is of nu great importance. In many places, however, there are lime quarries; and as the ftone is of the beft quality, abundance of fuel only is wanting to render them of great value. They are wrought in the parihes of Ecclefcraig, Laurencekirk, and otherso In the parifh of Arbuthnot, and on the Yea-hore near St. Cyrus, bcautiful pebbles and fine jafpers are found. A

## K I N

great part of the coaft, which is bold and dangerous, confifts of rocks of that fingular character called Brectia, or "plumb-pudding flone," having the appearance of loofe ftones bound together by an artificial cement. In the northealtern part of the county; near Aberdeen, granite quarries are wrought for exportation.
In this county is only one royal borough, Inverbervie, or Bervie; but there are feveral populous villages, of which Stonehaven, Johafhaven, and Laurencekirk, are the chief.
The principal rivers connected with this county, are thofe of the North-Enk on the welt and fouth, and the Dee on the north. The other ftreams, which are but of little nute, are called the Dye, the Cowie, the Carron, the Bervie, and the Luther.
The moft remarkahle remnant of antiquity in Kincardine-fhire,- is Dunnottar cafle. It ftands on the eattern coaft, on a rock projecting into the fea, acceffible from the land on the weft fide, and that only by a narrow, tteep, and winding path, over a deep gully, by which it is connected with the main land, and which ferves as a kind of natural folle or ditch, the adjacent rock having been fcarped and rendered inacceffible by art. Here are various buildings and conveniences neceflary for a garrifon; fuch as chapel, barracks, a bafon or ciftern of water twenty feet in diameter, a bowlinggreen, and a forge, faid to have been ufed for cafting ironbullets. On this rock, notwithftanding its difficulty of accefs, the church and burial-place of the parifh were originally fituated; the building now called the chapel being formerly the parihl-church. In this cattle, the regalia of Scotland, (the crown, fceptre, and fiword,) were dcpofited in the year 1651 , to preferse them from the Englifh army, which overran this country during the civil wars of that period.

In the parifh of Ecclefcraig, are the ruins of a fortrefs, formerly a place of great ftrength, being erected on a perpendicular and peninfulated rock fixty feet above the fea. In the parifh of Fettercairn is a ruined building, called Fenella's caftle, faid to be the place where Kenneth III. was affiaflinated. In Fordun parih a houfe ftill remains, called St. Palladius's chapel, where the image of the faint was kept, and to which pilgrimages were performed from the moif diftant parts of Scotland. In the parifh of Arbuthnot, was born the celebrated Dr. Arbuthnot, phyfician to queen Anne. He formed a diftinguifhed literary triumvirate with Mr. Pope and Dr. Swift.

In the population return to parliament in the year 1801, Kincardinefhre was ftated to contain 5990 houfes, and 26,349 inhabitants.
KINCHA, a river of Afia, which rifes in Thibet, paffes through the Chinefe province of Se-tchuen, and enters the province of Hou-quang, where it changes its name to Yangife, after which it crofles the province of Kiang-nan, and suns into the fea, N. lat. $31^{\circ} 55^{\prime}$. E, long. $112^{\circ} 44^{\prime}$.

KINDELBRUCKEN, a town of Saxony, in Thuringia, on the Wipper; 21 miles N.E. of Erfurt. N. lat. $51^{\circ}$ $16^{\prime}$. E. long. $11^{\circ}$ 10'.

KINDERHOOK, a poit-town of America, in Columbia county, New York, on the E. fide of Hudfon's river, containing 50 dwelling-houfes and a Dutch church; 13 miles N. of Hudfon's city. The townfhip contains 424 S inhabitants, of whom 483 are flaves. N. lat. $+2^{2} 25^{\prime}$. W. long, $73^{\circ} 34^{\prime}$.

KINESCHMA, in Gcography, a town of Ruffia, in thie government of Koftrom, on the Volga; to miles S.E. of Koftrom.
KINETON, or Kington, a market town and parifh in a hundred of the fame name, and county of Warwick, England, was formerly poffeflod by the kings of England, and it is faid that Edward the Confeffor, and William the Conqueror, held this town and manor. King John kept his court here, at a calle N.E. of the town. In the fourth year of king Henzy III. Stephen de Legrave, obtained the king's charter for holding a weckly "Mercate," or market here on Tuefdays; and afterwards the fame king granted an annual fair for two days. A church was built here about the beginning of Edward II.'s reign. In the year 1800 , the town contained $16 ;$ houfes, and 779 inhabitants. In the vicinity of Kineton, to the S.E. is Edge hill, where a fignal battle was fought in the year 1642 , between the armies of Charles I. and thofe of the parliament. Jago has commemorated the place, and the event, in an intereflirg poem, entitled, "Edge-hill." Dugdale's "Antiquities of Warwickfhire illultrated," fol. 1656.

KING, a monarch, or potentate, who rules fingly and fovereignly over a people,

Camden derives the word from the Saxon cyning, which fignifies the fame; and that from can, powter, or ken, knozyledge, with which every monarch is fuppored to be invefted. The Latin rez, the Scythian reis, the Punic refob, the Spanifh rey, the French roy, come all. according to Poftel, from the Hebrew שׂำ, rofch, shief, heac.

Kings, both among the ancient Greeks and Romans, were prielts as well as priaces. Virgil, fpeaking of Anus, king of Delos, fays,
"Rex Anius, rex idem bominum, Phobique facerdos."
As to the Romans, Livy and Dionyfius are exprefs; they fay, that though Numa inflituted a great number of orders of priefthood, yet fome he difcharged himfelf, and in perfon. After the expullion of the kings, they were obliged to create a rex fucrorum, a king of the facrifices, for the adminiftration of the prieflly part of the royalty.
Lawyers fay, the king of England is a mised perfon, a prieft as well as a prince: at his coronation he is anointed with oil, as the priefts and kings of Ifrael were, to intimate, that his perfon is facred.

Among the Greeks, the king of Perfia had anciently the appellation of the great king; the king of France lately had that of the mofl Cbrifitian king , and the king of Spain has that of Catholic king. See Catholic.
The king of the Romans is a title formerly belonging to the emperor of Germany; but lately conferred on the infant fon of Bonaparte.
The kings of England, by the Lateran council, under pope Julius II. had the title of Cbriflianif/mus conferred on them; and that of defender of the faith was added by pope Leo X. though it had been ufed by them fome time before.
The title of grace was firlt given to our kings about the time of Henry IV. and that of majgly firlt to Henry VIII. before which tine our kings were called grace, highnefs, \&c.
In all public inftruments and letters, the king ftyles himfelf nos, we; though till the time of king John, he fpoke in the fingular number.

The Hungarians formerly gave the name king to their qucen Mary, to avoid the infamy which the laws of that courtry calt upon thofe who are governed by women: accordingly the bore the title of king Mary, till her mar-

## K I N G.

riage with Sigifmund, at which time fe took the title of queen.

By our laws the fupreme executive power of thefe kingdoms is vefted in a fangle perfon, the king or queen: for it matters not to which fex the crown defcends: but the perfon entitled to it, whether male or female, is immediately invefted with all the enfigns, rights, and prerogatives of fovereign power, as is declared by ftatute I Mar. It. 3. c. 1. (Sec Queen.) As the exccutive power of the Englifh nation is velted in a fingle perfon, by the general confent of the people, manifefted by long and immemorial ufuage, it is become neceflary to the freedom and peace of the ftate, that a rule, uniform, univerfal, and permanent, fhould be laid down, in order to make out, with precifion, who is that fingle perfon, to whom are committed (in fubfervience to the Waw of the land) the care and protection of the community ; and to whon, in return, the duty and allegiance of every individual are due. Accordingly our conltitution has not left the decifion of this important queftion dark or doubtful. It has marked out the right of fucceffion in characters fufficiently obvious. See the article Right of Cnows.

The king's title having been afcertained, the next point of principal importance is the affiftance which the law has provided for him in the difcharge of his duties, the maintenance of his diznity, and the exercife of his prerogative. For this purpofe a diverfity of councils has been eftablifined: fuch are, the high court of parliament, the peers of the realm, the judges of the courts of law, and more efpecially the privy council, generally called, by way of eminence, "the council." (See Parliament, Peers, Judges, and Privy Councle.) The next object of confideration will be the duties incumbent on the king by our contlitution; with a view to which his dignity and prerogative are eftablifhed by the laws of the land: it being a maxim in the law, that protection and fubjection are reciprocal. (7 Rep. 5.) Thefe reciprocal duties are, according to the ftatement of judge Blackfone, what were meant by the convention in 1688 , when they declared that king James had broken the original contract between king and people. (See Original Contract.) The principal duty of the king is to govern his people according to law. "Nec regibus infinita aut libera poteflas," was the conflitution of our German anceltors on the continent. (Tac. de Mor. Germ. c. 7.) And this is not only confonant to the principles of nature, of liberty, of reafon, and of iociety, but has always been efteemed an exprefs part of the common law of England, even when prerogative was at the higheft. "The king," fays Bracton, (1. 1. c. 8.) who wrote under Henry III. " ought not to be fubject to man, but to God, and to the law; for the law maketh the king. Let the king, therefore, render to the law what the law has invefted in him with regard to others; dominion and power; for he is not truly king, where will and pleafure rule, and not the law." And again, (1. 2, c. 16. \$3.)" the king alfo hath a fuperior, namely, God, and allo the law by which he was made aking." Fortefcue, alfo having well diltinguifhed between a monarchy abfolutely and defpotically regal, introduced by conquelt and violence, and a political or civil monarchy, which arifes from mutual confent, fuch as he fuppofes the government of England to be, lays it down as a principle, that "the king of England muft rule his people according to the decrees of the laws thereof; infomuch that he is bound by an oath at his coronation to the obfervance and keeping of his own laws." Moreover, it is exprefsly declared by flatute 12 and 13 W. III. c. 2. "that the laws of England are the birthright of the people thereof; and all the kings and queens who fhatl afcend the throne of this realm ought to admini-
fler the government of the fame according to the faid laws; and all their officers and miniters ought to ferve them refpectively according to the fame; and therefore all the laws and ftatutes of this realm, for fecuring the eftablifhed religion, and the rights and liberties of the people thereof, and all other laws and flatutes of the fame now in force, are ratified and confirmed accordingly." The terms of the original contract between king and people, the learned judge apprehends to be now couched in the Coronation OATn; which fee.

In order to enable the king to maintain the executive power in due independence and vigour, and to difcharge witt honour to himfelf, and benefit to his fubjects, the dutics of his high flation, the conftitution and laws have invelted him with a variety of prerogatives, fome of which are dired and others incistental. (See Prerogative.) The former, or direct and fubttantive prerogatives may be diftributed into three kinds; fuch as regard, firft, the king's royal character; fecondly, his royal authority; and laftly, his royal income. Thefe are neceffary to fecure reverence to his perfon, obedience to his commands, and an affluent fupply for the ordinary expences of government. We fhall refer to the article Revenue, what relates to the royal income; and here content ourfelves with enumerating fome particulars that pertain to the king's political character and authority ; or, in other words, his dignity and regal power ; to which laft the term prerogative is frequently reltricted. In order to exhibit and fupport the royal dignity, the law arcribes to the king, in his high political character, not only large powers and emoluments, which form his prerogative and revenue, but likewife certain attributes of a high and tranfcendent nature; by which the people are led to confider him in the light of a fuperior being, and to pay him that awful refpect, which may enable him with greater eafe to carry on the bufinefs of government. Firyg of all, the law afcribes to the king the attribute of fovercignty, or pre-eminence. "Rex eft vicarius," fays Bracton, "et minilter Dei in terra. Omnis quidem fub eo eft, ipfe fub nullo nifí tantum fub Deo." He is faid to have imperial dignity ; and in chatters before the conqueit, is frequently ftyled baffleus and imperator, the titles refpectively affumed by the emperors of the Ealt and Weft. His realm is declared to be an enipire, and his crown imperial, by many acts of parliament, particularly the ftatutes 24 Hen. VIII. oap. 12. and 25 Hen. VIII. cap. 28, which at the fame time declare the king to be the fupreme head of the realm in matters both civil and ecclefiaftical, and confequently inferior to no man upon earth, dependent on no man, and accountable to no man. (See alfo 24 Geo. II. cap. 24-5 Geo. III. cap. 2\%.) Hence it is that no fuit or action can be brought againt the king, even in civil matters ; becaufe no court can have juriPdiction over him. Hence it is likewife, that by law the perfon of the king is facred, even though the meafures purfued in his reign be completely tyrannical and arbitrary; for no jurifdiction on earth has power to try him in a criminal way; much lefs to condemn him to punifhment. If any foreign juridiction had this fower, as was formerly claimed by the pope, the independence of the kingdom would ceafe; and if fuch a power were vefted in any domeftic tribunal, there would foon be an end of the conftitution, by deflroying the free agency of one of the conflituent parts of the fovereign legiflative power. It may be aked, however, are the fubjects of England totally deltitute of remedy, in cafe the crown fhould invade their rights, either by private injuries, or public oppreffion? To ahis, fays judge Blackflone, we may aufwer, that the law has provided a remedy in both cafes. As to private injuries; if any perfon has, in

## K I N G.

point of property, a juft demand upon the king, he muft petition him in his court of chancery, where his chancellor will adminifter right as a matter of grace, though not upon compulfion. (Finch. L. 255.) And this is entirely confonant to what is laid down by the writers on natural law. See Puffendorff's Law of Nature, b. 8. c. 10. Locke on Goy. p. 2. § 205 .

As to cafes of ordinary public oppreffion, where the vitals of the confitution are not attacked, the law hath alfo af. figued a remedy. For as a king cannot mifufe his power, without the advice of evil counfellors, and the affltance of wicked minifters, thefe men may be examined and punified. The coaltitution has therefore provided, by means of indictments, and pariiamentary impeachments, that no man fhall dare to affit the crown in contradiction to the laws of the land. As to fuch public oppreffions as tend to diffulve the conftitution, and fubvert the fundamentals of government, thefe are cafes, which the law will not, out of decency, fuppofe; being incapable of diftrulting thofe, whom it has invelted with any part of the fupreme power; fince fuch diftruit would render the exercife of that power precarious and impracticable. The fuppofition of law, fays judge Blackitone, is, that neither the king nor either houfe of parliament (collectively taken) is capable of doing any wrong ; fince in fuch cafes the law feels itfelf incapable of furniohing any adequate remedy. For which reafon all oppreffions, which may lappen to fpring from any branch of the fovereign power, mult neceflarily be out of the reach of any fated rule, or exprefs legal provition; but, if ever they u fortunately happen, the prudence of the times mutt provide new remedies upon new emergencies. It is found, indeed, by experience, that whenever the unconftitutional oppreffions, even of the fovereign power, advance with gigantic frides and threaten defolation to a fate, mankind will not be reafoned out of the feelings of humanity; nor will facrifice their liberty by a fcrupulous adherence to thofe political maxims, which were originally eftablifhed to preferve it. And therefore, though the pofitive laws are tilent, experience will furnilh us with a very remarkable cafe in which nature and reafon prevailed. When king James II. invaded the fundamental conftitution of the realm, the convention declared an abdication, by which the throne was rendered vacant, which induced a new fettlement of the crown. After all, it mult be left to future generations, whenever neceffity and the fafety of the whole fhall require it, to exert thofe inherent (though latent) powers of fociety, which no climate, no time, no coniftitution, no contract, can ever deftroy or diminifh.
II. Befides the attribute of fovereignty, the law alfo aferibes to the king, in his political capacity, abfolute perfedion. The king can do no wrong; by which ancient and fundamental maxim we are not to underitand, that every tranfaction of government is of courfe jult and lawful, but that whatever is exceptionable in the conduct of public affairs is not to be imputed to the king, nor is he anfwerable for it perfonally to his people; and farther, that the prerogative of the crown extends not to do any injury; it is created for the benefit of the people, and therefore cannot be exerted to their prejudice. (Plowd. 487.) In the king there is no folly or weaknefs; no injuttice or error; and, therefore, if the crown fhould be induced to make an improper grant of any franchife or privilege, the law declares that the king was deceived in his grant, and thereupon fuch grant is rendered void, merely upon the foundation of fraud and deception, either by or upon thofe agents whom the crown had employed. Yet, notwithtanding this perfonal perfection which the law afcribes to the fovereign,
the conflitution has allowed a latitude of fuppofing the contrary, in refpect to both houfes of parliament ; each of which, in its turn, hath exerted the right of remontrating and complaining to the king even of thofe acts of royalty; which are moit properly his own; fuch as meffages figned by himfelf, and rpeeches delivered from the throne; neverthelefs, for the fake of frcedom of debate, thefe acts of ftate are ufually fuppofed to proceed from the advice of the adminiftration. In the king likewife there can be no negligence or laches, and, therefore, no delay will bar his right: nullum tempus occurrit regi. (Finch. L. 89. Co. Litt. 90.) In the king affo there cau be no infany, itain, or corruption of blood. By his crown he is, ipfo facio, cleared of all attainder; no non-age or minority is allowed in him; and his very grants of lands, though held in his natural capacity, cannot be avoided by non-age.
III. Nay more, the law aferibes a kind of perpetuity, or immortality to him. Rex Anglie non moritur. Henry, Edward, or George, may die ; but the king furvives them all. His death is termed his dcmifc, becaufe the crown is thereby demifed to another. Hc is faid not to be liable to death, being a corporation of himfelf, that lives for ever. There is no interregnum, but the moment one king dies, his heir is king, fully and abfolutely without any coronation, ceremony, \&c.
IV. To thefe it may be added, that the law attributes a kind of ubiquity to the king; he is in a manner every where, in all courts of judicature, which he alone has the right of erecting, and therefore cannot be nonfuited. In the exertion of lawful prerogative, fays judge Blackitone, the king is and ought to be abfolute; that 1 s , fo far abfolute, that there is no legal authority that can cither delay or refint him. He may rejeft what bills, may unke what treaties, may coin what money, may create what peers, may pardon what offences he pleafes; unlefs where the conflitution hath exprefsly, or by evident confequence, laid down fome exception or boundary; declaring that thus far the prerogative fhall go and no farther.

Some things there are which the king cannot do ; viz. he cannot diveft himfelf, or fucceflors, of any part of his regal prerogative, authority, \&c. There are feveral things allo which he cannot do falvo jure, falvo juramento, Es falva confoientia fua: in particular, there are two things which he cannot do without the confent of parliament; viz. make new laws, or raife new taxes.

In the exertion of thofe prerogatives, which the law has given him, the king is irrefittible, and abfolute, according to the forms of the contitution, and yet, if the confequence of that exertion be manifeltly to the grievance or difhonour of the kingdom, the parliament will call his advifers to a juft and ferere account. For prerogative confifting, as Mr. Locke has well defined it, (On Govern. 2. § 166.) in the difcretionary power of acting for the public good, where the pofitive laws are filent, if that diferetionary power be abuled to the public detriment, fuch prerogative is exerted in an unconflitutional manner. Thus the king may make a treaty with a foreign ftate, which fhall irrevocably bind the nation; and yet when fuch treaties have been judged pernicious, impeachments have purfued thofe minifiers, by whofe agency or advice they were concluded.
The king, with regard to foreign concerns, is the delegate or reprefentative of his people; and as fuch, he has the fole power of fending ambaffadors to foreign flates, and receiving ambafladors at home. See Embassador.
The king has power, by his prerogative, without any act of parliament, to make war or peace, to conclude leagues, treaties, and alliances with foreign itates, and to grant fafe-
conducts.

## KIN

conduCts. The king is confidered as the generalifimo, or the firft in military command, within the kingdom: and in this capacity he has the fole power to give commiffions for raifing and regulating fiects and armies, as well as for erecting, manning, and governing forts, and other places of Arength, to appoint ports and havens, to erect beacons, light-houfes, and fea-marks, to prohibit the exportation of arms or ammunition out of the kingdom, difpofe of magazines, caltles, fhips, public moneys, \&c. He convokes, adjourns, prorogues, and diffolves parliaments; and may refufe his affent to any bill paffed by both houfes, without giving his reafons for it.

In domettic affairs the king is confidered as the fountain of juftice and general confervator of the peace of the kingdom. However, by the fountain of jultice the law does not mean the autbor or original, but only the diflributor. Juftice is not derived from the king, as from his free gift ; but he is the feward of the public, to difpenfe it to whom it is due. (Bract. 1. 3. tr. 1. c. 9.) In this capacity the king alone has the right of crecting courts of judicature; and all jurifdictions of courts are either mediately or immediately derived from the crown; their proceedings run generally in the king's name; they pafs under his feal, and are executed by his ulficers. In early times, our kings, probably in perfon, often heard and determined caufes between party and party. But by the uniform ufage of many ages, they have delegated their whole judicial power to the judges of their feveral courts, which are the grand depofitaries of the fundanental laws of the kingdom, and have gained a known and ftated jurifdiction, regulated by certain and eftablifhed rules, which the crown itfelf cannot now alter but by act of parliament. (2 Hawk. P. C. 2.) In criminal proceedings it would be in the highelt degree abfurd, if the king perfonally fat in judgment; becaufe in regard to thefe he appears in another capacity, that of "profecutor." But though the king is not perfonally prefent in his courts of law; yet he is underftood to be virtually prefent; his judges are the mirror by which the king's image is reflected; fo that it is the regal office, and not the royal perfon, that is always prefent in court, always ready to undertake profecutions, or pronounce judrment, for the benefit and proteciion of the fubject. See Court and Judge.

As the king is the fountain of juftice, the prerogative of iffuing proclamations is velted in him alone. (See Proclsmation.) The king is likewife the fountain of honour, of office, and of privilege. Accordingly he is entrutted with the fole power of conferring dignities and honours, fo that all degrees of nobility, knighthood, and other titles, are received by immediate grant from the crown; either expreffed in writing, by writs or letters patent, as in the creation of peers and baronets; or by corpoocal inveltiture, as in the creation of a fimple knight. And as the king may create new titles, fo he may create new offices, but with this reitriction, that he cannot create new offices with new fees annexed to them, nor annex new fees to old offices; for this would be a tax upon the fubject, which cannot be impored but by act of parliament. ( 2 Int. 533.) The king has alfo the prerogative of conferring privileges upon private perfons; fuch as granting place or precedence to any of his fubjects ( 4 Inft, ${ }_{3} 6 \mathrm{r}$. ) ; fuch is allo the power to enfranchife an alien, and make him a denizen. Such is likewife the prerogative of erecting corporations; which fee.

The king is alfo the arbiter of commerce. Under this branch of the prerogative he has power to eftablifin public marts, or places of buying and felling; fuch as markets and fairs, with the tolls belonging to thens; and likewife to regulate weights and meafures; to give money, which is the
medium of conumerce, authority, or to make it current: and the coining of money is the act of the fovereign power, and the fettling of the denomination or value for which the coin is to pafs current. The king may alfo at any time decry or cry down any coin of the kingdom, and make it no longer current. Among the incidental prerogatives belonging to the king, and which are exceptions, in favour of the crown, to thofe general rules that are cttablined for the relt of the community, we may mention the following. Debts due to him are always to be fatisfied in the firft place, in cafe of executorhip, \&c., and till his debt is difcharged, he may protect the creditor from the arretts of others. He may diltrain for the whole debt on a teuant that holds but part of the land; is not obliged to demand his rent as others are; may fue in what court he pleafes, and diftrain where he lifts. In all doubtful cafes, femper profumetur pro rese: no ftatute reftrains him, unlefs he be particularly named. In all cafes where the king is plaintiff, his officers may enter with an arreft ; and, if entrauce be denied, break open a houfe, and feize the party ; though in other cafes a man's houfe is his cafle, and has a privilege to protect him againft all arrefts. Moreover no colts flall be recovered againtt the king; and the king can remove a jointtenant.
He has alfo cuftody of the perfons and eftates of idiots and lunatics; he is ultimus beres jegni, and to him revert all eftates, when no heir appears. All treafure-trove (i. e. money, plate, or bullion, found, and the owners not known) belongs to him; fo all waifs, eltrays, wrecks, lands recovered from the fea, gold and filver mines, royal fifhes, \&c belong to him. See Revenue.
The king is confidered by the laws of England as the head and fupreme governor of the national church. ( 26 Hen. VIII. cap. I. I Eliz. cap. 1.) In virtue of this authority, he convenes, prorogues, reftrains, regulates, and diffolves, all ecclefiaftical fynods or convocations. See Convocation.
He has the fupreme right of patronage, called patronage paramount, over all the ecclefaltical benefices in England.

From this prerogative of being the head of the church arifes the king's right of nomination to vacant bifhoprics, and certain other ecclefiatical preferments. As head of the church, the king is likewife the "dernier refort" in all ecclefiaftical caufes; an appeal lying cltimately to him in chancery from the fentence of every ecclefiatical judge; which right was reltored to the crown by ftatute 25 Henry VIII. c. 19. The king can unite, feparate, enlarge, or contract the limits of bithoprics, or ecclefiaftical benefices, and by his letters erect new bifhoprics, colleges, \&c. See Regalia.
He can difpenfe with the rigour of the ecclefiaftical laws, except thofe which have been confirmed by act of parliament, or declared by the bill of rights; as, for a baltard to be a prieft, for a bihop to hold a benefice in commendam, \&c. He has alfo power to difpenfe with feveral acts of parliament and penal flatutes, by a nonobitante, where himfelf alone is conccrncd; to moderate the rigour of the law, according to equity; to pardon a man condemned by law; except in appeals of murder, and in cafe of impeachments by the houle of commons; and to interpret by his judges, in ftatutes and cafes not defined by law.

King of the Sacrifices, rex facrificulus, or facrorumt, was a title of an ancient prielt, or miniter of religion, at Rome ; who was fuperior to the flamen dialis; but inferior to the pontifex maximus.

He was created at the comitia centuriata, or affembly of the centuries, and was at firlt chofen out of the number of the patricians. He could not, during his office, hold any magiftracy, nor harangue the people. He prefided at all the facrifices, proclaimed the fealts, \&c.

His wife bore the title of queen of the facrifices, regina facrorum; and had herfelf a part in the facred ceremonies.

King at Arms, or of Arms, is an officer of great antiquity, and anciently he was of great authority ; his bufinefs is to direct the lieralds, prefide at their chapters, and have the juriddiction of armory.

The origin of this title is doubtful. Some of the French writers imagine that it was given to heralds becaufe they attended upon and regulated military ceremonies. Others attribute to them the tyle of kings, becaufe they governed and prefided in ceremonies of tournaments, in like manner as the maiter of the ceremonies at Athens was fyled $\beta \alpha=\bar{\lambda} \lambda \varepsilon \alpha$. Others again afcribe the title to them, becaute in affigning arms, as expreffions of honour to any perfon, they refembled the kingly prerogative. But this fuppofes that the cuftom of granting arms by the kings of heralds is as ancient as their titles: whereas Mr. Edmondfon obferves, in his "Complete Body of Heraldry," that it doth not any where appear that thefe kings had anciently the addition armorum given to them, they being then called, as they truly were, reges heraldorum; which for the moft part continued till about the reign of Henry IV., when they began to be entitled reges armorum, although their primitive appellation was alfo ufed for fome ages. The latter titic of reges armorum was attributed to them before fuch times as thofe officers made any grant of arms.

Sir Henry. Spelman is of opinion, that the title of king of arms was attributed to fuch officers in England as belonged immediately to the king's majeity ; whillt thofe who appertained to princes of the blood royal, or to the nnbility, were Atyled fimply heralds. The moft probable conjecture is, that this denomination " king of heralds," of later times called "king of arms," was given to that perfon who was the chief, or principal officer prefiding over the heralds of any kingdom, or of any particular province, ufually termed by heraldic writers "the marches," or of any order of knigithood; and owing its rife probably to the French dialect. Among the French, the word roy, or kiny, and from them in their and our hiltories and records, the Latin word rex hath been frequently referred to the principal, the governor, the judge, the vifitor, the fuprome, the prefident, or chief, of many profeffions, arts, or comuninities. In the moft ancient writers, thefe officers are ityled merely "kings of heralds," without the addition of any titie of office; but
in courle of time they became diftinguifhed by the appellations of their different provinces.

In England we have three kings of arms; viz. Garter, Clarenceux, and Norroy.

Garter, principal King at Arms. See Garter.
The two lalk are alfo called provincial heralds, becaufe they divide the kingdom between them into two provinces, which are feparated by the river Trent.

Thefe, by charter, have power to vilit noblemen's families, to fet down their pedigrees, diftinguifl their arms, appoint perfons their arms, and, with Gartor, to direct the other heralds.

Anciently the kings at arms were created, and folemoly crowned, by the kings of England themfelves; but of later days the earl marfhal has a fpecial commifforn, at every creation, to perfonate the king. Sec Clahencelx, and Norroy.

To thefe may be added Lyon King at Arms, for Scotland, who is the fecond king at arms for Great Britain; he is invefted and crowned with great folemnity. To him belong the publifhing the king's proclamation, marfhalling funerals, reverfing arms, \&c. And alfo Uliter, king of arms, in Ireland.

Uliter was fubtituted, as fome fay, in the roum of Ireland king of arms, by Edward VI.; though the king himfclf in his journal takes notice of it as a new inftitution. "There was a king of arms made for Ireland," fays he, "whofe name was Ulter, and his province was all Ireland: and he was the fourth king of arms, and the firt herald of Ireland." 'The patent paffed under the great feal of England, with an ample teftimony of the neceffity and dignity of the office. Whether Uifter was fubftizuted in the room of Ireland king of arms, or elfe was newly erected, fuch an officer of the crown of England, on which Ireland is dependent, fill continues, and may execute his heraldic order in this kingdom, though out of his province, in as extenfive a manner as either Clarenceux or Norroy may do without the limits of either of their marches. We here add, that each of the military orders of knighthood eftablined in England, viz. the Garter and the Baith, give titles to kings of arms. Garter has been already mentioned. (See Garter.) Bath king of arms was created in the eleventh year of king George I. for the government of the order of the "Bath, ${ }^{\text {" }}$ then newly created, by virtue of letters patent, bearing date at Weltminfter, May the ISth, in that year. In conformity to the itatutes pertaining to this order; he was mominated and created, by the great mafter of the order, with the ceremonies ufually obferved in the creation of other kings of arms, to continue in his faid office during good behaviour, denominated Bath, and enjuined feduoufly to attend the fervice of the order. His habit and fervice are particularly preferibed. In the year 1725 , his majeity, by lign manual, conflututed and ordained, the then Bath king of arms, "Gloucefter king of arms, and principal herald of the parts of Wales ;" and letters patent paffed the great feal, granting to him the faid office of "Gloucełter," empowering him to grant arms and crells to perfons refiding within the dominions of Wales; and alfo perpetually coniolidating the office of "Gloucefter" with that of "Bath" kinc of arms : ordering, moreover, that in allaflemblies, and at alil times, he fhould take precedency above and before all other provincial kings of arms. See Collefe. of Heralds, and Herald.

King's Band, in Mufical Hiflory, a royal houfhold eftablifhment. In the reion of king Edward IV., Nufic, after leading a vagrant life in our country, and being paffied from parifh to parifh, feems at length, by the favour of this mo.

## K I N

narch, to have acquired a fettlement; for it appears by his letters patent, under the great fcal of liss realm of England, bearing date the $2.4^{2}$ h of April, 1469 , in the ninth year of his reign, that this prince did incorporate certain minttrels, and give them a charter.

The original charter is preferved in Rymer's Focdera: and in the eleventh year of Charles I., when that monarch was petitioned to grant a new patent to the profeffors of the art and fcience of mufic, the form of that which had been from Edward IV. was made the ground-work of the new charter. For a further account of this intitution, fee Chapel Rojal Effablifoment.

The fplendid robes and gorgeous attire of bards and mindtrels at all times are upon record. The flowing veft of Orpheus in the triple capacity of prieft, legiflator, and mulician, is fpecified by Virgil; Arion is related by Herodotus to have leaped into the fea in the rich veftments he ufually wore in public; Suidas fpeaks of the faffron robe and Milefian flippers worn by Antigenides; and the performers in the tragic chorus, which uled to be furnifhed at the expence of fome wealthy citizen of Athens, wore alfo a fplendid and coftly uniform.

Indeed the cuftom of prefenting ftate muficians with fupcrb and expentive dreffes during the fourteenth century, feems to have travelled into England from the continent, and to have continued here till after the eftablifhment of the king's band of four-and-twenty performers; part of their prefent falary being ftill paid at the wardrobe-office, as an equivalent for the annual drefs with which they ufed to be furnithed at his majetty's expence. The children of the king's chapel ftill continue to wear the fcarlet uniform of the original eltablifhment. And the waits, or muficians who attend the mayor and aldermen of our cities and incorporate boroughs, are ftill furnifhed with fplendid cloaks. See Minstrels and Waits.

Kixg of the Mingrels, in Alufical Hifory. Dr. Plot, in his Hittory of Staflordfire, has minutely related the origin of an ancient and curious, though barbarous, privilege in favour of Englifh minftrels, granted by John of Gaunt, duke of Lancaiter, at his caftle of Tutbury, in the year ${ }^{3} 3 S_{1}$, at the inauguration of the firft king of the minftrels.

Du Cange gives feveral more early initances of minftrels having arrived at the honour of fovereignty in France: particularly Jean Charmillons, rex juglatotorum at Troyes, in Champagne, 1296. Kobert Cavaron, roi des meneftriers du royaume de France, 1338; and others in 1357, and ${ }_{1362}$. Copin de Brequin, roi des meneftriers du royaume de France. Computum de ausiliis pro redemptione regis Juhamis, A.D. ${ }^{1367 .}$ Pour une couronne d'argent quil dona le jour de la tiphaine au roi des meneftriers. And one about fix years later than Joln of Gaunt's inftitution is mentioned in Rymer, tom. vii. p. 555, where John Caunz, king of the minitrels, condefcends to fupplicate for leave to vifit foreign countries.
"During the time in which ancient ear's and dukes of Lancafter, who were ever of the blood royal, great men in their time, and had their abode, and kept a liberal hofpitality here, at their honour of Tutbury, there could not but be a general cencourfe of people from all parts hither; for whofe diverfion all forts of mulicians were permitted likewife to come to pay their fervices; amongft whom, being numerous, fome
quarrels and diforders now and then arifing, it was found neceffary, after a while, they fhould be brought under rulef, divers laws being made for the better regulating of then, and a governor appointed them by the name of a king, who had feveral officers under him to fee to the executian of thofe laws, full power being granted them to apprehend and arrelt any fuch minftrels appertaining to the faid honour, as fhould refufe to do their fervices in due manner, and to conftrain them to do them; as appears by the charter granted to the faid king of the minftrels, by John of Gaunt, king of Caftile and Leon, and duke of Lancatter, bearing date the 22 d of Augurt, in the fourth year of the reign cif king Richard II., entitled "Capta le Roy de Minftralae," which is as follows :
"John, by the grace of God, king of Caftile and Leon, duke of Lancaiter, to all them who fhall fee or here thcfe our letters, greeting-Know ye, we have ordained, conflituted, and affigred to our well-beloved the king of the minftrels in our honour of Tutbury, who is, or for the time fhall be, to apprehend and arreft all the minftrels in our faid honour and franchife, that refufe to do the fervices and minftrelfy as appertain to them to do from ancient times at Tutbury aforefaid, yearly on the days of the Affumption of our Lady; giving and granting to the faid king of the minftrels, for the time being, full power and commandment to make them reafonably to juftify, and to conitrain them to do their fervices, and minftrelfies, in manner as belongeth to them, and as it hath been there, and of ancient times accuftomed. In witnefs of which thing we have caufed thefe our letters to be made patent. Given under our privy feal, at our cattle of T'utbury, the 22d day of Auguft, in the fourth year of the reign of the moft fweet king Richard II." For a further account of this eftablifhment, fee Burney's General Hiftory of Mulic, vol. ii. p. 361 , \& c. and the article Minstrets.

King's Palace. The limits of the king's palace at Weftminfter, extend from Charing Crofs to Weftminfter Hall, and fhall have fuch privileges as the ancient palaces. ( 28 Henry VIII.) If any perfon flall ftrike another in the king's palace, he fhall have his right band cut off, be impriloned during life, and alfo be fined. 32 Henry VIII. cap. 12.

## King Charles I. in Biography. See Charles. <br> King Charles II. See Charles.

King of Pruflia, Frederic. Among German dilettanti in mufic, his late Pruffian majefty is entitled to the firlt place, in talents as well as rank. This heroic and accomplifhed prince having had Quantz carly in life for his matter on the German fute and in compofition, played no other pieces than his own and thofe of his malter, which were never
allowed to be printed. His majefty, during more than forty years of his bufy reign, when not in the field, allotted four hours a day to the ftudy, practice, and performance of mufic. All the German mafters allowed him the firt place among dilettanti compofers, as well as performers on the flute. Fifcher, however, who was fome time in his fervice before he firtt came to England, did not feem to like his mufical productions, thinking them, even then, fomewhat dry and old farhooned. This prince had certainly great profefiors in his fervice, though he was never partial to Emanuel Bach, the greatelt of them all. His majefty, befides a great number of picces for the flute, and fome for the harpfichord, compofed fometimes for the voice; particularly in the paltoral opera of "Galatea et Alcides," in 1747, of which the overture and recitatives were Graun's, and the airs by the King jointly with Quantz and Nichelmann. Sometimes, the day before performance, his majefty would fend a new fong to the maeftro di eappelia to be introduced in an opera, and this was univerfally believed to be his own production in all its parts. During the laft years of his life, according to his chapel-matter, Reichardt, his Pruffian majefty having loft fome of his front tecth, not only difgontinued the practice of the flute, but his evening concerts, and became totally indifferent to mufic: a proof that his majelty's chief pleafure in the art was derived from his own performance.

King, Charles. Of this choral múfician, fir John Hawkins, who feems to have known him perfonally, gives the following account in the fifth volume of his hiltory :
"Charles King, bred up in the choir of St. Paul's under Dr. Blow, was at firf a fupernumerary finger in that cathedral, for the fmall tipend of 14l. a-year. In the year 1704, he was admitted to the degree of bachelor in mufic in the univerfity of Oxford; and upon the death of Jeremiah Clark, whofe filter was his firt wife, was appointed almener and mafter of the children of St. Paul's, continuing to fing for his original itipend until the 3 Ift of October, 1730 , when he was admitted a vicar choral of that cathedral, according to the cuftoms and flatutes thereof. Befides his places in the cathedral, he was permitted to hold one in a parifh church in the city, being organilt of St. Bennet Fink, London; in which feveral ftations he continued till the time of his death, which happened on the 17 th $^{\text {th }}$ of March, 1745 . With his fecond wife he had a fortune of feven or eight thoufand pounds, which was left her by the widow of Mr. Primatt, the chemift, who lived in Smithfield, and alfo in that houfe at Hampton, which is now Mr. Garrick's. But notwithfanding this acceffion of wealth, he left his family in but indifferent circumftances. King compofed fome anthems, and alfo fervices to a great number, and thereby gave occafion to Dr. Greene to fay, and indeed he was very fond of faying it, as he thought it a witty fentiment, that "Mr. King was a very ferviceable man." As a mufician he is but little efteemed. His compofitions are uniformiy reftrained within the bounds of mediocrity; they are well known, as being frequently performed, yet no one cares to cenfure or commend them, and they leave the mind juft as they found it. Some who were intimate with him Lay, he was not void of genius, but averfe to ftudy; which character feems to agree with that general indolence and apathy which were vifible in his look and behaviour at church, where he feemed to be as little affected by the fervice as the organ-blower."

King, William, organit of New college, Oxford, let to mufic Cowley's "Mittrefs," and publifhed it with the following title, "Poems of Cowley and others, compofed into Songs and Ayrs, with a Thorough-bafe to
the Theorbo, Harpficon, or Bafe-violl," fol, Oxford, 1 fe8,
King, Roberit, bachelor in mufic, of Cambridgc, 16 ofo, one of the royal band of William and Mary. He compofed feveral of the airs that were printed in the "Tripla Concordia;" as well as many of the fongs that were publifted in the "Theatre of Mufic."
King, Jonn Gles, an Englifh divine, was born in the county of Norfolk about the year 1732. He completed his youthful ftudies a: Caius college, Cambridge, where he took his degrees of B. A. and M. A. in the years 1752 and 1763 , and at fubfequent periods he was admitted to the degree of D. D., and received a member of the Royal Society, and of the Society of Antiquaries, In 1764, be obtained the appointment of chaplain to the Englifh factory at Peterfburg. In this fituation he was Ied to inquire into the ceremonies of the Ruffian church, which he continually faw practifed, and determined to give a faithful defcription of the fame in his own language. He accordingly publifhed, in 1772, in a handfome quarto, illullrated with engravings, a work, entitled "The Rites and Ceremonies of the Greek Church in Ruffia; containing an Account of its Doctrine, Worfhip, and Difcipline." In 1778 , he wrote and publifhed a letter to the bifhop of Durham, containing fome obfervations on the climate of Ruffia, and the northern countries, with a view of the flying-mountains at Zarfko Sello, near St. Peterfburg. Soon after his return to his native country, he was prefented to the rectory of Wormley, in Hertfordifire, in 1783, and 1786 he purchafed the chapelry of Spring Garden, in which he officiated as preacher. While he refided at Peterburg, the emprefs of Ruffia had appointed him her medalif, and he was engaged in a medallic work it the time of his death, which happened Nov. 3, 1787, when he was about fifty-five years of age. Befides the works already mentioned, Dr. King was author of "Obfervations on the Barberini Vafe," which are printed in the eighth volume of the Tranfactions of the Antiquarian Society. Gen. Biog.

King, Peter, baron of Ockham, was born in the year 1669, at Exeter, of which city his father was a confliderable tradefman. He was intended to fucceed in the bufinefs, but having a ftrong inclination for reading, he purchafed books, and fpent all the time he could command in improving his mind. He was related to the celebrated John Locke, who, difcovering the bent of his inclinations, advifed that he fhould be fent to Leyden for literary improvement. At this period his attention was chiefly turned to theology, and in 169. he publifhed "An Inquiry into the Conftitution, Difcipline, Unity, and Worhip of the Primitive Church, that flourifhed three hundred Years after Chrift; faithfully collected out of the extant Writings of thofe Ages." In the firlt volume, only three of the fubjects were treated on, and he afterwards publifhed a fecond part on worfhip. The chief object of this work was to prepare the way for that compreheri. fion of the diffenters within the pale of the eftablifhed church, which the revolution was fuppofed likely to effect.. After his return from Leyden, he was perfuaded by Mr Locke to make choice of the law for his profeffion, and he accordingly entered himfelf of the liner Temple. He now employed all his powers in acquiring an extenive knowledge of the laws and conftitution of his country, and obtained a reputation which introduced him into the houfe of commons in 1699. This fituation he held during fix fucceffive parliaments, but his legal and political avocations did not allow him to abandon his former theological ftudies; but having been led by his inquiries to examine the origin of the Apoftles' Creed, he publifhed, in 1702 , a volume, intitled "The Hiftory of the Apoftes' Creed, with critical Obfervations
on its feveral Articles." Mr. King's employment as a law. yer increafed with his general reputation, and in 1708 he was chofen recorder of London, and about the fame time he received the honour of knighthood: in the following year he was appointed by the houfe of commons to be one of the managers on the trial of Dr. Sacheverel, and in 1712 he boldly appeared as gratuitous counfel for Mr. Whilton, on his profecution for herefy before the court of delegates, and, in the end, obliged the bifhops and civilians to defift. On the acceffion of Gcorge I. he was appointed to the lord chief jufticefhip of the common pleas, and was fworn of the privy council. In 1725 , the judge was raifed to the peerage by the ityle and title of lord King, baron of Ockham, in Surrey, and was created lord-chanceller in the room of the earl of Macclesfield: the labours of this highoffice being too great for his frength, in 1733 he refigued the feals, and in a few months afterwards, viz. July 1734, departed this life, leaving behind him a character of great virtue and humanity, and of iteady attachment to civil and religious liberty. Biog. Brit.

King, Wiliam, a mifcellaneous writer, born in London about the year 1663 , was educated at Weftminiter fchool under Dr. Bufby, whence he was removed to Chrilt-church college in Oxford. He took his degree of M. A. in 1658, and in that year made his appearance as an author in a refutation of Varilla's account of Wickliffe, in his "Hiltory of Herefies." About this time he began the profeffional itudy of the civil law, in which he took a doctor's degree, and obtained a large practice as advocate in Doctor's Commons. In 1694, he publifhed, in anfwer to lord Molefworth's account of Denmark, his "Animadverfions upon the pretended Account of Denmark," which were fo highly approved by prince George of Denmark, that he was appointed fecretary to the princefs, afterwards queen Anne. In fome fubfequent years he publifhed feveral works of the humorous kind, fuch as "A Journey to London," intenjed as a burlefque on Dr. Martin Lilter's journey to Paris; and a fatire on fir Hans Sloane and the Royal Society. His habits were now become adverfe to every exertion of regular induftry, he deferted all his profeffional profpects, and, in 1702, he accepted an offer to gq to Ireland, where he had feveral appointments under government, by which he might have been fully employed, and derived wealth and even affluence. He returned to England in 1708 , but by no means improved in his fortune, and retired to his fludent's place in Chrift-church college, where he finifhed his largelt poem in imitation of Ovid's Art of Love, and compofed feveral other pieces. He clofely connected hinfelf with the Tory party, and wrote in defence of Sacheverel. He was concerned in the periodical paper, intitled "The Examiner :" and fuch were his fervices to his party, that he obtained the place of gazetteer; but the duties attached to the office were more than he liked to perform, and he refigned it in a fhort time. He died on Chriftmas-day, 1712. As a profe writer he is forgotten, but his account of ancient mythology was long a popular book in the fchools. His works have been collected and publifhed in three vols. Svo., under the title of "Original Works in Profe and Verfe." Biog. Brit. Johnfon's Lives of the Poets.

King, William, a learned Irifh prelate, was born at Antrim, in the province of Uliter, in the year 1650. From the grammar [chool, in which he had made great progrefs, he was fent to Trinity-college, Dublin, in 1667 ; here he was remarkable for his attention to the fludies of the place, and took his degrees in 1570 and $\mathbf{1 6 7 3}$, and in the latter of thefe years he was ordained deacon. In the following yeár he was admitted to priefts orderg, and was patronized by Dr.
'Parker, archbihop of Tuam, who appointed him his chaplais in $\times 676$. From this period ecclefiattical honours and preferments began to flow rapidly upon him, till at length, in 1685, he was ele Aed dean of St. Patrick's. He had already publifhed three tracts on the controverfy between the Papilts and Proteflants, and no fooner had the revolution taken place in England, than the dean became active in promoting the fame eltablifiznent in Ireland, both before and after the landing of king James there in 1689. That prince, fuily fenlible of the dean's influence, and of the weight of his oppolition, confined him twice in the tower of Dublin cafte on that account. This did not prevent him taking the degree of D. D. the fame year; but the Jacobite party continued to inveterate againt him, that they threatened to take away his hife, and actuaily made two or three unfuccefsful attempts for the purpole. Upon the flight of king James into France, after the batte of Boyne, in the year 1690, and the appointment of a day of thank io giving for the prefervation of king William's perfon, the dean preached the ferron on the cccafion, at St. Patrick's cathedral, and, in 1691, his zeal and activity in favour of the revolution were rewarded with the bifhopric of Derry. He now publifhed " The State of the Proteltants in Ircland under the late King James's Government, \&c." This treatife was fo well received, that a third edition of it was called for in a few months, and bifhop Burnet obferves, that it was univerfally acknowledged to be as truly as it was finely written, referring to it, in the "Hiftory of his own Time," as a fuli and faithful account. When public tranquility was reltored, the billop applied himfelf very diligently to the immediate duties of his pattoral care, and was exceedingly defirous of converting the Prelbjeterian party to the epifcopal forms. With this view, he publifhed, in 1694 , a treatife, entitled "The Inventions of Men in the Worthip of God:" this drew him into a controverly with Mr. Jofeph Boyfe, a diffenting minilter of Dublin, which terminated without effecting the object which the learned prelate had at heart. In 1yo2, bifhop King publifhed at Dublin his celebrated work, entitled "De Origine Mali," which was reprinted the fame year at London. The cbject of this work is to fhew in what way the feveral kinds of evil with which the world abounds, are confiftent with the goodnefs of Gód, and may be accounted for without the fuppofition of an evil principle. The bifhop was attacked by Bayle, Leibnitz, and others, upou different parts of his work; but he did not make any public reply during his life-time, being unwilling to enter again into the lifts of controverfy. He was not, however, an inattentive obferver of the arguments adduced againft him, but left behind him a great number of MSS., in which he confidered their feveral objections to his fyftem, and laboured to vindicate it from the lealt cavil : the fubftance was afterwards given to the public. In 1702, Dr. King was tranfated to the archbifhopric of Dublin, and, in $17 \times 9$, he publifhed a fermon, preached before the Irifh houle of peers, entitled "Divine Predeftination and Forc-knowledge confiftent with the Freedom of Man's Will," in which he maintained that the moral attributes of God were different from the moral qualities of the fame name in man. This doctrine was attacked by Dr. John Edwards and Mr. Authony Collins, to neither of whom did the archbinop reply, though he had prepared anfiwers, which were found among his MSS. at his death. In the year 1717, archbithop King was appointed one of the lords juftices of Ireland, and he held the fame office in the years 1721 and 1723. He died in May 1729, when he had nearly completed his 79 th year. He was a prelate of great learning, and fleadily attached to the principles of the Re volution ;

Solution; realous for the profperity of the eflablinhed clurch, to which he belonged; and of an unblemifhed and excmplary moral character. He was ambitious of the primacy of Ircland, which was refufed him, under the pretence of his being too old to perform the duties of the office. This reafon, it is faid, was as little agreeable as the refufal itfelf; and when the new primate called upoin him after his cleva. tion, archbilhop King received him in his own houfe, without rifing from his chair, malking this apology, in a fort of farcallic manner, "My lord, I am certain your grace will forgive me, becaufe you know I am too old to rife." After his death, the papers which he left were put into the hands of Mr. Law, afterwards bihon of Carlifle, who publithed a tranflation of his work "De Origine Mali," corrected and enlarged from the author's ootes, to which were added two fermons on the Divine I'refcience, and the Fall of Man, 2 vols. Svo. Biog. Brit.

T'his fertile tract of land, fituated on the W . end of Long ifland, and feparated from Staten ifland by the Narrows, ferves very much to the fupply of the New York market with butter, vegetables, fruit, \&cc. It is divided into lix townhips, and contains. 5740 inhabitants, includjng 1479 llaves. Its chief towns are Brooklyn, and Flatbufh-Alfo, a county of Nova Scotia, comprehending the iflands on the S.IV. and S. fides of the bafin of Minas. The rivers Habitant, Canaid, and Cornwallis, are navigable to fone difaince. The lands on thefe rivers afford arable and palture foil ; the rivers abound with fifh: and in the bafin of Minas are fine codfifh, haddock, and different kinds of flat fifh.

King's, or Pearl 1 fland, a fmall ifland in the bay of Panama; belonging to Spain, and famous for its pearlfilhery. N. lat. 7 12 $2^{\prime}$. W. long. $81^{\circ} 36^{\prime}$.

Kinc's Day, a bay on the S.E. coalt of Nova Scotia. N . lat. $44^{\prime} 32^{\prime}$. W. long. $59^{\circ} \mathrm{IO}^{\prime}$.

Krva's Bridge, a poll-town of New-York, 15 miles N. of New York city. The bridge conneets New York ifland with the main land.

King's County, a county of Ireland, part of the old diftrict of Ophaley, which, having been confifcated in the reign of the firlt Mary, was called the King's county, and its chief town Philip's-town, in compliment to her hufband, Philip II. of Spain. It has Weltmeaih and Meath on the N. ; Kildare and the Queen's county on the E. ; Tipperary on the S. and S.IV. ; and part of Galway and Rofrommon on the W. Its chief natural boundary is the Shannon, which feparates it from Galway. The little Brofna and the Barrow ferve, each of them, to mark its limits for a few miles. Its breadth, in the norihern and broadelt part, is 32 Irifh miles ( 39 Englifh), but it contracts very much as it flretches to the fouthward. In this part of the country it extends $3+$ Irinh ( 43 Englifh) miles from N. to S. It contains 282,200 acres, which make upiwards of $44^{\circ}$ fquare miles, equal to 453,370 acres, or yo7 fquare miles Euglifh. There are $5^{2}$ parifhes and 25 churches, and, according to Dr. Beaufort, a population of about $74,5 \mathrm{co}$. The completion of the grand canal has, however, iended much to increafe the population of this county. The only Vob. XX.
mountains in it are the Sticbhthoom, in the S.E. whith extend into the Queen's county. 'Thefe run in a range of about 15 mikes, having but one pafs, called the gai, of Glendine, which is wery difficult of approach, flcop and craggy, and not five feet wide. The foil in the noorthern part is montly argillaccous, and requires a great deal of lime to make it arable. The rocks are red zaggilite and freeflone, which iuterfect each other. In the centie there are varions foils, light fandy loan, fitif yeliows clay, gritty fhallow gravel, and deep brown earth. In this part of thic range the land is often fertile in patture, and grazed throughout the year with numerous flock of fhecp and young cattle: limettone is thickly interfperfed, and the bottom is a difl clay, where abundant crops of corn are yielded. In another part we lind a cold, fpongy clay. and at the foot, where the declivity vanifles, a deep irreclaimable bog, which can be approached only in very dry feafons. The mineral productions of this mountainou dilltict have not been yet afcertained. In the arable parts of the count $y$, we are informed that the foil is not naturally fertile, and is only rendered fo by manures, and proper attention to a rotation of crops. The quality of the foil is cither a deep moor, or a fhallow gravelly loam: the moilt feafon being moft favourable to the produce yielded by the latter, and the moors very productive in dry fummers. There is every where abundance of lime-ftose and lime-ftone gravel, which is found the bef manuse. The paftures, though not luxuriant, are kind and fattening, and well adapted for fheep-walks, where numerous flocks are fupported, the wool of which is abundant, and of a very fine quality. The coarect pafture, which is the unreclaimed moor, is highly nutritious to young cattle. The furface is rather an uninterrupted flat, unfavourable to dairy hufbandry, and the corn crops are principally oats and barley. In fo:ne parts, however, improvements in hufbandry are attended to, in the raifing of green crops, introducing artificial grafes, and drilling potatoes. Conliderably more than a third part of the whole county is occupied by bog and mountain. The bogs, however, fupply an abundance of moft excellent fuel, which not only ferves the inhabitants, but is fent by the canal to Dublin. They alfo yield, when calcined, an excellent and lafting manure, both for their own improvement and that of the high grounds. As there is a natural fall in many places, thefe bogs are very capable of being drained and reclaimed by lime-itone. Such land is fit for all the purpofes of hufbandry, and will be found more productive, either in patture or tillage, than the general run of the beft lands in the county. This reclaiming of bog is now purfued with much fpirit in many parts ; and nothing furely can be more gratifying than to behold rich carpets of white clover and trefoil in fpots which had been dark and barren moor. Thefe bogs have been lately furveged by the direction of the commiffioners for the inveftigation of bogs, and it is to be hoped that fome extenfive plart of drainage will be carried into effect. The mineral productions of the county are inconfiderable. Sir C. Coote, author of the Statiltical Survey, mentions only manganefe, iros ores in fmall quantity, ochre, marle, lime-ftone, freeflone, and potter's clay. There is a great fcarcity of timber, except ornamental plantations, though the bogs afford abundant proof of its having once been an almolt uninterrupted foreft. The alder appears to have been a native of this county, and a few of them fill rear their venerable tops in a park at Droughtville. This county is well watered: Befides the Shannon and the little Brofna, before mentioned, the greater Brofna, after winding through a great part of it, between pleafant banks, lofes iifelf in the Shan:
non. There are alfo feveral fmall rivers, and fome lakes, of which Lough Pallis and Lough Annagh are the largett; and the Grand Canal crofles the northern part of the county. Of the towns, Birr is the molt confiderable; but Philip'stown is the county town. Tullamore is a pretty and thriving place. The county is reprefented in parliament by the two knights of the suire only; the boroughs of Philip'stown and Banagher having been disfranchifed by the Union. Coote's Statiftical Survey. Beaufort's Memoir.

Kisc's Court, a poftown of the county of Cavan, Ire. land; 39 miles N.W. from Dublin.

King's Creek, a river of Virgiuia, which runs into the Chefapeak, N. lat. $37^{\prime} 20^{\prime}$. W. long. $76^{\prime} 3^{\prime}$. - Alfo, a river of North Carolina, which runs into the Cangaree, N. lut. $35^{\circ}$ 8. W. long. $81^{\circ} 40^{\prime}$.

KING's Ifand, an ifland in the Eaft Indian fea, near the W. coatt of Siam, about 51 miles in circumference. N. lat. 12 $2^{\prime}$ 18'. E. long. 98 . - Allo, a fmall ifland in Beering's itraits. N. lat. $65^{2^{\prime}}$. W. long. $168^{\circ}$ - Alfo, an ifland near the W. coaft of North America, feparated by Fifher's canal from the fouthernmok of Princefs Royal's iflands, and by Burk's canal from New Hanover ; fo called by captain Yancouver, after captain James King, of the Britifh navy. It is about 33 miles in length, and rather more than fix in breadth. Point Edward is the farthelt point to the N. and point Wailer to the S. N. lat. $51^{\circ} 56^{\prime}$ to 52 26'. E. long. $232^{\prime} 9$ to $232^{\prime} 43^{\prime}$.

Kivg's Keys, illets and rocks in the Spanifh main, near the Morquito fore. N. lat. $12^{\circ} 42^{\prime}$. W. long. $82^{\circ} 35^{\prime}$.

King's Point, the N.W. extremity of the inland of Sumatra; 15 miles IV. of Acheen. N. lat. $5^{\circ} 30^{\prime}$.

King and Quecn, a county of Virginia, on Mattapony river, which feparates it from king William's county. It is about 25 miles long and 20 broad, and contains 4499 free inhabitants, and 5380 flaves. At King and Queen, in this county, is a polt-office.

King George, a county of Virginia, between the Patowmac and Rappahannock rivers. It is 22 miles long and 14 broad, and contains 2762 free inhabitants, and $39^{9} 7$ flaves. In the count houfe is a polt-office.

King George's, J/funts, two iflands in the South Pacific ocean, difcovered by commodore Byron in $17 \sigma_{5}$, and vifited by captain Conk in 1773. The commodore's landing was oppofed by the natives, when, a thot or two being fired, one man was killed, and the re!t fled. The canoes were eurioufly wrought with planks, ornamented with carving, and the feams filled up by frips of tortoife-fhell. They were about 32 feet long, very narrow, with bottoms as fharp as a wedge. Two of them were joined together laterally by flrong fpars, fo that between them there was an interval of about fix or eight feet; each had a malt, and the fail was neatly made of matting. The houfes were low mean hovels, thatched with brancnes of cocoa-nut tree ; but they were delightfully fituated in a grove of itately trees. The cocoanut tree feemed to afiord them alnolt all the neceffaries of life; particularly food, fails, cordage, timber, and veffels for holding-water. The fhore appeared to be covered with coral, and the thells of large pearl oyfters. The illand was covered with fcurvy-grafs, The frefh water is good, but farce, being furmficd by very fmall wells, which are foon emptied, and as foon filied again. In one of the iflands was a lake or lagoon, in which were obferved two or three $\boldsymbol{v}$ cficle, one of which bad two tratts, and fome cordage aloft to fupport them. S. lat. $14^{\circ} 35^{\prime}$. W. long. $149^{\circ} 2^{\prime}$.

Kivg George the Third's Aichipelago, a group of illands in the North Pacific ucead, extending from N. to S. about

150 milcs in length ; about 15 miles broad towards the N . and diminifhing to little more than a mile at the fouthern extremity. N. lat. 56 10' to $5^{\prime}{ }^{\prime} 18^{\prime}$. E. long. $223^{\circ} 45^{\prime}$ to $225^{\circ} 40^{\prime}$.

Kivg George the Third's Ifand. Sce Otameme.
King George the Third's Sound, a harbour on the S.W coalt of New Holland, difcovered by captain Vancouver. in 1791. In approaching it from the weftward, it is the firf opening that appears like a harbour caltward of Cape Chatham. The Eclipfe iffands are an excellent guide to the Sound, having between them and Bald-head fome rocks on which the fea breaks with great violence. The port is fafe, and eafy of accefs any where between its outer points of entrance; Baid-head and Mount Gardner lying N. 623 E. and $S, 62^{\circ}$ W., it miles diftant from each other. S. lat. $355^{\prime}$. E. long. it 8 1 $7^{\prime}$.

King: George's Sound, a name given by Captain Cook to Nootka found. See Nootka.

King William's I/fand, a fmall inland in the Eaft Indian fea, near the N . cozit of the ifland of Poggy. S. lat. $2^{\circ} 33^{\prime}$. E. long. $99^{\circ} 43^{\circ}$ - Alfo, a fmall ifland in Dampier's ftratt, near the S. coatt of the iflard of Waigoo. S. lat. $0^{\circ} 32^{\circ}$. E. lonj. ${ }^{13} 30^{\circ} j^{\prime} 1^{\prime}$ - Alfo, a cape on the eaflern extremity of New Guinea. S. lat. 6 45'. E. long. it $8^{\circ} 5^{\prime}$.

KINGDOM, the dominion of a king. See Kixg and Monarchis.

Kingom, ameng Chemfls, is a ter:n which they apply to each of the three orders or clafles of natural bodies ; animal, vegetable, and mineral.

Kinganom of God, or of Heaven, in the Gofpel Hilfory, is a phrafe, which, according to Dr. Campbell, has a manifett allufion to the predictions in which this economy was revealed by the prophets in the Oid Teltament, particularly by Daniel, ch. ii. 44. vii. 13, I4; by Micah, ch. iv. 6, 7 ; and by other prophets. T'o thefe predictions there is a
 or fimply in $\beta_{a \sigma i \lambda s} x$, given, in the New Tellament, to the religious conflitution which would obtain under the Miefliah. In molt cafes $\beta_{\text {acineac }}$ anfwers to the Latin regnum. But this word is of more extenfive meaning than the Englifh, being equally adapted to exprefs both our terms reijan and king dom. The firft rclates to the time or duration of the fovereignty ; the fecond to the place or country over which it extends. Neverthelefs, though it is manifelt in the Gofpels, that it is much oftener the time than the place that is alluded to ; it is never, in the common verion, tranfo lated reign, but always kingleni. Yet the expreffion, fays Campbell, is often thereby rendered exceedingly awkward, not to fay abfurd. In order to prevent this mifapplication of terms, $\beta_{z \sigma b i s t z}$ ought fometimes to be rendered reign, and not kingdom. When it refers to the time, it ought to be rendered reign, and when to the place, kinglom. There are, however, a few paffages in which neither of the Euglith words can be confidered as a tranflation of $\beta_{\alpha J i \lambda t s z}$ iltrictly proper. In fome of the parables. (Matt, xviii. 23.) it evidently means adminilhration, or meitiod of governing; and. in one of them (Luke, xix. 12. 15.) the word denotes royalty, or royal authority, there beng a manifelt allufion. to what had been done by Herod the Great, and his imimediate fucceffor, in recurring to the Roman fenate in order to be invelted with the title and dignity of king of Judea, then dependent upon Rome. Upon the whole, we may obferse, that the phrafes, kinsdom of God, and king dom of bearen, are fynonymous; and that they fometimes denote the thate of the bleffed, and fometimes the goffel difpenfation. Campbell's I'rel. Dillo p. 83 g, se.

KINGHALE, in Geography, a town of Africa, in Cacongo, fituated on the Louifa. S. lat. $5^{\prime} 20^{\prime}$. E. long. $12^{\circ} 10^{\prime}$.

KINGHORN, a fmall fea-port town in the county of Fife, in Scotland, fituated on the north bank of the frith of Forth, nearly oppolite to the city of Edinburgh and port of Leith, from the latter of which it is about feven miles diftant. Kingloorn is principally inhabited by fifhermen and boatmen empliyed on the ferry, which is one of the chief routs of intercourfe between the metropolis and the counties of Fife and Angus. The boats employcd on the ferry are large, well built decked-boats; full-decked for carrying carriages, horfes, and black cattle; and there are handfome lmall pinnaces for pleafure parties, and paffangers who hare no equipage or horfes. The fares are regulated, and the conduct of the ferrymen fuperintended by the magitrates of Edinburgh, who punifh offences and frauds upon paffengers upon a fummary complaint. In the middle of the frith is a fmall pleafant ifland, about a mile in circumference, called Inch-Keith, upon which is the ruins of an old callle, which was once a place of fome flrength. About the comanencement of the prefent war fome entreachrents were made, and guns mounted upon this inand for the p:otection of the fhipping in the Forth from any furprite, probabiy from the recollection of the daring but nugatory attempt of Paul Jones, during the American centeit; but hitherto there has been no occafion to employ them. Inch-Keith, we believe, is the property of the city of Edinburgh.

KINGIKSOK, a town of Weit Greenland. N. lat. $61^{\prime} 55^{\prime}$. E long. $47^{\circ} 40^{\prime \prime}$.

KING-KI-TAO, a city and capital of Corea, fituated in the province of King-ki, and the ordinary relidence of the fovereign. N. lat. $47^{-} 3^{\prime}$. E. long. $1266^{\prime} 4^{\prime}$.

KI-NGNAN, a city of China, of the firlt clafs, in the province of Kiang-ff, feated on the river Kan, which is difficult and hazardous of navigation, on account of its numerous rocks and currents, and which requires the affiftance of perfons provided in this city. The adjuining lields and vallies are agreeable and fertile; and the mountaias are faid to contain mines of gold and filver. N lat. $27^{\prime} 7^{\prime}$. E. long. $114{ }^{2} 32^{\prime}$.

KINGROAD, a part of the Severn below Brittol, from whence the outward-bound fhips from that city take their departure.

KINGS, Books of, in Scripture Hiflory, two canonical books of the Old Teitament, fo called, becaufe they contain the hiitory of the kings of Ifrael and Judah, from the beginning of the reign of Solomon, down to the Babylouifh captivity. The firlt book of Kings contains the latter part of the life of David, and his death; the flourighing ftate of the Ifraelites under Solomon, his building and dedicating the temple of Jerufalem, his fhameful defection from the true religion, and the fudden decay of the Jewifh nation after his death, when it was divided into two kiugdoms: the reft of the book is taken up in relating the acts of four kings of Judah and eight of Ifrael. The fecond bnok, which is a contimuation of the fame hiltory, is a relation of the memorable acts of fixteen kings of Judah, and twelve of Ifrael, and the end of both kingdoms, by the carrying off the ten tribes captive into Aflyria by Salmanaflar, and the other two into Babylon by Nebuchadnezzar.
It is probable that thefe books were compofed by Ezra, who extracted them out of the public records, which were kept of what paffed in that nation. Thefe are the only books which the Hebrews call "Malachim or Kings," though the two books of Samuel have been alfo mentioned
under lhis sुencral title; and anthors have enumerated fone books of Kings, thofe of Samuel (which fee) being the tivet and fecoud. The four books contain the hittory of a!nout 600 years.

KINGSBRIDGE, in Geography, a frall market town and parifh in the hundred of Starborough, and county of Devon, Lingland, is fituated on a brauch of the Salcombe river, and, according to Rifion, derives its name from the bridge, which connects it wih Dodbrooke. The town i. in gencral well built. A frec-fehool was founded here by Mr Crifpin of Exeter, and has obtained fone degrec of repitation. The parifh was returned, under the populatioa act of 1800, as containing $1_{55}$ houfes, and 111 in inhabitant. Kingbridge is diltant from Dartmouth 10 miles, frors Exeter 39, and from London 207. It has a weekly market on Saturdays, and three aunual fairs. David Tolley or Tolbey, called by Leland Tavelegus, an eminent Greek and Latin fcholar in the time of Henry VIII., was a native: of this town. Beanties of England and Wales. Pulwhele's Hiftory of Devonflire, folio.

KINGSBURY, a townflip of America, in the county of Wafhington, and ftate of New York, fituated on the bend of Hudfon's river, on the N.E. fide; containing 165 r innabitants.

KINGSCLERE, a fmall market torn and parifh in the hundred of the fame name, Hampfhire, England, is fituated on the edge of a chain of hills, 17 miles from Reading in Berkfhire, and 55 from London. It is mentioned by Camden as being a conluderable town, but is now of a mean appearance, and only remarkable for having been the refldence of the Weft Saxon kings. The church is a fmall fluccoed building, with a low tower. This parifh was returned in the year 18or as containing 394 houfes, and 1939 mhabitants, of whom 492 were employed in trade, principally in the malting line, which produces a confiderable traffic with London. A weekly market is held on Tuefdays, and here are three annual fairs. It is probable that the palace of the Saxon fovereigns was connected with Freemantle Park, a fhort diftance to the fouth, as that is known to have been a royal refidence in the time of king John, and was in the poffeffion of the crown fo late as the reign of queen Elizabeth. The manfion has been laiely pulled down, and the park pluughed up and converted into a farm. Beaúties of England.

KINGSEY, a townfhip of Lower Canada, N.W. of Shipton, adjuining on both fides of Nicolet river, having about 30 inhabitants.

KINGSLAND Creek, a river of Virginia, which rums into James river. N. lat. $37^{\circ} 24^{\prime}$. W. long. $77^{\circ} 40^{\prime}$.

KINGSTON, or Esopus, a polt-town of America, in New York, in Ultter county, on the weft fide of Hudfon's river, fix miles welt of Rhinebeck, and on the eaft fide of Efopus hill, or creek. In 1777, this town was burned by the Britifh troops, under the order of general Vaughan. It has been fince rebuilt on a regular plan, and contains about 150 houles, a court-houfe, gaol, a Dutch reformed church, and an academy. Its fituation is pleafant, being furrounded by a fpacious plain; 56 miles S. of Albany. N. lat. $41^{\circ}$ 56. W. long. $73^{\circ} 5^{\circ}$. The townhip contains 4615 inhabitants. - Alfo, a townfhip in Addifon county, Vermont, containing 58 ; inhabitants.-Alfo, a port-town in Plymouth county, Maflachufetts, on the weftern part of Plymouth bay, bounded northerly by Duxborough, and containing 1037 inhabitants. It was incorporated in $1707 ; 38$ miles S.E. of Bofton.-Alfo, a polt-town in Rockingham county, New Hamphire, on the road that leads from Exeter to

Haverhill

Haverhill in Maffachufetes; 6 miles from the former, and 32 from the latter. It was incorporated in 1694 , and contains 785 inhabitants.- Alfo, a town, now "Conwayborough," in Horry difriet, South Carolina, on the weft tide of Wakkamaw rirer, having an epifcopal church, and about 36 houfes; 41 miles N. by E. from George iown-Alfo, the chicf town of Lenoir county, Newbern diftrict, in North Carolina. It is a poft town, fituated on a beautiful plain on the north fide of Neus river, and containing a courthoufe, graol, and about 30 houfes; 40 miles W . of Newbern.-Alifo, a townthip in Luzerne county, PennfylVania, containing 752 inhabitants. - Alfo, a town of Upper Canada, at the liead of the river St. Lawrence, on the north thore, oppofite to Wolf illand; occupying the fcite of old fort Frontinac, laid out in 1584 , and now advanced to a confiderable fize. It has a barrack for troops, a houfe for the commanding officer, an hofpital, feveral ftore-houfes, and an epifcopal church. About Kinglon there are feveral valuable quarries of lime-ftone, and the country in general is rather ftony, though not detrimental to the crops. It is 200 miles $S$. of Montreal, and 150 N . of Niagara. Large veffels go no farther than this place; thence to Niagara, \&xc. fores and merchandize are conveyed in boats.-Allo, a townihip of Upper Canada, being the fourteenth and uppermoft in afcending the St. Lawrence. It is in the county of Frontinac, and lies partly open to lake Ontario.-Alfo, the capital of the illand of St. Vincent's, in the Weft Indies, and the feat of government. It lies at the head of a bay of the fame name, on the fouth-weft fhore of the ifland, in St. George's parih. N. lat. $13^{\prime} 6^{\prime}$. W. long. 60.-Alfo, a town of Jamaica, in the county of Surrcy, fituated on the sorth fide of a beautiful harbour, and founded in 1693 , when repeated defolations by earthquake and fire had driven the inhabitants from Port Royal. It contains 1665 houles, befides negro-huts and warehoufes. The number of white inhabitants, in the year $1 ; 88$, was 6539 ; of free people of colour, 3280 ; of flaves, 16,659 : total number of inhabitants, of all complexions and conditions, $26,47 \mathrm{~S}$. It is a place of great trade and opulence. Many of the houfes in the upper part of the town are extremely magnificent; and the markets for butchers' meat, turtle, fihh, poultry, fruits and vegetables, \&c. are inferior to none. From comparative regifters of mortality it appears, that fince the furrounding country is cleared of wood, this town has been proved to be as healthful as any in Europe. Afize courts are heldevery three months in Kingiton, for the county of Surrey. N. lat. 18. W. long. $76^{\prime} 33^{\prime}$

- Kingston-upon-Hull. See Hull.

Kngaston-uron-Thames, a market town and parim in the bundred of Kingfon, and county of Surrey, England, derives its name from having been a royal refidence; and the adjunct is affixed to mark its fituation, and diltinguifh it from other Kingitons. It is feated on the fouthern bank of the river Thames, at the diftance of 11 miles from. Weft-minfter-bridge. In the fourth, fifth, and fixth years of king Edward II., this town fent members to parlament; and again in the forty-feventh of king Edward ILI. The corporation afterwards petitioned to be relieved from fending members, and the town then ceafed to be a borough. Several valuable privileges and immunities were granted to Kingiton by charters from kings John, Henry III., Edward III., and other fubfequent monarchs. The corporation now confilts of about fifty members. Here are one weekly market, and three annual fairs. In the year 1769 , an at of parliament was obtained for feparating the parifh of Kingtion and its dependent cbapelries of Richmond,

Moulfey, Thames-Ditton, Peterfham, and Kew, into two vicarages and two perpetual curacies. In this town is Car-bury-houfe, a feat of the late lord Dillon, near which is a very large barn, which has four entrances, four threfhing floors, and is fupported by twelve pillars: twelve waggons may be unloaded at once within its walls.

The hiltorical annals of Kingfon relate many interefing events, as having occurred here. In the year 838 , a grand council was affembled at this place, and was attended by Egbert, firlt Saxon king of all England, his fon Ethelwolf, and the principal nobles and bimops of the land; at the fame, the archbifhop of Canterbury prefided. Other monarchs were crowned here, of which the following are fpecified by our ancient hiftorians: Edward the Elder, crowned A.D. 900 ; his fon Athelftan, in 925 ; Edmund, in 940 ; Eldred, or Edred, in 946; Edwy, or Edwin, in 955 ; Edward the Martyr, in 975 ; and Ethelred, in 978 . Previous to the reign of Henry III. a caftle was flanding here, as that monarch, in the year 1264, marched out of London, and feized the caftle of Kenington, or Kinglton, which then belonged to Gilbert Clare, earl of Gloucefter, and which is not mentioned in any fubfequent period. In the civil wars of the feventeenth century, Kington was again a place of public celebrity; for the firlt armed force is faid to have been aftembled here under the command of colonel Lunsford, with a troop of 400 or 500 horfe. The colonel was proclaimed a traitor, as having levied war againft the parliament, and was apprehended. Refpecting this event, and fome other contemporameons proceedings, the different party writers are very contradictury. In the month of October 1642, the earl of Effex was in this town with 3000 men under arms; and at feveral other times, during the parliamentary civil war, Kingiton was poffeffed by both parties: but the townfmen were moftly in favour of the royalitts. Leland ftates, that " many olde monuments be founde yn the declyving doune from Come-Parke towarde the galoys:" alfo, "fundation of waulls of houfes, and diverfe coynes of braffe, fylver, and gold, with Rumayne sufcriptions, and painted yerthen pottes; and yn one, yn cardinal Wolfey's tyme, was founde much Romayne money of fylver, and plates of fylver to coyne, and maffes to bete into plates to coyne, and chaynes of fylver." The bifhops of Wincheiter furmerly had a hall here.

In the market-place is the town-hall, which was buite in the time of queen Elizabeth. In this are held the Lent affizes for the county of Surrey; and in a room adjoining, the corporation hold their courts of affembly.

Adjoining the town is an old manfion, called Ham-houfe, which was intended for Henry, prince of Wales, fon of James 1 . It afterwards belonged to the duke of Landerdale, who furnifhed it in a very expenfive and gorgeous Atyle. In the centre of the houfe is a large hall, furrounded with an open gallery. Some of the ceilings are painted by Verrio; and leveral rooms are ornamented with paintings by the old matters, among which are a few valuable portraits. In this houfe was born John, duke of Argyle, and his brother Archibald, who was allo created duke, and made lord keeper of Scotland. The church of Kingiton has fome ancient parts. On its fouth fide was the chapel of St. Mary, which fell down in the year 1730, and bursed the fexton, his daughter, and another perfon, in the ruins. The daughter, however, was refcued alive, and fucceeded her father. In the church are feveral monumental memorials, fome of which are for perfons of eminence. Near Kingfton is a bridge acrofs the Thames, faid, by Mr. Lyfons, "to be the molt ancient on the river, except that of London. It is men:
siuned

## KIN

sinned in a record of the eighth of Henry III." An act of parliament was obtained in the thirteenth year of George, for lighting and watching this town. In 1800 , Finglton contamed 682 houfes, and 3793 inhabitants. Lyfons' Environs of London, vol. i. 4!0. 1796.

KINGSTOWN, a town of Africa, in the kingdom of Kamtor.

KINGSTREE, a poit-town of America, in Williamsherough county, South Carolina; 480 miles from Wahingtan.

KING.TCHEOU, a eity of China, of the firft clafs, in the province of Hou-quang, feated on the Yang-tfe river. The diftrict of this town has two cities of the fecond order, and eleven of the third clafs. It is furrounded with lakes, which contribute to render the land about it fruitful and pleafant. It is well.built and populous; and its trade is great. A wall divides it into two parts, one of which beLongs to the Chuefe, the other to the Tarturs, of which the garrifon confifts. N. lat. $30^{\prime} 28^{\prime}$. E. long $111^{\prime} 37^{\prime}$.

KING-TE-CHING, a village belonging to the dilrict of Jao-tcheou in China, in which are collected the belt workmen in porcelain, and as populous as the largett cities of China. It is reckoned to contain a nillion of inhabitants, who confume every day more than ten thoufand loads of rice. It extends $1 \frac{\pi}{2}$ league along the banks of a beautiful river, with crowded buildings, and its ftreets are thronged with inhabitants; for a great number of whom it furnihes employment. The river in this place forms a kind of harbour, about a league in circumference, which accommodates a great number of barks. This village contains about 500 furnaces for making porcelain; and to thofe who appreach it at night it appears like a large city on fire. Strangers are not permitted to fleep here, but they are required either to feep in their barks, or with their friends. N. Iat. $29^{\circ} 25^{\prime}$. E. long. $116^{\circ} 5^{\circ}$.

KINGTON, or EYYetos, a fmall market town and parih in the hundred of Hunting don, and county of Hereford, is fituated on the Black Brook, under Bradnor mountain. A caltle was conftructed at this plaee, at a former period, for the defence of the marches; but the who'e is now defroyed. The church is a very irregular ftructure, having a detached tower, with a fpire of fingular form. The town is in general well built, and has a free grammar fchool, erected and endowed by lady Watkins. The inhabitants of this parim, as afce:tained by the att of 1801, amounted to 1424 ; the number of houfes to 311 . The principal manufacture is that of woollen cloth. Kingten is diftant from Hereforl 20 miles, and from London 155. Here are four annual fairs, and a weekly market on Wedref. days. The markets immediately before Eafter, Whitfuntide, and Chritmas, are very confiderable for corn, cattle, and cloth; and are equal to moll fairs. On the fummit of Bradnor mountain are the remains of a fquare entrenchment.

About two miles eaftward of Kington are the ruins of Lyons-hall caflle, a very ancient ftructure, of which fcarcely any thing now remains but fragments of the outer walls; the cafte having been demolifhed in the reign of Edward II. Beauties of England, vol. vi.

KING-TONG, a city of China, of the frft clafs, in the province of $Y$ un-nan, on the $P_{\text {a-pien }}$ river. It is furrounded with very high mountains, is which, it is faid, there are filver mines. The adj cent country abounds with rice, and the vallies are well watered. N. lat. $24^{\circ} 30^{\circ}$. E. long. 10039.

KINGUA, a town of Eaft Greenland. N. lat. 65 $21^{\circ}$. E. long 45 26.

## K I N

KING-TWILLIAM, a county of Virginia, between Mattapony and lamunky rivers. It is 47 miles lont, and 15 bruad, and contains 5744 free inhabizants, and 3315 nlaves. At the court-huufe is a poft-office.
KINGIVOOD, a townhip in Huntingdon county, New Jerfey, containing 2446 inhabitants, of whom req are flaves; 15 miles S.W. of Lebanon. - Alfo, the name of a fmall river of New Jerfey:

KING-YANG, a city of China, of the firft clafs, in the province of Chen-fio N. lat. $36 \quad 6^{\prime}$. E. long. $107^{\prime}$ 20'.

KING-YUEN, or Kix-Yrex, a city of China, of the firit clafs, in the province of Quang-fi. This city is built on the banks of a large river, and furrounded with lofyy and craggy mountains. The valliss between thefe mountains are full of villages and forts, and in the rivers is found gold. Under its jurifdiction are two towns of the fecond order, and five of the third. N. lat. $2 t^{6} 2 G^{\prime}$. E. long.

KIN-HOA, a city of the firlt clafs in China, in the province of T'che-kiang, lituated in the midit of the province, on the banks of a fine river; formerly diftinguifhed both as to the extent and beauty of its buildings, bat much injured by the attacks of the Tartars. It has eight towns of the third order in its diftriet, fituated partly in a level country, and partly among mountains. Rice grows plentifully, and the wine made of it is much efteemed. The inhabitants carry on a large trade in dried plums and hams, which are fent into all provinces of the empire. Near it are fmall fhrubs, refembling jeffamine, which produce tallow, that make very white candles. N. lat. 29. 16. E. long. $119^{\circ}$
$16^{\prime}$

KINIC Acin, in Chemiffry, is a peculiar fubltance, recently found in Peruvian bark, where it exilts in combination with. lime. We are indebted for the difcovery to a Mr. Defchampe, apothecary at Lyons, who defcribed the falt in the 4 Sth volume of the Annales de Chimie. He obtained it by macerating the bark in cold water; afterwards exaporating the folution, and leaving it to cryftallize. The cryflals produced were equal to about y per cent. of the bark employed. He did not profecute his inquiry further; and it was not until fome experiments which were afterwards undertaken upon it by Vauquelin, that the falt in queftion was found to contain a new acid. The relearches of this excellent chemilt, however, appear fully to have eltablifhed the fact; and he has denominated it the kinic acid, from the word quinquina, which is a name given by the French to the yellow kind of bark from which the falt defcribed was extracted.
The kinat of lime, obtained by the foregoing procefs, is of a white colour, and cryftallizes in plates. It is devoid of tafte, diffolving in about five times its weight of water, at the temperature of $55^{\circ}$. Alcohol exerts no action upon it. By expofure to heat it is decompofed, and carbonat of lime and charcoal are the products. Its folutions are not altered by ammonia; but the fixed alkalis precipitate the lime. This alfo takes place with the oxalis and fulphuric acids. It appears to be compored of 90 aeid, and 10 lime.

To procure the free acid, M. Vauquelin precipitated the lime by an oxalat, and afterwards concentrated the liquid by evaporation. It was of a fyrupy confiftence; and onbeing fet afide to cryftallize, was founds. at the end of a week, to have undergone no change : but the moment he touched it with a glafs rod, the whole mafs affumed the form of divergent crytalline plates. The colour of the aeid was of a flight brown; occafioned, probably, by the eva-

## K I N

poration having been carried too far. Its tafte was extremely four ; and there was alfo a bitternefs in it, which might be owing to an imperfect feparation of the other conftituents of the bark. Expofure to the air effected no alteration upon it.

By heat, kinic acid is decompofed, and converted into charcoal. It combines with different bafes; and with the carths and alkalis, produces folmbe and cryitallizable falts. On the nitrats of filver, mercury, and lead, no change is occafioned by it. A mates de Climie, t. 59 .

KINI'I's', in Grography, a town of Moravia, in the circle of Olnutz ; $2+$ miles WV. of Olmutz.

KINK-COUGH, in MEdicine. Sce Pertussis.
KINKS, in the Sea Language. When ropes are new, or too hard laid, they are apt in foldings to make turns, which are called kinks.

KIN-LI, in Geograply, a town of Corea; 15 miles E.N.E. of Cou-fun.

KIN-MEN-LO, an ifland in the Chinefe fea, near the coalt of China, about 24 miles in circumference, of a triangular form. N. lat. $24^{\circ} 30^{\circ}$. E. long. $118^{\circ} 20^{\prime}$.

KINNAIRD's HEAD, a promontory on the caft coalt of Scotland, forming the fouth boundary of the frith of Murray; fuppofed to be the "promontorium Taixalium" of Ptolemy. N. kat. $57^{\circ} 58^{\circ}$. W. long. $1^{\circ} 54^{\circ}$.
kinnaras, or Cinnaras, in Hindoo Mytbology, are male dancers in Swerga, or the heaven of Indra.

KINNBACK, in Geagraphy, a fmall illand on the weft fide of the gulf of Bothinia. N. lat. $65^{\circ} 9^{\prime}$. E. long. $21^{\circ}$ $30^{\prime}$.

KINNEGAD, a polt-town of Ireland, in the county of Weltmeath, province of Leimfter. A kind of cheefe, of a very inferior quality, made in this neighbourhood, is called Kinnegad cheefe, from this town. It is $29 \frac{1}{2}$ miles.W. by N. from Dublin.

KINNEL, in Rural Economy, a provincial term fome--times applied to a powdering tub or falting veffel.

KINNEYETO, in Geograplyy, a confiderable town of Africa, in the kingdom of Manding; about 24 miles N.E. of Kamalia. N. lat. $12^{\circ} 55^{\prime \prime}$. W. long. $5^{\circ} 5^{2}$.

KINNOR, in the Jewifg Antiquities. See Cinyra, and Cimnor.

KINO, in Chemifry, is an aftringent fubflance, of a black colour, fuppofed to have been originally introduced into this country from Africa. It is commonly called a gum, but very improperly; for, as Vauquelin has remarked, it has neither the phyfical nor chemical properties characteriltic of that clafs of vegetable products. According to Dr. Duncan, the kino now known in the fhops is principally imported from Jamaica; and is an extract from the coccoloba weifera, or feafide grape. It is nearly wholly foluble in hot water and hot alcohol, and chiefly confilts of tamin in a particular Itate ; which has the property of precipitating the falts of iron of a green colour, inftead of black. With gelatine it forms a rofe coloured coagulum. We are indebted to Dr. Duncan for the firt defcription of its properties ; and he has publifhed the refult of his obfervations in the New Edinburgh Difpenfatory, p. 242. Vauquelin afterwards took up the fubject; but the kino that his experiments were made upon, Dr. Duncan fufpects to have been the product of fome of the fpecies of eucalyptus, particularly the refinifera; being the fubtance called Botany Bay gum, a quantity of which was fome years ago imported into Europe. It differs from the kino of the coccoloba in being of a much finer quality. Nicholfon's Journal, vol. vi. No. 24, p. 232-234.

Kivo, in the Materia Medica, or "Gummi rubrum aftringens gambienfe," the gum refin of a non-defcript

African tree. Although the tree, from which this refin is obtained, is not yet butanically afcertained, it is known to grow on the banks of the river Gambia in Africa. The firft account of this drug is related by Moor in his "'Tragels into the interior l'arts of Africa," ed. 2. p. 113, by which we learn, that in wounding the bark of this tree, the fluid kino immediately iffices drop hy drop, and by the beat of the fun is formed into a hard mafs. 'This, which was for fome time confidered as a fpecies of Sanguis draconis, was afterwards fully explained, and its medical character eftablifhed, by Dr. John Fothergill. (Med. Obf. and Enq. vol. i.) Kino has a canfiderable refemblance to Catechu, but redder, and is more firm, refinous, and aftringent. It is now in common ufe, and is the moftefficacious vegetable aftringent, or Ityptic, in the materia medica. The "tincture of kino" is prepared by macerating three ounces of kino powdered in two pints of proof fpirit, for 14 days, and flraining it. All the aftringency of kino is included in this preparation. The dofe is from one fluiddrachm and a half to two fluid-drachms. The "compound powder of kino" confifts of 15 drachms of kino, half an ounce of cinnamon bark, and a drachm of hard opium, which are to be reduced feparately into a very fine powder and then mixed. This aftringent powder was firft introduced into the London Pharmacopeia of 1809 ; the proporion of opium contained in it being one in twenty. The dofe is from five gr. to $\fallingdotseq j$.

KINOGAM, in Geography, a river of Canada, which runs from lake Wiakwa to the river Saguenay. N. lat. $4^{8 \circ} 34^{\prime}$. W. long. $7 \mathrm{I}^{\circ} 31^{\prime}$.

KINOLI, a town of Afratic Turkey, in Natolia, on the coaft of the Black fea; 16 miles N.W. of Sinob.

KINOSA, St., an illand in the Grccian Archipelago. N lat. $36^{\circ} 53^{\prime}$, E. long. $25^{\circ} 34^{\prime}$.

KINROSS, the chief town of a fmall county of the fame name, bordering N.E., E., and S. upon Fife, and the other part on Perth, in Scotland. The number of inhabitants of this county in ISOI was 6725 , of whom 888 were employed in trade and manufactures, and 667 in agriculture. Kinrofs is a fmall town of little confequence, excepting as a market for the neighbouring country. It is fituated on the border of Lochleven, a fine frefh water lake, with two fmall iflands in it, on one of which is a cafle, which was one of the many places in which the unfortunate Mary Stewart, queen of Scots, was confined, and from which the effected her efcape. The lands near Kinrofs, like thofe of the adjoining counties of Fife and Stirling, are fertile and well cultivated. The county returns a member to parliament alternately with the fmall illand of Clackmannan. The town was formerly famous for its cutlery; but the chief manufacture now is Silefia linen. In 1801, the number of inhabitants was 2124 , of whom 394 were employed in trade and manufactures; 18 miles N.N.W. of Edinburgh. N . lat. $56^{\circ} 13^{\prime}$. W. long. $3^{\prime 2} 25^{\prime}$.

KINROSS-SHIRE is a fmall inland county in the northern part of Scotland. The ancient fhire of this name was divided, about the year 1426 , into the two counties of Fife and Kinrofs; and at the revolution Kiurofs, being thought too fmall a county as it then flond, was enlarged by the addition of Orwell, C'eifl, and Tillibole; which pirimes, before that period, wcre part of the county of Fife. But though thefe are now two diltinct counties, and are feparately reprefented in parliament, they are both comprehended in the fheriffdom of Fife. Kinrofs-fhire is bounded on the ealt and fouth by Fifehire, and on the north and well by Perthfhire. It extends, from caft to welt, from Foflaway church to Auchmore bridge, eleven miles; and from Kellybridge nearly due north to Damhead, about wine miles and
a half. The general figure of the county is circular, though the line of its boundary is very irregular. That which limits with Perthlhire meafures twenty-one miles; but when taken in a right line is only ahout fourteen : the boundary with Fife meafures nearly twenty-eight miles, buc in a flraight line dues not exceed nineteen. The county contains 78 fquare miles, or about 30,702 Scottifh acres; comprehending one town, kiurofs, with tix other parithes; and was returned under the population aft of 1801 as containing 1409 houfes, and 6725 inhabitants. The furface of the county is areatly varied. The middle portion occupies a fituation comparatively low, and may be confidered as a kind of plain flightly varied with gentle rifing grounds. The boundaries, in every direction, are hilly, or formed of a higher land thars the laigh or vale of Kinrofs, with a fingle exception, at the narrow paflage at the ealtern extremity of the county, where the river Leven ifucs from the celcbrated loch of that name. The Ochil hills form the northern boundary of Kinrols-fhire ; the Cleifh hills, the fouthern; and Balneartie hill, with Weft Lomond, or Bifhop's bill, as it is called, bound it on the ealt and fouth-eaft quarters. The fides of thefe hills, which face the central part of the county, are for the moft part excellent paltures, generally, retaining beautiful verdure; patches of mooriand occurring only near their fummits. In the interior and higher part of the Ochils, however, heath becomes more abundant. The chief variety in the appearance of the low grounds is produced by the mixture of corn and grafs-lands, and by a few thriving plantations interferfed with villages. Some intervening moralfes, and extenfive moors, likervife variegate the furface. Even the margin of Lochleven is ornamented in this way by a common moor of more than 300 acres, in the vicinity of the town of Kinrofs, in the very centre of the countr. The afpect of the whole fhire is open and expofed, there being but a fmall part inclofed, and many of the inclofures furmed not of hedges but of flone walls.

Of the waters of this countr, the molt remarkable is the lake called Lochleven, on the weftern banks of which Itands the town of Kinrofs. This lake, though inferior in magnitude and grandeur to Lochlomond, is a noble expanfe of frefh water, about fifteen miles in circumference, including its angular juttings, and covering nearly 3300 acres. The furface of the water at its higheft rife and loweft fall, varies about three feet. Lochleven is bounded on the calt by the Lomond hills, on the fouth by that of Balneartie, and cn the weft by the plain of Kinrofs. It is remarkable for producing trout of a large fize with flefh of a reddifh colour, nearly approaching to the talte and appearance of falmon. Some of them weigh from two to eight, and even tea pourds each. The high colour of there trout is afcribed to the great quantity of fmall red fhell-fifh which abounds at the bottom of the loch; the trouts hase often their ftomach full of them. Lochleven receives the waters of three fmall rivers; Gairny, the fouthermoft ftream in the county, South Quech and North Quech, which both have their rife among the Ochil hills. Lochleven gives rife to the river Leven, which paffes through a confiderable part of Fifefhire into the fea, forming the larget water in that county. In September, the eels, which greatly abound in Lochleven, begin to emigrate in great numbers to the fea; but only at tempt this paffage during the night. The county contains feveral imall lakes; of thefe four are in the parifh of Cleifh: the largeft is about a mile and a half in circumfercuce: the four cover about 250 acres. The climate in the higher grounds of this county is cold and wet; owing to the elevation of the land, and chiefly to the hills, which attract the clouds and vapours. Frof fets in earlicr, and
continues longer, than in the adjacent dillicks towards the fouth. The county is well interfected with roads, which are, in general, kept in excellent repair by the fatute labour. The carriages and thie perfonal duty may be furnihied in kind, or commuted, at the option of the perfons chargeable. The principal turnpike roads are thofe foom Perth to Qucensferry, and from Stirling to Kinrofs: they are kept in the highint prefersation.
Of the antiquities of Kinrofs-fhire, thofe connected with Lochleven are the moft remarkable. The caftle of Lochleven, now in ruins, flands upon an inand of about two acres in extent. The circuit of the outer rampart is 58 , feet. This caftle is faid to have been built by Congal, fon of Dongart, king of the Piets: but it has been rendered particulariy confpicuous in Scottifh hiltory, by the confinement of the unfortunate queen Nary. In the largeft ifland of the lake was furmerly fituated a priory dedicated to St. Serfi, or Servanus; and fait to have been founded by Brudo, the lan but one of the Piction fovereigns.

KINSALE, a fea-port and poft-town of the county of Cork, Ireland. It is fituated at the mouth of the river Bandor, which forms a fine harbour, and is navigable for large foops near 12 miles above the town, though a bar prevents large men ef war from coming into the balin. In this port there was formerly a dock furnifhed with tores for the ufe of the navy, but this has lately been removed to the neighbouring harbour of Cork, where the accommodations are greater, and which is the chief naval ftation in Ireland. The entrance of Kinfale harbour is defended by 2 fort, which having been contructed in the reign of Charles II. is called Charlesfort, in which there is always a good garrifon. Kinfale is the town which the Spaniards too ${ }^{2}$ poffeffion of, and in which they were befieged and taken prifoners, at the latter end of queen Elizabeth's reign. The town, which contains at lealt ro,000 inhabitants, is built at the fide of Compafs hill; the ftreets are narrow and the houfes indifferent, yet in the bathing feafon it is the refort of much fahtionable com. pany, and there are at all times many genteel refidents, fo as to afford good fociety. Kinfale is reprefented by one member in the imperial parliament, who is chofen under the influence of the lord de Clifford, chief proprietor of the town. It gives title of baron to the defcendant of the famous John de Courcy, who procured for himfelf and polterity the privilege of being covered in the king's prefence. Kinfale is 136 miles S.W. from Dublin, and about 12 miles S. from Cork. N. lat. $51^{\circ} 42^{\prime}$. W. long. $8^{\circ} 30^{\prime}$.

Kinsale, old Head of, a cape of Ireland, projecting a confiderable way into the fea, and forming a very noted land mark. N. lat. $51^{\circ} 37^{\prime}$. W. long. $8^{\circ} 30^{\prime}$.

Kinsale. a poit town of Virginia, 16 miles from Weftmoreland court houfe, and 12 from Northumberland courthoufe.

KINSOMBA, a town of Africa, 25 miles S.E. of New Benguela.

KINTAL, or QUintal, a weight of one hundred pounds, more or lefs, according to the different ufage of divers nations.

The kintal of Smyrna is 123 pounds three ounces nise drachms, or 120 pounds feven ounces 12 drachms; but that of Aleppo is 46 , pounds 11 ounces 15 drachms.

KIN.TAM, in Geography, an ifland in the Chinefé fea, near the coalt of China, about 24 miles in circumference. N. lat. $30^{\circ} 9^{\prime}$. E. long. $121^{\circ} 2 t^{\prime}$.

KINTARRA, a town of Hindooftan, in the circar of Cicacole; io mi'es N. of Coffimcotta.

KIN-TCHENG, a town of Corea; 80 miles $E$. of: Kiog-ki-tao..

RIN

## K I N

## K I P

KIN-TCHIN, a city and capital of the incs of Lieoukieou. This city is fituated in the S.E. part of the large iीand called "Cheou-li," where the court refides. The king's palace, which is reckoued to be four leagues in circumference, is built on a neighbouring mountain. It has four gates, which correfpond to the four cardinal points; and that which fronts the welt, forms the grand entry; The view which this palace commands is moft extenfive and delightful; it reaches as far as the port of Napa-kiang, at the diltance of 10 lys , ( $2=0 \mathrm{lys}$ making 60 geographical miles ), to the city of Kin-tching, and to a great number of other citics, towns, villages, palaces, temples, monafteries, gardens, and pleafure-houfes. N. lat. $26^{\circ} 2^{\prime}$. I. long. 146' $26^{\prime}$.

KINTEN, a town of Pruffian Lithuania; 15 miles S. of Meme.

KINTORE, a fmall borough town and parih of Aberdeenfhire, Scotland, in the dittriet of Garrwik, is feated on the river Don, at the diftance of 15 miles N.W. of the county town, and 137 N . of Edinburgh. It is faid that this place obtained a charter at an early period, but the ouly anthentic deed of this defcription was granted by $J$ ames V. : its government is velted in a provolt, two bailifis, a dean of guild, a treafurer, and a council of eight other burgeffes. The firft of thefe offices has long been veited in the earls of Kintore. In this place are a town-houfe and a prifon; and in the year 1800 it contained 198 houfes and ${ }_{4} 6$ inhabitants. In conjunction with Damff, Cullen, Elgin, and Inverury, it returns one member to the Britifh parliament. The parifh of Kinture is about fix miles in length by eight in breadth, and rifcs gradually from the river Don to a range of hills. In it is Thaintone, the feat of Forbes Mitchell, efq, and in one part of it are feveral cairns and tumuli, which are traditionally faid to mark the fcene of an action between Robert Bruce, and the army of Edward I. Sinclair's Scatiftical Account of Scotland.

KINTYRE, or Cantyre, one of the three diftricts of Argylefhire, in Scotland. Of the three diarricts or divifions of the comnty of Argyle, viz. Lorn, Kinapdale and Kintyre, the latter is the mott level and beit adapted to the purpores of agriculture. It forms a long narrow peninfula, bordered by Lochfine and the Firth of Clyde on the ealt fide, and by the weltern fea on the welt. Of this peninfula, by much the greatelk part belongs to the duke of Argyle, who has a chamberlain or factor refident at Campbelltown, for the fuperintendance of this part of his eftate. There is alfo a cultom houfe at Campbelitown, for the regulation of the collection and prevention of frauds on the revenue, and fome of the cruizers are generally on this flation, for the detection and capture of fmugglers. The loch or harbour of Campbelltown is excellently adapted for this, as from it a velfel of force can with eafe command the whole fhipping of the Clyde in moderate weather, and may board, over-haul, and infpect almolt every veffel in the leaft fufpected. The termination of the peninfula is called the Mull or Moyle of Kintyre.

KINVACA, a town of Africa, in Fooladoo. N. lat. $33^{\prime} 10^{\prime}$. W. long. $6^{2} 2^{\prime}$.

KINIJRE Poist, a cape of Ireland; in the county of Cork, at the entrance of Oytter haven, and about three miles eaft from Kinfale harbour.

KINWAT, a town of Bengal; 17 miles S.E. of Curruckpour.

KINYALOO, a town of Africa, in the town of Manding. N. lat. $1 z^{\circ} 5^{\prime}$. W. long. $6^{\circ} 5^{\prime}$.

KIN-YANG, a city of China, of the firft clafs, in the province of Chen-li ; which, being regarded as a barrier
againf the incurfions of the Tartars, is ftrongly fortified in the Chinefe manner: the adjacent country is very fruitful; and produces a kind of herb, called "Kinfee," i.e. golden filk, to which is afcribed fome medicinal virtue, and alfo a kind of bean which is faid to be an admirable fpecific againft any fort of poifon. This city has in its dittrict one town of the fecond order and four towns of the third order. N. lat. $5^{\circ} 6^{\circ} 6^{\prime}$. E long $107^{3} 19^{\prime}$.

KINY'AKOORA, a town of Africa, in the kingdom: of Gadou: 36 miles S.IV. of Kanmalia.

KIOANON Point, called in fome maps Kikeloned, is the extremity of a large peninfula which projects far into the S. fide of Lake Superior.

KIO.FEOU, a celebrated city of China, in the province of Chang-tong, which was the birth-place of Confucius. Sereral monuments are fill to be feen there, erected in honour of this eminent man.

KIOGE, a fea-port of Denmark, fituated on the ifland of Zcaland, in a bay at the mouth of a river, formerly a place of confiderable trade, with manufactures of valuable tapeftry. In 1659, it was fortified by Charles Guftavus, king of Sweden, with ditches and ramparts; 10 miles S.S.W. of Copenhagen. N. lat. $55^{\circ} 28^{\prime}$. E. long. $12^{\circ} 13^{\prime}$.

KIOLEN, a town of Sweden, in Warmeland; 40 miles N.W. of Carlitadt.

KIONGONG, a town of Bengal ; 30 miles N.N.E. of Burdwan. N. lat. $23^{\circ} 41^{\prime}$. E long. $88^{\circ} 10^{\prime}$.

KIONTONA, an Indian town on Conewango river, in Pennfylvania; in miles N. from its mowh in the river Al. leghany.

KIOPING, a town of Sweden, in Weftmanland, on a river of the fame name, communicating with Malar lake. It is a place of good trade; 10 miles W. of Strocmanalm. N. lat. $59^{\circ} 33^{\prime}$. E. long. $16^{\circ} 43^{\prime}$.

KIORAH, a town of Hindooftan, in Boggilcund; 27 miles N.N.E. of Rewah.

KIOREHVESI, a town of Sweden, in Tavafland; $5^{6}$ miles N. of Tavathus. N. lat. $61^{\circ} 56^{\prime}$. E. long. $24^{\circ} 33^{\prime}$.

KIOV. See Krev.
KIOVA, a town of Africa, in the kingdom of Congo, and province of Sogno.

KIOUMZEIK, a well built town of Ava, fituated on the Irawaddy, and graduaily improving. The manufacture of cotion cloth is the fource of its profperity. A town called "Hinzaelah" near it, is of much greater antiquity ; 76 miles N.N.W. of Rangoon. N. 1at. $17^{2} 42^{\prime 2}$

KIOZDI, a town of Walachia; 77 miles N. of Bu. chareft.

KIPE, a kind of ozier bafket, wide in the middle, and narrow at both ends; ufed for taking fifh.

Kire is alfo a game, which confifts in throwing fomething into a hole, called the kipe-hole.

KIPHANTA, in Geography, a town of European 'Turkes. in the Morea; 20 miles E. of Mifitra.

KIPPER. See Salmon Fisirery.
Kiperr-Time, a fpace of time between the feltival of the finding of the Holy Crofs, May the 3 d and 12 ths day; during which, falmon-fifhing in the river Thames, from Gravefend to Henley, is forbidden by Rot. Parl, 50. Edw. III.

KIPPIS, Andrew, in Biography, an eminent nonconformitt minifter of the laft century, was born at Nottingham on the 28th day of March, in the year $\mathbf{x 7 2 5}$. He was defcended, both by the father's and mother's fide, from ejected minifters of the names of IKing and Ryther, whis are mentioned with refpect in Dr. Calamy's Account of the Miniltere

Miniflers ejected and filenced by the $\Lambda$ et of Uniformity. Upon the death of his father, when he was about five years of age, he was removed to his grandfather at Sleaford in Lincolnhire, where he received his grammatical education. His talents and application attracted the peculiar notice of Mr. Merrivale, who was paftor of a congregation of dif fenters in that town; and by his advice and encouragement, his views were directed to the profeffion of a diffenting minifter, and to thofe literary purfuits in which he aftervards fo much excelled. At the age of fixteen, he was admitted to the academy at Northampton, under the care of Dr. Doddridge ; and in that feminary he profecuted his ftudies with fuch diligence and improvement, and conducted himfelf with fuch exemplary propricty, as to conciliate the affectionate elteem and partial attachment of his tutor. Having completed his courfe of five years at the academy, he undertook the charge of a diffenting congregation at Bofton, in Lincolnnire, with which he fettled in September 1746. From Bofton he removed to Dorking in Surrey, in $\mathbf{1 7 5 0}$; and in 1753, he fucceeded Dr. Hughes as paftor to the fociety in Prince's ftreet, Weftminfter. In the fame year he married Mifs Elizabeth Bott, the daughter of a refpectable merchant at Boiton, in whom he found a fenfible, prudent, fprightly, and cheerful companion, and by whofe attentions his mind was relieved from all family concerns; fo that he was left at full leifure to profecute the various duties which his numerons engagements devolved upon him. Whether we confider the literary talents, the minitterial abilities, or the external accomplifhments of the fubject of this article, no perfon could have been better qualified for the fituation into which he was introduced than himfelf. His fettlement with the fociety in Weltminfler laid the foundation of that celebrity which he afterwards acquired, and of that extenfive ulefulnefs which diltinguihed his future life. He was thus foon introduced into a connection with the Prefbyterian fund, to the profperity of which he was afterwards very ardently devoted. In June 1762, he became a member of Dr. Williams's truft; and this appointment afforded him an additional opportunity of being eminently and extenfively ufeful in a variety of refpects. His connection with the general body of Proteflant diffenting miniflers, belonging to the cities of London and Weftmintter, and with many charitable inltitutions, which the liberality of diffenters has eftablifhed, gave him frequent occation to exercife his talents for the honour and intereft of the caufe, to which, both by his fentiments and profeffion, he was zealoully attached.

His literary abilities and attainments were acknowledged by all who knew him. It was, therefore, natural to imagine, that when a favourable opportunity offered, he would be employed in the department of public education. Accordingly, when the death of the reverend Dr. Jennings rendered it neceffary to make a new arrangement of tutors in the academy, fupported in London by the funds of Wil. liam Coward, efq. the trultees directed their views to him ; and in the year $\mathrm{I} 7 \sigma_{3}$, he was appointed claffical and philological tutor to that inltitution.

In 1767 he received the degree of docter in divinity from the univerlity of Edisburgh; an honour, in the unfolicited grant of which the principal and profeffors very cordially concurred. No one can difpute his peculiar clam to fuch a token of refpect. -

In March ${ }_{177} 8$, he was elected a fellow of the Society of Antiquaries; and in June 1779, a fellow of the Royal Society. He was a member of the council of the former fociety from 1782 to 1784 , and of that of the latter from
Voz. XX.

1786 to 878\%. In both thefe focieties he was a regular attendant, and a refpectable and ufeful member.

Having, in the year ${ }^{7} 784$, quitted his connection with Mr. Coward's academy, which, upon the refignation of the two other tutors, was difcontinued, he cordially concurred. with a very refpectable body of diffenters, in 1786, in eftablifhing a new inftitution in the neighbourhood of London, with a view of educating minifters and other young gentlemen intended for civil life. Dr. Kippio was very affiduous and active in his endeavours to accomplifh this laudable defign; and though his other engagements rendered it very inconvenient for him to accept any official connection with it, he was urged to unite with other perfons, for whom be entertained a peculiar refpeet ; and the at length, though not without reluctance, acquiefced in the appointment to be one of the tutors of this new inflitution. The diflance of his refidence from Hackney, where the college was fixed, and fome other circumitarces which it is unneceffary to recite, induced him in a few years to withdraw from it, as a tutor : though he ftill continued to ferve it by a liberal fubfcription, and by his intereft with opulent friends.

Dr. Kippis continued to profecute his other ufeful labours without intermifion; and till within a fortnight of his death, his friends had no reafon to imagine that they were fo near their clofe. In the courfe of the fummer, a few :weeks before his death, he took a long journey on public bufinefs, and returned, as his fellow travellicrs apprehended, with recruited fpirits and eftablifhed health; and they were equally furprifed and grieved when they heard that he was confined to his bed with a fever, which baffled the fill of the molt eminent phyficians, and which haftily advanced to the fatal crifis. His diforder was of fuch a nature, that he found himfelf both difinclined and unable to make any exertion, or to converfe much even with his mof conflant attendants. There is reafon, however, to believe, that in a very early ftage of his diforder he was not without apprehenfions of its terminating in his diffolution. The laft public fervice he performed was on the 20th of September; and on Thurfday evening, the 8th of OCtober, he awoke after a tranquil fleep of fome continuance, and in a little while expired: having ferved his generation according to the will of God, and attained the age of 70 years and 6 months.

It is not eafy to do fufficient jultice to the eminent. talents, the extenfive labours, and exemplary character of Dr. Kippis.

His mild and gentle temper, his polifhed manners, his eafy and graceful addrefs, and a variety of external accomplithments, prepoffeffed thofe who firft faw him in his favour, and could not fail to conciliate efteem and attachment on a more intimate acquaintance. Thefe qualities contributed very much to recommend him to perfons in the higher rauks of life, to feveral of whom he had occafional accefs; and qualified him, in a very eminent degree, for the fituation in which he exercifed his minitterial office. But he was no lefs condefcending, courteous, and affable to his inferiors, than to thofe who occupied fuperior flations. Dr. Kippis had nothing of that aufterity and referve, of that haughitinefs and fupercilioufnefs, of that parade and felf-importance, and oltentations affectation of dignity, which forbid accefs, and which mar the frecdom and the pleafure of all the focial intercourfes of life. And yet thefe difgurfful and odious qualities fometimes accompany literary men, and efpecially thofe who have acquired any confiderable degree of eminence and reputation.

The mental abilitics of Dr. Kippis were of the fuperior kind. He pollefted a comprehenfive underftanding, a found E.
julgment, a retentive memory, a correct imagination, a refincd talle, a quicknefs and a facility of exerting his faculties on any fulbject or occalion, however fuddenly they might occur.
The natural powers of his mind were cultivated with an affiduity and perfeverance of application, in which he had fow fuperiors, and not many equals. They had been habituated through life to regular and conflant exercife, and had acquired itrength and vigour from ufe. He was never hurricd and diftralted by the variety of his literary purfuits; aud though he had many engagements, which requircd his attention, and which diverted his mind from the objects of tludy to which he was devoted, he never feemed to want time. Every kind of bufinefs was referred to its proper feafon. By a judicious arrangement of his Itudies, as. well as of his other occupations. the number and variety of which he never oftentationfy difplayed, and by the punctuality of his attention to every kind of bufinefs in which he was employed, he avoided confufion; he retained on all occafions the poffeffion of himfelf; and he found leifure for reading and writing, and for all his literary avorations, without encroaching on that time which he appropriated to his profeffional dutics and focial connections.
Indeed, there have been few perfons, fays his biographer, who read fo much, and with fuch advantage to thempelves and others, as Dr. Kippis. Hence he acquired that extenfive aciquaintance with books, and with the literature of ancient and modern times, and particularly of the laitt century, which rendered him an inftrutive companion, and which directed him where to apply for neceffary infornation on any fubject that employed his own attention or that of others. But though he read much, he was not one of thofe who walle their time in defultory reading, and who make no addition to their flock of ufeful knowledge by the volumes which they turp over for mere prefent amufement. He read with attention and difcrimination. He formed an accurate judgment of the intrinfic value of every publication, to which he had recourfe : and there have been few works, in the department of literature with which he was converfant, that have iffued from the prefs, for many years, of the fpecific objects and real merit of which he could not give a jutt and fatisfactory account.
There is one circumftance, to which it was principally owing that Dr. Kippis feemed, in the midalk of a great number of engagements, to have time at his own conmmand, and which enabled hinn to difpatch much bufinefs without apparent hurry and confution.
We mention it here, for the dircction of young perfons, and efpecially of young ftudents, whofe habits are not ettablifhed. He had been accuttomed from his youth to carly rifing; and he thus fecured to liinfelf a certain porticn of time, during which he was not liable to be interrupted by any foreign avocations. This habit was no lefs conducive to his health, than to the difcharge of his various literary and profefional obligations. Providence had bleffed him with an excellent conltiutuion. He had preferved it unimpaired by a courfe of unifornn regularity and temperance. He was little interrupted through life by any bodily diforder in any of the occupations to which he was devoted. If we except a fever, which laid him afide for fome years before his death, and a conltitutional cough which was rather beneficial than injurious, he enjoyed an unufual fhare of health and fiprits.
Dr. Kippis poffeffed other qualities, befides his mental abilities, however excellent, however affiduoully cultivated, and howerer uffully employed, which rendered his charaticr
in a nill higher degree eftimable and praife-worthy. In private life, his difpolition and deportment were amiable and exemplary. His picty originated in honourable fentiments of the perfections and providence of God; and its practical influence was uniform and permanent. Hc exhibited, in all his connections and concerns, a humble, meek, placable, forgiviug, and benevolent temper. The gentereefs, mildneff, and philanthropy of his difpofition formed very diftinguifling traits of his character. With thefe virtues, fo congenial to the Ipirit of the religion he profefed, fo conducive to the tranquillity of his own mind, and fo powerful as incentives to activity and ufefulneff, he united an infexillle integrity, and an independence of fpirit, which difdained every thing that was mean, felfin, and fervile.
If we accompany Dr: Kippis from private and domeftic life into the various flations of public ufefulnefs, which Providence affigned him, we flalll find him eminently qualified, and ardently difpofed to ferve his generation according to the will of God. His knowledge of the world, the rectitude of his judgment, and the mildnefs of his temprr, gave him confiderable influence in various connections to which he belonged. At the Prefbyterian Board, in Dr. Williams's Truft, and in the general body of affociated minillers, his opinion always claimed peculiar deference. As be was become the father of feveral focieties of this kind to which he ftood related, his age commanded refpect; and his condefcending, complying difpofition rendered, it eafy and pleafant to act with him on every occafion. Notwithttanding the variety of his encagements, he was a conltant attendant. He never pleaded them as an apology for abfence. He never wifhed to decline any public fervice, whatever perfonal inconvenience or trouble might attend it. He preferred the concerns of others, who needed his affiftance, to 1is own.
As a fcholar, the literature of Dr. Kippis was various and comprchenfive. But the fudies to which he principally applicd, and in which he noot excelled, were thofe of the claffics, the belles lettres, and hiillory; belides thofe which were immediately conncted with his profeffion. The hiftory of his own country had been the fubject of his long and laboured inveltigation; and the principles of the Britith conffitution he had diligently fludied. To thefe he was zealoufly attached; and he ably defenced them, though he was not unapprized of the corruption which time liad introduced, and of the necefity and wifdom of a fpecedy reformation. He was a fleady, uniform, and ardent friend to the caufe of civil and religious liberty; and in the courfe of his life he had various occafions of avouching himfelf the advocate of this caufe. But whillt he deteltced tyranny and oppreffion, he dreaded anarchy and tumult. In the political contefts, which have lately agitated this country, the moderation of his temper was eminently conficicous. His difpofition was gentle and conciliating. He was an enemy to every fpecies of violence ; and he thought that calmneff, firmuels, and perfeverance in the purfuit of conllitutional meafures, were the moft likely means of obtaining a reformation of acknowledged abufes, and a ternination to public calamities and evils. Though he thought it moot prudent to withdraw from fome focietics of a political nature, with which he had been long connected, he never abandoned the principles upon which his firlt coanection with them was founded; nor did he cyer difguife his fentiments either of men or of meafurcs, whenever a proper occafion for declaring them occurred.
In many other focicties of a different kind, that were clfablifhed for literary improvement or friendly intercourfe.

Dr. Kippis was a very valuable and ufeful member. Whillt Lis modelty prevented his obtruding his fentiments on others, or aftuming the lead, and prefuming to dichate amongth thofe who were in various refpects inferior to himfelf, he was always communicative and entertaining. He never offended either by an ungracious referve and affected filence, on the one hand, or by an intrutive and troublefome loquacioufnefs on the other. His literary character was univerfally acknowledged by perfons of this defcription, with whom his acquaintance was intimate and extenfive. The courfe of his ftudies furnithed him with a variety of anecdotes, that rendered his converfation, on particular occafions, interelling and infructive. His knowledge of books, and his judgment of their refpective merit, which was always formed with candour and pronomaced with modelty, were very comprehenfive and accurate; and he was often appealed to by thofe who wifhed to obtain information on fubjects of this nature. In thofe friendly affociations to which he belonged, he was always placid and cheerful; placid without dulnefs, and cheerful without an unbecoming levity. In him were invariably united, the knowledge of the fcholar, and the judgment refuiting from experience and an attentive obfervation of the courfe of the world, with the manners of the gentleman, and the decorum belonging to his public character as a Chritian, and his profeffion as a minitter.
Amid! a variety of other occupations, Dr. Kippis fuftained the office of tutor, for more than 25 years, with fingular reputation to himfelf, and with great benelit to the young perfors who were under his care. His lectures and his general conduct conciliated the efleem, and promoted the improvement of his pupils. They all honoured and loved him; for he had a haspy talent of attaching their affection and refpect. They lamented his removal from this fphere of public fervice. To young men, and particularly to young minitters, Dr. Kippis was always attentive and friendly. He was ready, on all occafions, to affitt them with his advice in the profecution of their private fludies and public labours s and to thofe who needed pecuniary aid, his hand was extended for the diftribution of his own property, as well as that of others entrulted to his difpofal.

As an author, Dr. Kippis commenced his career in early life, as many other young men have done, by contributing to the magazines of the time, particularly the Gentleman's Magazine. He afrerwards became a more contant writer in the Monthly Review. Hisarticles were chiefly hiltorical and theological, with occafional ffrictures on works of general crudition. He alfo furnihed a periodical publication, called the Library, with feveral valuable papers. He laid the foundation of the New Annual Regitter; and fuggelted the improved plan upon which that work is conduted. The Hiltory of Ancient Literature, and the Review of modern Books, were, at its firlt commencement, written by him, and continued to the jear $\mathrm{I}_{\boldsymbol{y}} \mathrm{S}_{\boldsymbol{t}}$, inclufive. He was alfo the author of the "Review of the Tranfactions of the prefent Reign," prefixed to the Regiter for 1780; and of the "Hitiory of Knowledge, Learring, and Talle, in Great Britain," prefixed to the fucceeding volumes, to the year 1794 inclutive.

During the application of the diffenting minifters to parliament, for the enlargement of the Act of Toleration in the year 1772 , to which he devoted much of his time and attention, he publifhed a valuable pamphlet, vindicating that meafure as to the matter, manner, and time of it. It was intended as an anfwer to a poblication afcribed to a writer who afterwards filled a very high flation in the church, and was
entitled " $\Delta$ Vindication of the Protefant Diffenting Miniflers, with regard to their late Application to Parliament," Svo.

Soon after his admiftion into the Royal Socicty, he publifhed a pamphlet, entitled "Ohrervations on the late Contefts in the Royal Society," ${ }_{1}-8_{+}, 8$ ro, ; with a view of allaying the animofities that fubfitted in that body, which produced a good effect. Wis intimate connection with fir John Pringle, bart. who was formerly a very refpectable and ufeful prefident of the Royal Society, led Dr. Kippis, after his deceafe, to republith hit. Six D:Icourlies, delivered at the affigment of fir Godfrey Copley's medal, to which he has prefixed a valuable life of the author, $1783,8 \mathrm{vo}$. Ast the clofe of the American war he publifhed a political pamphlet, formed from materials which were commun cated to him by perfons of eminence, and detligned to jullify the peace, which terminated that unhappy consell. This pam. phlet was entitled " Confideraticns on itie Provifonal Treaty with America, and the Preliminary Articles of Peace with France and Spain." He a'fo publifhed fereral fingle difo courfes, which were delivered on particular oncafions; fome. of which are reprinted in his volume of fermons, 1794 . Nor fhould we omit to mention his acconst of the life and voyares of captain Cook, $1 \%$ S8, 4 to. ; Lisis new edition of Dr. Doddridge's Leeturcs, with a great number of additional references; his life of this excellent perfon, prefixed to a new edition of his Expolition of the New Tellament, 1792; his life of Dr. Lardner (to whofe abilities, character, and writings he has paid the juft tribute of refpect) prefi:ed ta the complete collection of his works; in II vols. 8 vo. 1788: and "An Addrefs de'ivered at the Interment of Richard Price, D.D. F.R.S., S.C. 1795;" and an "Ordination Charse," $1 ; 58$, Soe. He alfo affilted in felecting and preparing "A Collection of Hymns and Pfalms, for public and private Worhip," 1795, Svo. and raro. which is ufed in many places of worfhip among Proteftant diffenters, and has pafied through feveral editions. But the work, to which Dr. Kippis devoted his principal attention for many of the laft years of his life, and by which he has acquired fingular reputation, was the Biographia Britannica. His indefatigable induftry in col'ecting materials for it, his accefs to the bell fources of information, his knowiedge of men and books, his judgment in felecting and marking every circumitance that could ferve to dittinguifh talents and character, and the habit which he had acquired by long practice of appretiating the value of different works, qualified him, in a very high degree, for conducting this elaborate performance. It has been mach regretted, that he did not luve to carry on this edition of the "Biographia," farther than to about a third part of the fixth volume, which has not yet made its appearance.
Notwithtanding the time that mut have been devoced to the feveral objects now recited, and to the correction and publication of the works of friends, who refpected his judgment and wifhed to avail themfelves of his affitance, which he could never refufe to thofe who requefled it; Dr. Kippis never nogiected the fludies and duties more immediately pertaining to his character as a divine, and his profefiron as a minilter. His acquaintance with the various branclies of theology, and with fubjects fubfervient to his critical fudy of the fcriptures, was very extenfive. He was in the daily habit of reading fome portion of the Net Teftament in the original language. He was converfant with the beit writers on Jewifh and Chriflian antiquities; and in the courfe of his reading no work efcaped him, that was defigned to illuftrate the evidence, to chab in the truth and
divine
divine original, and to inveftigate the geruine doctrines of the Chriftian Revelation.

He was a believer in Cluritianity upon the matureft examination and the fulleft conviction. No perfon was better acquainted with the controverfies which Revelation has produced. He had ftudied them in his earlier and riper years with great attention; and though he was ready to allow the force of every difficulty and objection, yet to the ample preponderance of evidence his deliberate and impartial judgment fubmitted. Anthority, indeed, is not abfolutely conclufive in queftions of this naturc. Yet whilh Chirittians can rank in the number of the adrocates of their religion fuch men as Bacon and Boyle, Newton and Locke, Clarke and Hoadley, Jortin and Lardner, and many other living wrieers of the firft eminence with refpect both to learning and character, who have profeffedly ftudied the evidence of Revelation; there is no real ground of alarm from tha feeble effurts of avowed inlidels, who have acquired popularity in another way, and to whom a partial attention may be directed, but who manifelt great ignorance of this fubject, and who are tery reprehenfible on account of their mode of attacking Chriftianity.

The principles which Dr. Kippis derived from Chriftianity were the directory of his conduct and the furrese of his confolation. By the amiable fenfibility of his heart, as well as by the fober conviction of his judgment, he was led to value the difcoveries and hopes of the gofpel; to fubmit to the practical influence of its doctrines and precepts ; and to cherifh the pleafing and animating expectations which it afforded. He had imbibed in a very high degree the mild and placable and benevolent fpirit of the religion which he profefled, and he exemplified this fpirit both in his preaching and in his practice.

Of his fentiments as a divine, and of his abilitics as a preacher, it is hardly neceffary for us to fay any thing on this occafion. Towards the clofe of his life the inclination of his mind was to the diftinguifhing opinion of the modern Unitarians; though he was far from embracing all the tenets that have been adopted by fome perfons who are thus denominated. However, he difapproved their appropriating this appellation to themfelves, which he confidered as affuming and exclufive ; and he lamented that excefs of zeal, with which fpeculations, comparatively of fmall importance, are maintained and propagated. Thofe doctrines and duties which be thought of principal moment, he feduloufly inculcated. Tenets of inferior importance, and that had no immediate influence on rectitude of tumper and practice, he more generally avoided. Such, indeed, were the meeknefs and moderation of his temper, his folicitude to preferve pace and unity, and his governing defire to guard againit the pernicious effects of a controverfial and contentious firit, that he beheld with concern the intemperate eagernefs and ardour with which difputes of trivial moment have been fometumes conducted, and he deprecated the unhappy divifions which they are likely to occafion.

As a preacher, Dr. Kippis was rational and feriptural; judicious and inffructive ; practical and interecting, efpecially towards the clofe of his difcourles; and he blended the argumentative and pathetic on particular oscafions. His compofitions were always well ftudied; his voice was clear and harmonious; his delivery was natural and unaffected, and on occafirns that required it, animated and impreffive; and though he fought not that popularity which depends more on lound and gelture and mechanical exertions, than on rational and fervent addreffes to the judgment and affections, and which is generally of no long duration, he re-
tained the refpeet and efleem of the fociety in Weftminfter for more than 42 years.

Such are the gencral outlines of the character and labours of Dr. Kippis. "The portrait, I am fenfible," fays the writer from whofe ascrunt of him this article is extracted, " is not fufficiently juut to the original. In delineating a character, which exlibits fo many excellencies and fo few defeets, none can furpect me of approaching to adulation. My refpect for him was great. I honoured him as a father. I loved him as a brother. But my affection, I am confident, has not mifled my judgment. By the favour of Providence, which marks the bounds of our habitation, I was led in early life into an intimate connection with him. Our acquaintance, as co-tutors and co-adjutors in public bufinefs, ripened into an eltablinhed friendflip; and our friendfhip continued, without fo much as a momentary interruption, and with increafing attachment, for more than 32 years, to the day of his deaith. It muft have been my own fault, if I have not derived advantage from his extenfive literary knowledge, from the wifdom of his counfel, and from the exemplarinefs of his conduct. No apology, I truft, will be thought neceffary for introducing myfelf on this occafion. As it was my anbition to cultivate the friend hhip I enjoyed, it is my pride to have it publicly known, that I valued that friendhip, as one of the chicf honours and pleafures of my life. The friend I have loit cannot be eafily replaced." See Rees's Funcral Scrmon, preached at the Meeting-houfe, in Prince's-ftreet, Weltminfter, Oct. 18, 1795.

KIPPURE, in Geography, the name of the highert mountains in the chain extending into the counties of Wicklow and Dublin, about ten miles fouth of the city of Dublin.

KIRA, a fmall ifland in the gulf of Engia; nine miles W. of Engia.

KIRAHIANA, a town of Hungary; 15 miles E.S.E. of Munkacz.

KIRALI, a town of Afratic Turkey, in Caramania; 35 miles W.S.W. of Cogni.

KIRANOOR, a town of Hindooftan, in the Carnatic; 22 miles N. of Nattam.
KIRANORE, a town of Hindooftan, in Marawar; 20 miles S. of Tripatore.

KIRByE, George, in Biograppy, an excellent Englifh madrigalift on the Italian model; tut who was more rema:kable for fimplicity than tafte and fancy. In 1597, he publifhed his firtt fet of madrigals to $3,4,5$, and 6 voices ; feveral of which were fuccelsfully revived at the concert of ancient mufic and the Catch-club, during the firft years of thofe inftittitions. They are now fuffered again to fleep in peace, with thofe of Walker, Wilbye, Eit, and Bennet, our principal madrigalifts, perhaps never to be waked again.

IKIRCAGATCH, in Geography, a town of Afiatic Turkey, about 40 miles N.E. of Magmi or Magnefia, on the route to Prufa, which has rifen to confiderable population, from the cultivation of cotton.

KIRCAJAN, a town of Perfia, in the province of Kerman; 117 miles E. of Sirgian.

KIRCALDY, a fmall town of Fife, on the N. crall of the Frith of Forth, about threc miles eait of Kinghorn, from which alfo there is a ferry to Leith and Edinburgh. Befides the ferry and the finhing, Kircaldy ufed to employ a confiderable number of flips, brigs, and other veffels, in the trade with the eaflern cotutries of Europe and the Baltic, but thefe were more frequently chartered or freighted firm other ports than their own. It has alfo been long a conficer-
able place for the manufacture of coarfe goods both of linen and cotton, and this trade is ftill profecuted to a very confiderable extent. The chief article of their manufacture confilts in low-priced blue and white checked goods, ufed for feamens' fhirts, and for clothing for the negroes in the Weit Indies. So great has been the demand for thefe articles at particular times, that fhortly after the capture of Trinidad by the Britith, the writer of this article was requefted by an eminent We?t India houfe in Liverpool, to endeavour to procure for them feven thoufand pieces of thefe checks, or any quantity which could be fupplicd. Upon application, however, he found the demand fromother quarters fo great, that only a very fmall proportion of the fupply could be procured. Coarfe low-priced checked handkerchiefs are alfo manufactured to a very confiderable extent.

Kircaldy was erected into a royal burgh in the fifteenth century, and its charter was ratified by Charles I. in $16+4$, and is governed by a provoft, bailiff, and council, at which time it is faid that roo fail of fhips belonged to the port: the chief article of export is coals; and the importation confits of corn, flax, flax-feed, linen-yarn, wood, iron, afhes, tallow, bark, hides, Scc. Kircaldy is united with Dyfart, Kinghorn, and Burnt-iland, in electing a member to ferve in parliament. In ISOX, the number of inhabitants was 3248 , of whom 700 were employed in trade and manufactures; 13 miles north of Edinburgh. N. lat. $5^{\circ} 7^{\prime}$. W. long. $3^{\prime}{ }^{\prime}$ 。

KIRCH, Godpres, in Biograpby, an able aftronomer, was born at Guben, a town in Lower Lufatia, in the year 164o. He profecuted his ftudies at Leipfic, where he acquired confiderable reputation by the almanacs which he publifhed. In 1692, he married Mary Margaret Winckelman, who rendered him much ufeful affitance by making aftronomical obfervations for the conftruction of his Ephemerides. In 1jor, on the eftablifhment of the Academy of Sciences at Berlin, by Frederic I., king of Pruffis, that prince invited M. Kirch to be a member of the fociety, and to take upon himfelf the office of aftronomer in ordmary, with an honourable penfion for his lupport. He died at Berlin in 17 to, at the age of feventy-one years. He had been in the habit of correfponding with all the learned focieties of Europe, and publithed a varicty of aftronomical treatifes, which are in con'iderable eftimation.

Kirch, Marx-Margaret, wife of the preceding, was daughter of a Lutheran clergyma:a at Panitzfli, a vilage near Leipfic, where fhe was bora in the year 15 бo. Having loft her father when the was only twelve years of age, the was ellucated by his fucceffor, and induiged the finclination which the difcovered for the :cquifition of knowled $\check{2}$, and particularly that of altronomy. This partiality for his favourite purfuit was a recominendation to M. Kirch, who obtained her hand in ma-riage, and found her a moit valuable affirtant in his fcientific labours. She was nit contented, however, with rendering her hufband iraportant fervices, but fhewed herfelf capable of wiewing thic heavens with the eye of a difcoverer, and in 1702, the firft faw a comet, upon which M. Kirch publifhed his obfervations. In 1707, fhe difcovered a peculiar Aurora Borealis, of which mention is made in the Memoirs of the Academy of Sciences at Paris, for the year 1716. Thefe exertions of her genius procured her the efteem of the learned at Berlin, not. withltanding which fhe was in very low circumftances when lier hufband died. She contrived to maintain herfelf and educate her children, by contristing almanacs, and, in 1711, fhe publifhed a differtation, intitled "Preparations for obferving the grand Conjunctions of Saturn, Jupiter, \&c."

Soon after this the found a patron in the baron de Throfick, Tho furnithed her with apartments in his own houfe, allapted to the carrying a:1 her attronomical obfervations. Here fhe lived till the baron's death, which happened about two years afterwards. She now removed to Dantric, when Peter the Great wifhed to engage her to fettle in his empire. She preferred her native country, and, in 1716, accompanied her fon to Berlin, where fle was appointed affronomer to the Academy of Sciences in that city. She was now introduced to the notice of the royal family, and fecured the patronage of fome of the branches of it. She died in 1720, in her fifty-firft year.

Kirch, Christian Frederic, fon of the preceding, was born at Guben, in the year 169t, and difcovered an early and very ftrong bias for fcientific purfuits. He commenced his ftudies at Beriin, and afeerwards continued them at Halle, whence he made excurfions, for improvement, to Nuremberg, Leiplic, and Prufia. He was employed a confiderable time in the obfervatory at Dantzic, and during his refidence here the czar, Peter the Great, offered him an eflablifment at Mofcow ; but his attachment to his mother, who was averfe from leaving Germany, led him to decline it. In 1717, he was made member of the Academy of Sciences at Berlin, and, in 1723, he was choferi a correfponding member of the Royal Academy of Sciences ar Paris, and he fhewed himfelf worthy of that diltinction, by the frequent valuable contributions which he tranfmitted to them during the remainder of his life. He died in 1740, in the forty-fixth year of his age. He publifhed feveral works connected with aftronomy, which were in confiderable reputation at the period in which he flourilhed. Moreri.
KIRCHBACH, in Geography, a town of the duchy of Stiria; 14 miles S.E. of Gratz.
KIRCHBERG, a town and caftle of Bavaria; 12 miles N. of Landihut.-Alfo, atown of Germany, in the principality of Hohenlohe, on the Jaxt; 28 miles W. of An-fpach,-Allo, a town of Saxony, in the circle of Erzgebirg; fix miles S. of Zwickau.-Alfo, a town of the principality of Naffata-Dietz, capital of a bailiwic; Give miles S.E. of Dietz. - Alfo, a town of Aultria; 11 miles S. of St. Pol-ten.-Alfo, a town of France, in the department of the Rhine and Mofelle, and chief place of a canton, in the diftrict of Simmern. The place contains 772 , and the canton 6491 inhabitants, in 35 communes.

KIRCHEIN Mus.etm at Rome, was founded by father Kircher about the middle of the feventeenth contury. This celebrated mufeum is full of ancient paintings, vafes, gens, intaglios, cameos, and other antiquities, which are there in fuch abundance, that a fpectator might fancy himfelf at Portici; but the curiofities which we were moit eager to fee and examine, were father Kircher's mufical inftruments and machines celcribed in his Mufurgia, They were almott ali out of order in 157C, and in decay; and it is to be feared that time has not improved them. Their conftruction was not only curious, but manifetted the ingenuity as well as zzal of the learned father, in his mufical enquiries and ex. periments.

KIRCHEIM-Bomlandex, in Geography, a town of France, in the department of Mont Tonnerre, and chief place of a canton, in the diftrict of Mayence; 28 miles N.TV. of Manheim. The place contains 1872, and the canton $9 \frac{9}{4} 65$ inhabitants, in 22 communes. N. lat. $49^{\circ} 39^{\prime}$. E. long $75^{\circ}$.

Kircher, Athanasics, in Biograpby, a celebrated mathematician and philofopher, was born at Fulda in the year 1601, and when he was feventeen years of age he commenced lus noviciate in the fociety of the Jefuits, among
whom

## $K 1 R$

## K I R

whom he diftinguifhed himfelf by his valt proficiency in literature and fcience. Having finifhed his itndies, he was felected by his fuperiors to fill the chair of profeflor, and taught philofophy, mathematics, the Hebrew and Syriac languages, in the univerfity of Wirtzburg, in Franconia, with great fuccefs till the year 1631. During the war between the emperor Ferdinand II. and Guftavus, king of Sweden, he withdrew to France, and refided fome time in the Jefuits' college at Avignon. After this he was called to Rome, where, for fix years, he filled the pot of mathematical profeflor in the Roman college, and then undertook the profeflurthip of Hebrew. He died in the year 1680, in the eightieth jear of his age. His works amount to twenty-two volumes folio, eleven in quarto, and three in octavo. Of thefe the following are mentioned as the principal, "Prelufiones magneticx;" "Primitix gnomonicx catoptrice ;" "A rs magna lucis et umbre;" "Mufurgia univerfalis;" "Obelifcus Pamphilius;" "CEdipus たgyptiacus ;" "Itinerarium extaticum ;" "Obelifcus Rgyptianus;" "Mundus fubterraneus;" "China illuftrata." Kircher was a man of very extenfive erudition, and of indefatigable indultry, but the fubjects of his ftudious labours were more frequently curious than ufeful, and a vilionary fancy, rather than a cool judgment and accurate enquiry, too frequently guided his pen. Whatever wore the Itamp of antiquity fafcinated his attention, and he had a particular paffion for decyphering hieroglyphical characters, of which, if he could not difcover the true meaning, he was always ready to give what he conceived to be a plaufible one. He had colleeted a rich cabinet of antiquities, curiofities, medals, mathematical inttruments, rare animals, minerals, \&cc. for the mufeum of the Roman college, the arrangement of which was begun by himfelf, and finifhed by father Bonanni, who publifhed a defcription of it at Rome in 1709, intitled "Mufum Kircherianum, \&c." Moreri.

The chief work of Kircher, which we fhall notice here, is his "Mufurgia Univerfalis," dedicated to Leopold, archduke of Auftria, afterwards emperor of Germany, who was not only a patron of mufic, but an excellent performer on the harpfichord. The Mufurgia is written in Latin, in ten books, occupying two volumes in folio, of which the firit contains feren books, and the fecond three.

The fubjects which he treats are, chiefly, the following: -of the propagation of found; -of the elements of practical mufic;-of harmonics, or the ratio of founds;-geometric and algebraic divifion of the monochord;-new experiments on the conftruction of mufical inttruments;-of melody, comprehending new fecrets for producing every fpecies of can-tilena;-a parallel between the ancient and modern mufic, pointing out the dignity of the ecclefiattical canto fermo, and the means of arriving at the pathetic Ityle;-of compofition, or the combination of found, and application of melody to poetical numbers and rhythms in all languages;-mufical wonders produced by latent means and new experiments of various kinds; -and laftly, of the various derivations of mufic and the phyfical and artificial purpofes to which it is, os may be, applied.

This work, which undoubtedly contains many curious and amuling fections, is, however, difgraced by the author's credulity and ill-founded affertions.

Father Kircher has been very truly calleã "Vir immenfox quidem, fed indigeftr eruditions," a man of immenfe, but indigetted learning.

He was always carelefs of what he afferted, credulous, and inaccurate ; collecting, without choice or difcernment, whatever he found relative to the fubject upon which he was
writing ; and adopting whatever was offered to him, true or falte, provided it contained any thing marvellous.

His Mufurgia, publifhed at Rome in 1650 , is a large book; but a much larger might be compofed in pointing out its errors and abfurdities. Yet with all its imperfections, it contains much curious and ufeful information, for fuch as know how to fift truth from falfehood, and ufefulnefs from futility; for a confiderable portion of which, however, he was obliged to Père Merfenne, whofe "Harmonie Univerfelle" appeared in 1536.

Kircher, Conrad, a German Proteftant divine, who was fettled at Acgriburg, and was author of a very learned and laborious work, of confiderable ufe in illuftrating the genuine fenfe of the holy fcriptures. This work was intitled "Concordantia veteris Teftamenti Grecz, Ebræis vocibus refpondentes $\pi<\lambda u \chi$ grfor. Simul enim et Lexicon Ebraicolatinum, \&c." printed at Franckfort, 1607, in two volumes, quarto. This work, which is a Hebrew Dictionary and Concordance, is ftrongly recommended by father Simon when treating of the bell methods to be adopted in undertaking any new tranflation of the feriptures. It contains all the Hebrew words in the Old Teflanient, introduced in an alphabetical order, and underneath is the Greek verfion. of them from the Septuagint, followed by a collection of the paffages of fcripture in which thofe words are differently interpreted. Moreri.

KIRCHHAMB, in Geograply, a town of Carinthia, on the borders of the Tyrol; 16 miles N.N.W. of Greiffenburg.

KIRCHHAYN, a town of Heffe Caffel, on the Wohra, containing more than 400 houfes; 35 miles S.S.W, of Caf-fel.-Alfo, a town of Lufatia, on the Little Elfer; i4 miles S. of Luckau. N. lat. $51^{\circ} 36^{\prime}$. E. long. $13^{\circ} 35^{\prime}$.

KIRCHHEIM, a town of Wurtemberg, on the Lauter ; 24 miles N.V. of Ulm-Alfo, a town of Germany, the capital of a lordßhip belonging to the family of Fugger; 25 miles E.S.E. of Ulm.

KIRCHLAUTERN, a tnwn of the duchy of Wurzburg; 8 miles N.W. of Bamberg.
KIRCHPACH, a town of Auftria; 10 miles W.N.W. of Horn.

KIRCHPERG, a town of Bavaria; 13 miles N.W. of Mofburg.-Alfo, a town of Aultria; 8 miles S.W. of Sonneberg.

KIRCHSCHLAGEN, a town of Auftria, with a medicinal bath ; 10 miles S. of Zwetl.

KIRCHWALSEDE, a town of Germany, in the county of Verden ; II miles N.E. of Verden.

KIRCKMAN, JACOB, in Bizgraphy, an excellent harp-fichord-maker from Germany, who canse to England about the year 1740, and worked with the celebrated TMabel, as his foreman and finihher, till the time of his death. Soon after which, by a curious kind of courthip, Kirckman married his maller's widow, by which prudent meafure he became poffeffed of all Tabel's feafoned wood, tools, and fock in trade. Kirckman himfelf ufed to relate the fingular manner in which he gained the widow, which was not by a regular fiege, but by form. He told her one fine morning, at breakfaft, that he was determined to be married that day before twelve o'clock. Mrs. Tabel, in great furprize, afked him to whom he was going to be married, and why fo foon? The finifher told her, that he had not yet determined whom he fhould marry, and that, if fhe would have him, he would give ber the preference. The lady wondered at his precipitancy, hefitated full half an hour ; buthe continuing to fwear that the bufinefs mult be done before twelve o'clock that day, at length fhe furrendered;
dered; and as this abridged courthip preceded the marriage act, and the nuptials could be performed at the Fleet or May Fair, "without lofs of time, or hindrance of bufinefs," the canonical hour was faved, and two fond hearts were in one united, in the moit fommary way poflible, julk one month after the deceafe of Tabel.

Kirckman lived long enough to flock the whole kingdom with his inftruments, and to amafs great wealth. He had no children, but as many nephews hovering over him as a Roman pontiff.

Theodor:s, the father of Ifocrates, was a flute-maker, who acquired wealth fufficient by his employment not only to educate his children in a liberal manner, but alfo to bear one of the heavieft public burthens to which an Athenian citizen was liable ; that of furnihing a choir or chorus for his tribe, or ward, at feftivals and religious ceremonies.

Each tribe furnifhed their dittinct chorus; which confitted of a band of vocal and in!trumental performers and dancers, who were to be hired, maintained, and drefied, during the whole time of the fettival : an expence confiderable in itfelf, but much increafed by emulation among the richer citizens, and the difgrace confequent to an inferior cxhibition. The fluctuations of trade and public favour have rendered the bufinefs of boring flutes far lefs prolitable at prefent, than it was in the time of Theodorus. But our harpfichord maker, Kircknzai, who was known to be worth $90,000 \%$ twenty years before he died, doubled the prolits of his inAtruments, by becoming a pasmbroker and a ufurer ; obliging young beirs with money as kindly, and with as much liberality, as a Hebrew.
At a time when ruin flared harpfichord-makers in the face, by the rage with which mufical ladies were feized for the guitar, in preference to all other intruments, Kirckman hit on an ingenious expedient which faved himfelf from bankruptcy, and reftored the harplichord to all its former favour. (See Guitar.) He did not live to fee his excellent double harplichords of fixty or feventy guineas price, fold at autions for twelve or fourten ponds, and the original purchafers turn then out of their houfes as ufelefs lumber. Bot fuch are the viciffitudes of this world, that our defcendants will, perhaps, know as little about the pianoforte, as we do now of the lute or lyrc. Kirckman is fuppofed to have died, in 1778 , worth near $=00,000$.

KIRCUBBIN, in Geograply, a polt-town of Ireland, in the county of Down and profince of Ulfter, fituated in the peninfula of Ardes, and 97 miles N. by E. from Dublin.

## KIRCUDBRIGHT. See Khacunbright.

KIRDORE, a town of Upper Heffe; $3+$ miles W. of Caffel.

KIRENSIS, a town of Rufia, in the government of 1rkuth, on the Lena. N. lat. $57^{\circ} 40^{\prime}$. E. long 10 I $14^{\prime}$.

KIRENSKOI, a town of Ruffia, in the governmeat of Irkutf, on the borders, built in the year $10_{55}$, on a fertile foil, bur now decaying; 112 miles W. of Doruning.

KIRGANELIA, in Bo:any, from Kirganeli, a name in the Hortus Malabaricus for feveral fpecies of Phyllanthus. Juff. 387 . This genas is founded by Juffeu on a frrub called in the ifland of Mauritius Bois de demoifils, and which Commerfon, in conformity perhaps to that appellation, deftined to commemorate a botanical Neapolitan 1.dy, Maria Angela Ardinghelif, who tranflated the works of Dr. Hales into Italian. Our fpecinen from Commerfon is marked Ardinghelia, and we cannot account for Juffieu's paffing this name over in filence. How far the genus is difinct from Phyllanthus, or from Cicca, with which latter its pulpy fruit nearly accords, we are not furnifhed with materials fufficient to decide.

Kirghises, Kingeiscs, or Kirgufes, in Geography, a tribe of Tartars, who occupy about one-half of Independent Tartary, in the north. They are alfo called "Kaizaks," and are of undoubted Tartaric orizin, fo that they feem to live in perfeet amity with their fouthern brethren, the Uzbeks. Thefe Kirgufes are divided from Siberia by the great Stepp, or defort of Iffim, which is interlected by a river of the fame name. On the weft of the Kirgufes there ftill remain fome tribes of Kalmuks, though the moft of them migrated from the Volga in 1770 , when they fought the protection of the Chinefe. The Kirgules are fuppoled to derive their name from the founder of their horde; and from time immemorial lave been claffed under three divifions, of great, middle, and leffer, though quite unknown to Europe till the Ruflian conqueft of Siberia, at which time they nomalifed at the fuperior Yeniffey about the Yufs, the Abakhan, $\mathbb{E c}$. ; and in the year $\mathbf{1} 606$, fome tribes of them became fubject to the Ruffian empire, at the fame time with the Barabinzes. From that period, by their pufillaninity, their faithleffnefs, their frequent rebellion, and the fubjugation of correlative nations, they have had the character of an extremely turbulent people. The revolutions which have thus been produced in their political condition, induced them to remove from the Ieniffey to the Oby, and gradually farther to the welt and the fouth. They at prefent inhabit the prodigious defert between the Ural and the Irtyfh, denominated by the Ruffians the Kirghilian Steppe, and bordering weftward on the Cafpian and the government of Caucafus, northwards upon the parts about the UFa and the Tobol, and eaftwards on the government of Kolhyvan. The great horde, defended by mountains on the fouth and calt, afferted their independence in repeated contefts with the Kalnuks of Soongaria. The middie and little hordes have acknowledged the Ruffian fovereignty ever fince the year 1731; but having always been unfaithful allies, and a very piratical people, the Ruffians have been obliged to conAruct lines of finall forts along the frontier rivers. Each of thefe two hordes is eftimated at 30,000 kibitkies, or families; and fuppofing the great horde to contain 60,000, and each family to conlit of lix perfons, the population of this wide region may amount to 720,000 ; but it probably does not exceed half a million. Their manners have been minutely deferibed by Pallas. Their tents are confrukted of a kind of felt ; their drink is kumifs, made of acidulated mare's nills. The great horde is confidered as the fource of the two others. Being fettled near the mountains of Alak, called alfo Ala Tau, this horde has been denominated the Alataninn Kirgufes. They lead a wandering life from the borders of the Upper Sirr, or Syrt, near 'I'afikund, to the Steppe of Iffim. Each horde has its peculiar khan; but the middle horde, when Pallas approached this country, was contented with a prince, that acknowledged the khan of the leffer horde; and in 1777, this khan of the leffer horde, whofe election had been confirmed by Rufliz, was called Nur Hali, a fenfible and equitable prince. The features of the Kirgufes are Tartaric, with the flat nofe and fmall eyes; but not cblique like thofe of the Monguls and Chinefe. They have horfes, camels, cattle, fheep, and goats. Some individuals in the middle lorde are faid to have 10,000 horfes, 300 camels, 3 or 4000 cattle, 20,000 hheep, and more than 2000 goats; while fome in the leffer horde were proprietors of 3000 horfes, and a proportionable number of the other animals. Their dromedaries furnifned a confiderable quantity of woolly hair, which was fold to the Ruffians and Bucharians, being annually clipped like that of fhecp. Their chief food is mutton, of the large-tailed fort; and fo exquifite is the lamb,

## K I R

## KIR

lamb, that it is fent from Orenburg to Peterßurg for the tables of the palace. The lamb-dkins are the moft celebrated after thafe of Bucharia, being damafked as it were by clothing the little animal in coarle linen. But the wool of the fheep being coarfe, is ufed only in domeftic confumption for felts and thick cloths. The theppes fupply them with objects of the chace, wolves, foxes, badgers, antelopes, ermines, weazels, marmots, $\mathbb{E c}$. In the fouthern and caltern mountains are found wild fheep, "ovis mulimon," the ox of Thibet, "bos grunniens," which feems to delight in fnowy alps; with chanoys, chacalls, tigers, and wild affes.
"As the Kirgufans regard one another as brethren, they are obliged to employ flaves, being captives whom they take in their incurfions. Their drefs is the common Tartaric, with large trowfers and pointed boots. A thin velt fupplies the place of a fhirt, and they commonly wear two fhort robes. The head is fhaved, and covered with a conic bonnet. Their clothes are numerous and light, fo that if they fall from horfeback, they are feldom hurt; their faddle-horfes are richly ornamented; but their riders are fhort in ftature, and their trowfers afcend to the arm-pits, fo that they refemble a pair of pantaloons on horfeback. The dadies ornament their heads with the necks of herons, difpofed like horns. They appear to be Mahometans, though rather of a relaxed creed.
" The Kirgufians carry on fome trade with Ruffia. The chief traffic, which is wholly by exchange, is at Orenburg, but the middle horde proceed to Omilk. Sheep, to the amount of 150,000, are annually brought to Orenburg; with horfes, cattle, lambs, fkins, camels'-wool, and camlets; fometimes they offer flaves, Perfians or Turcomans. In return they take manufactured articles, chiefly clothes and furniture. From Bucharia, Khiva, and Tafhkend, they receive arms and coats of mail, which Ruffia refufes, in return for camels and cattle. They are extremely ford of the Kalmuk women, who long retain their form and charms; and often marry them, if they will adopt the Mahometan reltgion. There is an annual feftival in honour of the dead. About the beginning of the 17 th century this people, who were formerly Shamanians, became children of circumcifion, by the exertions of the priefts of Turkiltan; but Pallas, in 1769 , found them addicted to forceries and other idle fupertitions."

This barren country, now inhabited by the Kirgufes, has been the fcene of coniferable events: and it is not improbable, that its numerous deferts and plains have been formerly more fertile, at leaft in pafturage. However this be, thefe regions have been held $b$ y fucceffive nations of high repute, from the Maffagetx of early times to the Turks. Pallas, cited by Pinkerton in his Geog. vol. ii. Tooke's View of the Rufian Empire, vol. i.

IEIRIAN, a mountain of Thibet. N. lat. $33^{\circ} 12^{\prime}$. E. long. $79^{\circ} 44^{\prime}$.

KIRIANI, a town of European Turkey, in Livadia; 8 miles S.E. of Athens.

KIRILOV, a town of Ruffia, in the goverument of Norgorod; 52 miles N.W. of Vologda.
Kirin, or Kiren-Oula, one of the three grand dcpartments of the country of the Mantchew or Mandfhur T'artars, or Eaftern Chinefe Tartary, bounded on the N. by the river Saghalien, on the E. by the fea, on the S. by Corea, and on the W. by the province of Leao-tong. This country, which is rendered extremely cold by the number of forefs that cover it, is fearcely inhabited; it contains only two or three ill-built cities, furrounded by plain m:d-walls, The valuable plant "ginfeng" grows here ; and the cm.
pcror fends hither thofe criminals, who are condemned ta banifoment by the laws. The capital is alfo called Kirin, or Kerill, and is fituated on the river Sollgari, called at this place Kirin, which falls into the Saghalien or Amur, and was the refidence of the Mantchew or Mand hur general, who was invelted with all the powers of a viceroy ; infpecting the troops and having authority over all the Mandarins; 500 miles N.E. of Peking. N. lat. $43^{\circ} 48^{\prime}$. E. long. $126^{\circ} 24^{\prime}$.
KIRKBY-Lonspale, a market town and parifh in the valley of Lonfdale, whence its fecond, or diftinetive name, on the bank of the river Lune, at the fouthern edge of the county. It is I 2 miles fouth-ealt of Kendal, and 252 north of London. In the year 1800, the town contained $260^{\circ}$ houres, and 1283 inhabitants. At this place Kirkby, bifhop of Carline, repulfed the Scots. He was a native of this town. Over the £une is a curious bridge of three arches, and in the market place is a crofs of rather fingular character. The church is a large building, 120 feet in length, by 102 in breadth. In the church library is the following infcription: "This library, pulpit, and new loft, together with the fchool-houfe, were founded by Mr. Heary Willon, of Underry, who gave to the colleges $100 \%$ befides $35 \%$. yearly to feven poor fcholars going to Queen's-college in Oxford ; and to this church and fchool 2401 ; to the poor of Kirkby-Loufdale lordfhip $500 \%$; befides many other gifts to pious ufes in other places : by all which, he, being dead, yet fpeaks." About two miles from the town, towards Lonidale, is Borrow-hall, the feat of Thomas Fenwicke, efq. It is feated in a narrow dale, and nearly furrounded by mountains. At Kirkby are a weekly market and three fairs, annually. Nicholion and Burn's Hiftory, \&c. of Weftmoreland, 2 vols. 4 to. $177 \%$.

KiRkBy-Moorfide, a market town and parifh in that part of Yorkfhire called the North-Riding, England, as its name implies, is feated among the moors, or mountains, which abound in that part of the inland. This town is 28 milcs N. of York, and 233 from London. In the year 1800 , it contained 287 houfes, and 1396 inhabitants. By the ftatement in Domefday-book the manor of this place, then called Chirchabi, was one of the heads of the ancient family of Stutevilies, one of whom founded an abbey at Keldholone, about one mile from this town. On the top of a hill, to the north-eaft of Kirkby, is the fcite of an ancient building, faid to have been the feat of the abovenamed family, who continued to refide here till the reign of Henry III. The Nevilles, lords, Latimer, had alfo a manor-houfe here. George Villiers, the diffolute duke of Buckingham, part of whole eltates lay here, and at Helinfey, where he had a feat, died in a miferable condition, in a mean houfe in this town. Pope, in his Moral Eflays, has characterifed the place, and feverely reprobated the man in lines of peculiar force and feverity.
" In the worit inn's worlt room, with mat hall-hung, The floors of p!after, and the walls of dung, - On once a flock-bed, but repaired with fraw, With tape-tied curtains, never meant to draw, The Gcorge and garter dangling from that bed, Where tawdry yellow ftrove with dirty red, Great Villiers' dies."
A bout one mile weft of the town is Kirkdale church, an ancient edifice, feated in a mult romantic fituation, and noted for an infeription over the fouth door. An account of this was written by Mr. Brooke, for the Society of Antiquaries, who publifhed the fame with a print in vol. vo Archrologia.

Kinkby-Siephen, a market town and parifh in the county of Weftmoreland, England, is feated on the weftern bank of the river Eden, in a mountainous part of the country. The town confifts of one flreet, running north and fouth, at the extremities of which are profpects of the Helbec and Wildbore mountains. Formerly here was a fpacious area for a market place, which has been nearly covered with buildings. A market is held here every. Monday, and is chiefly occupied by the manufacturers and dealers in ftockings. This town is four miles from Brough, and 266 north of London. The parifh church is a large building, and contains fome old monuments. Adjoining it is a handfome parfonage-houfe, built by the late Dr. Chaters, prebend of Durham, to whofe family the living belongs. In the town is a free grammar-fchool, which has two exhibitions.

Near Kirkby are the ruins of Pendragon-cafle, which was formerly the feat of the lords Clifford: and about one mile fouth of the town are Wharton-parks, the ancient feat of the Wharton family. This place is deferted, and the houfe fallen to decay. Nicholfon and Burn's Hittory, \&cc. of Weftmoreland, 2 vols. 4 to 1777.

KIRKCALDY. See Kircaldy.
KIRK-CLISSA, or Kirkleesas, a town of European Turkey, in the province of Romania; formerly called "Teffaraconta Ecclefix," or forty churches; at prefent it has neither walls nor churches, and but few Chritian inhabitants. It is inhabited by many Jews, who are chielly employed in making butter and cheefe, for which they have a ready market among their friends at Contantinople; 30 miles E. of Adrianople.

KIR KCUDBRIGHT, the chief town of one of the ftew. artries into which the county or fhire of Galloway in Scot'and is divided. Kirkcudbright is fituated on the Solway Frith, near the mouth of the river Dee, and, excepting as a market town for the adjacent diftrict, is not eminent for any \{pecies of commerce, manufacture, or trade. The harbour is fate, with good anchorage, and fheltered from all wiads; but being a tide-harbour is well fit for veffels that can take the ground. It was anc:ently a burgh of regality, and held of the Douglaffes, lords of Galloway, as fuperiors. On the forfeiture of the earl of Douglas, laft lord of Galloway, in 1455 , it was by James II. erected into a royal burgh, and is now governed by a provolt, three bailiffs, and towncouncil. In the environs are many traces of ancient camps, Britih and Roman. Its cafte, the mounts and dikes of which are ftill remaining, was evidently conftructed to defend the entrance of the river Dee. In 1801, the number of inhabitants was $2380 ; 28$ miles S.W. of Dumfries. N. lat. $54^{\circ} 55^{\prime}$. W. long. $4^{\circ} 5^{\prime}$.

KIRKCUDBRIGHTSHIRE, a divifion or county of Scotland, called the Stcwartry of Kirkcudlright, forms the eaitern, and by far the molt extenfive portion of Galloway. The latter name was anciently applied to an independent principality, which included the greater part of Ayrfhire and Dumfrieshire, but is now bmited to the two counties of
 tween $54^{\circ} 40^{\prime}$ and $55^{\circ} 20^{\prime}$ of N. latitude, and contains 892,57 fquare miles, on 449,313 Scotch acres. It is bounded on the fouth by the Solway frith, which divides it from England; by Dumfrieshire and the eltuary of the Nith on the eait, by the fame county and Ayrfhire on the north, and by the latter, with the flire of Wigton and the bay of that name, on the weft. Kirkcudbright has no fubdivifions, except that four of the moit northerly parifhes, Cavefairn, Dalry, Kells, and Balmaclellan, are commonly called the diltrici of Glenkens. The afpect of the country,
however, affords a very matural divifion into two pares. it a line be drawn from the centre of Irongray parsin to tho Gatehoufe of Fleet, all to the weft and north, with littl: exception, is fo mountainous, that it may be very properly termed a Highland diftrict ; while the fouth and eaft exhibr: a linc champaign and cultivated country. Thie parifies are 28 in number, the whole population of which, according to the parliamentary returns of 1800, amounted io 29,211 perfons. Kirkcudbright, Gatehoufe of Flect, Crectown, Cattle Douglas, and New Galloway, are the princeipal towns. Belides thefe there are feveral confiderable villages, which it will not be neceffary to particularize in this place. Kirkcudbright is the county town, and a royal borough, as is alfo New Galloway. Creetown, which is fituated at the upper part of Wigton bay, has lately been conitituted a borough of barony: fo likewife has Cattle Douglas, a thriving village, not much above thirty years old, but which now contaims nearly a thoufand inliabitants. Some attempts have been made to introduce the cotton manufactures here; but the high price of coals oppofes an almoft unfurmountable impedinent to ultimate fuccefs. The fame circumftance operates, in no inconfiderable degree, again:t the eftablifhment of manufactures, requiring larga quantities of fuel, in every part of the ttewartry. Thofe villages which are fituated on the coaft, however, being flyplied with coat From England, have made more rapid progrefs, even in the manufacture of cotton, than could reafonably have been expected.
Though, as mentioned above, the greater part of this ftewartry is hilly; yet, upon the whole, it contairs few mountains remarkable for their fize or height. The moft lofty of thofe in the weftern divifion is that called Cairnfmuir, within the parihh of Minisgalf, which rifes 1737 feet above the level of the fea, and is furrounded by Ieveral others of equal altitude, though lefs ftriking to the eye, from the greater elevation of the circumjacent grounds. The hill cafled Cairnbarrow, in the parifhes of Anworth and Kirkmabreek, is inoo feet in height, very little encumbered with rocks, and commanding a very beautiful and extenfive view, not only of the thewartry of Nirkcudbright and the faire of Wigton, but alfo of the Ine of Man, and the oppofite coalts of England and Ireland. Crowfell, which terminates a lofty ridge of hills in the fouth-eaftern part of the county, was formerly one of the alarm-potts for giving notice of the incurfions of the Englifh. The elevation of Douglas-Cairn, on the fummit of this mountain, is faid to be about 1 gos fect, and Knockendoch, which furmouuts the north wheg, 1500 feet above the level of the fea. From this range of hilis, the country defcends towards the fhore in the molt regular and beautiful manner, exhibiting a delightful view of well-inclofed fields in a fate of excellent cultivation. Irio mediately upon the fea, the fcene is of a very different defcription: the coaft here being remarkably bold and rock y, difclofes from the fand, at low water, fome grand and picturefque appearances; tremendous and rugged precipices; high and pointed fpires, under the bafes of which are palfages refembling the form of rude arches; large and regular amphitheatres, leading into caverns, the extent of which no human being lias yet ventured to explore.

At this point, and indeed on almoit every part of the coalt of this county, a great varicty of marime plants are found. Among thefe the moft remarkable are fanphire, ufed for preferves or pickles; and the water poljpus, or fes anemone, which naturalits conlider as the connecting link between the animal and vegetable kingdoms: for, though dellitute of the faculty of locomotion, it poffefies a degree

## KIRKCUDBRIGHTSHIRE.

of irritability and fenfation much fuperior to any other known vegetalle production. For a particular account of this very curious fubject, fee the article ANemone.
The flewartry of Kirkcudbright gives rite to feveral rivers, belides a number of fmaller ftreams. The molt remarkable of thefe are, the Orr or Urr, the Ken, the Dec, the Flect. and the Cree. The Urr, which is alfo called the Uurre or Whurr, flows from a lake of the fame name, in the parilh of Balmaclellin, fituated in the diltrict of Glenkens. Hence it runs almolt directly fouth, and falls into the Solvay frith near the villaye of Colvend. This river is navigable for veffels of $\$ 0$ tons burden, to the dillance of eight miles from its mouth. By meaus of it, therefore, coals, lime, and other articles, imported from England, are conveyed thus fat up the county, and hence dilitributed to the more interior parts. The dangers and difficulties, however, altending this trade, owing to the numerous fand-banks in the chanive of the Solway, which are every day beconing more extenfive, oppofe powerful obtacles to its increafe, either here or at any other port on this coalt, One advantage poffeffed by this river, is a large baifon called Gibbs-hold, which it forms within land, about two miles from its confluence with the Fea, where large veifels often fecure a fafe retreat during ftormy weather. The Ken, the fecond river above mentioned, takes its rife alfo in the northern part of the ftewartry, near the borders of Nithfdale. Flowing hence, at firt in a fouth-welterly direction, it feparates the parifhes of Dalry and Caveefphairn ; then proceeding towards the fouth, with an inclination eaflwards, it falls into Kenmuirloch, and forms a junction with the Dee. This river begins its courfe among the hills in the north-weftern divifion of the county. After receiving the Ken, it flows towards the Solway frith, into which it difcharges itfelf, after paffing the town of Kirkcudbright. The Dee is remarkable both on account of its breadth and depth, particularly at the place called Kenmuir-loch. It is navigable to the village of Tongland, two miles above the town of Kirkcubbright; and, were it not for the number of rccks and fhallows with which it abounds beyond this point, might be made the means of introducing an inland navigation to the very centre of the county. A furvey was made fome years ago, with a view to fupply the defects of the river by a navigable canal, but the plan was not fucceffful in meeting the approbation of parliament. A fmall canal, however, has been cut by the fleward of the county betweeu the Dee and a lake called Carlinwark-loch, which is fituated above the fhallows of Tongland, and furnihhes marle in great abundance. The Fleet and the Cree are alfo navigable for feveral miles. The former rifes out of a lake called Lochflet, and pours jts waters into the bay of Wigton, at a thort ditance from the village called Gatehoufe-of-Fleet. The Cree takes its rife amoug the mountains which feparate the northern part of the county from Ayrfhire, forming, for feveral mules of its courfe, the boundary of the itewarty. It ferves as a continuation of the navigation of Wigton bay, and produces lifh of various kinas, particularly falmon, in great plenty.
Few counties can boaft of a greater number of lakes or Jochs than Kirkcuabright. With the exception, however, of Lochken, or Keimuir-loch, already mentioned as formed by the waters of the Ken and Dee, which is ten miles in length, they are, generally fpeaking, of fmall extent. The pariin of New Abbey, in the caltern ditriet of the flewartry, coutains three lakes, Lochkendan, Lochend, and Craigend, the two lait of which are nearly a mile long, and more than one half of a mile broad. Lochrutton, which gives name
to a parifh, is of fimilar dimenfions. In the centre of it is an artificial ifland, nearly of a circular form, and fomewhat more than half a rood in circumference. It is com. pofed, on the furface, of a valt collection of large ftones. In Balmaclellan parifh there are five lakes. One of thefe, though very fmall, is famous for a particular fpecies of trout, many of which weirh ten Englifh pounds each. Carlingwark-loch, in the parih of Kelton, formerly covered 116 acres, but fince the canal joined it to the Dee, it has been reduced to lefs than 80 . This loch contains an in. exhaultible fund of the very beft thell marle. Before its extent was contracted, there were two illes in it, upon which the country people fay two churches or chapels formerly itood. Indeed, the tradition in the neighbourhood is, that there had been a town in the loch, which was drowned or fiwal. lowed up. The difcovery of an iron forge, on the fouth ifle, fome years ago, feems to give fome probabi ity to this idea. It was furrounded by the remains of a tone building. or rampart, and communicated with the oppolite fide of the lake by a caufeway or road of ftones, fecured by piles of oak wood, and having an opening in it, fuppofed to have been for a drawioridge. Several canoes, hollowed by fire, after the manner of the American favages, and a large iron mallet, have alfo been found in this loch. Befides thofe alread noticed, there are a number of fmaller lakes in different parts of the county. Nonc of them, however, deferve to be particularized except Loch Kohn or Koan, which is fittuated in the parifh of Croffmichael. It extends over 40 acres of ground, and is from 10 to 22 fathoms deep. No rivulets or ftreams flow into it, nor indeed has it any vilible fource of fupp'y excepting the clouds. It never freezes but during the moft intenfe froit.

This county contains a variety of minerals and mineral fprings. The want of coals, however, and the difficulty of thipping them, in general prevents the former from being turned to advantage. A rich iron-mine, in the parifh of Kerrick, was wrought for fome time by an Englifh company, but they were at latt obliged to abandon it. A lead mine, however, has been opened, and is ftill fuccefsfully carried on in the weftern divifion of the ftewartry. Both thefe metals are found in abundance in many other parts. Appearances of copper have alfo been oblerved; but it is not known that any trial of it has been made. There is alfo great plenty of limeftone, though of an inferior quality, as yet untouched; and a valt fund of excellent thell-marle for manure, which is too much neglected by the farmers, and. lime exported in its tlead, at a very confiderable expence.

The remains of antiquity in this county are itill very numerous, and many of them in no fmall degree interelting. The abbey of Sweetheart, or New Abbey, in a parifh of that name, is a beautiful lofty building in the light pointed fyle. It was founded in the 13 th century by Devongilla, the mother of John Baliol, king of Scotland. This flructure ftands in a fine level field about 20 acres in extent, which is enclofed by a ftone wall ten feet high, built of granite ftones, fome of which are of immenfe fize.

Hil's caltle fituated near Lochrutton, and about three miles from Dumfries, was one of the many fortified places which belonged to the Douglas family, as lords of Galloway. Edward the firft lodged here, on his way to Kirkcudbright in the year 1300. A tower and a few finall buildings, which furround a fquare court, are all that remain of this edifice. Buittle cafte, the favourite refidence of king John Baliol, is ftill to be feen in the parifh whence it derives its name. The hand of time, however, has nearly levelled it with the ground. An old coin was difcovered
here fome ycars ago, bearing the date $12200^{\circ}$ This neighbourhood is remarkable for a number of vitsified forts, the nature and formation of which antiquaries have found it difficult to determine; and refpecting which various opinions are entertained.

One of thefe forts appears alfo on the top of a fmall hill in the parifh of Anvorth. The fummit forms an area of thirty paces long and twenty broad, and is nearly furrounded by an irregular ridge of loofe ftones, intermixed with large portions of vitrified matter. Thefe flunes are of the common blue fchitus kind, and from the manner in which they lie fcattered about, it would feem that the fort has either been deficient in regularity of. Atructure originally, or been intentionally demolifhed. Some coins of Edward VI. and queen Elizabeth were lately found near this fpot. Thrieff caftle, which is fituated in an ifland formed by the river Dee, is famous for having been the chief relidence of the Douglaffes. A great fquare tower is all that remains of the once proud and lofty manfion of thefe celebrated warriors.

Lincludden college was founded in the reign of Malcolm IV. It was originally a Benedictine nunnery, but afterwards converted into a monaftery, in the chancel of which is an elegant monument, erected in honour of Margaret, daughter of Robert III. and wife to one of the earls of Douglas. The college is fituated upon a fmall ftream called Cluden, about two miles from its junction with the river Nith, and prefents in its ruins many marks of its former magnificence and grandeur.

Dundrennan Abber, which ftands in the parifh of Kerrich, about a mile and a half from the Solway frith, is alifo a fine ruin. It was founded in the year 1142, and has acquired celebrity as the afylum of Mary queen of Scots after the battle of Langlide. Befides thefe, the ftewartry contains feveral other curious remains of antiquities. The moft remarkable are the rocking yone, in the parifh of Kells, which is to nicely balanced, that it can be moved by the flighteft preffure; the monaftery of Tongland, the Dun of Bareland, the moat of Urr, probably the largelt work of the kind in Scotland, and the caftle of Kennuir, fituated near the lake of that name. To thefe may be added the tomb of king Galdus, called Cairnholy, faid to have been crected to commemorate the fall of that prince in a battle, between the Scots and Piets about the year 82, or, accurding to another tradition, in memory of bifhop Whitchorn and other gentlemen, who were killed in an action with the Englifh about the year 1150 . Which of thefe accounts is the correct one it is perhaps impoffible to determine. This, however, is certain, that this Rewartry was the fcene of many fanguinary contefts, particularly during the invalions of the Romans, and during the contentions of Bruce and Baliol.

The principal country feats in the flewartry are thofe of the earl of Selkirk, Mr. Murray of Broughton, and a large houfe built by the late fir Samuel Hannay, the exterior of which is wholly formed of the moft beautiful granite. The chief products of this dittrict, befides thofe already noticed, are freep and black cattle for the Englifh market. It has given birth to few remarkable characters, except Thomas Gordon, famous for his writings in the Bangorian controverfy; and Paul Jones the celebrated pirate, who fpread fo much terror over different parts of the coaft during the American war.

A very interelting and well written account of this diftrict, was publihed in iSro, entitled "General View of the Agriculture of Galloway; comprehending two counties, riz. the Stewartry of Kirkcudbright, and Wigtonthire," by the Revo Samuel Smith, minilter of Borgue.

KIRKHAM, a fmall market town and parth in the hundred of Amoundernefs, Lancaflhire, England, is fituated in a tract of country called the File-lands, between the Ribble and another fraill river. It is 22 rniles diflant from Lancalter, and 225 from London; and contained, according to the return under the population act of 1800,362 houfes, inhabited by 1561 perfons. The chicf trace is in coarfe linen and fail cloth. Here are a well endowed frec-fchool for the education of 100 boys, and a charity-fchool for 40 girls: two fairs are held atnually, and a makket weekly on T'uefdays. The Lancater canal paffes by this town, from Liverpool. One mile weft of Kirkham is Ribby-hall, a large weil built brick manfion, belonging to Jofeph Hornby, ef $q$. Beauties of England, vol. ix.
KIRKI, a town of Grand Bucharia; 100 miles S.E. of Bokhara.

KIRKIE, a town of Hindooftan, in the circar of Chandaree; $2+$ riles S.S.W. of Chatterpour.

KIRKINTULLOCH, a fmall town of Dembartonflire, fituated about nine miles from Glafgow, and four from Kilfyth. The Forth and Clyde canal is carried over the fmall river Logie, about half a mile from this place, by an aqueduct of a lingle arch of great dimentions, which was confidered at the time it was built as a very extraordinary fpecimen of mafonic art. Wirkintulloch is not a place of any importance, but the country round it is populous and well cultivated, and many refpectable land-holders of middling fortunes refide upon their eftates, and contribute much to its improvement. It is a burgh of barony, governed by two bailiffs, annually chofen. In ISOI, the number of inhabitants was $\hat{3}^{210}$, of whom 1785 were employed in trade and manufacture. Its manufactures are linen and cotton.

KIRK-MOTE, a fynod. See Sryod.
Sometimes the word is alfo taken for a meeting in the church, or veftry. See Mote.

KIRK-OSWALD, in Geografhy, a market town and parifh in the ward of Leath and county of Cumberland, England, is feated in the pleafant vale of Eden, and is a place of fome note in the carly annals of the kingdom. The church dedicated to St. Ofwald, the king and martyr of Northumberland, is a large irregular building, evidently erected at different periods; probably at the expence of the Dacre family, whofe arms appear in various parts of the building. Here is an handfome monument raifed to the memory of fir Timothy Featherfonehaugh, an active fupperter of king Charles I. He was beheaded, and his two fons were flain in the battle of Worcefter. A defcendat of the fame name refides near this town. At the weft end of the church iflues a copious fpring of excellent water; which, in the reign of Monachiim, was deemed to poffers miraculous powers. The belfry tower flands on an eminence at fome diftance from the church. In the town is an endowed free fchool, and a meeting houfe for Diffenters. Ans an elevated $\mathrm{f}_{\text {pot, }}$, about a quarter of a mile from the town, are the ruins of a caltle, which Sandford defcribes "as the faireft fabric that ever eye looked upon." At prefent only a fmall tower and fome vaults are all that remain: but originally it was extenfive, of a fquare form, and bounded on three fides by a fofs, and on the fourth by a brook. Hugh de Morville procured a licence from king John to incluie his woods at Kirk-Ofwald, to furtify his manor houfe, and to have there an annual fair and a weekly market. This Hugh was one of the murderers of archbithop Becket ; and the weapon of affaffination was kept for a long time in this fortrefs.

On a hill about three miles from Firis-Ofwald, near the vil-
lage of Llttle Salkeld, is a noted Druidical monument, called " Long Meg and her Daughters." It contirts of a circular arrangement of unhewn ltones; the circumference of the circle is about 350 yards. Some of the fones are 10 feet high, and from 12 to 15 feet in girth. The flone called Long Meg, about 17 feet out of the circle, is is feet in height, and nearly it feet in circumference. Pennant's Tour to Allton-Moor, 4to. Hutchinfon's Hiftory, \&c. of Cumberland, 2 vols. 4 to. Beauties of England, vol. xi. 8 so. 1 Sioz.

KIRK-SESSIONS, the nare of a petty ecclefiallical judicatory in Scotland. Each parifh, according to its extent is divided into feveral particular diftrifts, every one of which has its own clder and deacon to overfee it. A confiltory of the minifters, elders, and deacons of a parilh, ferm a kirk-fetfions.

Thefe meet once a week, the minifter being their moderator, but without a negative voice. It regulates matters relating to public worflip, elections, catechifing, vifitations, \&c. It judges in matters of lefs fcandal; but greater, as adultery, are left to the preflytery; and in all cales an appeal lies from it to the prefbytery.

KIRKSTAl, L, in Geography, a village in Yorkfhire, was formerly a place of note, and adorned with a moft fplendid and richly endowed abbey, of which the ruins of the church prefent a grand and interefting mafs of ancient ecclefintical architecture. It was founded in the reign of king Stephen fur Ciltercian monks. Parts of the original bulding itill remain: the columns of the nave are madive, and fupport heavy, pointed arches. The fide aifles are nearly perfect, as are alfo the nave, tranfepts, and clooir. At the welt front issa fine door-way with a femicircular arch, and above it two handfome windows, curioully ornamented. On the fouth lide are feveral ruinous apariments, among which the dormitory and fome other rooms are ftill covered in. "\$irkttall will be found highty interefting to the picturefque travelier, as it affords a variety of fubjects for the pencil, both architectural, and where the ruins will unite finely with the landfcape." This place is three miles from Leeds, and 191 from London. Dayes' Excurfions in Yorkfhire, 8 ro. 1805, in which work is a neatly engraved view of Kirkftall, and an interefting account of the picturefque features of the country around that grand pile of ruius.

KIRKULETI, a river of Alia, which rifes in the mountains of Armenia, and traverfing the principality of Guriel, runs into the Black fea. N. lat. $41^{\prime} 55^{\prime}$. E. long. $41^{\circ} 25^{\prime}$.

KIRKUR, a town of Hindoottan, in Rohilcund; 35 miles $S$. of Bereilly:

KIRKWALL, the chief or principal town of the Orkney illands, Scotland, is feated on the northern coalt of the Main-land, in the latitude of $59^{\prime} 9^{\prime} \mathrm{N}$. and in the longitude of $z^{\circ} 30^{\prime} \mathrm{W}$. of Greenwich, towards the S.E. fide of the bay of the fame name; and is divided into the old town that bends along the bay, and the new, which itretches a confiderable way to the fouth. Its original name appears, from ancient authorities, to have been Kirkiovog, or the kirk on the bay. The town has only one flreet, ncarly a mile long, with many excellent houfes ranged on each fide, which, tor the Atyle of their building, and the manner in which they are finifhed and furnifhed, may bear a comparifon with thofe of any fmall town in the kingdom. Several gentlemen of property refide here, and alfo a confiderable number of fhopkeepers; but the bulk of the people is compofed of tradefmen, boatmen, fervants, and day-labourers: and when the population of the country parifh, which makes a fourth of the whole, is confidered, the united parihes of Kirkwall and

St. Ola, in which are two eftablifhed clergymen, contair, the former about two thoufand, the latter five hundred inhabitants. The town was ereeted into a royal borough by charters from the Scottifh fovereigns, confirming all its ancient privileges : and all its rights and advantages were at lalt folemnly ratified by act of parliament. The government is vefted in a provoft, four magittrates, a dean of guild, a treafurer, and fifteen other members, who together ${ }^{\text {c }}$ compofe a council. In this town, the fheriff, the admiral, the commiffary, and the juftice of peace courts, are alfo occafionally convened for the adminitration of law ; and for the cognizance and regulation of ecclefiaitical matters : the three prefbyteries, of which the provincial fynod is compofed, and Cometimes the fynod itfelf, meet at lealt once a year, or oftener, according to circumftances. Here are alfo a cuftomhoufe, a polt-office, and a tore-houfe, into which are collected the rents, that are moltly paid in kind, of both the bihopric and earidom, which are generally let on leafe to merchants, who fometimes difpofe of them here, and fometimes ferd them out of the country. Kirkwall, with the four northern burghs, Wick, Dornock, Tain, and Ding wall, choofe a burgefs to reprefent them in the Britifh parliament. The principal modern building is a town-houfe, divided into apartments refpectively appropriated to a prifon, an affembly'hall, a court of jultice, and a lodge of freemafons. At a Cmall diftance are fchool-houfes for the feveral branches of education. Thefe ftructures, however, are but trifing, compared with the relics of the bihop and earl's palaces, the caltle, once a place of great flrength, and the venerable cathedral of St. Magnus : but for nothing is the town more celebrated than for its excellent harbour, which is broad, fafe, and capacious, with a bottom of clay fo firm, and a depth of water fo convenient, as to afford anchorage for hlups of a large fize, and in great numbers. Towards the fouth-eall fide, are ttill vifible the veltiges of a rude temporary fort, thrown up on an emergency by Oliver Cromwell; and on the oppofite fide another of the fame kind has been evidently marked out for co-operal:on in either annoying or protecting the harbour. Mott of the lands in the parifh of St. Ola, which furround Kirkwall, formerly made part of the temporalty of the bifhopric of Orkney, and were feparated at the Reformation, or on the profpect of the abolition of epifcopacy. Some additional particulars reiatung to this town, and to places in its vicinity, will be given in a fublequent article, under the word Orkneys. In the interim, the reader is referred to an interefting volume publifhed ia xio8, entitled "Hittory of the Orkney Iflands," \&c. by the Rev. Dr. Barry: fecond edition, with corrections and additions, by the Rev. James Headrick.

KIRLAK, an ifland of a triangular form in the Frozen fea, about 240 miles in circumference. N. lat. $71^{\circ} 30^{\prime}$ to $725^{-1}$. E. long. $121^{\circ}$ to $126^{\prime}$,
Kirimansha, or Kirmoncia, a town of Perfia, in the province of Irak; 145 miles N.E. of Bagdad. N. lat. $34^{\circ} 35^{\prime}$. E. long. $46^{\prime} 30^{\prime}$.
KIRN, a town of France, in the department of the Rhine and Mofelle, and chicf place of a canton, in the diftrict of Simmern; 17 miles W. of Creutznach. The place contains 1240 , and the canton 4084 inhabitants, in 18 communes. N. lat $49^{\circ} 47^{\prime}$. E. long. $7^{\circ} 26^{\prime}$.

KIRNBERGER, John Phlip, in Biography, a German mulician, much refpected as a learned contrapuntilt, was born in 172 I , at Saalfeld, in Thuringia, a province of Saxony; at the age of eighteen he went to Leipfic, where he fludied under Sebaftian Bach till 1741 , when he went into Poland, where he was admitted into the fervice of feveral Polih Erinces ; and afteswards appointed director
reftor of the mufic at a convent. In 175 F , he werit to Drefden, where he ftudied the violin under Fickler, and fome time after entered into the fervice of the king of Pruffia, as a performer on that inttrument. Aboat the year 1756, he was appointed court mulician to her roval highnel's princefs Amelia of I'ruffia. The harpfichord, which was his firt, was likewife his beft inftrument, and his com. pofitions for that and the organ were very numerous, as well as his polemical and theoretical writings. Befides thefe publications, he was editor of four coilections of harpfichord pieces, which included feveral of his own; and of all thefe he marked the fingering according to the rules of Emanuel Bach.

During the laft years of his life, his knowledge in the laws of harmony made him regarded as the Pepufch of Berlin; but being gifted with lefs temper than the venerable organilt of the Charter-houfe, his cr tical quarrels kept his mind in perpetual perturbation. Naturally grave and auftere, he was faid to be rendered more four by oppofition and difappointment.

His fugues and church mufic are models of correct counterpoint, but too elaborate and dry for the public. He never feems to have afpired at, or thought of, facility, grace, and elegance. His ambition feems to have been to dhew what could be done by labour and ftudy, which had never been attempted before, and which, when achieved, amufed the eye much more than the ear. He feems to have created giants which none could vanquifh but himfelf. His mufical inftitutes manifeft great meditation and fcience; but will be intelligible to none but thofe who have already advanced far into the myfteries of counterpoint.

This profound mufician, whofe knowledge in all the laws and fubtleties of canon, fugue, and modulation, were indif-- putable, but who, in his latter days, appeared to be more ambitious of the character of an algebraif than a mulician of genius, now and then fuffered fine paffages, and even whole movements, to efcape him ; which proves that, like his great mafter Scbattim Bach, if he had condefcended to be lefs artificial, he was poffeffed of the means of exciting, by his abilities, delight as well az wonder. See his Inttitutes, pp. $24^{2}$ and 243 , where the compoftion is admirable, clear, neat, and plealing. This able profeffor died at Berling in 1773, at the age of fixty-two years.

KIRNEE, in Geography, a town of Hindooftan, in Bahar; 4 S miles S.W. of Arrah.

KIROLL, a town of Hindooftan, in Dooab; aS miles N. of Etaya.

KIROO, a town of Bengal; 24 miles N. of Tomar.
KIRRIEMUIR, commonly pronounced Killamoor, a town and parifh of Angus-hire, Scotland, is built on the S.W. fide of a hill near a romantic glen, through which flows the fmall river Gairie. This town is 16 miles from Dundee, 20 from Arbroath, fix from Forfar, and 75 from Edinburgh. Here is a large weekly market ; and the town contains fome confiderable manufactories for Ofnaburghs and coarfe linens. In the year 1792, the value of thefe goods, manufactured here, and in the immediate neighbourhood, was about 30,000 . fterling. The town is a burgh of barony, but the date of its charter is unknown. In the population report of 1800 , this town was returned as containing 949 houfes, and $442 x$ inhabitants; but it is prefumed this total mult include the whole parifh, as in a previous cenfus for 1793 , the town is faid to have comprifed only 1584 inhabitants. The parificonfifts of an area meafuring about eight miles in length by fix in breadth, and is beautifully diverfified by hills, dales, woods, and plains.

At Kinnordy, Mr. Lyall has a handfume fat, with fine plantations; and at Clova, the feat of Mr. Ugilvie, the woods are abundant, and ferve to beautify the afpect of the country. At Invercanty is a large caltle formenly belonging to the Ogilvies. Sinclair's Statiftical Account of Scot. land.

KIRSANAIF, a town of Ruffid, in the government of Tambof, feated on the Vorona, which falls into the Khoper; 56 miles S.E. of Tambof.

KIRSHEHR, a town of Afiatic Turkey, in Natolia, and capital of a diftrict; formerly a conliderable city, and called "Diocxfaria." In the vicinity falt is manufactured; $8_{+}$miles N. E. of Cogni. N. lat. $39^{\circ} 12^{\prime}$ E. long. $3413^{\prime}$.

KIRSHETCH, a town and diftrict of the government of Volodimir, in Rufiia, feated on a rivulet that falls into the Kliarma.

KIRSOVA, a town of European Turkey, in Bulgaria, on the Danube; 30 miles S. of Galatz. N. lat. $44^{\circ} 50^{\prime}$. E. long. $27^{\circ} 30^{\prime}$.

KIRSTENIUS, Peter, in Biograply, a learned phyfician, was born at Brenau, in Silelia, on the 25 th of December, 1577 , where his father was a merchant. He loft his parents when he was very young, but his guardians took good care of his education, intending him for his father's profeffion. He early evinced, however, a paffion for letters, which they did not think proper to control, and left him to indulge it to the utmoft. He learned the Greek and Latin languages, and paid confiderable attention alfo to the He brew and Syriac ; at the fame time, as he now began to looki to medicine as his object, he cultivated natural philofophy, anatomy, and botany, with the greateft alfiduity. He afterwards Itudied at the univerfities of Leipfic, Wittenberg, and Jena, where he was much diftinguifhed among his fel-low-ftudents, and determined upon farther improving himfelf by travelling. He had been told, that no perfon could obtain a high rank in the practice of phylic, unlefs he underltood Avicenna; and knowing the tranflation of that phyfician's work to be bad, he had a ltrong inclination to learn Arabic. To this he was urged by Jofeph Scaliger and Iface Cafaubon, who judged that he was capable of rendering great fervice to the republic of letters in that way: and he refolved to read not only Avicenna, but alfo Mefue, Rhafes, Avenzoar, Albukafis, and Averröes. This paflion, however, did not prevent him from gratifying the inclination which he had to travel, and he accordingly fpent feven years from home. He firlt went through the Low Countries into France, and thence to Siwitzerland, where he received the degree of M. D. from the univerfity of Balle, at the age of twenty-four. He then continued his travels, vifiting Italy, England, and Spain, and reaching even Greece and Afia.

Soon after his return to Silefia, he was appointed by the magiftrates of Breflau to be director of the college and fchools of that city. But he afterwards religned that difficuit employment, and applied himfelf entirely to the practice of phyfic and to the ftudy of Arabic, with which he became fo enamoured, that he refolved to promote the know ledge of it by eftablifhing an Arabic prefs, and employed. all the money he could \{pare in accomplifhing that object : refufing, at the fame time, the moft honourable offers from. courts and univerfities, which would have interfered with his projec. He afterwards retired into Pruffia, fill. with the intention of fulfilling his defigns, and purfuing his favouriteftudies; but obtaining the friendihip of chancellor Oxen ftiern, he was induced to accompany him in a journey to Germany. While at Erfurth, Kinfenius received the offer

## K I R

of a profeffornip, which he accepted. But his patron in. duced him, neverthelefs, to quit this univerfity, and to accompany him to Sweden, where he was appointed profeflor of medicine, in 1636, and foon afterwards phyfician to the queen. His conftitution, however, was confiderably impaired, and he did not enjoy thefe advantages above four ycars; for he died on the eighth of April, 1640, in the fixty-third year of his age. The epitaph, infcribed by Schröcr to his memory, eulogizes his extraordinary knowledge of languages, of which, it is there faid, he was acquainted with twenty-fix.

He publiflied feveral works, for which divines are as much indebted to him as thofe of his faculty. Thefe are, 1. "Grammatica Arabica."-2. "Trià Specimina Characterum Arabicorum."-3. "Decas facra Canticorum et Carminum Arabicorum ex aliquot MSS. cum Latina ad verbum interpretatione." 4. "Vitæ quatuor Evangeliftarum ex Antiquifimo Codice MS. Arabico eruter." 5. "Liber fecundus Canonis Avicemne, typis Arabicis ex MSS. editus, et ad verbun in Latinum tranflatus, Sce." 6. "Liber de vero Ufu et Abufu Medicinz."-7. "Hypotypofic, five, Informatio Medicæ Artis ftudiofo perutilis, aliquandiu in Pharmacopolio verfaturo."-8. "Nota in Evangelium S. Matthxiex collatione Textuum Arabicorum, Syriacorum, Egyptiacorum, Græcorum, et Latinorum." 9. "Epiftola S. Judx ex MSS. Heidehergenfi Arabico ad verbum tranflata, \&c." Hutchinfon Biog. Med. Eloy. Diet. Hitt.

Kirstenius, George, alfo a phyfician, was born at Stettin, in January, 1613. He purfued his ftudies, during feveral years, at Jena and Strafburg, and afterwards travelled through Germany and the Low Countries. He was invited to profeffional chairs in the univerfities of Gripfwald and Derp; but the political troubles of the times prevented him from accepting them : he determined at length to fettle at his native place, and contented himfelf with a profefforthip in the Royal College of Stettin. He died on the 4th of March, 1660. The greater part of his life was paffed in uffeful refearch, and he obtained a high reputation in his profeffion. He left feveral learned effays, in Latin, on the fecretion of milk, on wounds of the head, on the fight, fmell, tafte, \&c. which were efteemed in their day; and he publifhed alfo the following works: "Oratio de Medicinæ dignitate et proflantia," 1647.-"Adverfaria et Animadverliones in Joannis Agricolx Commentarium in Poppium et Chirurgiam parvam," 1648.-"Difquifitiones Phytologice," ${ }_{1651}$. Eloy. Dict. Hift.

KIRTI, in Hindoo Mythology, a name of Parvati, the confort of Siva.

KIRTLE, a term ufed for a fhort jacket; alfo for a quantity of flax, about a hundred weight.

KIRTON, or Kirktown, in Geography, a large village and parifh in the divifion of Holland, and county of Lincoln, England, has been a place of confiderable fize and importance, but from having lolt its weekly market, and being out of a public road, and divefted of manufactures, is now reduced to the rank of a village. In the year 1800 , it contained 269 houfes, and 1238 inhabitants. Kirton has long been famed for its large and elegant church, which was formerly collegiate, and, according to fome writers, was built by Alexander, bifhop of Lincoln, in the time of king Henry I. This ftatement is, however, evidently erroneous, for the ftyle of architecture marks it to be as late as the early part of the $15^{\text {h }}$ century. Being much injured by neglect, and larger than neceflary for the population of the parifh, the chancel, tower, and ranfepts were taken down in the year 1806. A new tower was, however, erected at the welt end
of the charch with the original materials. At the weftern end of the nave is a femicircular arch, probably of the age of the bifhop above named. In the church is a handfome vetangular font, on the pedeftal of which is an infcription, ftating, that it was made for Alauni Burton, in the year 1405. Beauties of England, vol. ix. 1807.

Kirton Lindfay, a market town and parifh in the wapentake of Corringham, in Lindfay divifion of the county of Lincoln, England, is fituated 20 miles from Lincolis, and 147 from London. The inhabitants were returned under the population act as 1092, the houfes as 243. Dr. Stukeley itates, that John of Gaunt had a palace here. At this place Mr. Pegge places the Sidnacetter of the Romans. See Gough's edition of Camden's Britannia, vol, ii. p. 266. ed. 1789 .

KIRWANI, a town of Africa, in the country of Dentela, in which Mr. Park faw fome iron fmelting-furnaces; 20 miles W. of Baniferile. N. lat. $12^{\circ} 30^{\prime}$. W. long. $11^{\circ}$.

KIRWEILER, a town of France, in the department of the Lower Rhine; 15 miles N. of Strafburg.-Alfo, a town of France, in the department of Mont Tonnerre; 18 miles S. of Lauterburg.

KIRZAK, a town of Ruffia, in the government of Vladimir ; 48 miles W.S.W. of Vladimir.

KIS, in Natural Hiffory, a name given by fome people to the common pyrites; and by others to a peculiar kind of it, containing copper, and a fmall quantity of filver.

KISAK, in Geography, an ifland near the S.W. coaft of Eaft Greenland. N. lat. $59^{\circ} 51^{\prime}$. W. long. $45^{\circ}$.

KISERYA, a town of Hindooftan, in Bahar; 32 miles S.S.E. of Bettiah. N. lat. $26^{\prime} 20^{\prime}$. E. long. $85^{\circ} 6^{\prime}$.

KISH, or Kesh, a poft-town of Ireland, in the county of Fernanagh; 93 miles N.W. by N. from Dublin.

Kisi, a land-bank in the Irifh fea, about lix miles long, and harely one wide; 7 miles from the coalt of the county of Dublin. N. lat. $53^{\circ} 15^{\prime}$. W. long. $5^{\circ} 54^{\prime}$.

IIISHCORRAN Mountains, a long ridge of mountains in the fouthern part of the county of Sligo, Connaught, Ireland, on the fummits of molt of which are very large cairns. Beaufort.

KISHENAGUR, a circar of Bengal, lying on the E. fide of the Hoogly, about 110 miles long, and from 7 to 30 broad.-Allo, the capital of this circar ; 45 miles N. of Calcutta. N lat. $23^{\circ} 23^{\prime}$. E. long. $88^{\prime} 33^{\circ}$.-Alifo, a town of Hindooftan; 15 miles S. of $A_{4}$ imere.

KISHMA, Kisimisif, Kifmich, or Dsij/me, the largeit ifland in the Perian gulf, 30 miles long and from fix to eight broad. A narrow channel feparates it from the continent of Perfia, navigable, but dangerous, on account of pirates. This ifland contains three or four towns or villages, one of which, on the N. coalt, is called by the fame name. N. lat. $26^{\prime} 54^{\prime}$. E. long. $56^{\circ} 5^{\prime}$.

KISHNUKOOD, a town of Perfia, in the province of Segeftan ; 36 miles W. of Candahar.

KISHTAC, an ifland in the N. Pacific ocean, E. of Foggy Cape, oppointe to the mouth of Cook's river; about 100 miles long, and from 30 to 50 broad. N. lat. $57^{\circ}$ to $58^{\prime} 40^{\prime}$. W. long. $152^{\circ} 30^{\prime}$ to $154^{\circ} 50^{\prime}$.

K1SHTEWAR, a country of Afia, lying SE. of Cafhmere, near the banks of the river Chunaub. Its capital, called Muvdul, or Mundul-Muder, is fituated about three coffes E . of this river.

KIS1-HISAR, a town of European Turkey, in Bulgaria; 36 miles N.E. of Solia.

Kisile-daria. See Kiesil.
KISKEMANITAS, a river of America, which is a
branch
branch of the Alleghany, into which it difcharges itfelf. N. lat. $40^{\prime} 40^{\prime}$. W. long. $79^{\circ} 42^{\prime}$, in Weltmorcland county, Pennfylvania. Its headwaters are, Little Conemaugh and Stone creck, which after their junction affume the name of Conemaugh river. After receiving other waters it takes the name of Kikemanitas. It is navigable for batteaux 40 or 50 miles, and good portages are found between it and Juniatta and Potowmac rivers. Coal and falt are difcovered in the vicinity of thefer rivers.
KISKIN-Ostrog, a town of Ruffia, in the peninfula of Kamtfchatka; 52 miles W. of Verchnei-KamtfchatRoi.
KISKO, a town of Sweden, in the province of Nyland; 32 miles N . of Eknas.
KISLAK, a town of Poland, in the palatinate of Braclaw ; zo miles E.S.E. of Braclaw.
kislar. See Kizurar.
KISMA, a town of Perfia, in the province of Ghilan; 21 miles W.N.W. of Rehd.
KISMALO, a town of Hungary; 12 miles N.N.E. of Gran.
KISSABATTY, a town of Bengal; 22 miles S.E. of Burdwan. N. lat. $23^{\circ} z^{\prime}$ '. E. long. 88 ' is'.

KISSAMOS, a fmall town, formerly the harbour of "Aptera," which gives name to a diltrict or province in the north-weftern part of the ifland of Crete. This town would be of fome importance, if the pachas had not prohibited the exportation of the commodities of the ifland, except from the chief place of their government. This province is one of the beft cultivated and molt productive of the ifland ; it furnifhes a tolerably large quantity of oil and wine; it produces honey, wax, and filk; but little barley and wheat. Its mountains are for the moft part wooded; and.among the trees are fcattered many common and holm oaks, the acorns of which allow the Greeks to breed a large number of hogs. Here are alfo many carob-trees, whofe fruits are carried to Canea. In this province the vine deferves attention, which produces grapes with one hoeing and without any manure. The wine of Kiffamos is a claret, fpirituous, and of a tolerably good quality. As it is not an article of commerce, the Greeks convert a part of it into brandy for their winter flock. On the gulf of Kiffamos is a quarry of beautiful gypfum. The fort of "Grabufa," fifuated ort a fteep iflet, at the molt weftern and northern part of Crete, is comprifed in the diftrict of Kif. famos. The junction of thefe fmall iflands and an advanced cape form a natural harbour, in which the largelt flips anchor in fafety. The population of the Turks of Kiifamos is eftimated at upwards of a third of the inhabitants. See Caspia.
KISSEE, or Kissey, a town of Africa, in the country of Sierra Leona, at the head of a river of the fame name, eight journeys from Teembo. According to Dr. Afzelius the town of Kiffey may be, in direet dittance, about $\bar{\xi} 6$ geographical miles to the N.E. by E. of Sierra Leona.

XISSEL, Jonn. VAN, in Biography, a painter of portraits and !till life. He was born at Antwerp in 1626. Nature was his gride in the practice of the art he profeffed, and it was his conflant cultom to make fketches of all his various productions at the different feafons of the year; merely fletching fome, and colouring and even modelling others; by thefe means he poffeifed a large itock of things ready to his hand for comporition, and he executed them with great tafte and delicacy.

He demanded fo high a price for his productions, that few could purchafe them. Among thore who did was the king of Spain, who, after having obtained many of his
work3, at laft gained poffefion of the painter allo. He was appointed painter to the queen of Spain, and was retained in her fervice as long as he lived.
His portraits are very highly elteemed, being executed with a light free touch, and a tone of colour that very much refembles Vandyke's. He died in $1 ; 08$, at the age
of 82 .
KISSELPOUR, in Geography, a town of Bengal; 35 miles S.S.W. of Doefa. N. lat. $22^{\circ} 32^{2}$. E. long. $8+4$ '
KISSER, a town of Africa, in Tunis; 18 miles S.E. of Sbeah.
KISSI, Sr., a fmallifinand in the Grecian Arclipelago. N. lat: $33^{\circ} 43^{\prime}$. E. long. $24^{\circ} 10^{\prime}$.

KISSIMA, a town of Japan; 45 miles N. of Nan. garaki.
KISSINGEN, a town of the duchy of Wurzburg, on the Saal, in the environs of which are fome medicinat: and falt fprings ; ${ }_{2}+$ miles N . of Wurzburg. N. lat. $50^{\circ} 34^{\prime}$. E. long. $10^{\circ} 5^{\prime \prime}$.
KISSOREGUNGE, a town of Hindooftan, in Bundelcund; IS miles S.E. of Chatterpour.
KISSUNPOUR, a town of Hindooflan, in Bahar ; 11 miles N. W. of Bahar.
KIST, a word ufed by Paracelfus as the name of a weight, equal to 14 grains.
IISTNA, in Ccography, a town of Hindooftan, in the Carnatic.
KISTNABARAM, a town of Hindooltan, in Myfore; 13 miles S. of Tademeri.

KISTNAGHERI, a town and fortrefs of Hindooflan, in the Myfore country; 90 miles E. of Seringapatam. N. lat. $12^{\circ} 30^{\circ}$. E. long. $78^{\circ} 22^{\prime}$.

KISTNAGUR, a town of Bengal ; 24 miles N. of Goragot.-Alfo, a town of Bengal; rô miles S. of Nagore. N. lat. $22^{\circ} 52^{\prime}$. E. long. $87^{\circ} 21^{\prime}$.

KISTNAH, a river of Hindooftan, which rifes in the mountains of Vifiapour, about 20 miles from Sattarah, and after obliqucly travering almoft the whole extent of Hindooftan, from W. to E., difcharges itfelf, by feveral mouths, into the gulf of Bengal, between Mafulipatam and Nizapatam, in the circar of Guntoor. The Godavery and Kinnah, approaching one another in their defcent towards the fea, inclofe a tract of country, for an account of which, (fee Delta.) The inands, formed by the mouths of the Kiitnah, are very fertile, and produce grain, excellent timber, and fome of the beft tobacco in India; and befides, the low grounds, which at fpring tides are overfown, produce a fhrub of great ufe in dyeing chintzes and callicoes.
KISTNAPORAM, a town of Hindooftan, in the Carnatic; 25 niles W.N.J.
KIS'TNAPORUM, a town of Hindooftan, in Golconda; $4^{8}$ miles S . of Hydrabad.
KISTNAVERAM, a town of Hindooftan, at the mouth of a river, which runs into the bay of Bengal; 15 miles S.E. of Nellore. N. lat. 14 ${ }^{\prime} 16^{\prime}$. E. long. $80^{\circ} 11^{\prime}$.
KISTVAEN, or Cist-Vaen, in Britifo Antiquities, a flone cheit, coffin, or cavity for the interment of the human body, after its deceafe. Many antiquarians have confounded this fubject with the Cromlech, and have thws confufed their readers, and irdeed bave bewildered themfelves. Some even call the perpendicular, or ftanding ftones of the Cromlech, by the appeliation of Kiftvan, and the horizontal, or covering.flone, the Cromlech. This is multiplying terms without meaning or utility. Kiltvzen is a compound word from the Britinh language, and literally figgities a cheft of ftone ; i. .c. Cijf, a chell'or coffer, and

Vacn,

## K I S

Iraen, from Mrian, a fone: the $m$ in Britifh being commonly changed to $v$ in compufition. The Kiftvaen decidedly differs from the Cromlech, the firt being always immerfed, or covered over with many fones, when the whole is called cairn, or by a heap or mound of earth, which is called baro row. Mr. Owen defrribes the Ciltvaen "as a kind of cell formed by placing four flat ilones together in a fquare, with another laid on the top for a cover. ${ }^{\text {. }}$ In fome inflances, however, the cift is formed by five, fix, or feven ftones, raifed on their edges, and covered by two or three flat flones. In Berkihire, near the track of the ancient Ridge-way, on the downs, in the vicinity of the White-horfe Hill, are fome remains of a monument of this clafs. The upper part of a barrow being removed, feveral large fones were difcovered, foine of which were fet up edge-ways, and others placed flat, or horizontally. Three of large dimentions formed the fides and end of a cell, which was nine feet from eaft to welt, by about fix feet from north to fouth. At the mouth, or entrance towards the 'welt, were two upright ftones, forming jambs, between which was a paffage to the cilt. Several other flones were placed near the entrance, and the barrow appeared to have been furrounded with a circle of Itones. (See Beauties of Eagland, vol. i.) "In the various practice of the Britons, the Ciftvaen fometimes contained the urn which preferved the precious afhes of the deceafed; but it often contained the afhes and bones without any urn." (Caledonia, by Chalmers, vol. i. p. 84.) Toland thinks that Kiftvaens were altars for facrifice: and fome writers have conjectured that they were intended for cells, or dungeons to contine prifoners. "In Cornwall, and elfewhere, we find Kilvaens (of an area equal to the fize of the human body) confifting of fide ytones pitched on end, without any covering fone: thefe certainly once inclofed hones of the dead, though now generally dug up to fearch for money." Borlafe's "Antiquities of Cornwall," p. 228: fee alfo p. 225. Gough, in his "Sepulchral Monuments of Great Britain," vol: i. p. 16, \&c. has given accounts of the contents of feveral Kiftvaens. See alfo Stukeley's "Abury" and "Stonehenge." King's " Munimenta Antiqua," vol. i. Pp. 232. 253.267. Rowland's "Mona Antiqua." Davies' "Mythology and Rites of the Druids," p. 394. "Archrologia," vol. ii. pp. 256. 362.-iii. 116. -iv. 114.-xii. 328.-xiv. 227. Jamiefon's Etymological Dietionary, Douglafs's "Nenia Britannica," folio.

KISWA RDA, in Geography, a town of Hungary ; I7 miles E. of Tokay.

KISZENAU, or Kitznu, a town of European Turkey, in Moldavia; 72 miles E. of Jaffi. N. lat. $47^{\circ} 13^{\prime}$. E. long. $29^{\circ} .30^{\prime}$.

KIT, in Muffc, the name of a fmall violin of fuch form and dimenfion as to be capable of being carried in a cafe cr Theath in the pocket. Its length, meafuring from the extremities, is about fixteen inches, and that of the bow about feventeen. Small as this inftrument is, its powers are coextenfive with thofe of the violin.

Krr, in Laboratory Works, a compofition made of refin glb., pitch 6 lb ., bees-wax 6 lb ., and tallow Ilb ., ufed for the latt covering of carcaffes. This is ufed, when previounly pounded and rendered completely liquid.

Kır is likewife ufed, among dragoons, to denote their lot of neceffaries, collected and packed up in a fmall compafs. The term is alfo applied, among the infantry, to the contents of a foldier's knapfack.

Kit, in Rural Econony, in fome places, a name given to a milking-pail or veffel in the form of a churn, with two ears and a cover, ufed to convey milk in by horfes or other means, in country fituations.

KITAIBELIA, in Botany, fo named, by Willdenow, in honour of Dr. Kitaibel, one of the authors of the fplendid work, entitled I'lanta Rariores Hungaria, which was publifhed in imitation of Jacquin's Flora Auffriaca. and intended as a continuation or fequel of that book. Willd. Nov. Act. Soc. Nat. Scrut. Berol. v. 2. 107.-Curt. Mag. t. 821. Clafs and order, Moxadelphia Polyandria. Nat. Ord. Columnifera, Linn. Malvacea, Juff.
Eff. Ch. Calyx double; the outer one feven, or ninecleft. Capfules fingle-feeded, forming a roundifh, fivelobed head.

1. K. vitifolia. Willd. Sp. Pl. v. 3. 800. Waldt, et Kitaib. Pl. Rar. Hung. v. I. 29. t. 31.-A native of Sclavonia. This plant, when wild, rifes to the height of feven or eight feet, and is entirely covered with fmall vifcid glanduliferous hairs. Stem round, even, not ftriated. Leaves alternate, on footfalks, fxe-lobed, unequally toothed; the intermediate lobe longer than the reft, pointed. Footfalks round, the lower ones as long as the leaves, the upper fhorter. Stipulas ovate, rather heat-fhaped, bifid. Floruers axillary, generally about three, pedunculated. Inner calyx villofe, fmaller than the outer one. Petals white, wedgefhaped, truncate, a little fimaller than the fegments of the outer calyx.

KITANESJO, in Gengraphy, a town of Japan, on the N.W. coart of the ifland of Niphon. N. lat. $36^{\circ} 40^{\circ}$. E. long. $137^{\circ} 30^{\prime}$.

KI-TCHANG, a town of Corea; 65 miles S.S.E. of Kang-tcheou.

KITCHEN, a room appropriated to the dreffing of meat, and furnifhed with fuitable accommodations and utenfils for that purpole. See Building.

The kitchen in the king's houfhold is under the direction and management of a clerk-comptroller, who has a falary of 500 l . a-year, fubordinate clerk at 250 l . a-year, firft clerk at $150 \%$ a-year, junior clerks, two matter-conks, the falary of the firlt being 237\%. 10s. a-year, and of the fecond $217 \%$ los. a-year, yeomen, grooms, \&c.

Kitchen-Gardin, that fort of garden which is principally deftined to the growth of different forts of culinary vegetables and roots.
The land defigned for this fort of garden fhould be fufficiently fpacious, of a good depth and quality of mould, dry, and at the fame time well fituated for warmth, and the influence of the furi.

The foils and fituations which are the moft adapted for this purpofe, as well as the furms and modes of laying them out, have been already fully explained in fpeaking of gardens in general. The great expence of cultivating kitchen gardens by means of hand-labour, however, renders it effentially neceffary that they fhould be fo contrived, as to have the principal part of the work executed in other ways, as by the ufe of fmall teams. In this way much money may in numerous inftances be faved, and at the fame time the labour be equally well performed. Mules and large affes have been found extremely beneficial in this intention, in a great number of fituations. See Garden.

Kitcuen-Garden Plants, the common name of all fuch plants as are cultivated for the purpofe of food, in gardens of this kind.

## Names and Sorts of Plants, with Modes of Culture respectively.

Agaricus campgltris, the field agaric or mufhroom. Cultivated by the fpawn of the root, or invifible feed, running in lumps of earth or dung, in the autumn feafon.

Allium, garlick, onion, leek, \&c., of the firtt kind, large
white garlick and red garlick-By the cloves of the root when feparated.

In the fecond, or rocambole fort-By the root and bulbs from the ftalk.

In the third, or onion kind, as the common oval Stralburg onion, great oval Portugal onion, Alat white Spanifh onion, flatted Spanifh onion, filver-fkinned onion, bulblefs rooted Welch onion-3y feed annually, which flould be fown at different times in the early (pring months.

In the fourth fort, as chives or cives-By dividing the roots, and planting them out in the fpring.

In the fifth kind, the efcalot or fhallot-By offsets of the root planted out in fpring.

In the fixth fort, or Canada tree-onion-By offset bulbs of the root, and the bulbs at the top of the ftalk, planted out ortpring.

In the feventh, or the leek kind, as the broad-leaved London leek, narrow-leaved leek-By feed annually, which fhould be fown in the early fpring.

Anethum, dill, \&c. ; common dill——By feed annually, fown in the fpring.

Fentel, light-green leaved, dark-green fennel, fweetfecaed fennel-By feed fown in fpring; allo by flipping the old roots, and planting them out in the autumnal feafon.

Italian fennel——By feed annually, fown in the fpring.
Angelita favita, common angelica-By feed annually, fown ill fering.

Apium, parfley, celery, \&c.; parीey, common planeleaved parfley, curled leaved common parfley, broad-leaved, or large rooted parley_—By feed fown in fpring.

Celery, common upright celery, upright celery with folid ftalks, turnip-rooted fpreading celery-By feed fown in the fpring, for traniplantiug in fummer and autumn.

Afparagus officinalis, common alparagus-By feed fown in the autumn, and when once railed, the roots abide for fome years.

Atriplex bortenfis, garden orach, white-leaved garden orach, green orach, purple orach-By feed annually fown in the fpring feafon.

Beta vulgaris, beet, common culinary beet, green-leaved culinary beet, white beet, chard, or great white Swifs beet, mangel wurzel beet-By feed annually fown in the fpring months.

Red beet, large long red-rooted beet, turnip-rooted red beet, red-rooted beet with green leaves, pale-red beet-By feed annually fown in the early fpring.

Barago, borage - By feed annually fown in autumn or fring.

Brafica, the cabbage, cauliflower, broccoli, turnip, \&c. The cabbage fort, fmall early fummer cabbage, dwarf early fugar-loaf-haped cabbage, large hollow fugar-loaf-cabbage, carly Ruffia cabbage, common round white cabbage, longfided hollow cabbage, oval hollow cabbage, flat-topped cabbage, mulk-fcented cabbage, giant cabbage, red cabbage -By feed annually fown at different times, in fpring and autumn, for ufe all the year, by having the plants fet out at various times.

Savoy cabbage, common green curled favoy, large green Dutch favoy, yellow favoy -- By feed annually fown in fpring, for autumn and winter ufe.

Laciniated, and other open-leaved coles, green curled borecole, red curled borecole, thick-leaved curled borecole, finely fringed borecole, broad erect curled-leaved Siberian borecole, or Scotch cole or kale, red and green common

Vol. XX.
planc-leaved green colewort-By feed annually fown its fpring and fummer, for plants for autumn and winter ufe.
Turnip cabbage, turnip cabbage with the turnip abuve ground, with the turnip under ground-By feed fown annually in fpring and fummer.

The caulifower forts, early cauliflower, late caulifower - By feed fown annualiy in fpring and autumn, for plants for fummer and autumn ufe.

Italian braflica, or broccoli, early purple broccoli, late large purple broccoli, comprehending varities, with blue, brown, green, and yellowifh heads, dwarf purple broccoli, white or cauliflower broccoli, black broccol-By feed fown in fpring and beginning of fummer, for plants for autumn, winter, and fpring ufe.

The turnip, early Dutch turnip, white round turnip, green-topped turnip, red-topped turnip, yellow turnip, oblong white turnip, long white-reoted French turnip, round purple French turnip- By feed fown in fpring and fummer, for plants for ufe moft part of the year.

Calendula offrinalis, common marigold-By feed fown annually in foring, fummer, or autumn.

Cichorium cndivia, endive, green curled endive, white curled endive, broad-leaved Batavian endive-- By feed fown annually, in fummer, from May till July, for plants for autumn and winter ufe.
Cochlearia armoracia, horfe radifh - By pieces of the roots planted out in fpring, for ufe for moft part of the year.

Crambe, fea-cabbage or colewort, the different varieties -By feed fown in fpring; but when once raifed, the ro ts remain for years, fending up floots for ufe in fpring and fummer.

Cusumis, cucumber and melon, the cucumber, carly fhort prickly cucumber, early clufter cucumber, long green prick. ly cucumber, long white prickly cucumber, long fmooth green Turkey cucumber, large fmooth white cucumber, large fmooth green Roman cucumber - By feed fown annually, at different times on hot-beds, in the early fpring and fummer.

The melon, Romana melon, Cantaleupe melon ; varieties of each, and feveral other forts-By feed fown annually at different times, on hot-beds, in the fpring months.

Cucurbita, the gourd and water melon- By feed fowr annually in the fpring feafon.

Cynara, artichoke and cardoon, the common artichoke, globular-headed red Dutch artichoke, oval-headed green French artichoke-By fuckers from the fides of the old plants, in fpring, of many years duration.

The common cardoon-By feeds fown annually in the early fpring.

Daucus carota, the carrot, orange-coloured carrot, red carrot, yellow carrot, white carrot-By feed fown annually in fpring, fummer, and autumn, for ufe molt part of the year.

Helianthus tuberofus, tuberous fun-flower, or Jerufalem artichoke--By pieces of the root planted annually in the fpring feafun.
Hyyfopus officinalis, common hyflop, the feveral different varieties - By feed fown in furing, and by planting flips
and cuttings of its branches.

Laifuca, lettuce, early green cabbage-lettuce, white cab. bage-lettuce, brown Dutch cabbage-lettuce, great admirable cabbage-lettuce, green and white ball cabbage-lettuce, green cos-lettuce, white cos-lettuce, black cos-lettuce, ipotted Aleppo cos-lettuce, brown Cilicia lettuce, Imperial lettuce, red Capuchin lettuce, green Capuchin lettuce, curled-

Jettuce-By feed fown annually, at differeat times, in fpring, fummer and autumn, for plants for fetting out for ufe molt part of the year.

Lavandula, lavender, fpike-flowered common lavender, common marrow-leaved, broad-leaved, blue-flowered, whiteflowered, and dwarf lavender-By flips planted out in fpring, which are of many years continuance.

Stachas, or French lavender-By planting flips or cuttings, and by feed, which are of many years duration.

Leferitiann fativum, garden-crefs, common fmall-leaved, broad-leaved, curded-leaved-By fowing feed at different times of the year, according as the plants are wanted.

AIclifh offuinalis, balm, common balm- By dividing and planting the roots in fpring or autumn, which are of many yoars duration.

Acubha, mint, penny-royal, \&ic., green common fpearmint, curleci-leaved fpearmint, variegated fpearmintDy dividing the roots, by young plants, and by cuttings of the flalks, planted out in fpring, and which continue many years.

Peppermint-By roots and plants, \&c. like the former.

Penny-royal_By dividing and flipping the plants, as for the mint, and planting them out.

Ocynuian bafficum, bafil, common fweet bafil, feveral va-rieties-By feed fown in spring on a hot-bed, the plants being afterwards planted out.

Origanum marjoram, common, wild, perennial pot marjoram, winter perennial fiweet marjoram, marjorana; or annual fweet marjoram - By fowing feeds in fpring, and the two former alfo, by nipping the roots, and planting them.

Pafinaca fativa, parfnip, common garden parinipBy feed fown annually for winter ufe.

Pbafolus vulyaris, common kidney-bean, dwarfs and runners, dwarf kinds, early white, early yellow, liver-coloured fpeckled dwarf, Canterbury white dwarf, Batterfea white dwarf, large white dwarf, cream-coloured dwarf, black dwarf, fparrow-egg dwarf, amber-fpeckled dwarf-By feed fown annually, at different times, from April till July, or the following month.

Running kinds, fcarlet runner, white variety, large Dutch runner, Batterfea white runner, negro runner, variable run-ner-By fowing the feed like the former, but principally in the fummer months.

Pifium, the pea, Charlton pea, golden Charlton, earlieft golden Charlton, long Reading hotpur, Maiter's hotfpur, Spanih morotto, green nonparcil, early dwarf marrowfat, large marrowfat, green rouncival or union, white rouncival, Ledman's dwarf pea, fmall fugar pea, large fugar pea, clufter pea, crown pea, egg-pea, fickle pea, \&\&. .—By feed fown annually, at different times, from October till June, hut principally in the early fpring months.

Por:ulaca olevacia, purflane, green purflane, golden pur-flane-By feed fown different times in April and May. .

Poterium fanguiforba, burnet, common garden burnetBy feed fown in autumn or fpring, and parting the roots.

Raphanus fahivus, the radifh, thort-topped early radih, Jong-topped radifh, deep-red radifh, paic-red, tranfparent, mild radifh, falmon-coloured radifh, finall white turnip-rooted sadilh, fmall red turuip radifh, large white turnip-rooted Spanith radifh, large black turnip-rooted Spanifh radifh -By feed fown at different times, from Chriftmas till . July or Augult ; but the latter forts fown principally in June and July, for autumn and winter ufe.

## K I T

Rofimarints, rofemary, fome varieties-By planting layers, hips, and cuttings in fpring.

Rumax acto fa, ferrel, common long-leaved forrel, roundleaved French forrel, barren forrel - By parting the roots and the firtt fort alfo plentifully by feed.

Ruta graveolens, rue; feveral varieties-By planting. flips and cuttings; alfo by feed.

Salvia, fage, clary, \&ic. The forts are; common fage, red fage, broad-leaved green fare, narrow-leaved green fage, broad-leaved hoary fage, fage of virtue, worm-wood fage, \&c.-By planting ilips in April, May, and June; alfo by fowing the feed in the fpring feafon.

Clary -- By feed fown amnually in the foring.
Satureja, favory, winter peremial favory, fummer annual favory - Both by feed fown in the fpring feafon, and the former alfo by planting :llips.

Scandive cerefolium, "chervil, annual garden chervil--By feed annually, in Augult, for winter and fpring ufe, or fown alfo in foring and tummer, for fucceffion crops.

Scorzonera, fcorzonera, Spanifh fcorzoncra-An eatable root, raifed from feed fown in fpring.

Sinapis, multard, white muitard, black muftard, field or wild multard; the former to ufe young in fallad, and the two laft for their feeds, to make the table fauce called multard - By feed in spring ; or, if for fallads, at any time of the year.

Sium fijariun, fifariun or fkirret-An eatable root raifed by planting offsets commonly of the root; alfo by feeds.

Smyrnium olufatrum, Alifanders, or common Alexanders - By feed amnually in fpring.

Solanum, night-fhade, furnifhing the potatoe and tomatoe, tuberous-rooted folanum or potatoe, the common found red potatoc, early round red, oblong red, deep red, pale red, rough red, white kidney-fhaped, large red-ended kidney, white round, white clufter, prolific American -By planting pieces of the roots or the roots whole in fpring ; alfo by fowing feed occafionally to obtain new varieties.
Tomatoe or love-apple ; varieties -By fowing the feed annually, on a hot-bed, in the fpring.
Spinacia, fpinach, round thick-leaved or fmooth-feeded, triangular leaved or prickly feeded; the former for fpring and fummer crops, the latter to ftand the winter-By fowing annually in fpring, fummer, and autumn, for ufe moft part of the year.
Tanactum vulsare, common tanfey - By parting the roots, and planting in fpring or autumn.

Thymus vulgaris, common thyme, the varieties with broad leaves, with narrow leaves, with ftriped leaves-By fowing feeds in March and April; alfo by planting flips of the roots and branches, and by cuttings; but feed is the only way to raife a quantity of the common fort ; and the other methods to continue the varieties, or for a general fupply.

Tragopogon porrifolium, falfafy - An efculent root, by feeds annually in fpring.
Tropcolum, Indian crefs, or nafturtium, nafturtium minus, nafturtium majus; their fowers for garnifh and fallads, and their feeds to pickle-Raifed annually from feeds fown at different times in fpring.

Valeriana locyfa, corn fallad or lamb's lettuce-By feed fown in foring and autumn.

Vicia faba, the bean, early Mazagan, early Libon, longpod, Turkey long-pod, toker bean, Sandwich bean, Wind-for-bean, white bloffomed, red-bloffomed, Spanith bean, nonpareil bean, dwarffan bean, very low-By feed fown an-
nually, at different times from October until June, but prin. cipally in the early fpring months.

More full explanations of the nature of the culture, application, and ufe of each, will be given under the different heads to which they particularly belong.

KI-TCHENG, in Geography, a town of Corea; 65 miles E.N.E. of Kiang-ki-tao.

KITCHIK-JOURLOU, a town of Natolia; 16 miles $N$, of Ifbartel.

KITCHWARA, a circar of Hindooftan, in Malwa, bounded on the N. by the circar of Cotta, on the L. by Chandarce, on the S. by Malwa, and on the W. by Oudipour and Banfwaleh.

KITE, in Ornithology. See Falco Milvus. Its motion in the air diftinguifhes it from all other birds; being fo fmooth and even as to be farcely perceptible : fometimes it will remain quite motionlefs for a long while: at other times, glide through the 贮, without the leaft apparent action of its wings, from whence it derived the old name glead, of the Saxon glida. Lord Bacon obferves, that when kites fly luigh it portends fair and dry weather. Pliny thinks that the invention of the rudder arofe from the obfervation made of the various motions of the tail, when the kite was fteering through the air. Lib. x. c. ro.

The kite is 3 deftructive bird to farmers, \&cc. on which account it is neceffary to guard againft its depredations as much as poffible. This laft purpofe may fometimes be effected by laying fuch animal fubftances as have been infufed in fome fort of liquid with nux vomica, in the places where they come in order to feed.

Kite, in Electricity. See Conductor.
KITLOLL, in Geograply, a town of Bengal; 15 miles S.S.W. of Goragot.

KITNAISE, a town of Egypt, on the left branch of the Nile; 20 miles S. of Faoué.

KITOISKA, a town of Ruffia, in the government of Irkutfk, fituated on the Kitoi, which runs into the Angara: 68 miles N.N.W. of Irkutik.

KITORAH, a town of Hindooftan, in Boggilcund; 25 miles N.N.E. of Rewah.
KITRIANI, a town on the S. coalt of the illand of Siphanto. N. lat. $36^{\circ} 55^{\prime}$. E. long. $24^{\circ} 49^{\prime}$.

KITTATINNY Mountains, a ridge of the Alleg. hany mountains, which runs through the northern parts of New Jerfey and Pennfylvania.

KITTEN Island, a fmall ifland in the Mergui Archipelago, near the S.E. coalt of Cat illand.

KITTER, a town of Hindooftan, in Bahar ; 37 miles N. of Hajypour.

KITTERY, a townfhip of York county, in the fate of Maine, incorporated in 1653 , and confifting of three parifhes, which contain 3114 inhabitants. It is fituated between Pifcataqua and York rivers, 67 miles N. of Bofton.

KITTILA, a town of Swedifh Lapland; 103 miles N. of Kemi.

KITTIWAKE, in Ornithology, a Species of the gull kind, being the larus riffa of Limmeus: the head, neck, belly, and tail are of a fnowy whitenefs; behind each ear is fometimes a duiky fpot; the back and wings are grey; the bill is yellow, tinged with green; the legs are dulky, and have a fmall knob inftead of the back toe. This bird inhabits the romantic cliffs of Flamborough-head, the Bafs illc, the rocks near the caftle of Slains, in the county of Aberdeen, and Prieftholm-ifle. The young of thefe birds are a favourite dith before dinner, for whetting the appetite, in North Britain, but they have a rank tafte and frmell. Pennant. See Larus.

KITT's, St., in Georaphy. Sce St. Cnerstapmene':
KI'TVADA, a town of Japan, in the illand of Nupinon; 45 miles N.W. of Meaco.

KITZBUHEL, a town of the county of 'Iyrol, on the Acha; 36 miles E. of Infpruck. N. lat. $47^{\circ} 25^{\prime}$. E. long. $127^{\prime}$.

KI'Z INGEN, a town of the duchy of Wuraburg, on the Maine ; it is a large, handfome town, owing its rife to a convent of Benedictmes, founded in $7+5$ by duke Pepine Mott of the imhabitants are Lutherans; 10 miles E.s.E. of Wurzburg. N. lat. $49^{\prime} 4^{\prime}$ '. E, long. 10 12'.

KIU, a city of Chira, of the lirlt clals, in the provinee of Tche-kiang' ; pleafantly litwated near a fine river, and between two others that run into it. It borders on Kiang-fi and Fo.kien; but to the laft province the paflage is dificult on account of the intervening mountains. N. lat. $292^{\prime}$. E. long. $118^{\circ} 39^{\prime}$.

KIVA. See Knirs'a.
KIVAK, a town of Perfia, in the province of Khorafan; 300 miles $N$. of Herat.

KIVALORE, a town of Hindoofan, in the Carnatic ; S miles W. of Negapatam.

KIVIJARVI, a town of Sweden, in the government of Wafa; 70 miles S.E. of Jacob!tadt.

KIUKA, a town of Sweden, in the government of Abo; 30 miles S.S.E. of Biorneborg.

KIULO, a town of Sweden, in the government of Abo; 30 miles s.S.E. of Biorneborg.

KIUN.TCHEOU, a city of China, of the firft clafs, and capital of the ifland of Hainan, which fee. It flands on a promontory, and fhips often anchor at the bottom of its walls. Two different kinds of Mandarins command here, as in all the other provinces of Chind; the firlt are called literati ; the fecond, mandarins of arms, or military officers. Its jurifdiction extends over three cities of the fecond clafs, and ten of the third. N. lat. 20 . E. long. $109{ }^{\prime} 3 j^{\prime}$.

KIURAWASI, town of Sweden, in the government of Kuopio; 15 miles N.N.W. of Kuopio.

KIUSIU, an ifland of Japan, alfo termed Saikokf, or the weftern country, fituated on the S.W. The length of Kiufiu from N. to S. is about two degrees, or 140 Britifh miles, and the greateft breadth about 90. See Ximo.

KIUTAJA, or CUTAJA, a town of Afiatic Turkey, capital of a fangiakate, and refidence of the beylerbeg of Natolia, fituated at the foot of a mountain, near the river Purfak, which runs into the Sakaria: It contains feveral mofques, and three Armenian churches. The foil is fertile, and the air healthy. Near it are fome warm bathis, in high eftimation for feveral diforders; 136 miles E. of Conftantinople. N. lat. $39^{\circ} 14^{\prime}$. E. lons. $30^{\circ} 30^{\prime}$.

KIWVACZE, a town of Poland, in the palatinate of Brzefk; 20 miles E. of Brzefl.

KIZ, a town of Kharafn; 290 miles N.W. of Samarcand.

KI'ZELGICK, a town of Natolia, on or near the fcite of the ancient Euromus; 9 miles N.iv.TV. of Melatio.

KIZIDANY, a town of Samogitia; 20 miles E.S.E. of Rofienne.

KIZILBASCH, or Kezelbascif, a Turkih term fig. nifying rad-bead: applied by way of obloquy to the Perlians, ever fince Ifhmael Sophi, founder of the family laft reigning in Perfia, who ordered his foldiers to wear a red cap, round which is a fearf or turban with a dozen plaits in it, in memory of twelve imams, fucceffors of Ali, from whom he pretended to defcend.

Viginere writes the word kezeilbafs, and adds, that according

## K L A

to the vulgar interpretation among the Perfians, the twelve plaits fignify the twelve facraments of their law. Bat not contented with this, he looks out for another original, and tells us there is a myttery in it, derived from the ancient paganifm, when the Perfians adored fire, whole heat is denoted by the red colour, which in fome meafure fy mbolizes with the fun, held by them in the higheft veneration. Ho adds, that the twelve plaits fhew the twelve months of the year, and twelve figns in which that luminary performs his courfe.

KiZilermak, or Kizil-irmak, the celcbratel Halys of antiquity, in Geography, a river of Afiatic T'urkey, which rifes in mount Taurus, a few miles S. of Kaifarieh, in Caramania, and runs into the Black fea, N. lat. $41^{\circ} 40^{\circ}$. E. long. $3^{6^{\circ}}$, on the coalt of the gulf of Sanfoun.

KIZIL-KHAN, a town of Afiatic Turkey, in Diarbekir ; 12 miles IV. of Merdin.

KIZILAGADJE, a town of Perfia, in the province of Ghilan ; 25 miles N. of Altara.

KIZILHIZAR, a town of Syria; 8 miles E. of Antab.

KIZIL-OZAN, or Sefin Bud, called by Hanway Sffil trood, a river of Perfia, which M. D'Anville derives from the mountain of Elwend, not far N. of Hamadan; fo that, by a very winding courfe to the Cafpian fea, its length doubles what is ailigned in more recent maps. This river is the Mardus of antiquity, and the Swidura of Gmelin, rifing on the confines of Turkey, and failing into the fea below Langorod. It fupplies numerous pike, carp, and other kinds of fihh, efteemed by the Perlians. Gmelin fays that it abounds in flurgeon.

KTZILRABAT, a town of the Arabian Irak; 10 miles iv 1.5 of Shemban.
 the no-f func: bewen :........ and the fea of Azepin; intudoted by Coffacts Tartars. N. Lat. 45 . E. Lon5 37.

KIZIZAN N , a town of Moravia, in the circle of Bramn ; 15 miles S.E. of Brumn. N. lat. 49 8'. E. long. $1652^{\prime}$.
Kizliar, or Kislar, a Ruffian town, fortrefs, and port, in the government of Caucafus, eflablified in the year 1735, near the eattern coait of the Cafpian, and covering the frontiers towards the limits of Perfia. Veffels formerly entered the fouthern branch of the Terek; but as the mouths of that river are now choaked up, the merchandize is landed in a fmell bay, at the diftance of 34 miles. Kiflar draws from $A^{\prime}$ 'achan the European commudities neceflary for the Perfian traffic, together with corn and provilion for the Ruflian colonies on the Tcrek, and for the neighbouring dittrict of mount Caucafus. Befides the goods which are difpofed of at Kinar, and fent to the Perfian ports, the inhabitants carry on a contraband trade to Shamakee, Derbent, and even Teflis, in Georgia, which is exccedingly precarious from the numerous banditi who pillage the caravans. The environs of Kiflar are very fertile in corn and fruit, with plents of game; 160 miles S.S.W. of Aftrachan. N. lat. $44^{\circ} 50^{\prime}$. E. lon's $46^{\circ} 44^{\prime}$.

KIZLUK, a town of Ruffia, latcly in the palatinate of Braclaw ; 16 miles E. of Braclaw.

KLACKS, a furall ifland on the W. fide of the gulf of Bothnia. N lat. Gr 21'. E. long. $174^{\prime}$.

KLADNO, a town of Bchemia, in the circle of Schlan ; 10 miles N.W of Prague.

KLAN, atown of Ittria; 13 miles N.E. of Pedana.
Klan, or Clano, a town of the duchy of Carniola; 28 miles E. of Trielte.

## K L E

KLANG Pornt, a cape on the S. coall of the inland of Java. S. lat. $7^{\circ} 40^{\prime}$. E. long. $109^{\circ} .32^{\prime}$.

KLATTAU, a town of Bohemia, in the circle of Pilfen, built in 775 , and furrounded with walls in 1000 ; having fome filver mines in its vicinity; 21 miles $S$. of Pilfen. 'N. lat. $49^{\prime} 24^{\prime}$. E. long. $13^{\circ} 15^{\prime}$.

KLEBANI, a town of Poland, in the palatinate of Braclaw; 10 miles S. of Braclaw.

KLEBANON, a town of Poland, in Podolia ; 60 miles N. of Kaminiec.

KLEBER, J. B. in Biography, a French general, was born at Straburgh in 1759, and was bred an architect. Accident led him to enter humfelf into the Auftrian fervice, in which he continued eight years, and then returning to his native country, became infpector of the public buildings in Upper Alface. The revolution of France rekindled his military ardour, and he obtained a commiffion in the fervice. He difplajed great bravery and jadgment at the fiege of Maycnce, after which he was employed in La Vendée; but the fanguinary fcenes there fo difgufted him, that he obtained his recall, and was afterwards engaged in the north, where he defeated the Auftrians, took Mons, and drove the enemy from Louvain. He captured Maeltricht, and contributed to the taking of feveral other fltong places. Difcontented with the Directory, he left the army and returned to Paris, where he led a private life, writing his military memoirs, till Bonaparte, being appointed general of the army of Egypt, chofe Kleber as his companion. At the fiege of Alexandria he was wounded on the head as he was climbing the ramparts, but he did not retire till he received a fecond wound. He defeated the Turks in feveral actions; and Bonaparte, on quitting Egypts left Kleber in the chief command. In a fhort time he figned the treaty of El-Arifh with fir Sidney Smith, by which the French agreed to lea ve Egypt ; but it was annulled by the Britifh government, and hoftilities were renewed. Kleber, though reduced, did not bend under his misfortunes, but defeated the Turks at the obelifk of Heliopolis. He next took Cairo by florm, and formed an alliance with Murat Bey; but he was affaffinated by a Turk, named Solyman, who gave him four flabs withia dagger, in the year 1800 .

KLECK, in Geograply, a town of Lithuania, in the palatinate of Novogrodek, 24 miles W.N.W. of Sluck.

KLEIN, a town of the duchy of Stiria; 12 miles E.S.E. of Landfperg.

KLEINENBERG, a town of Weftphalia, in the bihhopric of Paderborn; 8 miles N.W. of Warburg.

KLEINHOVIA, in Botany, was fo defignated by Linnxus, in honour of Mr. Kleinhoff, a fedulons and ingenious cultivator of the botanic garden eftablihed in the illand of Java. Linn. Gen 468. Schreb. 324. Willd. Sp. PI. v. 2. 878. Cavan. Diff. v. 2. 288. Mart. Mill. Dict. v. 3 Juff. 27 S. Lamarck. Dict. vo 3. 367. Gxrtn. t. $137^{\circ}$ Clafs and order, Dodecandria Mongegynia. Nat. Ord. Columaifere, Linn. Molvacea, Juff.

Gen. Ch. Cal. Perianth deciduous, of five, oblong, nearly equal leaves; the lower one rather fhorter than the reft. Cor. Petals five, lanceolate, feffile, a little longer than the calyx; the upper one fhorter, broader, curved and truncated; nectary central, fupported by a column the length of the calyx, furrounded with glandules at the bafe, afcending at the top, bell-fhaped, very fmall, divided half way down into five recurved fegments. Stam. Filaments is, very fmall, three placed on each fegment of the nectary; two of them are terminal, the ather rather lower; anthers of two lobes. Pijf. Germen fuperior, ovate, five-fided; placed in the hollow of the nectary ; ilgle fimple; itigma
filghtly
filightly notched. Peric. Capfule five-lobed, five-fided, inflated. Seeds folitary, roundifh, fotnewhat muricated.

Obf. 'Ihis genus is, according to Linareus, who places it in Gynandria, allied to Ayenia, but perfectly diltinet from it.

Eff. Ch. Calyx of five leaves. Petals five. Nectary bellfhaped, five lobed, bearing the flamens, and affixed to the column of the germen. Capfule five-iided, inflated, confiting of five tingle-iceded cells.

1. K. Hojpila. Linn. Sp. Pl. 1365. Cavan. Diff. v. 2. t. I 1 6.-(Catti-marus; Rumph. Amboin. v. 3. 177. t. 113.) A native of Java, Amboina, and the Ptilippine iffands, Howering throughout the year, and bearing fruit in October.-Sten like that of a common apple-tree, thick, incurved, and knotty. Branches finooth. Leaves alternately fcattered, fomewhat heart-fhaped, broad, ovate, acute, feven-ribbed, with arched veins. Stipulas lanceolate. Florvers bright purple. Fruit at firlt greenifh purple, afterwards reddifh. Rumphius has remarked, that the younger leaves, when bruifed, emit an odour like violets, on which account the natives of Amboina wafh their heads with an infufion of them. 'This handfome tree is univerfally admired among the Malays for the beauty of its foliage as well as for the firmmefs and exceilence of its wood, of which their quivers are generally formed.

KLEINIA, named in honour of the celebrated German zoologit, James Thecdore Klein, F.R.S. well known for his critical oppofition to Limnzus in that department of natural hitory. His claim to botarical diltinction is founded chiefly on a treatife concerning the plant now called Cacalia Kkeinia; nor would this perhaps have excited much attention, but for the abfurdity of the phrafe by which he diltinguihes it, Nec Cacalia, nec Cacalingtrum, an Tithymaloides. This is cited in the Criticn Botanica of Linnæus, as an inflance of the confufion that mult enfue from botanits not beltowing new names upon new plants.-Klein flourihed in the firlt half of the eighteenth century, having been born in 1685 , and living till 1759 -Schreb. 545 . Willd. Sp. Pl. v. 3. 1738. Jacq. Amer. 215.-Clafs and order, Spngenefia Polysamia AEqualis. Nat. Ord. Compofita Difcoidee, Linn. Corymbifere, Juff.

Obf. For an account of the feparation of this genus from Cacalia, fee that article.

Gen. Ch. Common Calyx perfectly fimple, oblong, cylindrical, compofed of five, linear, lanceolate, pointed, equal leaves. Cor. compound, uniform, tubular. Florets all fertile, numerous, equal, a little longer than the calyx, funnelfhaped; tube flender, very long; limb fomewat bell-fhaped, five-cleft Stan. Filaments five, capiliary, very fhort; anthers cylindrical, cubular. Pif. Germen fuperior, linear, half as long as the calyx; Atyle thread-fhaped, the length of the ftamens; ftigma bilid, revolute. Pcric. none. The whole calyx is bent back wards when in fruit. Seeds folitary, linear; feed-down capillary. Recept. naked, flattifh.

Eff. Ch. Receptacle naked. Down limpie. Calyx fimple, equal, of five leaves.
I. K. ruderalis. Willd. n. 1. Jacq. Amer.t. 12-. (Cacelia ruderalis; Swartz. Prod. 110.)-Leaves oblong-lanceolate, acute at each end, nearly entire.-Found in gravelly watte ground and on walls, in Jamaica, St. Domingo, and Martinico.-Root annual. Stcm erect, about three feet high, very fmooth. Leaves moflly alternate, fometimes nscivided, fometimes waved or cut, of a glaucous green. Flowers greenifh-yellow, inodorous.
2. K. Porophyllum. Willd. n. 2. (Cacalia Porophyllum; Linn. Sp. Pl. 116 . Cavan. Ic. v. 3.11.t. 222 )-Leaves elliptical, obtule, befprinkled with tranlparent dots.-A
native of l'cru. It flowered in the royal garden of the Licurial during the month of November.-Stem flraight, fimple, fnooth, flightly ttriated, about a foot and half high. Leazes numerous, fcattered, on footitalks, oval or riliptical, crenate, and doted with finall draphanons fputs. Fluvers terminal, cyiindrical.
3. K. angulaza. Willd. n. 3. (Cacalia angulata; Vahb. Symb. v. 3. 92. C fonchifolia; Forfk. My gypt-Arab. n. $4^{85}$.) - "LDwer leaves on fontfalks, oblong, wotherd, angulated; upper oncs lanceolate, entinc." - is native of Arabia Felix - Scom herbactous, divided at the upper part, Atriated. The fowering lirancles elongated and naked upwards. Leazes very fmooth, about an inch and half long. Flowers corymbere.
4. K. Jujruticofa. Willd. n. 4. (Cacalia fuffruticofa; Linn. Mant. 109. C. Linaria; Cavan. Ic.v. 3. 29. t. 257.). -" Leaves linear, entire, with pellucid dots. Stem rather Thrubby."-A native of New Spain, and fent by Arduino to Linnæus from Brafil.-Sterns about fix inches high, threadfhaped. Leaves fcattered, entire, finall, flefly. Flowerfalks terminal, lingle-flowered, erect. Flowers numerous, of a purple-colour, and very fimilar to thofe of K. PoroFhyllum, but the lierbage is totally unlike that fpecies.

Kleist, Christian Ewald Vox, in Biograply, was born at Zueblin, in Pomerania, in 175 . His parents, who were of the order of nobility, fer.t him to the Jefuits' college in Upper Poland, whence he was fent to the academy of Dantzic, and afterwards to the maiserfity of Konigfores. At the age of twenty-one he entered the Danifi military fervice, but having an attachment to literature he did not forget the Mufes amidit his other avocations. Once he was fo intent on reading Milton, that he forgot to relieve guard. He did not remain long in the Danilh fervice, but entered into that of Prufia. Frederic the Geat gave hima commiffion in the regiment of prince Henry, and in this fituation he formed an intimacy with all the great characters at Potfdam. He was particularly noticed by the king, and advanced in the army. He requelted and obtained leave to take an active part in the campaign of the year 1759, but this initance of military ardour proved fatal to him, and deprived Germany of one of its belt poets. He was prefent at the battle of Kunnerfdorff, and after the moft heroic difplays of valour in the fucceffive attacks of four batteries, he fell covered with wounds, of which, after much fuffering, he died in the forty-fourth year of his age. His principal work, as a poet, was entitled "Spring," which was firlt publifhed in $1 / 49$. On account of this poem he was called the imitator of Thomfon: be is reckoned to excel in painting the fweet and beautiful fcenes of nature, in a ftyle fingularly elegant and harmonious. The Spring was tranllated into feveral languages. He wrote Idylis in the manner of Gefner, which poffefs great fimplicity and neatnefs. He was author, likewife, of fome moral treatifes, and "Reflections on the Art of War." He publifhed an edition of his works in 1756 , with additions, among which is a defcription of an inundation, a piece of the terrific kind. Gen. Biog.

KLEMPENOW, or Clempenow, in Geography, a town of Anterior Pomerania ; eight miles N. of Treptow.

KLEEMS, a town of Moravia, in the circle of Olmutz; eight miles S.E. of Olmutz.

KLEPOT, a town of Tranfylvania; 14 miles S. of Hunyad.

KLEPS, a town of Norway ; II miles S. of Stavanger.

KLESAKU, a town of Walachia; 21 miles W.S.W. of Bucharett.

KLETTGAU ${ }_{2}$

## K L I

KLET'TGAU, a landgravate of Germany, calted alio " "The county of Sulz," fituated near the Rhine as it leaves the lake of Conttance.

KLEWAH, a town of Ruffian Poland, in Volhynia; 24 miles E.N.E. of Lucko.

KLIMATOVSKOI, a town of Ruffia, in the govern. ment of Novgorod; 44 miles W.N.W. of Novgorod.

KLIMAT'ZSFOI, an intand of Ruffia, in the lake of Onetzkoi : 48 miles N.N.E. of Petrovadik.

KLIMI.t, or Climin, in the MFatria Mfedica, the name given by the Arabian writers to the lapis calaminaris. Avicenna and Serapion never call it by any orther mane. Some pronounce the word calimia. Hence the modern Greeks have formed their culimici, which is the name of the fanse fubllance; and our calaminaris is evidently deduced from the fane original.

KLIMOVA, in Gcograply, a town of Ruflia, in the government of Tobolfk, on the 'Tungufta; 200 miles E. of Enifeik.-Alfo, a town of Ruffia, in the grovernment of Tobolik, on the Mura; 232 miles E.S. E. of Enifeilk.

KLimOVIGI, or Klimovitciif, a town of Ruffia, and diftrict of the government of Mogilev, or Mohilef, on the river Ofteg, which falls into the Sofh; So miles E. of Mogiley.

KLIN, a town of Ruffia, and diftrict of the government of Mofcow, on the river Seften, falling into the Dubnia, which joins the Volga; 36 miles N.N.W. of Mofcow:Alfo, a fmall ifland in the N. Pacific ocean, near the E. coalt of Kamt Tchatka.

KLINGENFEL, a town of the duchy of Carniola; nines miles S. VV, of Landfrafs.

KLINGENTHAL, a town of Saxony, in the Vogtland, inhabited chicfy by miners and woodmen, driven out of Bohemia an account of their religion; 12 miles E. of Oelfnitz.

ILLINGERSKOI, a town of Ruffa, in the government of Irkutk; 76 miles S.S.E. of Nertchindk.

KLINGNAN, a town of Sivitzerland, in the county of Baden ; nine miles N. of Baden.

KLINGSTEIN, in Mineralogy, Pierre Sonante, Broch. Its colour is dark greenifl-grey, paffing into yellowifh and afhgrey, a light olive-green or liver-brown. It occurs in mafs. The crofs fracture is almof dull, the longitudinal fracture is glifening. The former is fplintery, pafling into conchoidal, the latter is more or lefs flaty. It branches into indeterminate tharp-edged, fometimes tabular fragments. Ufually tranflucent on the edges, confiderably hard, and not eafily frangible. When ftruck with a hammer, it gives a ringing metallic found, whence its name. Sp. gr, 2.57. It melts eafily before the blow-pipe, and yields a clear, almoft colourlefs glafs. According to Klaproth's analytis, it confifts of

Werner refers it to the floctz-trap formation, refting upon bafat, into which it frequently paffes. It often contains crytals of feldfrar, and then forms flate porphery. Reufs reckons it to belong to the primitive rocks. It occurs in tbe middle mountains of Bohemia, particularly the Don-
nerfberge, near Milbfchau, a conical mountain above 2500 fect high, which confilts entirely of this mineral. It has alfo been obferved by Jamiefon in the ifland of Landafh, in the Frith of Clyde. Very beautiful varieties of it alfo occur in rock maffes between Llanberris and Caernarvon in North Wales. Aikin's Dict. of Chem, and Mincr.

KLINKETS, in Fortification, a fort of fmall gates made through palifadoes, for fallies.

KLINKOSEE, in Geography, a town of Poland, in Podolia ; 52 miles N.N.E. of Kaminicc.-Alfo, a river of Poland, which runs into the Dnicfter ; eight miles $S$. of Kaminiec.

KLIP Fisif, in Iclithyolosy, a name by fome authors fuppofed to mean the lupus pilcis, or wolf-lifh; and by others, the comtnon cod-fif.

Of the former opinion is Fabricius, who fuppofes the lupus fo called, becaufe it is able to climb up rocks, or generally lies hid among rocks: the word klip, in the German, figniifying a rock. Of the other is Schonefeldt, who fuppofes the cod has its name of klip-fifh, or rock-fifh, from its being ufually dried upon the rocks.

Klir-fifb is allo a name by which the Dutch in the Eaft Indies call a fat fifh, caught frequently on thofe fhores, and fometimes called alfo foldaten vifch, or the foldier's fifh. It fomewhat refembles the bream in fhape. Its general fize is about fix or feven inches in length, and it is of a very white and filvery hue. It differs very greatly, however, from the bream in many particulars. The nerves of its back fin are prickly, as in the perch; its tail. is pointed, not forked; and the irifes of its eyes are yellow. It is one of the fineft fifh of the Eaft Indies. Its flefh is very firm, and falls into large pieces, when dreffed, like that of the cod, and is very weil tafted. See Chėtodos teira, cornutus, and friatus.

KLIPPEN, in Geography, a fmall ifland in the Atlantic, near the coalt of Africa. S. lat. $32^{\circ} 1^{\circ}$.

KLOBUK, a town of Moravia, in the circle of Hradifch; 20 miles E. of Hradifch.

KLODAWA, a town of the duchy of Warfaw; 12 milcs N.W. of Lenczicz.

KLOETZEN, a town of Weftphalia, in the principality of Lunebury-Zelle; 45 miles E. of Zelle. N. lat. $52^{3} 4 \mathrm{I}^{\prime}$. E. long. 1 I ${ }^{\circ} 8^{\prime}$.

KLOKLSBERG, a town of Bohemia, in the circle of Bechin; 12 miles S.E. of Rofenberg.

KLOKOTZ, a town of Croatia; 24 miles S. of Carlftadt.

KLOPSTOCK, Frederic Theophilus, in Biograpby, a Gcrman poet, was korn at Quedlinburg in 1724 . He was the eldelt of eleven children, and diftinguifhed himfelf in his youth among his companions in bodily and mental exercifes. At the age of fixteen he went to college, and being placed under an able tutor, he made himfelf familiar with the languages, and acquired a tatte for the beauties of the beit claffical authors. He made attempts in compofition both in profe and verfe. In the latter lie wrote fome paftorals, but not contented with thefe humbler efforts, he formed the refolution of compofing an epic poem, and fixed upon the "Meffiah" as his fubject. In I $7+5$, he went to the univerfity of Jena, where he commenced the ftudy of theology, but in the midit of his academical purfuits he was planning his projected work, and fietched out his three firft cantos. In $17 \not f^{6}$, he removed from Jena to Leipfic, and became a member of a fociety of young men who had formed themfelves into a literary club for mutual improvement. About this time he excrcifed his genius in lyric compofitions. Several of his odes, together with the thre firt cantos of his Mefliah,

K L O
Meflith, appeared in a periodical paper, entitled "Bremen Contributions." The publication of ten books of his Merfish made his name known throughout Germany, and raifed his reputation very high. This work was extremely popular among thofe who had hearts to feel the beauties of poetry and the warmth of devotion. '1he Meffiah was quoted again and again from the pulpit by the younger divines, white thofe more advanced cenfured the fictions in which the poet had indulged himfelf on facred topics, and rigid grammarians made fevere ftrictures on the ftyle and verfification. He travelled into Switzerlarid in 1750, to pay a vifit to Bodmer of Zurich, in confequence of an invitation, where he was received with every token of refpect. The fublime fcenery of that country, the fimplicity of the inhabitants, and the freedom they enjoyed, were much fuited to the talte of Klopitock. Here he intended to have fpent the remainder of his life, buc baron Bernttorff caufed an invitation to be fent to him to relide at Copenbagen, with affurances of fuch a penfion as would make him independent. Klopitock acceded to the propofal, and fet out in 1751 , by the way of Brunfwick and Hamburgh, at which latter place he became acquainted with Mifs Muller, a lady perfectly adapted to his own mind, whom he foon after narried. They feemed by Prosidence deltined to be one of the happielt couples upon earth, but he was foon deprived of her, for fle died in clitdbed: her memory, however, was facred to Klopituck to the laft moment of his exiftence. He lived chiefly at Copenhagen, till the year 177 I , after which he refided at Hamburgh as Danifh legate, and counfellor of the margrave of Baden, who gave him a pention. The latter part of his life was little variad by incidente, and after he had brought the Meffiah to a conclufion, he continued to employ himfelf in compofition, and in the correction and revilion of his worts. He died at Hamburgh, in March 1803 , being 79 jears of age. By thole who were intimate with him, he is reprefented as a truly amiable man, happielt in a fmall circle of private friends, and paricularly fond of the fociety of young perions. The character of Klopltock, as a poet, is that of exuberance of imarination and fentiment. His fublimity is almolt unparalleled, he is apt to lofe himfelf in myltical abltraction, and his excefs of feeling fometimes betrays him into rant and extravagance. An able critic claims for the author of the Mefliah a rank among the firit poets. His odes and lyric poems have likewife been much admired by his countrymen, and his dramas difplay great force and dignity, but they are better adapted to the clofet than the 隹age. To his talents as a profe writer, his "Grammatical Dialogues" will bear witnefs : they abound with judicious remarks, and the object of them is worthy of a true patriot, vir. an attempt to prove that the German tongue is capable of ail the ftrength and noblenefs of a claffical language.

- KLOTEN, in Geograpby, a town of Switzerland, in the canton of Zurich; 5 miles N. of Zurich.

KLOTZ, Cirmistian Adolpules, in Biograpby, an eminent German critic, was born in the year 1738 at Bifchofswerden, near Dreiden, where his father was fettled as a clergyman. He difplayed, at an early period, fuch an attachment to letters, that his parents fpared no expence to gratify his tafte, and to enable him to cultivate his talents to the bett advantage. He employed thofe leifure hours, which other lads devote to amufement, in compofing and reciting German verfes. At Gerlitz, he ftudied under Baumgarten the Greek and Roman claflics, and gave a fpecimen of his powers in verfification, by a poem compofed on the "Deltruction of Zistau," which was laid watte in the year 1757. In 1758, he proceeded to Leipfic to ftudy
jurifprudence, and while here, he publihned feveral papers in the "Acta Eruditorum," and fome feparate pieces. In 1-68, he publifhed his "Opufcula loctica," containing twenty-three odes, threc fatirec, and as many clewins. From Heeipfic he repaired to Jena, where he opeard a fohoul, which was well attended. Having accepted of an insitation to a profefforhip at the univerfity of Gottingen in : $-1,2$, he fue off for that place, and almott immediately after his arrivai lee was attacked by a fevere illnefs, from which, however, he recovered, and immediately publifted a treatife, "De Verecundia Virgilii," to which were added three difiertations re. lative to the eclogues of the poct. He alfo publiffert "Mifcellanea Critica," and applied himfelf to the thedy of ancient gems and paiutings, with which he tocame well ace quainted. His celebrity had now increafed fo much, that he received two offers in the fane day, one from the prince of Hefle Darmitadt, to be profeffor of the Oriental languages at Gieffen, and the other from his Pruffan majefy, to tue profeflor of eloquence at Halle. While he was dediberatiner refpecting the choice he fhould make, he was nominated by his Britaunic majelty to be profeflor of philofuphy at Cottingen, with an increafed falary, which induced him to remain in that city, till fome attempts were made to rain his reputation. He then quitted Guttingen, and accepted an offer made him by his Pruffian majelty, of being profeflor of philofophy and eloquence at Halle, with the rank and title of aulic counfellor. While preparing for his departure, he publithed "Hiltoria Nummorum Contumelioforum et Satgricorum," containing a hiftory of thefe coins ; and on his removal to Halle he gave the public another work of the fame kind, and at the fame time he effected, what had been often attempted before without fuccefs, the inftitution of a new fociety, called the "Literary Society of Halle," which afforded great fatisfaction to the liberal-minded part of the learned in Germany: In 1766, he was invited by his Polifh majefty to Warfaw to fuperintend the education of the children of the Polifh nobility, which he would gladly kave accepted, as it afforded him an opportunity of vifiting new countries, but the king ordered him to remain at Halle, conferred upon him the rank of privy-counfellor, and accompanied this mark of honour with a confiderable addition to his falary. He died in 1771, leaving behind him many other works befides thofe to which we have referred. Before his death, he revifed every thing which he had written oa coins, and pablifhed "Opufcula, nummaria quibus Juris Antiqui Hitoriæque nonnulla Capita explicantur." Gen. Biog.

KNAPPIA, in Boiany, fo named by the writer of the prefent article, in honour of John Leonard Knapp, efq. F. L. S. and A. S. author of "Gramina Britannica, or Reprefentations of the Britilh Grafles, with Remarks and occalional Defcriptions," an elaborate work in quarto, with

## K N A

Irg coloured plates, drawn by the author, publifhed in 1 SOt.-Sm. Fi. Bfit. 1387. Engl. Bot. v. 16. 1127. (Chamagroftis; Sclirad. Germ. v. 1. 158.)-Clafs and order, Triandria Digymiz. Nat. Ord. Gramina.

Gen. Ch. . Cal. Glume of two erect, equal, oblong, abrupt, keeled valves, without awns, containing a fingle floret. Cor. the length of the calyx, ovate, obtufe, clofed, confifting of innumerable, fimple or branched, parallel fibres, denfelv matted together, united at their bafe, without awns. Stam. Filaments three, capillary, twice as long as the corolla; anthers of two elliptical pointed lobes, feparate at the bafe and fummit. Pif. Germen fuperior, ovate, fimoth; ftyles two, very flort ; Atigmas very long, capillary, acute, downy. Peric. none, except the permanent corolla and calyx. Seed one, elliptical, unconnected with the glumes, but enveloped in them.

Eff. Ch. Calyx of two abrupt awnlefs valves, fingleflowered. Córolla compofed of denfely-compaEted fibres, clofed, permanent. Seed unconnected.
3. K. agrofidea. Engl. Bot. t. 1127. Knapp Gram. t. I10. Hull. ed. 2. 23. (Chamagroftis minima; Schrad. Germ. ${ }^{5} 5$ S. Agroftis minima ; Limn. Sp. Pl. 93. Willd. Sp. Pl. v. 1. 372. Sm. Fl. Brit. 82. Hudf. 32. With. 134. Gramen minimum, paniculis elegantiffimis; Bauh. Titeatr. 26. G. minimum, Anglo-Britannicuns; Raii Syn. Indic. Pl. Dub. G. fparteum, capillaceo folio minimum ; Dill. Gift. 172. t. I6. excellent.) -A native of fandy paftures, efpecially near the fea, in various parts of Europe; as Germany, the fouth of France, and the fouth-welt coalt of Anglefea, at which latt place it has been obferved in plenty by the Rev. H. Davies. It is a fmall, delicate, annual grafs, flowering in the early fpring, after which it foon withers and difappears. The root confifts of a few long fimple fibres. Siems from one to three inches liigh, fimple, flender, ftraight, fmooth, naked, except at the bottom. Leaves almoft entirely radical, fhort, linear, channelled, blunt, with very broad fheathing membranous bafes. Spike fimple, ferminal, hadly an inch long, of eight or ten little purplifh or green flowers, placed alternately, each on a fhort ftalk, on a flender, zig-zag, common ftalk, to which, when in feed, they become clofery preffed.

The name of Knappia cannot be fuperfeded by Chamagrofis, the latter being untenable, as compofed of another eitablifhed generic name Agrofis, and contrary to the rule of Linneus, Phil. Bot. fect. 225, "a generic name, with one or two fyllables prefixed, fo as to make it apply to a totally diferent genus from what it originally defignated, is to be rejected." " We cannot but wonder, therefore, that the excellent Schrader fhould have been led, by any of his lefs learned countrymen, to adopt fuch a uame, when another was already before him, liable to no objection. S.

KNAPSACK, in Military Langruage, is a rough leather or canvas bag, which a foldier carries on his back, containing all his neceffaries. Square kuapfacks are moft convevient, and fhould be made with a divifion to hold the fhoes, black-balls, and brufhes, feparate from the linen. White goat-ikins are fometimes ufed. Soldiers are put under foppages for the payment of their knapfacks, which, after fix years, become their property.

KNAPIVEED, in Botany. See JAcEA.
Knapweed, a common name given to a kind of weed, which is fometimes called blue-bottle. It infelts arable land greatly in many cafes.

KNARED, in Geography, a town of Sweden, in the province of Halland; ${ }_{1}+$ miles E.S.E. of Halmiltad.

KNARESBOROUGH, a borough, market-town, and garih in the wapentake of Claro, Well-Riding of Yorkfhire,

## $\mathrm{K} N \mathrm{~N}$

England, is fituated on a rocky mountain, at the foot of which runs the river Nid. It is one of the ancient burghs that were part of the demefnes of the crown, found under the ti:le of Terra Regia, in Domefday Book, and other records. The fcite of Knarefborough corre fponds with the defcription given of the towns of the Britons; beirg placed on the bank of a river for the fupply of water, and on the fliirt of a foreft, for conveniency of hunting and palture. The remains of a ditch and rampart, which may yet be traced, include an area of 900 feet in length, and 600 in breadth. Soon after the Norman conquelt, a frong caitle was built here by Serlo de Burgh, who accompanied the conqueror to England, and received this manor, with feveral others, as a reward for his fervices. The caftle, having fallen to the crown, was granted by Henry III. to his brother Richard, earl of Cornwail, in the year 1257. In 1327, it was taken by John de Iolburn, an officer belonging to the earl of Lancatier: but, being befieged by the king's order, and Lilburn finding no profpect of relief, he furrendered, having firtt deltroyed all the records, and every memorial of the liberties and privileges of the burgh. In 1371, the callle and manor were granted by Edward III. to his fon, John of Gaunt, duke of Lancafter: from whofe time it has been an appendage to the duchy of Lancalter. The town and caflie had a conliderable fhare in the civil war of the 17 th century: after a brave reliitance, the caftle furrendered to lord Fairfax; and was ordered by the houfe of commons to be rendered untenable. The walls and towers have ever fince been mouldering away. This cafte contained nearly two acres and a half within its walls, which were flanked with eleven towers: thefe, with feveral other buildings in the different wards, afforded accommodation for a numerous garrifon. Part of the principal tower is ftill remaining, and appears to have been built about the time of Edward III. It confilts of three ftories above the keep or dungeon. The firft room on the ground-floor has been, from time immemorial, the repolitory of the ancient records. On the fecond ftory is a flate-room, called the king's-chamber, in which Ri chard II. was imprifoned after his depofition. Beneath this tower is the dungeon, to which there is a defcent by twelve fteps: the roof is arched with fone, and fupported by one round pillar, nine feet in circumference. In a part of the ruins are the remains of a fecret cell, or hiding place, conftructed in the middle of the wall: this receptacle is three feet four inches high, two feet eight inches wide, and more than twenty feet in length. In the caftle-yard is the entrance to an arched fubterraneous paffage leading to the moat. Leland, fpeaking of this caftle, fays, "It ftandeth magnificently and flrongly on a rock, having a deep ditch hewn out of the rock, where it was not defended by the river Nid."

The church of Knarefborough, dedicated to St. John the Baptitt, was a grant from the crown at the beginning of the I2th century. On the north fide of the choir is a chapel belonging to the Slinglby family: on an altar-tomb are whole length figures of fir Francis Slingfby and his lady; the knight in complete armour ; the lady in a long robe, with folding plaits down to the feet : here are alfo figures of fir William Slingfoy and Henry Slingfoy, efq. and various other monuments and inferiptions. On the fouth fide of the choir is a chapel belonging to the Plumptons of Plumpton, though no traces now remain of that ancient family, except their arms ftained on glafs in the window. The feats on either fide of the choir, and a pulpit facing the ealt window, appear to be ancient.

Knarefborough was fummoned to fend members to parliament in the firlt year of queen Mary ; from which

## K NA

time it has returned two reprefentatives: the right of election is vefted in the holders of burgage tenures, $8_{4}$ in number. In the diary of fir Henry Slingfly, who was elected in 1640, is the following note:"There is an evil cuftom at fuch elections, to beftow wine on all the town, which cont me fixteen pounds at leaft." The practice of purchafing the burgage-houfes began about the year 1714; fince which a majority of the votes have been in the poffeffion of the dukes of Devoufhire, who have nominated the two members. The town, though a borough, is not incorporated; but is governed only by a bailiff and conftable. Here are a fpacious market-place, and a neat market-crofs, which was erected in the year 1719. Over the river is a good thone bridge. On the eaft fide of the church is a frec-fchool, endowed, in 1616, by the Rev. Robert Challoner, a native of Goldboroagh, and rector of Amermam, in Buckinghamfhire. The prefent building was erected by fubfeription in 1741. In Windfor-lane is a Diffenters' chapel, founded by lady Hewley, of Bell-hall, near York; the prefent edifice was built, on the ancient fcite, in 1778. In Gracious-flreet is a Quaker's meetinghoufe, erected in 1701. A confiderable marnfacture of linen has been carried on here for many ages, and is ftill in a flourilhing condition; upwards of 1000 pieces, each 20 yards in length, being often woven in a week. In the year : 764, an act of parliament was obtained for the better fupply of river water, of which the conveyance before was, from the elevated fituation of the town, rendered difficult and expenfive. In the Long walk, clofe by the river Nid, is the Dropping ruell, or Petrifying fpring, which iflues from a lime-ftone rock, about 40 yards from the bank of the river; and, after running about 20 yards, divides, and fpreads itfelf over the top of a ledge of rock, whence it trickles or drops down from 30 or 40 places, into a channel hollowed for the purpofe. The fpring is fuppofed to fend forth 20 gallons in a minute. This rock, which is about so yards high, 16 long, and from io to 16 broad, about the year 1704, ftarted from the common bank, and left a chafm between them. Tradition ftates, that near this rock the famous Yorkfhire fybil, Mother Slipton, was burn, about the year 1488. From the Dropping well, the walk extends along the river fide to the High-bridge ; producing, as the river meanders very much, every 10 or 20 yards, a new point of view, which, though compofed of the fame objects, is furprifingly variegated. From fome parts of this walk are feen the venerable ruins of the cafte, the hermi. tage, \&c. with an intermixture of rocks and trees, over which part of the tower of Knarefborough church makes its appearance. On the other fide of the river, at the foot of a perpendicular rock, is St. Robert's chapel, fuppofed to have been made, in the reign of king John, by a learned and pious hermit of that name. This chapel is hollowed out of the folid rock ; its roof and altar are beautifully ornamented; at the entrance is the figure of a knight templar in the act of drawing his fword. Near Grimbald-bridge is a hermitage called St. Robert's cave, fuppofed to have beer the dwelling of the hermit above-mentioned. This cave has been rendered remarkable by a circumitance, which, in the year $175^{8}$, led to the difcovery of the murder of Daniel Clarke, committed 14 years before, by Eugene Aram, a fchool-mafter of this town, a man of extraordinary learning, who pleaded his own caufe in the moft able manner. He was, however, convicted and executed. About half a mile from St. Robert's chapel, ftood the priory, founded by the great carl of Cornwall, about the year 1257, for a fociety of friars of the order of the Holy Trimty. The fcite, at the diffolution, was granted to the eard of

Vod.. XX.

Shrewbury. It foon after became the property of the Slingftys, in which family it has cver fince renaided. ' $1 \mathrm{l},-$ chapel, priory, and other buildings, are now entirely de molified; the ruins lying fattered in " many a mouldenings heap." "The remains of the fifh-ponds thew them to be: of a fingular coniltruction, fo that the water might be dramb off at pleafure. On the oppolite bank of the river tlands a high rock, called Grimbald-cratg; from the tup of which is a fine profpect of the fubjacent vale, the river, Birkham-wood, and the lofty fummit of Almias-cliff. On the fide of the rock is a cavern, which, by its rude remams. appears to have been the refidence of a hermit, of the name of Grimbald.

Knareflorough is 17 miles dittant from York, and $20:$ north of London. The population, as returned to parluament in the year 1800 , was 3388 , inhabiting 766 houte. A market is held on Wedneliday, which is plentifully fupplied with all kinds of provilions: the quantity of corn fold here weekly, is fuppofed to excced that of any other mark : in the county. In the year 1708, queen Anne granted on the burgeffes five annual farrs, with a court of Pe-poudre : a court held in fairs to redrefs diforders committed in the:rn.

On the eaft fide of the town is Hay-park, containing about 1200 acres, granted by the crown to an anceftor of the late lord Bingley; and afterwards in the polfetion of fir John Hewley, whofe widow appropriated the rents to charitable ufes.

Knarefborough foreft extends from calt to weit upwards of twenty miles, and in fome places eight miles in breadth. By the Domefday furvey, there were then only four towno fhips in this foreft; Birltwith, Fulton, Beckwith, Rolfert. But in the year 1369 , there appear to have been three principal towns and fixteen hamlets.

At a fhort dittance from Knarefborough is Bilton park, formerly in the poffeffion of the Slingtby family, afterwards in that of Stockdale for above an hundred years, from whom it paffed by fale to the Wations ; John Farlide Watfon, efq. is the prefent poffeffor.

On a fmall elevation above the river Nid, flands Conyngham houfe, formerly called Coghill hall: which for feveral centuries belonged to the Coghill family; but was purchafed of fir Thomas Coghill, bart. with 5 I acres of land, by the countefs of Conyngham in the year $17960^{\circ}$ Hargrove's Hiftory of the Cattle, 'Town, and Foreft of Knarefbrough, $1 ヶ 98$, 12 mo .

KNAVE, ail old appe'lation for a man fervant, and fo ufed in if Edw. M1. flat. 1. cap. 3.

The word is formed from the Saxon cnapa, or Flemifh knape, which fignify the fame.

KNave alfo fignifies a male-child, or boy, in which fenfe knave-cbild has been frequently ufed in contradiltinction to a girl; and in this fenfe Wickliffe ufes the word in his tranflation of Exod. i. 16. and other places of the B3ble. In the old Saxon tranflation of Mat. viii. 6. "Puer meus jacet in domo paralyticus," was termed $M y^{\prime n}$ knapa.

Kxave has fometimes allo been ufed as an addition; as Willielmus Cowper de Denbigh, knave, \&c.

It is a common opinion, that Rom. i. 1 . was tranflated, Paul, a knave of defus Cbrijl. This miltake was occalioned by a Bible in the duke of Lauderdale's library, where the word kneaze' is inferted in !efs charakters than the others. and a rafure might ealily be difcerned.

Knave-Line, in a Ship, a rope fattened to the crofs-trees, under the main or fore-top, whence it comes down by the ties to the ram-head, and there it is reeved through a piece of wood of about two feet long, and fo is brought to the fhip's fide, and there bauled up taught to the rails.

KNAUTIS,

## K N A

## K N E

KNA UTIA, in Botany, reccived its appelation in honour of two botanifs, Chriftopher Knaut, the father, and Chriltian Knaut, the fon, who lived at Hatle, in Saxony, about the end of the $15^{\text {th }}$, and beginning of the 18 th centurics, and who diftinguifhed themeiles by fome paradoxical opinions refpecting the methodical arraugement of plants. The method of the former is an alteration of that of Ray, without any inprovement.-The latter was abfurd enough to fuppofe that the effence of a flower confited in its co-rolla.-Linn. Gen. 49. Schreb. 65. Willd. Sp. Pl. v. I. 561. Mart. Mill. Dict. y. 3. Sm. Prod. Fi. Grec. p. Y. S5. Ait. Hort. Kew. eủ. 2. vo 1. 23r. Juff. 195. Lamarck Dict. v. 3. 367. Illuitr. t. 58. Gertn. t. 86.Clafs and order, Lictrandria Monogynia. Nat. Ord. Aggregratr, Linn. Dipfacke, Jufl.

Gen. Ch. Cal. Common perianth, containing the florets difpofed in a fimple orb, cylindrical, oblong, erect, divided into as many fegments as there are florets ; proper perianth very fmall, crowning the germen. Cor. univerfal, equal ; proper of one petal, unequal; tube the length of the calyx; limb unequal, in four fegments, of which the outer one is larger and ovate. Stam. Filaments four, longer than the tube of the corolla, inferted into the receptacle; anthers oblong, incumbent. Pi/f. Germen inferior; ityle threadfhaped, as lorg as the ftamens; tligma thickifh, bitid. Perico, none. Seeds folitary, fquare witha woolly tip. Reaept. common, very fmall, flat, naked.

Obf. This genus is diltinguihed from Scaliofin in having a tubulated caly x , and the floftets arranged in a timple orb.

Eff. Ch. Common calyx oblong, fimple, containing, about five flowers: proper calyx fimple, fuperior. Florets irregular. Receptacle naked.
I. K. orientalis. Linn. Sp. Pl. 146. Till. Pif. t. 4S."Leaves cut. Florets five, longer than the calyx."-A native of the Levant, flowering from June to September, and frequently to be feen in our gardens. "Root annual. Stens branched, about four feet high. Brancbes terminated by fingle peduncles, each fupporting a floweer. Florets of a bright-red colour. Leaves on the middle of the them pinmated; the reit are ferrated. Seeds compreffed, hairy, many-toothed at top. Down a concave crown, with many brittle-fhaped, unequal teeth.
2. K. propontica. Linn. Sp. Pl. 1666. Willd. n. 2. (Scabiofa orientalis villofa, fore fuaverutente, fructu pulchro oblongo; Tourn. Cor. 35.) -" Upper lates lanceolate, entire. Florets ten, equal with the calyx." - A native of the Eaft, from whence Forkal fent feeds of it to Limureus, who raifed plants from them in his garden, from one of which he made the following defcription. - "Stem biennial, the thicknefs of a finger, two feet in height, villofe, refembling Clsirantbus incanus. Leaves roughinh, ferrated; the upper ones a fpan long. Caly.x oblong, cylindrical, compoled of eight or ten leaves, awl-fhaped at the point. Corolla four-cleft, purplinh; anthers of the fame colour ; filaments and piftils white. It differs from the latt fpecies in having the upper leaves undivided; florets about ten, inttead of five, whilt the feed-crown is fifteen-toothed and fringed." -It appears to us, neverthelefs, to be a mere variety.
K. palafiting and plumofa of Linnæus are referred by Dr. Smith, in his Prodromus Flora Grace, to the genus Scabiofa, to which they mot indubitably belong.
Krautia, in Gardening, contains plants of the herbaceons, annual, and bennial kinds; of which the fpecies cultivated are, the oriental knautia (K. orientalis) ; and the Levant knautia (K. propontica).
Method of Cufturc. - Plants of this kind may be eafly increafed by feeds, which, when permitted to fatter in the
nutumnal fealon, produce good plants. After they this may be taken up, and planted out in the clumps and borders of pleafure grounds, among other low thrubs near the walks. In this way the plants live through the winter, and flower in June. There is no particular fort of culture requifite afterwards, but to keep the plants perfectly clean from weeds. The feeds fall to the ground as fivon as they become fully ripe.
Thefe plants are capable of affording variety among other hardy flowering plants which are of limilar growths.

KNAWEL, in Botany, faid to be a word of German origin, but of its fignification Dillenins confeffes himfelf, " though a German," to be ignorant. He adopts it, in his Nowa Plantarum Genera, 94. t. 3, for what Liunzus more happily called Sclerantjus, of which we fhall treat in its place.
KNECK, in the Sea Language, the twifting of a rope or cable, as it is veering out.

KNELLER, Sir Godfrey, Baronet, in Biography, a portrait painter, more liberally encouraged, more praifed and paid than any other man who ever trod the fame path with

## K N E

Fith the fume portion of real power in the art of painting. A rapid pencil and a ready talent of taking likenefles were the foundation of his reputation ; and a mon fortunate ignorance of the art among the bett informed even of the public, by whom he was employed, aided his progreds. Not but that he was equal to the production of good works if he had been more carefully trained, and had lived amonglt thofe who knew how to value works of art upon jult principles ; but he was amongft the mont vain of mankind, and had no regard whatfoever for that pofthumous fame which leads men to facrilice prefent enjoyments to future glory. His niutto was, "to live whilit he lived," and, confequently, to make money was a matter of greater moment with him than to make good pictures; and he fucceeded fully ; for although he loit 20,000 \% by the South-fea fpeculation, he left, at his death, an eflate of $2000 /$. a-year. His prices, whillt he painted here, were 15 guineas for a head; 20 if with one hand; 30 for a lalf, and 60 for a whole length.

He was born at Lubec about the year ro4i. His father was furveyor-general of the mines, and infpector of count Mansfelde's revenues. At firlt Godfrey was dettined for a military life, but painting was his paffon. His father acquiefced in his wifhes, and placed him under Bol, at Amfterdam. He had even fome initructions from Rembrandt. He vilited Italy in 1672, and remained fome time at Venice, where he painted fome of the firlt families, and amonglt them the cardinal Baffadonna. It is probatwe that le here learnt that free, loofe tyle of execution in which he delighted, but by no means excelled; with him it fell to negligence and clumbinefs, particularly in his draperies, whift fometimes his heads exhibit a perfect mafter of the pencil.

Kneller did not ftay long in Italy, as in 1674, he came to England with his brother, John Zachary, who affited him in painting, without intending to refide here; but being recommended to Mr. Banks, a Hamburgh merchant, he painted him and his family. Mr. Vernon, fecretary to the duke of Monmoush, faw them, and fat to Kneller; and perfuaded the duke alfo to fit. His grace was delighted, and engaged the king his father to have his picture by the new artilt, at a time when the duke of York had been promifed the king's picture by Lely. Charles, unwiling to have double trouble, propofed that both artifts fhould paint him at the fame time. Lely, as the eftablifhed artift, chofe his light and fation: Kneller took the next belt he could, and performed his talk with fo much expedition and $1 k i l l$, that he had nearly finifhed his piece when Lely's asas only dead-coloured. The circumftance gained Kneller great credit; and Lely obtained no lefs honour, for he had the candour to acknowledge and admire the abilities of his rival. This fuccels fixed Kineller here, and the immenfe number of portraits he executed, prove the continuance of his reputation.

He was equally encouraged by Charles, James, and William; and had the honotr of painting the portraits of ten fovereigns (riz. Charles II. James II. and his queen, William and Mary, Anne, George I. Louis XIV. the czar Peter the Great, and the emperor Charles VI.), which is more than can be faid of any other painter. His belt friend was William, for whom he painted the beauties of Hampton Court ; and by whom he was knighted in 1692, and prefented with a gold medal and chain worth 3 col. In his reign, he alfo painted feveral of the admirals for Hampton Court, and the Kit-Cat club. He lived to paint George I. and was made a baronet by him. In 1722, fir Godfrey was feized with a violent fever, from the immediate danger cf which he was refcued by Dr. Meade. He languifhed,

However, fome time, and died in OCvober 9,729 . His indy lay in itate, and was buried at his coumtry-leat called Whton; but a montument was crected to lum in Weftminter Abbey, for which he left $300 \%$ and grave particular inftructions for the execution of it to Rytbrach.

During the latter part of his time, that is, after the death of 1 ely, in 1580 , Kneller thood at the head of the profefions of hisart in this cotentry, and that mont confpicuoully. It is not therefore furprimg that he experinnced the encouragement he did. He has lefe fome few good pictures behind him as proofs of the natural powers he poffefted; b:tt lus mott fincere admirers, who are judges, mutt acknowledge that the fur greater portion of thofe he allowed to pats into the world under his same, are a difgrace to ham and his patrons. His pieture of the converted Chinefe at Windfor, he is faid to be mott froud of, as jufly he might be. This, however, flews his profligacy in principle, as it exlibits that he really knew what was gnod, and coul. 1 produce it if he chofe. According to his own doctrine, he did as much and no more than was neceflary to pafs current among his employers. "Hiftory painters," he faid, "make the dead live, and don't begin to live till they are dead. I paint the living, and they make me live."

There is a fingular paucity of imagination in Kneller's pictures. He did indeed (and Walpole jultly commends him for it) indulge in an ideal drapery for women, inftead of the monftrous dreffes they wore at the time; but his ingenuity does not appear equal to affitt them fo much; fo that there is a ridiculous misture of politive formality in the ftiff neckloths and wired fkirts of cuats of the one, and of an affected flow and grace in the loofe robes of the other, which confit of nothing more than a chemife thrown open, and difcovering the bofom, and a robe-de-chambre lvofely drawn over it.

All that Kneller can be juflly praifed, or defervedly efteemed for, generally fpeaking, is, that his heads, or rather his faces, have a grod deal of livelinefs and gentility. It feldom amounts to character in the general run of his portraits. Now and then the mafter-hand appears, when the fubject or the moment were favourable. There is, at Pet. worth, a head of fir Ifaac Newton that would be an hononr to any man to have produced; and portraits of branches of the Seymour family, which are a difgrace to the name they bear.
The artilts who fucceeded him, dazzled by his fuccefs, and allured by the profefled admiration of his tafte, moit unaccountably luft jight of the infinitely greater beauties of Vandyke's manner, and folluwed his alone. In confequence, the art funk to the lowelt ebb, till it was fomewhat redeemed by Richardfon's writings, and Hudfon's and Ramfay's talents in painting. But true tafte was not reftored till Reynolds took up the pencil; and now, happily, the weakneffes as well as the merits of Kneller are duly appreciated, and hundreds of his works cenfigned to the oblivion he probably wifhed they might experience. Wher the mafs may be thus difpofed of, and the feleet only remain, then he will obtain, unalloyed, the praife his talents, when carefully exerted, fully deferved.

KNEMA, in Botany, a genus named by Loureiro, is derived from xurun, the fpole of a wheel, on account of the anthers being difpofed into a ftar-like, or wheel-fhaperd form. - Loureir. Cochinch. 6o4-Clafs and order, Diacig Monadeiphia. Nat. Ord.

Gen. Ch. Male, Cal. none. Cor. of one petal, fleny ; tube thick, fhort ; limb in three, acute, fegments, woolly un: the outlide. Sifoni, a fingle filament, fhort, turbinatid;
anthers 10 or 12, ovate, two-celled, expanded horizontally about the top of the filament. Female, (flowers on a diftinct plant.) Cal. Perianth inferior, very fhort, fomewhat truncated, permanent. Cor. as in the malc. Pi/t. Germen fuperior, roundifh, hairy; ftyle none; ttyle laciniated, erect. Peric. Berry ovate, fucculent. Seed folitary, ovate, tunicated.
Eff. Ch. Male, Calyx none. Corolla three cleft. Anthers formed into a itar, about the filament. Female; Calyx rather truncated. Corolla threc-cleft. Stigma onc. Berry fuperior, fingle-feeded.

1. K. corticofia. Loureir.-A native of the woods of Cochinchina.-This is a large tree, with a thick brown, or reddifh bark. Branches afcending. Leaves lanceolate, entire, fmooth, alternate, on foot-ltalks. Both male and female fowers nearly terminal, on many-flowered Italks. Corolla brown on the outfide, yellowifh red within. Berry imall, pulpy, red.

It feems to us that Loureiro refers this genus to the order AIcmandria rather inadvertently, becaufe he defrribes 10 or 12 anthers as pertaining to the generic character.
KNEVELS, in a Ship. See Kevels.
KNIAGININ, in Geograply, a town of Ruffia, in the government of Nizagorod, on a rivulet that falls into the Volga; 40 miles E.N.E. of Niznei Novgorod.

KNLASE, a town of Poland, in Volhynia; 50 miles S.W. of Lucko.

KNIFA, in Botany, one of Adanfon's whimfical names, of whofe origin or meaning no account is given. He ufes it to defignate a genus of his own, compofed of the Linnæan Hypericum mutilum and fetofum, whofe flowers have but two ityles, and their capfules two cells.

KNIFE is a well known inftrument made for cutting, and adapted in form to the ufes for which it is defigned.

Knives are faid to have been firlt made in England in 1563, by one Matthews, on Fleet-bridge, Loudon. Anderf. Hilt. Com. vol. i. p. 402.

Surgeons have various forts of knives. See Bistoury, \&c.

KNIFVEN, in Geography, a fmall ifland on the W. fide of the gulf of Bothnia. N. lat. $60^{\circ} 3^{3} 8^{\prime}$. E. long. $17^{\circ} 30^{\prime}$.

KNIGHT, Eques, among the Romans, was the fecond degree of nobility; following immediately that of the fenators.

At the time of building the city of Rome, the whole army of Romulus confifted of 3000 foot and 300 horfe, which 300 horfe were the original of the Roman equites or knights.- Thefe made the fecond order that had places in the fenate.

Manutius and Sigonius are of opinion, that befide the equeftrian order, and thofe knights immediately below the fenators, Romulus inllituted a military order, whereof the Ruman cavalry was compofed. But no ancient author takes notice of any order of knighthood initituted on purpofe for the war, nor any other knights but thofe 300, which, as we have oblerved, were the firit foundation of the equeftrian order.

The knights had horfes kept for them at the public charge; but when they were admitted among the fenators, they refigned that privilege. To be a knight, it was neceflary they fhould have a certain revenue, that their poverty might not difgrace the order; and when they failed of the preicribed revenue, they were expunged out of the lifts of knights, and thrult down among the plebeians. Ten thoufand crowns are computed to have been the revenue required.
The knights grew fo very powerful, that they became a
balance between the power of the fenate and the people. They neglected the exercifes of war, and betook themfelves principally to civil employments in Rome; infomuch that Pliny obferves, in his tume, they had no longer a horfe kept at the public expence.

Some fay that the order of knights, as diftinet from the people, did not begin before the time of the Gracchi; others fay, the privilege was then firlt granted them, that no jedge fhould be chofen, but out of their order: fome time after which they admitted them into the fenate. This, however, is certain, it was only from that time that a certain revenue was neceflary, and that this entuled them to the knighthood, without being defcended from ancient knights.

Knicut, in a more modern fenfe, properly fignifies a perfon, who, for his virtue and martial prowefs, is, by the king, raifed above the rank of gentlemen, into a higher clafs of dignity and honour.
The word knight, in its original German, knecht, fignifies a fervant; and has fince been ufed for a foldier or man of war. We have but one initance among us where knight is ufed in the firit fenfe, and that is in knigbt of the fiere, who properly ferves in parliament for fuch a county. In the Latin, French, Spanih, Italian, and Dutch languages, knight is expreffed by a word (equites) which properly lig. nifies a borfeman, as being ufually employed on horfeback. Indeed our common law calls them milites, foldiers, becaufe they formed a part of the royal army, in virtue of their feodal tenures: one condition of which was, that every one who held a "knight's fee" immediately under the crown was obliged to be knighted; to ferve the king as foldiers in his wars, in which fenfe the word miles was ufed pro vaffalo: or fine for non-compliance.

The exertion of this prerogative, as an expedient to raife money, in the reign of Charles I., gave great offence, though warranted by law, and the recent example of queen Elizabeth; but it was by the ftatute 16 Car. 1. c. 16. abolifhed: and this kind of knighthood has, fince that time, fallen into great difregard.

Knighthood was the firt degree of honour in the ancient. armies, and was ufually conferred with a great deal of ceremony on thofe who had diftinguifhed themfelves by fome notable exploit in arms. They were originally faid to be adopted, adoptabantur in militem, which we now call dubbed; as being fuppofed, in fome meafure, the fons of him who knighted them.
The cuftom of the ancient Germans was to give their young men a fhield and a lance in the great council: this was equivalent to the "toga virilis" of the Romans. Before this, they were not permitted to bear arms, but were accounted as a part of the father's houfehold; after it, as part of the community. (Tacit. de Mor. Germ. § 13.) Hence fome derive the ufage of knighting, which has prevailed all over the weftern world, lince its reduction by colonies from thofe northern heroes. See Knigitiood, Military, infra.
The ceremonies at the creation of a knight have been various. The principal were a box on the ear, and a flroke with a fword on the fhoulder. Then they put on him a fhoulder-belt, gilt fword, fpurs, and the other military accoutrements; after which, being armed as a knight, he was led in great pomp to the church.
The manner of making a knight with us, is defcribed by Camden in a few words: "Qui equeltrem dignitatem fufcipit, flexis genibus leviter in humero percutitur : princeps his verbis Gallice affatur: fus vel fois chevalier au nom de Dieu, furge vel fis eques in nomine Dei." This is meant
of knights-bachelors, which are the lowen, though the molt ancient order of knighthood among us; for we have an in. fance of king Alfred's conferring this order on his fon Athelitan. Wiall. Malmob lib. ij.

Knights grew fo very mumerous, that the dignity became of much lefs repute. Charles V. is faid to have made five hundred in a fingle day: on which account, thercfore, now orders of knighthood were inflituted, in order to diltinguifn the more deferving from the crowd. For the feveral kinds of knights amorg us, fee Bacuelon, Baxyeret, Bahonet, Batif, Garter, \&c.

Knigut is alfo undertood of a perfon admitted into any order either purely military, or military and religiour, inftituted by forne king or prince, with certain marks and tokens of honour and diftinction.

Such are the knights of the Garter, of the Elephant, of the Holy Gbof, of Molta, \&e. All which fee under Garter, Elephint, \&s.

Kviguts-Errant, a pretended order of chivalry, whereof ample mention is made in the old romances.

They were a kind of heroes, who travelled the world in fearch of adventures, redreffing wrongs, refcuing damfels, and taking all occafions of fignalizing their prowers. This romantic bravery of the old knights was heret fore the chimera of the Spaniards; among!t whom there was no cavaler but had his nuiftrefs, whofe etteem he was to gain by fome heroic action. The duke of Alva, notwithttanding his age azd gravity, is faid to have vowed the conquelt of Portugal to a young lady.

Kxiguts of the Shire, or Kxigits of Parliament, are two gentlemen of worth, chofen on the king's writ in pleno comitatu, by fuch of the freeholders of every county as have the value of fos. per ann, within the county, clear of all taxes and deductions except parliamentary and parochial taxes, to reprefent fuch county in parliament.

This qualification of electors for knights of the fhire or county members, is fettled by ftat. 8 Hen. VT. c. 7 . and 10 Hen. VI. c. 2. amended by $1+$ Geo. III. c. 58. According to the eflimate of bifhop Fleetwood in his "Chronicon Preciofum," 40s. in the reign of Henry VI. was equal to 32l. per annum in the reign of queen Anne; and as the value
of money has been towered fince, judge Black fore concludes that $12 \%$ in the bihop's day murt have been equivalert to 20\% in his own time; and the depretiation of money in later times muft have made the difference much greater. (Sice De-Lxpensts.) The other qualifications of the electors for counties in England and Wales, collected from fatutes are; the: ro perfon under twenty-one years of age thall be capable of voting; nor any perfon convicted of perjury or fubornation of perjury: that no perfon frall vote in ri ht of any frechold granted to him frauculently to qualify him to vote: that every voter fhal! have been in the actual poffeflon or secipt of the profits of his freehold to his own ufe for twelve calendar monthis before, except it came to him by defcent, marriage, marriage fettlement, will, or promotion to a benclice or office : that no perfon fhall sote in refpect of an annuity or rent-charge, unlefs regiftered with the clerk of the peace twelve calendar months before: that in mortgaged or trult eftates, the perfon in poffeffion fhall have the vote: that only one perfon fhall be admitted to vote for any one houfe or tenement, to prevent the fplitting of freeholds: that no eftate fhall qualify a voter, unlefs the eflate has been affefied to fome landotax aid, at leaft twelve months before the election: and that no tenant by copy of court-roll fhall be permitted to vote as a freeholder. ( 7 and 8 W. III. c. 25. 10 Ann. c. 23. 2 G. II. c. 21. 10 G. 1I. c. 18. 31 G. II. c. 14. 3 G. III. c. 24 .) By ftatute 22 G. III. c. 41 . no commiffioner, or officer, employed in managing the duties of excife, cultoms, flamps, falt, windows or houfes, or revenue of the poftoffice, fhall be capable of voting in the election of a member of parliament.

Thefe knights, when every man who had a knight's-fee was cuftomarily conftrained to be a knight, were of niecefity to be milites gladio cindi, for fo the writ runs to this day; but now cultom admits efquires to te chofe to this office.

It is required by 23 Hen. VI. c. 15 . that all knights of the fhire fhall be actual knights, or fuch notable efquires and gentlemen as have eftates fufficient to be knights; and by nomeans of the degree of yeomen: and more precifely by 9 Ann. c. 5. that every knight of the thire fhall have a clear eftate of freehold or copyhold to the value of 6 col . per athnum, except the eldeft fons of peers and of perfons qualified to be knights of fhires. For other qualifications, fee Par. hiament.

The expences of knights of the fhire, are to be defrajed by the county, during their fitting in parliament, at the rate of four frillings a day. This rate of wages was eftablifhed in the reign of Edw. III. (Seealfo 35 Hen. VIII. c. I1.) It is hardly neceflary to add, that thefe are never now reaquired.

Knight's Crofs, in Botany. See Campiox.
Kvigur-Heads, or Bollard Timbers, are oak timberswith large upperparts or heads, which are faved and bolted together, one on each fide the ftern, or with a filling between, as they mult open at the heads fufficient to admit the bowfrit between them, and running high enough to fupport the fame above the ftern.

Kxigurs Fre, an ancient laze-term, figrifying fo mi:ch land of inheritance as was efteemed fufficient to maintain a knight with fuitable retinue ; which, in the days of H. III., was reckoned at 15\% per ann. And by ftat. I Edw. II. fuch as had $20 \%$. per ann. in fee, or for life, might be compelled to be knights. But this flatute is repealed by 16 Car . I. Sir T. Smith rates a kuight's fee at $+0 \%$, yearly. According to Coke, a knight's fee contained twelve carucates, or plougholands. Stow fays, that there were found in England, as the time of the Conqueror, $60,21 \mathrm{~s}$ knight's fees; ac.
cording to others there were 60,215 ; wheresf the religions houfes, before their fuppreffion, were poffeffed of 28,015 . Sue Fee.

In confequence of the introduction of the feodal fyftem upon the Nerman conqueft, all the lands in the kingdum were divided into knight's fees, in number, as Stow fays, above 60,000 ; and for every kright's fee, a kniglit or foldier, miles, was bound to attend the king in his wars, for 40 days in a year ; in which fpace of time, before war was reduced to a feience, the campaign was generally finified, and a kingdom either conquered or victorious. By this means, the king lad, without any expence, an army of ( 10,000 men always ready at his command. Accordingly we tind among the laws of William the Conqueror, one, (c. 58.) which in the king's name commands, and frmly cujoins, the perfonal attendance of all kuights and others; " quod habeant et teneant fe femper in armis et equis, ut decet et oportet : et quod femper fint prompti et paratiad fervitium fum integrum nobis explendum et peragendum, cum opus adfuerit fecundum quod debent de feodis et tenementis fuis de jure nobis facere." This perfonal fervice in time degenerated into pecuniary commutarions or aids, and at latt the military part of the feodal fyltem was abolifhed at the reltoration, by .ftat. I2 Car. II. c. 24.

Kaigurs ferzice, fervitium militare, a tenure whereby feveral lands in this nation were anciently held of the king. This was the firit, mult univerfal, and eftecmed the molt honourable feccies of tenure, called in Latin "Fervitium mlitare," and in law-French "chivalry" or "fervice de chivaler," anfwering to the "fief d'haubert" of the Norvians; a name that frequently cecurs in the Mirror. It differed in few refpects from a pure and proper feud, being entirely military, and the genuine effect of the feodal eltablifhment in Englund. In order to make this tenure, a quantity of land, calied a knight's fee "feudum militare," was neceflary; and he who held this proportion of land (or a whole fee) by knight-fervice, was bound to attend his lord to the wars for 40 days in every year, if called for ; and this attendance was his "reditus" or return, his rent or ferrice for the lund he claimed to hold. If he held only half a knight's fee, he was unly bound to attend 20 days, and fo in proportion. This tenure had all the marks of a ftriet and regular feud; it was granted by words of pure donation, dedi et con$\operatorname{cel} / \sqrt{1}$ (Co. Litt. 9.) ; was transferred by invelliture or delivering corporal poffefion of the land, ufually cailed livery ef feilin; and was perfected by homage and fealty: It alfo drew after it thefe feven fruits and confequences, as infeparably minident to the tenure in chivalry; vizz. aids, relief, primer feilin, wardfhip, marriage, fines for alienation, and efclieat; which fee refipectively. It was by this tenure of knight-lervice that the greatet part of the lands in this kandom was holden, and that rincipally of the king in capitc, till the middle of the $1{ }^{7}$ th century; and which was created, as tir Euward Coke exprefsty teltifies ( 4 Inlt. 192.), for a military purpoie; ciz. fur difence of the realn by the king's own principal fubjects, which was judged to be much better than to hirelings or Enreigners. The defcription above given relates to knight-fervice proper; which was to attend the king in his wars. There were alfo fome other Ipecies of knight-fervice; fo called, though improperly, becaufe the fervice or render was of a free alid honourable naturc, and equally uncertain as to the time of rendering it, as that of knight fervice proper, and becaufe they were attended with fimilar points and confequences. Such was the tenure by grand ferjeanty, which fee; and of this tenure that by sornuge (which fee) was a fpecies.

Finght's Canal, in Geography, an inlet of the Paci-
fic ocean, on the W. coalt of Nurth America, extending in an E. and N.E. direction about 50 miles. Its entrance from an arm of the fea lies in N. lat. $50^{\circ} 45^{\prime \prime}$. E long. $233^{\circ}$ 16 .
Kxigut's Ifland, a fmall inand in Becring's bay, N.W. of Eleanor's found, feparated from the Amerrican continent by a narrow chatinel, which is navigable. N. lat. $59^{-4} 45^{-1}$. E. long. $220^{\circ}+7^{\prime}$ - Alfo, an illand in Prince Walliam's found, about 30 miles in length from N. to S., and from two to five broad. N. lat. $60^{\circ} 2^{\prime}$. E. long. $212^{\circ} 52^{\prime}$ - Alfo, a fmall ifland in Hudfon's bay. N. lat. $6 \mathrm{t}^{\circ} 50^{\circ}$. W. long. 93 30'.-Alfo, an iffand in the I'acific cccan, at: the largeft of thofe called by Capt. Vancouver the "Snares;" difcovered by Broughton, commander of the Chatham under Vancouser, in Norember 1791. Some parts of the ifland prefented a very barren appearance, not unlike the W. fide of Portland, compofed of whitifh rocky cliffs. The rocky iflets are five in number, fome of which are of a pyramidical form. It did not appear to be inhabited. The fouth point is fitmated in S. lat. $48^{\circ} 15^{\prime}$. E. long. $166^{\circ} 44^{\prime}$.

Kxicurs, Poor, a group of fmall iflands, fo called by lientenant Cook, who difcovered them in November 1760, on the coatt of New Zealand, when he was in S. lat. $3^{6}{ }^{\circ}$ 36, at the ditance of three leagues N.E. by N.

KNIGHTEN-GILD, in our Ohl Hriltrs, a gild or company in London, confiltiang of nineteen knights, which king Edgar founded, giving them a portion of void ground lying wihin the walls of the city, now called Portfokenward.

KNIGHTHOOD, a miiitary order, or honour ; or a mark or degree of ancient nobility, or reward of perfonal virtue and merit.

There are four kinds of knighthood ; military, regular, hoonorary, and focinl.

Kincurnood, Miliary, is that of the ancient knights, who acquired it by high feats of arms.
Thefe are called -nilites, in ancient charters and titles, by which they ware dillinguihned from mere backelors, \&c. Thefe knights were girt with a fword, and a pair of gilt fpurs; whence they were called equites aurati.

Knighthood is not hereditary, but acquired. It does not come into the world with a man like nobility; nor can it be revoked. The fons of kings, and kings themfelves, with all other fovereigns, heretufore had knighthood conferred on them as a mark of honour. They were ufually knighted at their baptifn or marriage, at their coronation, before or after a battle, Scc.

Between the age of Charlemagne and that of the Crufades, the fervice of the infantry was degraded to the Plebeians; the cavalry formed the ftrength of the armises, and the honourable name of niles, or foldier, was conlined to the gentlemen who ferved on horfeback, and were invelted with the charater of knighthood. The dukes and counts, who had ufurped the rights of fovereignty, divided the provinces among their faithful barons; the barons ditributed among their vaffals the fiefs or benefices of their jurifdiction; and thefe military tenants, the peers of each order, and of their lord, compofed the noble or equeltrian order, which difdained to conceive the peafant or burgher as of the fame fpecies with themfelves. The dignity of their birth was preferved by pure and equal alliances; their fons a'one, who could produce four quarters or lines of anceltry, without fput or reproach, might legally pretend to the honour of knighthood; but a valiant plebeian was fometimes enriched and enrolled by the fword, and became the father of a new race. A fimple knight could impart, according to his judgment, the character which he reccived ; and the warlike fovereigns of Eu-
rope derived more glory from this perfonal didinetion than from the luttre of their diadem. 'This ceremony, of which fone traces may be found in Thacitus and the woods of Germany, was, in its oriцin, fimple and profane; the candidate, after fome previous trial, was invelted with the fivord and fpurs; and lis cheek or fhoulder was touched with a fight blow, as an emblem of the lalt affront, which it was lawful for him to endure. But fupertition mingled in every public and private action of life; in the holy wars, it fanctified the profeflion of arms; and the order of chivalry was allimilated in its rights and privileges to the facred orders of priethood. I'he bath and white garment of the novice were an indecent copy of the regeneration of baptifm; his fivord, which he offered on the alcar, was bleffed by the minitters of religion; his folemn reception was preceded by fetts and vigils; and he was created a knight in the name of God, of St. George, and of St. Michael the archangel. Ho fivore to accomplinh the duties of his profeffion; and education, example, and the public opinion, were the inviolable guardians of his oath. As the champion of God and the ladies ("I blufh," fays Gibbon, "to unite fuch difcordant names"), he devoted himfelf to fpeak the truth; to maintain the right; to protect the diftrefted; to practife court $/ j$, a virtue lefs familiar to the ancients; to purfue the inlidels; to defpife the allurements of eafe and fafety; and to vindicate in every perilous adventure the honour of his character. T'he abuife of the fame firit provoked the illiterate knight to difdain the acts of indultry and peace; to etteem himfolf the fole judge and avenger of his own injuries; and proudly to neglect the laws of civil fociety and military difcipline. Yet the benefits of this inltitution, to refine the temper of barbarians, and to infufe fome principles of faith, jultice, and humanity, were ftrongly felt, and have been often obferved. The alperity of mational prejudice was foftened; and the community of religion and arms fpread a fimilar co'our and generous emulation over the face of Chrittendom. Abroad, in enterprize and pilgrimage, at home in martial esercife, the barriers of every country were perpetually affociated; and impartial talte muft prefer a Gothic tournament to the Olympic gamez of claffic antiquity.

The lance was the proper and peculiar weapon of the knight ; his horfe was of a large and heavy breed ; but this charger, till he was roufed by the approaching danger, was ufually led by an attendant, and he quietly rode a pad or palfrey of a more ealy pace. His helmet and fword, his greaves and buckler, it is needlefs to defcribe in this place; but at the period of the crufades the armour was lefs ponderous than in later times; and inteat of a malfy cuirafs, his brealt was defended by an hauberk or coat of mail. Each knight was attended to the field by his faitbful fquire, a youth of equal birth and fimilar hopes; he was followed by his archers and men at arms, and four, or five, or fix foldiers, were computed as the furniture of a complete "lance." In the expeditions to the neighbouring kingdoms or the Holy Land, the duties of the feudal tenure no longer fubfilted; the voluntary fervice of the knights and their followers was prompted by zeal or attachment, or purchafed with rewards and promifes; and the number of each fquadron were meafured by the power, the wealth, and the fame of each independent chieftain. They were diftinguifhed by his banner, his armorial coat, and his cry of war; and the molt ancient families of Europe mult feek in thefe achievements the origin and proof of their nobility. Gibbon's Decl. and Fall of the Rom. Emp. vol. xi. For a further account of the character of the ancient knights and the beneficial effects of chivalry and the crufades: fee the articles Chivalry and Crolsades.

Thefe fervices, both of chivaly ated of grand-fricanty, were all perfonal, and as to their quantity or duration unertan. But periond attendance in knight-fervice being found menavenient and troublefome, the terants fourd incans of compounding for it; firlt, by finding others to ferve in their Itead, and in procefs of time by making a pecturiary fatisfaction to the lords in lien of it. (Suee Fectiace.) When knight-fervice, or perfonal military duty degenerated into efouage, or pecuniary affefiments, all the indvantages (promifed or real) of the foedal confatution were deflroved, and nothing but the hardfhips remained. Thefe hardflips, which were numerous and gresous, were from time to time palliated by fuccellive acts of parliament, till at length the humanity of king James I. conicuted, $(4$ Intl. 202.) , in contideration of a proper equivalent, to abolifh them all, upon a plan fimilar to that, which he had formed and began to put in execution, for removing the feodal grievance of heritable juridiction, in Scotland, which has fince been purfued and effected by the Itatute 20 Gco. II. c. 43. By another itatate of the fame year (20 Geo. II. c. 50.) the tenure of "ward-holding" (equivalent to the knight-fervice of England) is for ever abolifhed in Scotland. At length the military tenures, with all their heavy appendages, (having during the ufurpation been difcortinued) were totally deltroyed by the llatute 12 Car. II. c. 24 . Blackf. Com. b. ii. See Texure.

Kxightnood, Regular, is applied to all military order:, which profefs to wear fome particular halbit, to bear arms againt the infidels, to fuccour and affitt pilgrims in their paflage to the Holy Land, and to ferve in hofpitals where they fhould be received; fuch were the knights l'emplars, and fuch fill are the knights of Malta, \&c.
Kxicntnood, Honorary, is that which princes confer on other princes, and even on their own great miniflers and favourites; fuch are the knights of the Garter, St. Michael, \&c.
Kvigutuood, Social, is that which is not fixed, nor confirmed by any formal inftitution, nor regulated by any lafting flatutes; of which kind there have many orders been crected on occalion of factions, of tilts and tournaments, mafquerades, and the like.
The abbot Bernardo Juftiniani, at the beginning of his hitory of knighthood, gives us a complete catalogue of the feveral orders: according to this computation, they are in number ninety-two. Favin has given us two volumes of them under the title of Theatre $d$ 'Honneur \& de Chevalerie. Menenius has publifhed Delicix Equeftrium Ordinum, and Audr. Mendo has written De Ordiribus Militaribus. Beloi has traced the original, and Geliot, in his Armorial Index, bas given us their inftitutions.

To thefe may be added, Father Meneftrier de la Chevalerie Ancienne \& Moderne, Michieli's Trefor Militaire, Caramul's Theologia Regolare, Mirxus's Origines Equeftrium five Militarium Ordinum: but above all, Juitiniani's Hiftorie Chronologiche del' Origine de gl' Ordine Militari, e di tutte le Religione Cavalerefche: the edition which is fullett, is that of Venice in 1692, in two vols. fol.

KNIGHTON, Henry, in Biograpby, who Gourihed at the clofe of the 14th century under Richard II is celebrated as an ancient chronicler. He was a canon-regular of Leicefter abbey, and wrote a hiftory of Englifh affairs in five books, from the conquelt to the year 1395: He wrote likewife an account of the depofition of Richard II. His works are printed with the ten Englifh hithorians publified ${ }^{\text {a }}$

## K N I

by the learned Selden. He is reckoned an exaet and faith. ful narrator of events within his own times.

Liswitton, or Tref-y-clacudd, in Geograpby, a marketrown and parish in the hundred of Knighton, and county of Radnor, Souti Wales; is feated in a valley, through which the river Teme meanders at the ditance of 17 tniles W. of L.udlow, and 33 S. of Shrewibury. The val'ey of Teme, in the vicinity of this town, is ki:ted by lofty hillis, the fides of which are well clothed with wood and verdure. The town contains fome good houfes, ranged on the fides of freets, which in parts are tteep. Here is a free grammar fchool. 'The church has rather a fingular appearance, from its irregular form, detached tower, with itrange fpire. Knighton has a weekly market, and an annual fair: and contained, in the year ISoo, 221 houles and 755 inhabitants.

On the weftern fide of the town, is part of the noted boundary embankment called Offa's Dyke, which was formed in the year 760 , and intended to be the line of demarcation between England and Wales. Harold made a law, that if any Wellhman was found on the ealtern fide of this dyke, he flould lofe his right hand. See Presteign.

KNIN, a town of Bohemia, in the circle of Beraun, near which is a gold mine, 12 miles S.E. of Beraun. N lat. $49^{\circ}+9^{\prime}$. E. long. $1+18^{\prime}$ - Alio, a fortified town of Delmatia, ftrengthened by a deep ditch, and dituated on a narrow neck where the river Kerka is joined by another Atream, called Butim-fchiza. This is fuppoled to be the ancient caftle called "Arduba," taken by Germanicus, 40 miles E. of Zara. N. lat. $43^{\circ} 55^{-1}$. E. long. $16^{\circ} 55^{\prime}$.

KNIP Bay, a bay on the W. coalt of the ifland of Curaçoa.

KNIPHAUSEN, a fea-port town of Germany, in the lordfhip of Jever, taking its name from an ancient caftle, where the tribunal of juftice is held; 5 miles E.S.E. of Jever. N. lat. $53^{\circ} 29^{\prime}$. E long. 8.

KNIS ГENEAUX, otherwife called Killifinons or Kifo tinons, the name of a people, who are fpread over a confiderable extent in the centre of the northern part of America. We are indebted to Mr. Mackenzic ( $e e$ Voyage from Monereal, \&cc. Introd. p. 9I, \&c.) for a particular account of thefe peop!e. Their language is the fame as that of the people who inhabit the coat of Britif America on the Atbantic, the Equimaux excepted, and continues along the coalt of Labrador, and the gulf and banks of St. Lawrence to Montreal. The lime then follows the Utawas river to its fource, and continues from thence nearly W. along the highla ds, which divide the waters that fark into Lake Superior and Hudfon's Bay. It then proceeds till it ilrikes the middle part of the river Winipic, following that water through the lake Winipie, to the difcharge of the Safkatchiwina into it; from thence it accompanies the latter to Fort George, when the line, Ariking by the lead of the Beaver river to the Elk river, runs along its banks to its difcharge in the lake of the Hills, from which it may be carried back E, to the ifle a la Croffe, and fo on to Churchill, by the Miffifippi. The wbole of the tract between this line and Hudfon's bay and Araits, that of the Efquimaux in the latter excepted, may be faid to be cxclufively the country of the Krifteneaux. Some of them, indeed, have penetrated farther W. and S. to the Red river, to the S. of lak. Winipic, and the S. branch of the Sakatchiwina.

Thefe people are of a moderate ftature, well proportioned, with few examples of deformity, and very active. Their complexion is copper-coloured, and their hair black, in which they refemble all the natives of North America. It is eut in various forms, according to the fancy of the feveral
tribes, and by fome it is left in the long, lank flow of nature. They very generally extract their beards, and both fexes manifeft a difpofition to pluck the hair from every part of the body and limbs. Their eyes are black, keen, and penetrating; their countenance is open and agreeable, and they are fond of decorating their perfoos. In the ufe of vermilion, to which they are much accu!tomed, they contraft it with their native blue, white, and brown earths, to which they frequently add charcoal. Their drels is fimple and commodious. It confits of tight leggins, reaching near the hip: a ftrip of cloth, or leather, called Affian, about a foot wide, and five feet long, whofe ends are drawn inwards and hang behind and before, covering a belttied round the wailt for that purpofe : a ciole veft or fhirt reaching down to the former garment, and cinctured with a broad Atrip of parchment faltened with thongs behind; and a cap for the liead, conlifting of a piece of fur, or fmall flsin. with the brufh of the animal as a fufpended ornament; a kind of robe is thrown occafionally over the whole of the drefs, and ferves both night and day. Thefe articles, with the addition of fhoes and mittens, condtitute the variety of their appart. The materials vary according to the feafor, and conlilt of dreffed moofe-fin, beaver prepared with the fur, or European woollens. The leather is neatly painted, and fancifully wrought in fome parts with porcupine quills, and moofe-deer hair; the fairts and leggins are alfo adorned with fringe and taffels; nor are the thoes and mittens without fomewhat of appropriate decoration, and worked with a confiderable degree of ckill and tate. Their head-drefles are compofed of the feathers of the fwan, the eagle, and other birds. The teeth, horns, and claws of different animals are allo the occafional ornaments of the lead and neck. Their hair is always befmeared with greafe. The making of every article of drefs is a female occupation; and they pay particular attention to the appearance of the men, whilit they neglect no decoration of their own perfons; and their faces are painted with more care than thofe of the women.

The female drefs is formed of the fame materials with thole of the men, but they are differently made and arranged. Their fhoes are commonly plain, and their leggins gathered below the knee. The coat, or bcds-covering, falls down to the middle of the leg, as-d is faltened over the fhoulde:s with cords, a flap or cape turning down about eight inches, both before and behind, and agreably ornamented with quill-work and fringe; the bottom is alfo fringed, and fancifully painted as high as the knee. Being loofe, it is inclofed round the waitt with a ftiff belt, decorated with taffels, and fattened behind. The arms are covered to the wrilt, with detached fleeves, fewed as far as the bend of the arm, from thence they are drawn up to the neck, and the corners of them fall down behind, as low as the wait. The cap, when a cap is ufed, confitts of a quantity of leather or cloth, fewed at one end, by which means-it is kept on the head, and, hanging down the back, is faftened to the belt as well as under the chin. 'The upper garment is a robe like that of the men. Their hair is divided on the crown, and tied behind, or fometimes faftened in large knots over the ears. They prefer European articles to their own commodities. Their ornaments, like thofe of favages in general, confift of bracelets, rings, and fimilar baubles. Some of the women tattoo three perpendicular lines, whichare fometimes double: one from the centre of the chin to that of the under lip, and one parallel on either fide to the corner of the mouth.

The Kniftencaix women are the moft comely of any feen by Mr. Mackenzie on the American continent: they are well proportioned, and the regularity of their features
would be acknowled ged by the more civilized people of Europe; and their complexion is lefs darkly tinged than that of thofe farages who have lefs cleanly habits. Thefe people are in general fubject to few diforders. The lues venerea, however, is common, and is cured by the ufe of timples, with the virtue of which they are well acquainted. They are alfo fubject to fluxes, and pains in the brealt. They are naturally :nild and affable, as well as juft in their dualingz; they are generous and hofpitable, and extremely good nat:red, when not inflamed by fpirituous liquors; indulgent to their children to excefs; the father takes pains in qualifying them for the operations of war and hunting, and the mother is equally attentive to the inftruction of the daughters. Illegitimacy is only attached to thofe children who are born before their mothers have cohabited with any man by the title of humand. Chaftity does not feen to be a virtue among them, nor is fidelity thought to be effential to the happinefs of a wedded life. Sometimes, however, the infidelity of a wife is punifhed with the lofs of her hair, nofe, and perhaps life. A temporary interchange of wives is not uncommon; and the offer of their perfons is confidered as a neceflary part of the hofpitality due to ftrangers. When a man lofes his wife, it is confidered as a duty to marry her fifter, if the has one; or he may have both, if he pleafes, at the fame time. Notwithitanding the amiable traits of their character, they are not free from vices, even of the moft atrocious kind. They are addicted to incelt and beftiality. When a young man marries, he lives with the father and mother of his wife, and is confidered as a franger, till after the birth of his firft child; he then attaches himfelf more to them than to his own parents; and his wife gives him no other denomination than that of the father of her chiid.
The profeffion of the men is war and hunting: they alfo fpear filh, but the management of the nets is committed to the women. The females are fubordinate, like thofe of favages in other tribes; but their labour is alleviated by the contiguity of lakes and rivers, where they employ canoes. In winter, when the waters are frozen, they travel with nedges drawn by dogs. They are fubject, however, to every kind of domeftic drudgery: they drefs the leather, make the clothes and fhoes, weave the nets, collect wood, erect the huts, fetch water, and perform every culinary fervice; fo that their life is an uninterrupted fucceffion of toil and pain. Under the impulfe of this feeling, they fometimes deftroy their female children. By the ufe of fimples they alfo procure abortion ; and this they do without any material injury to their own health.

Their funeral rites commence with fmoking, and terminate with a fealt : the body is drefied in the belt babiliments poffeffed by the deceafed, or his relations, and is then depofited in a grave, lined with branches: fome domeftic utenfils are placed in it, and a canopy erected over it. During the ceremony, they make great lamentations; and when the deceafed perfon is very much regretted, the near relations cut off their hair, pierce the flefhy part of their arms and thighs with arrows, knives, \&c. and blacken their faces with charcoal. If they have diitinguifhed themfelves in war, they are fometimes laid on a kind of fcaffolding; and it is faid, that women, as in the Eaft, have facrificed themfelves to the manes of their hufbands. The whole property of the deceafed perfon is deftroyed, and the relations take in exchange for the wearing apparel any rars that will cover their nakednefs. The featt which is given on this occafion, and which in fome cafes is repeated annually, is accomparied with eulogiums on the deceafed; and on the tomb are carved or painted the fymbols of his tribe, which are taken from the different animals of the country.

Vol. XX.

Thefe people have frequent fealts ; and at nated verivise as in fprong and autumn, they practife leng and folemn cerco monies. Dogs, and particularly thofe that are fat and mik-white, are offered as facrifices. They alfo make lar se offerings of their property, of whatever kind it be. Tha\% ceremonies are performed on the batik of a river or lake: and if any ftranger, who is in want of any thing that is difplayed as an offering, chance to pala by, he has a right to take it, upon replacing fomething of anferior value; but to take or touch amy thing vantonly is confidered as a facrilegious act, and lifichly infulting to the great Matter of lifa, to adupt their expre flion, who is the facred object of their devotion. The foene of private facrince is the lodge of the perfon who prepares it, and it is conducted with a varicey of ceremonies. He begins by fpreading the contents of his medicinc-bas, containng various articles, on a piece of new cloth or well-dreffed monfe-fkin neatly painted. The prin. cipal of thefe artictes is a kind of houfethutd-god, which i, a fmall carved image about eight inches long, and is an object of the moft pious regard. The sest article is his war-cap, decorated with the feathers and plunics of rare birds, beavers, eagle's claws, \&c. From this is fufrended a quill or feather for every enemy whom the owner of it has flain in battle. The remaining contents of the bag are a piece of Bralil to. bacco, feveral roots and timples in repute for their medicinal qualities, and a pips. After certain previots ceremonies, an affiltant lights the pipe, and prefents it to the ofictating perfon, who, turning to the eatt, draws a few whiffs, which he blows to that point. He practifes the fame ceremony towards the other three quarters, with his eyes conitantly directed upwards. After fome other ceremonies performed with this pipe, he makes a fpeech, explaining the defign of the attendants being called together, and concludes with an acknowledgment of palt mercies, and a prayer fur the continuance of them, from the Mater of life. He then fits down, and the whole company declare their approbation and thanks by uttering the word ho! with an emphatic prolongation of the laft letter. The Affitant or Michiniwais again takes up the pipe, and holds it to the mouth of the officiating perfon, who, after fmoking three whiffs out of it, utters a fhort prayer, and then goes round with it in a courfe from eaft to welt, to every perfon prefent; and thus the pipe is fmoked out: when, after turning it three or four times round his head, he drops it downwards, and replaces it in its original fituation. He then returns the company thanks for their attcndance, and wifhes them, as well as the whole tribe, health and long life. Thefe fmoking rites precede every matter of great importance, with more or lefs ceremony, but always with equal folemnity. The public fealts are condreted in a fimilar manner, but with fome additional ceremony. At thefe feveral chiefs officiate, and the guefts difrourfe upon public topics, repeat the heroic deeds of their forefathers, and excite the riling gencration to follow their cxample. From thefe fealts the women and children are excluded: but the women, who are forbidden to enter the places facred to thefe feltivals, darce and ling around thera, and fometimes beat time to the mufic within them; thus forming an agreeahle contraft.

As to their divitions of time, the Kinifeneaux compute the length of their journies by the number of nights paffed in performing them; and they divide the year by the fucceffion of moons, the names of whicit are defcriptive of the feveral feafons. Thefe people are acquainted with the medicinal virtues of many herbs and fimples, and apply the roois of plants and the bark of trees with fuccefs. But the conjurers, who monopolize the medical fcience, blend myikery with their art, and conceal their knowledge. Their materia

## K NO

medica they adminiter in the form of purges and clyters; but the remedies and furgical operations are fuppofed to derive much of their effect from magic and incantation. A fh arp flint ferves them as a lancet for letting blood, as well as for fcarification in bruifes and fwellings.

Among their various fuperititions, they believe that the vapour which is feen to hover over moilt and fwampy places is the fpirit of fome perfon lately dead. They alfo fancy another fpirit which appears in the flape of a man, upos the trees near the lodge of a perfon deceafed, whofe property has not been interred with him. He is reprefented as bearing a gun in his hand; and it is believed that he docs not return to his reft, till the property that has been withheld from the grave has been facrificed to it. Mr. Mackenzie has given examples (ubi fupra) of the Knilteneaux and Algonquin languages, between which there is a confiderable refemblance. See Algonquins.

KNITTERFELD'l', a town of the duchy of Stiria, on the river Muehr; 20 miles S.W. of Pruck. N. lat. $47^{\circ}$ $14^{\prime}$. E. long. $4^{\circ} 3^{\prime}{ }^{\prime}$.

KNITTLE, in Sea Languzge, a fmall line, which is either plaited or twifted, and ufed for various purpofes at fea; as to faften the fervice in the cable, to reef the fails by the bottom, and to kiang the hammocks between decks, $\& c$.

KNITTLINGEN, in Geography, a town of Wurtem. berg, the birth-place of Fault, one of the firl printers; 22 miles S. of Heidelberg.

KNOCK-HEAD, a cape of Scotland, on the north coait of Banffithire; 3 miles W.N.W. of Banff.

KNOCKING Mill. See Stamping.
KNOCKLAYD, in Geography, a mountain in the northern part of the county of Antrim, Ireland; ; about two miles S. of Ballycafte.

KNOCKMELEDOWN, a chain of mountains in Ireland, between the colnties of Waterford and Tipperary, and extending into both. Thefe are rated by Smith amongft the higheft mountains in Ireland. On the fummit of one of them, major Eeles, the electrician, was buried by his own defire.

KNOCKNAREA, a cape of Ireland, in Sligo bay; 6 miles W. from Sligo.

KNOCKTOPHER, a por-town of the county of Kilkenny; Ireland; $\sigma_{3}$ miles S.W. from Dublin.

KNOLL, a term ufed in many parts of the kingdom for the top of a fmall hill, or for the hill itfelf.

KNOLLES, Richard, in Biograpby, an Englifh hiftorian, a native of Northemptonflire, was entered at the univerfity of Oxford about the ycar 15 万0. He was afterwards chofen mafter of the free-fchool at Sandwich, and proved his fitnefs for this poft by publihing a compendium of Latin, Greek, and Hebrew grammar. In 1610 he publifhed, in folio, "A Hiftory of the Turks," which had been the labour of twelve years, and was executed in a manner highly creditable to his reputation. It has paffed through many editions; and continuations have been made to it, of which the belt is that of Paul Rycaut, conful at Smyrna. Mr. Knolles likewife wrote "A brief Difcourfe of the Greatnefs of the Turkih Empire." He died at Sandwich, in 1610 .

KNOLLIS, Francis, an Englifh ftatefman, was born at Grays, in Oxfordhire ; and after receiving an univerfity education, he went to court, and became a zealous friend to the reformation, in the reign of Edward V1., at whofe death he went abroad. On the accefion of queen Elizabeth he returned, and was made privy counfellur, and vice chamberlain of the hourehold. He was employed in feveral
important matters of flate: was one of the commiffioners who fat in judgment on Mary queen of Scots; was appointed trealurer of the royal houfchold, and knight of the Garter. He died in 1596. Sir Francis wrote a treatife againtt the ufurpations of papal bifhops, printed after his death in 1608 ; and a general furvey of the Ine of Wight, which has not been printed.

KNOLLS, in Agriculture, a provincial term ufed in fome counties to fignify turnips.
IKNONAU, in Geograply, a bailiwick of Switzerland, in the canton of Zurich.

KNOPPERS, a fuperior kind of Gall-nuts; which fee.
KNORR à Russenhoth, Christian, in Biograpby, a learned German orientalif, was born in the year 1636. He purfued his fludies at various colleges, and then travelled for improvement into France, England, and Helland. The fubjects which had engaged his attention were chemitry and the cabaliftic art, of which he had been from his youth a great admirer. At Amitterdam he was introduced to the knowledge of the Oriental tongues, and Hebrew ; and made fuch progrefs in his favourite fludies, as to obtain the efteem and friendhip of Lightfoot, More, and Van Helmont. By the latter of thefe learned men he was introduced to the count palatine of Sulzbach, who, in 1688 , nominated him one of his privy council, and afterwards gave him the appointment of his chancellor. The dutics of thefe offices did not divert him from his literary, chemical, and myftical purfuits. He tranllated, into the German language, fir Thomas Brown's "Inquiry into vulgar Errors," and various other pieces ; but his reputation is chiefly founded on a work, entitled "Kabbala Denudata, feu Doctrina IIebreorum tranfcendentalis, et metaphyfica, atque theoiogica, \&c." in 3 vols. 4to. This work abounds in wild reveries, fanciful chimeras, and myttical abfurdities; but it contains, at the fame time, very learned and valuable refearches relative to the philofophy of the Hebrews.

KNOTS, in Gardening, a term ufed to exprefs the rudiments of the firft branches of plants, as they grow up from the feed. Thus, in the melon, the two firlt leaves or feedleaves are called the ears, and the branches that grow from them are called, according to the order of their growth, the firlt, fecond, and third knots. Mr. Quintiny's famous method of raifing the beft melons, depended principally on the cutting off every thipd knot of the plant as they grew up. Philof. Tranf. N ${ }^{2} 45$.

In trees, the knot denotes that part from whence it fhoots out branches, roots, or even fruit.

The wood is harder and clofer in the knots than in any other part, but it is alfo more fubject to fplit there.

The ufe of the knots of plants is to ftrengthen the ftem: they ferve alto as fearces to filtrate, purify, and refine, the juice raifed up for the nourifinment of the plant.

Knot, in Ailitary Lanyuage, the wing or epaulette, com: monly made of wortted, of a non-commiffioned officer or corporal. When ferjeants and corporals are fentenced to be reduced to the ranks, the knot is generally cut off by the drummajor, in the prefence of the battalion, as a mark of infamy.

Knot on board a Sbip, is a large knob formed on the extremity of a rope, by untwifting the ends thereof, and interweaving them regularly amongit each other. Of this there are feveral forts: the chief of which are the zuale knot, which is fo made with the lays of a rope, that it canoot Пip, and ferves for fheats, tacks, and floppers; the bow-line knot is fo firmly made, and fattened to the crengles of the fails, that they mult break, or the fails fplit, before it will Лlip; the flecp-/bank knot, which ferves to fhorten a rope without cutting it, which may be prefently loofened; the diamond

## K N O

knot, the rofe knot, \&c. The knots are gencrally ufed to falten one rope to another, by means of a fmall cord attached to the neck of the knot, calted the laniard, which is firmly tied about both ropes. They are alfo defigned to prevent the end of a rope from fliding through an eye, which the knot is intended to confine in a particular fituation.

Knot-Berries. Sce Raseberries.
Kxot-Grafs, in Botany. See Polygonum.
Kxot-Grafs, in Rural Economy, a common name often given to couch-grafs. See Coucn-Grafs.

Kxot-Grafs. Mountain. See Whitlow-Grafs.
Knots of the Log-Line, at fea, are the divilions of it. See Log.

Knot is alfo ufed for the intrigue of a romance, or dramatic piece; being that part where the perfons are the moft embarraffed, by a conjuncture of affairs, whofe end it is not ealy to forefec.

Ariftotle, under this term, includes all the incidents of a tragedy, from its begrinuing to the place where it begins to unravel. The knot holds as long as the mind is kept fufpended about the event. The knot ought always to laft to the middle of the fifth act, otherwife the reft of the piece languifhes.

Knot, Order of the, was the name of a military order in the kingdom of Naples, inflituted in 1352, by queen Jane I. on occation of the peace eftablifhed between her and the king of Hungary, by means of her marriage with Louis prince of Tarentum. It was fo called becaufe the knights wore for their badge a knot, like a true-lover's knot, embroidered on the brealt of their coat in purple filk, intermixed with gold.

The order confifted of fixty knights. Clement VI. approved of this order, and gave it the rule of St. Bafil: it chofe St. Nicolas for its protector; but it dwindled away after the death of its foundrefs.

Knot, in Ornithology, the name of an Englifh bird of the fnipe kind, not known among authors by any particular Latin name, unlefs it be the calidrys nigra, or black calidrys of Bellonius, which is doubtful from his defeription; and faid to have obtained its Englifh name from Canute, one of the Danifh kings of this ifland, who was particularly fond of it: it is the tringa Canutus of Linnæus, which fee.

Knot, or Bofs, in Pointed Arsbitedure, the key flone of the groin, where all its fpringers or ribs meet together.

KNOULTON Lake, in Geography, a lake of America, in the ftate of Vermont. N. lat. $44^{\circ} 4^{\circ}$. W. long. $71^{\circ} 50^{\prime}$.

KNOUT, or $\mathrm{K}_{\text {noot, }}$, is the name of a punihment infieted in Ruffia, with a kind of whip called knout, and made of a long Itrap of leather prepared for this purpofe. This inflrument is a hard thong, about the thicknefs of a crown piece, and $\frac{3}{4}$ of an inch broad, and tied to a thick plaited whip, which is connected, by means of an iron ring, with a fmall piece of leather faftened to a fhort wooden handle. With this whip the executioners dextroufly carry off a dip of fin from the neck to the bottom of the back laid bare to the waitt, and repeating their blows, in a little while rend away all the fkin off the back in parallel ftrips. In the common knout, the criminal receives the lafhes fuffended on the back of one of the executioners: but in the great knout, which is generally ufed on the fame occafions as racking on the wheel in France, the criminal is raifed into the air by means of a pulley fixed to the gallows, and a cord faftened to the two writts tied together; a piece of wood is placed between his two legs allo tied together; and another of a crucial form under his breaft. Sometimes his hands are tied behind over his back, and when he is pulled up in this
pofition, his fhoulders are diflocated. The executioners can make this punifhment more or lefs cruel : and, it is fuid, are fo dextrous, that when a criminal is condemned to die, they can make him expire at pleafure, either by one or feveral lafhes.

KNOWING, Principles and Rules of. See Princifle, and Rule.

KNOWLEDGE may be confidered cither as an opera. tion of the mind, or as the refult of that operation. In the former fenfe, it denotes the clear perception of truth; and in the latter, it fignifics the treafure of affociated ideas, that are laid up in the mind, in confequence of clear perceptions; 'thus, mathematics, aftronomy, ethics, hiftory, \&c. are bramehes of knowledge.
K.sowledge, according to Mr. Locke, confifs in the perception of the connection and agreement, or difagreement and repugnancy, of our ideas. See Idea.

In which fenfe, knowledge ftands oppofed to ignorance.
To know that white is not black, is only to perceive that thefe two ideas do not agree. So, in knowing that the three angles of a triangle are equal to two right oites; what do we more than perceive, that equality to two right ones neceffarily agrees to, and is infeparable from, the three angles of a triangle ?

Knowledge, Kinds of. As to what relates to the agrecment or difagreement of ideas, we may reduce the whole doctrine, and confequently the whole ftock of our knowledge, to four heads, viz. identity or diverfity, relation, co. exilfence, and real exifence.
With refpect to the identity or diverfity of our ideas, we may obferve, that it is the firit act of the mind to perceive its own ideas; and, fo far as it perceives them, to know what each is, and thereby to perceive their difference; that is, the one not to be the other: by this the mind clearly perceives each idea to agree with itfelf, and to be what it is: and all diftinct ideas to difagree. This it does without any pains, or deduction, by its natural power of perception and diftinction; and, for doing this, men of art have eftablifhed certain general rules or principles; as that, what is, is; and that it is impoffible for the fame thing to be, and not to be But no maxim can make a man know clearer, that round is not fquare, than the bare perception of the two ideas, which the mind, at firlt fight, perceives to difagree.
The next kind of agreement, or difagreement, the mind perceives, in any of its ideas, may be called relative, and is nothing but the perception of the relation between any two ideas, of what kind foever ; that is, their agreement or dif. agreement, one with another, in the feveral ways, or refpects, the maind takes of comparing them.

The third fort of agreement, or difagreement, to be found in our ideas, is coeriflence, or non-coexiflence, in the fame fub. ject; and this belongs particularly to fubftances. Thus when we pronounce concerning gold, that it is fixed, it amounts to no more but this, that fixednefs, or a power to remain in the fire unconfumed, is an idea which always accompanies that particular fort of yellownefs, weight, fufibility, \&c. which make our complex idea fignified by the word gold.

The fourth fort is that of aitual and real exiflence, agreeing to any idea.

Within thefe four forts of agreement, or difagreement, feems contained all the knowledge we have, indeed all we are capable of; for all that we know, or can affirm, concerning any idea, is, that it is, or is not, the fame with fome other; as, that blue is not yellow: that it does, or does not, coexift with another in the fame fubject; as, that iron is fufceptible of magnetical impreffions: that it hath that or
shis relation to fome other ideas; as, that two triangles upon equal bafes, between the fame parallels, are equal: or, that it has a real exittence without the mind; as, that Gud is.

The mind becomes poffefled of truth in feveral manners, which conltitute fo many different fpecies of knowledge. Thus, when the mind has a prefent view of the agreement or difagreement of any of its ideds, or of the relation they have one with another, it is called aftual knowledge.

Secondly, a man is faid to know any propolition, when, having once evidently perceived the agreement or difagreement of the ideas whereof it confits, and fo lodged it in his memory, that whenever it comes to be reflected on again, the mind affents to it without doubt or helitation, and is certain of the truth of it: this may be called babitual knowlalge. And thus a man may be faid to know all thofe truths which are lodged in his memory, by a foregoing, chear, and full perception.

OF bolitun! knowledge, there are two forts: the one conGilts of fich truths, had up in the memory, as, whenever they occur to the mind, it actually perceives the relation that is between their ideas; and this is in all thofe truths where the ideas themfelves, by an immediate view, difcover their agreement or difagreement one with another. The other is of fuch truths, whereof the mind having been convaced, it retains the memory of the conviction, without the proofs. Thus a man that remembers certainly, that he once perceived the demonftration, that the three angles of a triangle are equal to two right ones, knows it to be true, when that demonftation is gone out of his mind, and cannot puffibly be recollected; but he knows it in a different way from what he did before: namely, not by the intervention of thofe intermediate ideas; whercby the agreement, or difagreement, of thofe in the propofition was at firft perceived; but by remembering, that is, knowing, that he was once certain of tise truth of this propofition, that the three angles of a triangle are equal to two right ones, - the immutability of the fame relation between the fame immutable things, is now the idea that fhews him, that if the three angles of a triangle were once equal to two right ones, they will always be fo. And hence he comes to be certain, that what was once true, is always true; what ideas once agreed, will always agree; and confequently, what he once knew to be true, he will always know to be true, as long as he can remember that he once knew it.

Knowledge alfo may be ufefully diftinguifhed into three kinds; bijforical, philofopbical, and matbematical.

Knowledse, Iliforical, is merely the knowlesge of faits, or of what is or happens in the material world, or within our own minds. Thus, that the fun rifes and fets, that trees bud in the fpring, that we remember, wiil, scc. are inftances of hiftorical knowledge.

Knowledge, Philofophical, is the knowledge of the reafons of things, or of what is or happens. Thus he has a philofophical knowledge of the motion of rivers, who can explain how it arifes from the declivity of the bottom, and from the preffure which the lower part of the water futtains som the upper. So likewife the hewing how, and by what reafon, defire or appetite arifes from the perception or 1 magination of its object, wou'd be philofophical knowledge.

Knowledge, Mathematical, is the knowledge of the quantity of things, that is, of their proportions or ratios to fome given meafure. Thus he who knows the proportion of the meridian heat of the fun at the fummer folltice to its meridian heat at the winter folitice, might fo far be faid to iave a mathematical knowledge of the fun's heat. So likewife he kas a mathematical knowledge of the motion of a planct in its orbit, who can diftinctly fhew how, from the
quantity of the impreffed and centripetal force, the velocity of the planet is produced; and how, from the action of the double force, the elliptical figure of the orbit arifes.

Thefe three kinds of knowledge differ evidently, it being one thing to know that a thing is ; another, the reafon why it is ; and a third, to know its quantity or meafure.

It is alfo evident, that biforical knowledge, though extenfively ufeful, and the foundation of the relt, is the lowelt d:gree of human knowledge. Thofe who aim at the greateft certainty ought to join mathematical with philofophical knowledge. Nothing can more evidently fhew that an effect arifes from a cortain caufe, than the knowledge that the quantity of the effect is proportional to the force of the caufe. Belides, there are many things in nature, the reafons of which depending on certain figures or quantities, are not affignable but from mathematical princiules.

Knowledge, Degrees of. As to the different degrees, or clearnels of our knowledge, it feems to lie in the different way which the mind has of perceiving the agreement or difagreement of any of its ideas. Whaen the mind perceives this agreement or difagreement of two ideas immediately by themfelves, without the intervention of any other, we may call it intuiltive knowledge ; in which cafe the mind perceives the truth, as the eye doth light, only by being directed towards it. Thus the mind perceives that white is not black; that three are more than two, and equal to one and two. This part of knowledge is irrefiftible; and, like the bright funfhine, forces itfelf immediately to be perceived, as foon as ever the mind turns its view that way. It is on this intuition that all the certainty and evidence of our other knowledge depends, which certainly every one finds to be fo great, that he cannot imagine, and therefore cannot require a greater. The next degrec of knowledge is, where the mind perceives not this agreement, or difagreement, immediately, or by the juxtapofition, as it were, of the ideas ; becaufe thofe ideas, concerning whofe agreement, or difagreement, the inquiry is made, cannut, by the mind, be fo put together as to thew it. In this cafe, the mind is obliged to difcover the agreement, or difagreement, which it fearches for, by the intervention of other ideas: and this is that which we call reafoning.

Thus, if we would know the agreement, or difagree. ment, in bignefs, between the three angles of a triangle and two right angles, we cannot do it by an immediate view and comparifon of them, becaufe the three angles of a triangle cannot be brought together at once, and compared with any other one or two angles; and fo of this the mind has no immediate or intuitive knowledge. But we mult find out fome other angles, to which the three angles of a triangle have equality; and, linding thofe equal to two right cnes, we come to know the equality of thefe three angles to two right ones.

Thofe intervening ideas, which ferve to fhew the agreement of any two others, are called proofs; and where the agreement, or difagreement, is by this means plainly and clearly perceived, it is called dcmonffration; and a quicknefs in the mind to find thofe proofs, and to apply them right, is that which is called fogacity.

This knowledge, though it be certain, is not fo clear and evident as intuitive knowledge; it requires pains and attention, and ftcady application of mind, to difcover the agrecment, or difagreement, of the ideas it confiders; and there mult be a progrefion by fteps and degrees, before the mind can, in this way, arrive at any certanty. Before demonftration, there was a doubt, which, in intuitive knowledge, cannot happen to the mind, that has its faculty of per-
ception left in a degree capable of diftinct ideas, no more than it can be a doubt to the eye (that can ditincily fee white and black), whether this ink and paper be all of a colour. Now, in every fep that reafon- makes in demonftrative knowledge, there is an intuitive knowledge of that agreement, or difagrement, it feeks, with the next intermediate idea, which it ufes as a proof; for, if it were not fo, that yet would need a proof, fince, without the perception of fuch agrcement, or difagreement, there is no knowledge produced.

By which it is evident, that every flep in reafoung, that produces knowledge, has intuitive certainty; which when the mind perceives, there is no more required, but to remember it, to make the agreement, or difagreement, of the ideas, concerning which we inquire, vifible and certain. This intuitive perception of the agreement, or difagreement, of the intermediate ideas in each $\mathfrak{R e p}$ and progreffion of the demonitation, mult alfo be exactly carried in the mind; and a man mult be fure, that no part is left out, which, in long deductions, the memory cannot eafily retain, and therefore this knowledge becomes more imperfect than intuitive, and men often embrace falfehoods for demonftrations.

It has been generally taken for granted, that mathematics alone are capable of demonltrative certainty : but to have fuch an agreement, or difagreement, as may be intuitively perceived, being, as we imagine, not the privilege of the ideas of number, extenfion, and figure atone, it may poffibly be the want of due method and application in us, and not of fufficient evidence in things, that demonftration has been thought to have fo little to do in other parts of knowledge. For, in whatever ideas the mind can perceive the agreement, or difagreement, immediatcly, there it is capable of intuitive knowledge, and, where it can perceive the agreement, or difagrement, of any two ideas, by the inturtive perception of the agreement, or difagreement, they have with any intermediate ideas, there the mind is capable of demonlitration, which is not limited to the ideas of figure, number, extenfion, or their modes.

The reafon why it has been generally fuppofed to belong to thefe only, is, becaufe, in comparing their equality or excefs, the modes of numbers have every the leaft difference very clear and perceivable: and, in extenfion, though every the leaft excefs is not fo perceptible, yet the mind has found out ways to difcover the juit equality of two angles, extenfions, or figures; and both numbers and figures can be fet down by vifible and lafting marks. Bur, in other fimple ideas, whofe modes and differences are made and counted by degrees, and not quantity, we have not fo nice and accurate a diftinction of their differences, as to perceive or find ways to meafure their juft equality, or the leaft differences. For thofe other limple ideas being appearances, or fenfations produced in us, by the fize, figure, motion, \&c. of minute corpufcles, fingly infenfible, their different degrees alfo depend on the variation of fome or all of thofe caufes; which, fince it cannot be obferved by us in particles of matter, whereof each is too fubtile to be perceived, it is impoffible for us to have any exact meafures of the different degrees of thefe fimple ideas.

Thus, not knowing what number of particles, nor what motion of them, is fit to produce any precife degree of whitenefs, becaufe we have no certain ftandard to meafure them by, nor means to diftinguifh every the leaft difference ; the only help we have is from our fenfes, which in this point fail us. But where the difference is fo great as to prodice
in the mind ideas clearly dininct, there ideas, as we fee in colours of diferent kinds, blue and red for inftance, are as capable of demonitration as ideas of number and extention; and what is here faid of colours, holds true in all fecondary qualities.
'Thefe two then, intuition and demonflration, are the degrees of our knowledge; and whatever comes fhort of one of thefe, is only faith, or opinion, not knowledge, at leaft in all general truths.

There is, indeed, another perception of the mind, employed about the particular exintence of finite beings without us, which going beyond probability, but not reaching to either of the foreroing degrees of certainty, paffes under the name of knowledge.

Nothing can be more certain, than that the idea we re. ceive from an external object is in our minds : this is intuitive knowledge; but whether we can thence certainly infer the exittence of any thing without us, correlponding to that idea, is that whereof fone men think there may be a queftion made; becaufe men may have fuch an idea in their minds, when no fuch thing exifts, nor any fuch object affects their fenfes.

But it is erident, that we are invincibly confcious to ourfelves of a different percoption, when we look on the fun in the day, and when we think on it by night; when we actually taite wormwood, or fmell a rofe, or only think on that favour or odour; fo that we may add, to the two furmer forts of knowledge, this alfo of the exitence of particular external objects, by that perception and conicioufnefs we have of the actual entrance of ideas from them; and allow thefe three degrees of knowledge, viz. intuilive, demonfratize, and forfitize.

But, fince our knowledge is founded on, and employed about, our ideas oniy, will it follow thence, that it mult be conformable to our ideas, and that where our ideas are clear and diltinct, obfcure and confufed, there our knowledge will be fo too? We anfwer, No; for our knowledge confinting in the perception of the agreement, or difagreement, of any two ideas; its clearnefs or obfcurity conliils in the clearnefs or obfcurity of that perception, and not in the clearnefs or obfcurity of the ideas themfelves. A man (for initance), who has a clear idea of the angles of a triang!e, and of equality to two right ones, may yet have but an obfcure perception of their agreement, and fo have but a very obfcure knowledge of it : but obfcure and confufed ideas can never produce any clear or diftinct knowledge; becaufe, as far as any ideas are obfcure or confufed, fo far the mind can never perceive clearly, whether they agree or difagree ; or, to exprefs the fame thing in other words, he that has not determined ideas to the words he ufes, cannot make propofitions of them, of whofe truth he can be certain.

From all this it follows; I. That we can have no knowledge farther than we bave ideas.
2. That we have no knowledge farther than we can have perception of the agreement, or difagreement, of our ideas, either by intuition, demonftration, or ferfation.
3. We cannot have an intuitive knowledge, that thall extend itfelf to all our ideas, and all that we would know about them ; becaufe we cannot examine and perceise all the relations they have one to another by juxtapofition, or in immediate comparifon one with another. Thus, we canno: intuitively perceive the equality of two extenfions, the difference of whofe figures makes their parts incapable of an exact immediate application.
4. Our rational knowledge cannot reach to the whole extent of our ideas ; becaufe, between two diferent ideas which

## KNOWLEDGE.

we would examine, we cannot always find fuch proofs, whercby we can conmect one to another with an intuitive knowledge in all the parts of the deduction.
5. Senfitive knowledge, reaching no farther than the exiftence of things actually prefent to our fenfes, is yet much narrower than either of the former.
6. From all which it is evident, that the extent of our knowledge comes not only fhort of the reality of things, but even of the extent of our own ideas. We lave the ideas of a fquare, a circle, and equality; and yet, perhaps, fhall never be able to find a circle equal to a fquare. Sce Circle.

Knowledge, Extent and Limits of. The affirmations or negations we make concerning the ideas we have, being reduced to the four forts above-mentioned, viz identity, coexiftence, relation, and real exiftence, let us inquire hoiv far our knowledge extends in each of thefe.

1. As to identity and diverfity, our intuitive knowledge is as far extended as our ideas themfelves; and there can be no idea in the mind, which it does not prefently, by an intuitive knowledge, perceive to be what it is, and to be different from any other.
2. As to the agreement or difagreement of our ideas of co-exittence, our knowledge herein is very defective, though it is in this that the greatelt and moft material part of our knowledge, concerning fubftances, confilts: for our ideas of fubftances being nothing but certain collections of fimple ideas co-exifting in one fubject (our idea of flame, for inftance, is a body, hot, luminous, and moving upwards); when we would know any thing farther concerning this, or any other fort of fubftance, what do we but enquire what other qualities, or powers, thefe fubflances have, or have not? which is nothing elfe but to know what other fimple ideas do, or do not exift with thofe which make up fuch complex ideas. The reafon of this is, that the fimple ideas, which make up our complex ideas of fubitances, have no vifible neceffary connection, or inconfiftence, with other fimple ideas, whofe co-exiltence with them we would inform ©urfelves about. Thefe ideas being likewife, for the moft part, fecondary qualities, which depend upon the primary qualities of their minute or infenfible parts, or on fome thing yet more remote than the fe from our comprehenfion, it is impoffible we fhould know which have a neceffary union, or inconfiftence, one with another; fince we know not the root from whence they fpring, or the fize, figure, and texture of parts on which they depend, and from which they refult. Befides this, there is no difcoverable connection between any fecondary quality, and thofe primary qualities that it depends on. We are fo far from knowing what figure, fize, or motion, produces (for inftance) a yellow colour, or fweet tafte, or fharp found, that we can by no means conceive how any fize, figure, or motion, can poffibly produce in us the idea of any colour, tatte, or found, whatfoever ; there being no conceivable connection between the one and the other.

Our knowledge, therefore, of co-exiftence reaches little farther than experience. Some few, indeed, of the primary qualities have a neceffary dependence, and viifble connection, one with another: as figure neceffarily fuppofes extenfion ; receiving or communicating motion by impulfe fuppofes folidity: but qualities co-exittent in any fubject, without this dependence and connection, cannot certainly be known to co-exift, any farther than experience, by our fenfes, informs us. Thus, though, upon trial, we find gold yellow, weighty, malleable, fufible, and fixed; yet, becaufe pone of thele have any evident dependence, or neceffary conaection, with the other, we cannot certainly know, that,
where any four of thefe are, the fifth will be there alfo, how highly probable foever it may be. But the highelt degree of probability amounts not to certainty, without which there can be no true knowledge; for this co-exiftence can be no true knowledge; for this co-exiltence can be no farther known than it is perceived; and it cannot be perceived, but either, in particular fubjects, by the obfervation of our fenfes, or, in general, by the neceflary connection of the ideas themielves.

As to incompatibility, or repugnancy to co-exiftence, we know, that no fubject can have of each fort of primary qualities more than one particular at once, as one extenfion, or one figure; and fo of fenfible ideas peculiar to each fenfe: for whatever, of each kind, is prefent in any fubject, excludes all other of that fort ; for inftance, one fubject camnot have two fmells, or two colours, at the fame time.

As to powers of fubttances, which make a great part of our enquiries about them, our knowledge reaches little farther than experience; becaufe they confilt in a texture and motion of parts, which we cannot by any means come to difcover; and I doubt, whether, with thofe faculties we have, we fhall cver be able to carry our gencral knowledge much fa:ther in this part. Experience is that, which, in this part, we mult depend on: and it were to be wifhed, that it were more improved. We find the advantages fome men's generous pains have this way brought to the ftock of natural knowledge; and if others, efpecially the philofophers by fire, had been fo *wary in their obfervations, and fincere in their reports, as thofe who call themfelves philofophers ought to have been, our acquaintance with the bodies here about $u s$, and our infight into their powers and operations, might have been yet much greater.

As to the third fort, the agrement, or difagreement, of our ideas in any other relation; this is the largeft field of knowledge, and it is hard to determine how far it may extend: this part depending on our fagacity in finding intermediate ideas, that may fhew the habitudes and relations of ideas, it is a hard matter to tell when we are at an end of fuch difcoveries. They who are ignorant of algebra, cannot imagine the wonders of this kind that are to be done by it: and what farther improvements and helps, advantageous to other parts of knowledge, the fagacious mind of man may yet find out, it is not eafy to determine.

This, at leart, we may believe, that the ideas of quantity are not the only ones capable of demonftration and knowledge; and that other, and, perhaps, more ufeful parts of contemplation, would afford us certainty, if vices, paf. fions, and domineering interelt, did not oppofe or menace endeavours of this kind.

As to the fourth fort of knowledge, viz. of the real, afual exiflence of things, we have an intuitive knowledge of our own exiftence, a demontrative knowledge of the exiftence of God, and a fenfitive knowledge of the objects that prefent themfelves to our fenfes.

Hitherto we have examined the extent of our knowledge, in refpect of the feveral forts of beings that are: there is another extent of it, in refpect of univerfality, which will alfo deferve to be confidered; and this, in regard to our knowledge, follows the nature of our ideas. If the ideas, whofe agreement, or difagreement, we perceive are abftract, our knowledge is univerfal; for what is known of fuch general ideas, will be true of every particular thing, in which that effence, that is, that abftract idea, is found: and what is once known of fuch ideas, will be perpetually and for ever true; fo that, as to all general knowledge, we must fearch and find it only in our own

## KNOWLEDGE.

minds; and it is only the examining our own ideas that furnihes us with it. Truth belonging to effences of things (that is, to abftract ideas) are eternal, and are to be found out by the contemplation only of thofe effences; as the exiftence of things is to be known only from experience.

Knowlenge, Reality of. It is evident, that the mind knows not things immediately, but by the intervention of the ideas it has of them. Our knowledge, therefore, is real, only fo far as there is a conformity between our ideas, and the reality of things. But how fhall we know when our idcas agree with things themfelves? It is anfwered, There are two forts of ideas, that we may be affured agree with things: thefe are,

1. Simple ideas, which, fince the mind can by no means make to itfelf, mult be the effect of things operating upon the mind in a natural way, and producing therein thofe perceptions, which, by the will of our Maker, they are ordained and adapted to. Hence it follows, that fimple ideas are not fictions of our fancies, but the natural and regular production of things without us, really operating upon us, which carry with them all the conformity our ftate requires, which is to reprefent things under thofe appearances they are fittelt to produce in us. Thus the idea of whitenefs, as it is in the mind, exactly anfwers that power which is in any body to produce it there; and this conformity between our fimple ideas, and the exittence of things, is fufficient for real knowledge.
2. All our complexi ideas, except only thofe of fubftances, being archetypes of the mind's own making, and not referred to the exiltence of things, as to their originals, cannot want any conformity neceffary to real knowledge; for that which is not defigned to reprefent any thing but itfelf, can never be capable of a wrong reprefentation. Here the ideas themfelves are conlidered as archetypes, and things are no otherwife regarded than as conformable to them. Thus, the mathematician confiders the truth and properties belonging to a rectangle, or circle, only as they are ideas in his own mind, which poflibly he never found exilting mathematically, that is, precifely true; yet his knowledge is not only certain, but real, becaufe real things are no farther concerned, nor, intended to be meant by any fuch propolitions, than as things really agree to thofe archetypes in the mind.
3. But the complex: ideas, which we refer to archetypes without us, may differ from them; and fo our knowledge about them may come fhort of being real : and fuch are our ideas of fubflances. Thefe mult be taken from fomething that does, or has exifted, and not be made up of ideas arbitrarily put together, without any real pattern. Herein, therefore, is founded the reality of our knowledge concerning fubltances, that all our complex ideas of them muft be fuch, and fuch only as are made up of fuch timple ones as have been difcovered to co-exitt in nature: and our ideas, being thus true, though not, perhaps, very exact copies, are the fubject of real knowledge of them. Whatever ideas we have, the agreement we find they have with others will be knowledge. If thofe ideas be abftract, it will be general knowledge ; but to make it real concerning fubAtances, the ideas mult be taken from the real exiftence of things. Wherever, therefore, we perceive the agreement, or difagreement, of our ideas, there is certain knowledge; and wherever we are fure thofe ideas agree with the reality of things, there is certain, real knowledge.

Knowledge, melbod of improving or cularging. It being the received opinion amongt men of letters, that maxims are the foundation of all knowledge, and that fciences are each of them built upon certain precognita, from whence
the underfanding is to take its rifc, and by which it is to conduct itfelf in its enquiries in the matters belonging to that fcience : the beaten road of the fchool has teen to lay down, in the beginning, one or more gencral propofitions, called principles, as foundations whereon to build the knowledge that was to be had of that fubject.

That which gave occafion to this way of proceeding wae, the good fuccefs it feemed to have in mathermatics, which of all the fciences have the greatelt certainty, clearnefs, and evidence in them. But, if we conlider it, we thall find, that the great advancement and certainty of real knowledge men arrive to in thefe fciences, was no: owing to the influence of thofe primciples, but to the clear, diftinct, and complete ideas their thoughts were employed about, and to the relation of equality and excefs, fo clear betweer fome of them, that they had an intuitive knowledge, and by that a way to difcover it in others, and this is without the help of thofe maxims. For is it not puffible for a lad to know, that his whole body is bigger than his little finger, but by virtue of this axiom, the whole is bigger than a part ; nor be affured of it till he has learned that maxim? Let any one confider which is known firlt and clearett by mo't peopls, the particuiar intlance, or the general rule; and which it is that gives life and birth to the other: thefe general rules are but the comparing our more gencral and dbttract ideas, which ideas are made by the mind, and have names givea them, for the eafier difpatch in its reafonings: but knowledge began in the mind, and was founded on particulars, though afterwards, perhaps, no notice be taken thereof, it being natural for the mind to lay up thofe general notions, and make the proper ufe of them, which is to difburden the memory of the cumberfome load of particulars. 'The way to improve in knowledge is, not to fwallow principles with an implicit faith, and without examiuation, which would be apt to miflead men, inflead of guiding them into truth; but to get and fix in our minds clear and complete ideas, as far as they are to be had, and to annex to them proper and conftant names; and thus, barely by confidering our ideas, and comparing them together, obferving their agreement or difagreement, their habitudes and relations, we thali get more true and clear knowledge by the conduct of this one rule, than by taking up principles, and thereby putting our minds into the difpofal of others.

We mutt, therefore, if we would proceed as reafon advifes us, adapt our methods of enquiry to the nature of the ideas we examine, and the truth we fcarch after. General and certain truths are only founded on the habitudes and relations of abftract ideas; therefore, a fagacious, methodical. application of our thoughts for the finding out thefe rela. tions, is the only way to difcover all, that can with truth and certainty be put into general propofitions. By what fteps we are to procced in thefe, is to be learned in the fchools of the mathematicians, who from very plain and eafy begimnings, by gentle degrees, and a continued chain of reafonings, proceed to the difcovery and demonftration of truths, that, at firft fight, appeared beyond human capacity. This may reafonably be faid, that, if other ideas that are real, as well as nominal effences of their fpecies, were purfued in a way fimilar to that of mathematicians, they would carry our thoughts farther, and with. greater evidence and clearnefs, than poffibly we are apt to imagine. This is reafon fufficient to advance that conjecture above mentioned ; wiz. " That morality is capable of demonftration, as well as mathematics ;" fer moral ideas being real effences, which have a difcoverable connection and agreement one with another, fo far as we can find their habitudes and relations, fo far we fhall be poffeffed of real and general truths.

In our knowledge of fubtlances, we are to proceed after a quite different method; the bare contemplation of their abitract ileas (which are but nominal effiences) will carry us but a very little way in the fearch of truth and certainty. Here experience mult teach us what reafon cannot; and it is by trying alone, that we can certainly know what qualities co-exit, with thofe of our complex idea; for inflance, whether that ycllow, heavy, fufible body, we call gold, be mallcable, or not ; which experience (however it prove in that particular body we examine) makes us not certain that ${ }^{\text {t }}$ it is fo in all, or any other ycllow, heavy, fufible bodics, but that which we have tried; becaufe it is no confequence, one way or other, from our complex idea. The neceffity or anconfiftence of malleability has no vifible connection with the combination of that colour, weight, and fufibility, in any body. What is here faid of the nominal effence of gold, fuppofed to confift of a body of fuch a determinate colour, weight, and fulfibility, will hold true if other qualities be added to it. Our reafonings from thofe ideas will carry us but a little way in the certain difcovery of the other properties in thofe maffes of matter wherein all thofe are to be found. As far as our experience reaches, we may have certain knowledge, and no farther. It is not denied, but that a man, accuftomed to rational and regular experiments, fhall be able to fee farther into the nature of bodies, and their unknown properties, than one that is a ftranger to them: but this is but judgment and opinion, not knowledge and certainty:

This would make it fufpected, that natural philofophy is not capable of being made a fcience. From experiments, and hiftorical obfervations, we may draw advantages of eafe and health, and thereby increafe our flock of conveniences for this life; but beyond this, it is to be feared our talents reach not, nor are our faculties able to advance farther. Sce Physics.

The ways to cenlarge our knowledge, as far as we are capable, fuem to be thele two : the firlt is, to get and fettle in our minds, as far as we can, clear, diftinct, and conltant jd ads of thole things we would contider and know; for it being evident that our knowledge cannot exceed our ideas, where they are either imperfect, confufed, or ohfcure, we camot expect to have certain, perfect, or clear knowledge. The other art is, of finding out the intermediate ideas, which may fhew us the agreement or repugnancy of other ideas, which cannot be inmediately compared.
That thefe two (and not relying on maxims, and drawing confequences from fome general propofitions) are the right method of improving our knowledge in the ideas of other modes, befides thofe of quantity, the confideration of mathematical knowledge will eafily inform us; where, fritt, we thall find, that he, who has not clcar and perfect ideas of thofe angles or figures, of which he defires to know any thing, is utterly thereby incapable of any knowledge about them. Suppofe a man not to have an exact idea of a right angle, fcaenum, or trapezium, and it is clear, that he will in vain feek any demonfiration about them.

And farther, it is evident, that it was not the influence of maxims or principles that led the malters of this fcience into thofe wnoderful difcoveries they have made: let a man of good parts know all the maxims of mathematics ever fo well, and contemplate their extent and confequences as much as he pleafes, he will, by their affittance, fcarce ever come to know, that the fquare of the hypothenufe in a rightangled triangle, is equal to the fquares of the two other indes. This, and other mathematical truths, have been dif. co ered by the thoughts otherwife applied. The mind had uther objects, other views before it, far different from thofe
maxins, which men, well enough acquainted with thofe received axioms, but ignorant of ther method who firlt made thofe demonftrations, can never fufficiently admire.

Our knowledge, as in other things, fo in this alfo, has fo great a conformity with our fight, that it is neither wholly neceffary, nor wholly voluntary. Men, who have fenfes, cannot choofe but receive fome ideas by them; and, if they have memory, they cannot but retain fome of them; and if they have any diftinguifhing faculty, cannot but ferceive the agreement, or difagreement, of fome of them one with ancther. As he that has eyes, if he will open them by day, cannot but fec fome objects, and perceive a difference in them; yet he may choofe whether he will turn his eyes towards an object, curioufly furvey it, and obferve accurately all that is vifible in it. But what he doth fee he cannot fee otherwife than he doth; it depends not on his will to fee that black which appears yellow. Juft thus it is with our underltanding: all that is voluntary in our knowledge, is the employing or withholding any of our faculties from this or that fort of objects, and a more or lefs accurate furvey of them; but, they being employed, our will hath no power to determine the knowledge of the mind one way or another; that is do:e only by the objects themfelves, as far as they are clearly difcovered. Thus, he that has got the ideas of numbers, and has taken the pains to compare one, two, or three, to fix, cannot choofe but know they are equal. He alfo, that hath the idea of an inteligent, but weak and frail being, made by, and depending on, another, who is eternal, omnipotent, and perfectly wife and good, will as certainly know, that man is to honour, fear, and obey God, as that the fun flines when he fees it. But yet, be thefe truths ever fo certain, ever fo clear, he may be ignorant of either or both of them, who will not take the pains to employ his faculties, as he thould, to inform himfelf about them.
KNOWLTON, in Geograpby, a townfhip of America, in Suflex county, New Jerfey, containing 1937 inhabitants.

KNOWLTONIA, in Botany, fo named by Mr. Salifbury in memory of Mr. Thomas Knowlton, who is faid to have been Sherard's gardener at Eltham. Salif. Prodr. 372. Sims in Curt. Mag. v. 22. 775. (Anamenia; Venten. Malmair. 22.)-Clais and order, Polyandria Polygynia. Nat. Ord. Muftifiliqua, Linn. Ranunculacea, Juff.
Gen. Ch. Cal. none. Cor. Petals numerous, from ten to twenty, oblong, without any nectary, deciduous, the innermoft longeft and nearly linear; outermoft fomewhat ovate, externally hairy. Strm. Filaments numerous, thread-fhaped, much fhorter thin the petais; anthers vertical, two-lobed, roundifh, thick-edged, burfing at the edges. Pif. Germens fuperior, numerons, ovate, collected into a round head; Atyles lateral, awl-fhaped; ftigmas timple, flightly recurved. Peric. Berries numerous, diftinct, elliptical, pointed, of one cell. Sced folitary, large, fmooth, of the thape of the pericarp, and attached to its bafe. Receptacle glubofe.
Eff. Ch. Calyx none. Petals numerous, oblong, deftitute of a nectary: Receptacle of the fruit globofe. Berries numerous, of one cell. Seeds folitary.
Obf. Mr. Salifury feparated this very diftinet genus from. the Linnean Adonis, and publifhed it in 1796 , by the above unexceptionable name, which therefore takes place of Ventenat's Anamenia, publifhed feveral years after; the latter being moreover liable to objection, from frrict Linnean fcholars, as being formed of an Arabic word.

1. K. capenfis. Hairy Knowltonia. (K. velicatoria; Sims in Curt. Mag. t. 775. Adonis capenfis; Lim. Sp. Pl. 772.

Suppl.

Suppl. 272. Anamenia hirfuta; Venten. Malmaif. 22. n. 4. Chrilophoriana trifoliata, foliis feabris, flore fulphureorariore; Burm. Afr. 145.t.5\%.)-Hairy: Leaves twice ternate; leaflets elliptic-ovatc. Pctals linear. - Native of the Cape of Good Hope. With us it is a hasdy green-houfe plant, flowering in the fpring. Root peremial, and, as appears from Dr. Sims's delcription, of long daration, the plant from which his figure was taken, in 180 , having come out of Dr. Fothergill's collection near 25 years before. Lecaves feveral, radical, on long hairy falks, twice ternate ; their leafiets elliptical, or fomewhat ovate, ferrated, more or lefs hairy, the termimal ones ufually largeft. Stems taller than the leaves, branched nearly from their very bottom, hairy, almolt leaflefs; their branches elongated, fubdivided, fomewhat corymbofe; ultimatc ones umbellate, fingle-flowered, very hairy: Brabtazs leafy; the upper ones narrowelt, lanecolate and entire. Flowers an inch broad, fpreading, of a light ycllowith green.
2. K. veficatoriz. Blifering Rnowltonia. (Adonis veficatoria; Linu. Suppl. $27^{2}$ Willd. Sp. Pl. v. 2. 1307. Anamenia coriacea; Venten, Malmaif. 22. n. 1. t. 22. A. laferpitifolia; ibid. n. 2. Rarrunculus xethiopicus, fulis rigidis, floribus ex luteo vircfeentibus; Comm. Hort. v. I. t. I. Imperatoria ranunculoides africana enneaphyllos, laferpitii lobatis folis rigidis, margine fpinolis; Pluk. Phyt. t. 95. f. 2.) -Smooth, leaves twice ternate; leafers nearly heare-fhaped, coriaceous; the lateral ones unequal at their bafe. Petals elliptic-oblong. Umbels compound, many-fiowered.-Native of the Cape of Good Hope, and occafionally kept in green-houfes, like the preceding, from which we cannot but think it ipecifically different. The leaves are much larger, fmooth, very thick and rigid, with ftrong, almoft pungent, ferratures or teeth; fometimes they are thrice compounded. Stems more umbellate in all their fubdivifions, the ultimate umbels confilting of very numerons falks, which are but flightly hairy. Bradeas rather elliptical. Petals elliptic-oblong rather than linear. Berries purplifh black. Thunberg fays that the leases are ufed at the Cape to raife blifters, they having that property in common with fome fpecies of Ranunculus and Clematis, their near allies
3. K. gracilis. Slender Knowltonia. (Anamenia gracilis ; Venten. Malmaif. 22. n. 3. Adonis æethiopica; Thunb. Prodr. 94 ?)-" Leaffets ovate, deeply ferrated, rigid, hairy. Stems branched at the top; branches erect, with few flowers." Vent. - We know nothing of this but from the definition of Ventenat, who faw it in Juffieu's herbarium. Thunberg, whom he quotes with doubt, defines his plant thus. "Leaves more than twice compound ; leaflets deeply toothed, divaricated. Stem villous." - With this we have no further acquaintance, unlefs, as we ftrongly fufpect, it is the fame as the following; but if fo, it by no means anfwers to the character given in Ventenat's work.
4. K. filia. Fine-leaved Knowltonia. (Adonis filia; Lion. Suppl. 271. A. æthiopica; Thunb. Prodr. 94? A. daucifolia; Lamarck. Dict. v. 1. 46. Anamenia dau. cifolia; Venten. Malmaif. 22. n. 5.)-Leaves twice ternate ; leaflets pinnatifid, deeply cut, fmooth, their fegments decurrent. Flower-ftalks hairy,-The only fecimen we have feen was given to Linnous, by Thunberg, who gathered it at the Cape. We prefume, therefure, it mult be his Adonis athiopiza, with the character of which, cited under our laft fpecies, it fufticiently tallies. The leaves are finely divided, but not fufficiently like a Daucus to warrant Lamarck's change of the original name, however unmeaning that may be. The fem is tall and flender, bearing two hairy-Italked umbels. Lower braiseas compound. Pctals nearly lincar. La. Vol. XX.
marek's aceount feems entirely taken from the Supplemertum: of Linnxus. S.

KNOX, Jous, in Biograply, the intrepid and fuccef fut promoter of the Reformation in Scotland, was defcentect from an ancient family, and born near Haddingtot, in E Lothian, in the year 150 . Having received the elementar; parts of a good cducation, he was, at a proper time, fent to the univerfity of St. Andrews, where he applied himicalf with uncommon diligence in the itudies of theoplace, made a very rapid proficiency, and was admitted to the degree of M.as at an early age. Having determined to embrace the cocl:fialtical profeffion, he was admitted to priett's orders before the period ufually allowed by the canons. He now commenced teacher, and acequired great applaufe in that capacity. But by intructing others, he difcovered the errors of the common fyitem in which he had been cducated, and which he had endeavoured to eltablith in the minds of the people. Feeling diffatisfied with what he was engaged in. he chofe rather to be a hearcr than a preacher, and frequented the difcourfes of Thomas Williams, a black-friar, who publicly preached againft the pope's authority, and who wais the firlt from whem Mr. Knox received any tatte for the truth. Absut the fame time, Mr. George Wifhart, another celebrated reformer, coming from England, with the commiffioners fent by king Henry VIII. Knox learned from him the principles of the reformed religion, and with thefrhe was fo well pleafed, that from this monent he renounced Popery and became a zealous Proteltant. Mr. Kinox had quitted St. Andrews a little before this entire change of hot opinions, having been appointed tutor to the fons of the lairds of Ormifton and Langnidry, who were both favourers of the Reformation. Knox inftilled into the minds of his pupils the principles of piety and the Proteltant religion, notice of which being given to David Beaton, cardinal and archbifhop of St. Andrews, that prelate profecuted him with fuch feserity that he was obliged to abficond, and frequently to change the place of his concealment. He thought of retiring into Germany, but was diffuaded from it by the fathers of his pupils, and he took fhelter with them in St. Andrews caftle, which was then in poffeflion of the Lellies, the determined friends of the Reformation. In this afylum he continted to inltruct his pupils, and he gave them public lectures in theology, which he delivered at a Itated hour in the chapel, within the walls of the caltle. Thefe were frequented by feveral perfons of note in the city, who entreated Mr. Knox to take upon himfelf the office of preacher, to which, though with great reluctance. he agreed to comply. He began his public miniftry at St. Andrews, in the year 1547, with that fuccefs which always accompanies a boid and popular eloquence. He without hefitation ftruck at the root of Popery, and attacked both the doctrine and difcipline of the eftablifhed church with a vehemence peculiar to himfelf, but well adapted to the temper and wihes of the age. In his firft fermon he proved, to the fatisfaction of his hearers, that the pope was antichritt, and that the doctrine of the R.oman church was contrary to the doctrine of Chritt and his apoltles. He fhortly made converts of all the people in the caftle, and of great numbers in the city, who even joined him in partaking of the Lord's fupper. In the month of July 1547, an interruption took place in the exercife of Mr. Knox's miniftry, in confequence of the furrender of the cafte to the French, when he was carried prifoner with the garrifon to France. He remained in confinement in the galleys till the latter end of the year 1549, when, being fet at liberty, he paffed over to England, and arriving at London, was licenfed cither by Cranmer, or Somerfet, K

## K N O X.

thic proteitor, and appointed preacher, frif at Berwick, and afterwards at Newcaltle. In 1552, he was appointed one of Bix chapluns, whom the council thought proper to retain in the fervice of king Edward VI., not only to attend the court, but to be itinerary preachers of the Proteftant religrion throurhout the kingdom; he lad alfo the grant of forty pounds a year till fome benefice fhould be procured for him. Shortly after he was offered the living of All-hallows, which he refufed, not choofing to conform to the liturgy. Soon after the acceftion of queen Mary, he thought it right to retice from the impending form ; he accordingly went to Geneva, where he had not refided long before he was invited by the Englith refurees at Frankfort io become their minifter: this invitution he accepted, though againit his will, through the interferesce of John Calvin, and he continued his fervices among them till fome internal difputes about ceremonies broke up their fociety. Some of the Englifh, particularly D\%. Cox, afterwards bifhop of Ely, wifhed for a liturgy according to king: Edward's form, but Knox and others preferred the Gerera fervice; at length the party of Cox, to get ril of the Scotch reformer, taking adrantage of cerrain unguarded expections in one of his former publications, tirestened to accule him of treafos unlefs he quited the place, which heertid, and went again to Geneva. In 1555 , he went to Scotland; upon his arrival, finding the profeflors of the Proeethant religion greatly increafed in number, he formed them in:o a fociety, affluciated with them, and commenced his preaching with the ufual vehemence. He had an opportunity, in the courfe of a few months, to preacl2 in various paris of Scotland, and in all the places the people flocked in great crowds to hear lim. The Popilh clergy began to be alarmed at the confequences of his difcourfes, which were daily making converts, and fummoned him to appear before them in the church of Black-friars in Edinburgh : he, having received afturances of fupport trom various perfons of rans and ellimation, determined to obey the fummons, but before the day arrived, his enemies thought fit to abandon the profecution. Knox, however, went to Edinburgh, and as he was not allowed to vindicate his cuufe in the prefence of his opponents, he preached twice every day for ten days to the people, and had on thefe occafions more numerous audiences than he had before witneffed. Emboldened by fuccefs, he wrote a letter to the queen regent, urging her to hear the Proteftaut dofrine, which fhe declined, and Mr. Knox afterwards publifhed his letter with fome additions. In the furmmer of $1556, \mathrm{Mr}$. Knox fet out for Gencra, at the earnett entreaty of the Englifh congresation, and almott the moment in which he embarked, the Eifhops furrmoned him to appear before them, and upon his non-appearance, they paffed fentence of death upon him as a heretic, and burnt lim in effigy at Edinburgh. Againt this wicked fentence he appeeled, in a work which he printed at Geneva, and which contains a mafterly defence of rcligious independency, and is dittinguifhed for purity of thy le. In 1557 , he was invited back to Scotland, and having confulted Culvin and other perfons as to the prudence and neceflity of the thep, he fet out, and had proceeded as far as 13ieppe, when he was advifed that fone of his beff friends feemed, through timidity, to be abandoning their principles, and that theretore it would not be fafe for him to proceed. He innucdiately wrote letters to thofe who had invited him, complaining of their irrefolution, and even denouncing the "Fevere judgnients of God on all thofe who fhould betray the caufe of truth and of their country, by weaknefs or apoflacy. Thefe letters made fuch an imprefion on th te to whom they were immediately addreflcd,
that they all came to a written refolution, " that they would follow forth their purpofe, and commit themfelves, and whatever God had given them, into his hands, rather than fuffer idolatry to reign, and the fubjects to be defrauded of the only food of their fouls." To fecure each other's fidelity to the Proteftant caufe, a common bond, or covenant, was entered into by them, dated at Edinburgh, December 3,1557 , and from this period they were difitinguifhed by the name of "The Congregation." In the mean time Mr. Knox returned to Geneva, where, in 1558 , he publifhed his treatife, entitled "The firlt Blatt of the Trumpet againt the mointrous Regiment of Women ;" which was written in deteftation of the cruel and infamous government of queen Mary, and of the endeavours of the queen-regent of scotland to eftabilih arbitrary government in that kingdom. He intended to have followed this with "The fecond Blafl," but the death of Mary prevented him going any farther. He e:.petcd much from the government of Elizabeth. She had, however, been fo difgulted by what he had written againit the government of women, that the embraced an early opportunity of difplaying her refentment againft hima. She refufed his requeft of preaching to his friends in England, in his way from the continent, and rendered his abode there fo uncomfortable, that he was glad to make the beft of his road to Scotland, where he arrived in the month of May 1559. At this time a public profecution was carried on againlt the Protellants, and their trial was juft roady to commence at Stirling: Knox inllantly hurried to ?hare with his brethren in the threatened danger, or to affit them in their common caufe. Dr. Robertion, in defcribing this bufinefs, fays, "While their minds were in that ferment which the qucen's perfidioufnefs and their own danger occafioned, Knox mounted the pulpit, and, by a vehement ha. rangue againt idolatry, inflamed the multitude with the utmolt rage. The indicretion of a prieft, who, immediately after Knox's-difcourfe, was feen preparing to celebrate mafs, and began to decorate the altar for that purpofe, precipitated them into immediate action. With tumultuous, but irrefirtible violence, they fell upon the churches in that city, overturned the altars, defaced the piftures, bruke in pieces the images, and proceeding next to the monafteries, laid thofe fumptuous fabrics almolt level with the ground. This riotous infurrection was not the effect of any concert, or previous deliberation. Cenfured by the reformed preachers, and publicly condemned by the perfons of molt power and credit with the party, it mult be rergarded merely as an accidental eruption of popular rage" From this time Mr. Knox continued to-promote the reformation by every means in his power, fparing no pains, nor fearing any danger. Mr. Knox, by his correfpondence with fecretary Cecil, was chiefly intrumental in eltablifhing thofe negociations between "The Congregation" and the Englih, which terminated in the march of an Englifh army into Scotland to affll the Proteftants, and to protect them againlt the perfecutions of the queen-regent. This army, being joined by almoft all the great men of Scotland, proceeded with fuch vigour and iuccefs, that they obliged the French forces, who had been the principal fupports of the tyranny of the regent, to quiit the kingdom, and reftored the parliament to its former independency. Of that body, a great majority had embraced the Proteftant opinions, and encouraged by the zeal and number of their friends, they improved every opportunity in overthrowing the whole fabric of Popery. They fanctioned the confelion of faith prefented to them by Knox, and the other reformed teachers: they abolifhed' the juridietion of the ecclefiatical courts, and transferred

## K NOX .

the caufes to the cognizance of the civil courts; and they prohibited the exercife of religious worflip, according to the rites of the Romifh church. In the year $\mathbf{1 5 6 1}$, Mary queen of Scots, the widow of Francis II. King of France, arrived in her native country, from which fle had been abfent more than twelve years, though the was then fcarcely nineteen. On the Sunday after her arrival the commanded mafs to be celebrated in the chapel of her palace: the Proteftants, from low murmurs, began to exclaim loudly againft the practice, and Knox, with liis ufual vehemence, declared from the pulpit, "that one mafs was more frightful to him than ten thoufand armed enemies landed in any part of the realm." Knox himfelf frequently infulted her from the pulpit, and when admitted into her prefence, regardlefs of her fex, her beauty, and her rank, behaved to her with very unjuftiaable freedom. He avowed himfelf the author of "The Blaft," and contended for the right of teaching and propagating doctrines contrary to the common opinion, and concluded a long conference by faying, "If the realm finds no inconveniency in the regiment [government] of a wo. man, I fhall be wellcontent to live under your Grace, as Paul was under Nero. And my hope is that folong as ye defile not your hands with the blood of the faints of God, neither I nor the book flall either hurt you or your authority; for in very deed, madam, that book was written moft efpecially againtt the wicked Jezebel of England." In 1562, Mr. Knox was employed in bringing about a reconciliation between the earls of Bothweli and Arran, which fhews in what effimation he was held by perfons of the higheft rank in the ftate. In the fame year he was appointed, by the general affembly, commiffioner to the counties of Kyle and Galloway, and by his influence feveral gentlemen entered into a bond or covenant at Ayr, fimilar to that entered into at Edinburgh in 1557. About the fame time he accepted a challenge, made by the prior of Whithorn, to a public difputation upon the mafs, which continued for the fpace of three days, and the fubitance of which was afterwards publifhed. In 1563, during the queen's abfence on a progrefs to the weft of Scotland, the Proteftants at Edinburgh excited a riot in the chapel royal while mafs was celebrating: of thefe fome of the molt active were feized in order to be brought to trial. Knox, determined to affirt and fuccour them, and being authorized by the lalt general affembly to give information to the whole body of Proteftants in Scotland, fhould any circumiftance arife that might threaten danger to the reformation; iffued circular letters, requiring all who profeffed the true religion, or were concerned in its prefervation, to affemble at Edinburgh on the day of trial, that they might comfort and affitt their diftreffed brethren. One of theie letters fell into the hands of the queen, and it was immediately conftrued into an act of treafon, for which he was indicted, brought to trial, and acquirted. His conduct was alfo approved by the general affembly of the church, which met foon afterwards. In ${ }^{1565}$, lord Darnley, who had lately married the queen, confented, at the defire of his friends, to hear Mr. Knox preach, in hopes thereby of conciliating him, inftead of which he took occafion to declaim againft the government of wicked princes, who, for the fins of the people, are fent as tyrants and fcourges to torment them. Darnley complained of the infult, and the council filenced the preacher for feveral days. In the fame year he was appointed by the affembly to vifit and eftablifh the churches in the fouth; and he was the bearer of a letter from the affembly to the bifhops of England, drawn up by himfelf; the purport of which was to complain of the fevere treatment of the Eng. lifh Puritans, and to folicit indulgence for them. In I $57{ }^{\circ}$,
he found it expedient to confult his own fafety by withdran ing from Edinburgh, and in the followng year, as lye $k n$ ww his enemies were plotting his deltrution, he went firit t. Abbot'shall, in Fife, and from thence to St. Andrews, where he remained till Augult $157^{2}$. When the troubk of the country were in fome meafure abated, the people of Edinburgh, who had been obliged to leave it, returned, and fent a deputation to St. Andrews, to invite Mr. Kncx to re"fume his miniflry among them. He accepted the invitation, on condition that they would allow him to freak to them according to the dictates of his confcience, as in furmer: times, and on the laft day of Augult he preached to them in the great kirk. His voice was, however, very weak, and his health was evidently declining. The news of the accurfed maflacre of Proteftants at Paris gave the finiflhing blow to his already fhattered conltitution: he, neverthelets, muftered fufficient ftrength to preach againt the bloody deed, and with muoh energy denounced God's vengeance on the wicked actors in it, of which he defired the French ambaffador might be informed. From the moment that he had finifhed his difcourfe, his approaching diffolution was obferved with the utmoft concern by his friends. During a long illnefs he difcovered the utmott fortitude, and met tho approaches of death with a magnanimity worthy of his high character. He anticipated with joy the profpects of immortality, and exulted in the expectation of being releafed from the infirmities of the body. He died November 24th, 1572, in the fixty-feventh year of his age: his corpfe was attended to the grave by feveral of the nobility then in Edinburgh, particularly by earl Morton, who was regent at the time, and who exclaimed, when he faw the body depofited in the ground, "there lies he, who never feared the face of man ; who hath often becn threatened with the dagger, but hath yet ended his days in peace and honour: for he had God's providence watching over him in an efpecial manner, when his very life was fought." The private life of this eminent reformer was irreproachable and exemplary, and the world is not a little indebted to him for that degree of light and religious liberty which it enjoys: "He was," fays Dr. Robertion, "the prime inftrument of fpreading and eftablifhing the reformed religion in Scotland. Zeal, intrepidity, dilintereftednefs, were virtues which he poffeffed in an eminent degree. He was acquainted, too, with the learning cultivated among divines in that age, and excelled in that fpecies of eloquence, which is calculated to roufe and inflame. His maxims, however, were often too fevere, and the impetuofity of his temper exceflive. Rigid and uncomplying himfelf, he fhewed no indulgence to the infirmities of others. Regardlefs of the diftinctions of rank and character, he uttered his admonitions with acrimony and vehemence, more apt to irritate than to reclaim. This often betrayed him into indecent and undutiful expreffions with refpect to the queen's perfon and conduct. Thofe very qualities, however, which now render his character lefs amiable, fitted him to be the inftrument of Providence for advancing the refurmation among a fierce people, and enabled him to face dangers, and to furmount oppofition, from which a perfon of a more gentle fpirit would have been apt to flrink back." After the death of this great man, his "Hiftory of the Reformation of Religion in the Realm of Scotland, \&c."' was publifhed in a folio volume. To the fourth edition of which, printed in 1732 , feveral of his other pieces were added. There ato, among the Harleian MSS. in the Britiih Mufenm, two pieces attributed to Mr. Iinox, onc is a letter to his wife, and the other a treatife addreffed to the faithful in London, Newcafte, and Berwick. Biog. Brit. Robertfon's Hift. of Scotland.

K゙vox, iA Chagriagion, a county of Kentucky, containing \$19 inhahitants.-- ilin, a county of Teneflec, in Hamilton dittrict, bounded on the S. by Blount comes and IV. by the Indiana terntory, and watered by the ravers Holltom and Clinch it contains a, $1,8 \mathrm{~g}$ inhabitants, of whom 1122 are flaves.--Alo, a comury in the Indiana territory, erected in Tunc, 1 igo, and containing 2517 inlabitents, of whom 2b are flaves. Fort Knox is in the fame territory. - Alfe, onice of the two illands difcovered by cantain Ingrahaun; the other being Hancock, called by captain Roberts, who foon after difeoverel them, Freeman and Langdon. 'Ihefe in unds had every appearance of fertility. Their latitude is from $8^{\prime} 3^{\prime}$ to $8^{\prime \prime} 5^{\circ}$, and their longitude very nearly ${ }^{3}+1^{\circ}$ W. from Crechmich.

KNOX1A, in Botunt, a gernus named by Linmeus, in hemour of Robert Knox, an Englifhman, who Cperit many Jears in examining the natural productions of Ceylon, and whu publifhed at London, in folio, an "Hituorical relation" of that illand in the year 168I. In this work, "the botanical defcriptions," fays Haller, "fhew him to have been well flkilled in the knowledge of plants." It was tranflated into German, and publithed in quarto at Leiplic in 1659. A French edition of it appeared, in two volumes octavo, at Amiterdam, in $1693 .-L i m n$. Gen. 51. Schreb. 68. Willd. Sp. Pl. v. 1. 582. Mart. Mill. Dict. v. 3 . Juff. 197. Lamarck. Dict. v. 3. 369. N. lat. $55^{\circ}{ }^{1} 7^{\prime}$. E. long. $30^{\circ} 52^{\prime}$. -Alfo, a cape of Denmark, on the S.W. coalt of the illa:d of Zealand. N. lat. $55^{\circ} 5^{\prime}$. E. lung. $x 1^{\circ} 37^{\prime}$.
KNUTSFORD, a couliderable market town in the hundred of Bucklow, and county of Chelter, England, is feated on the great road from London to Liverpool, being 1,3 miles from the former, 30 from the latter, 24 from Cheiter, and 1; from Manchefter. It was formerly a chapelry within the parifh of Rotherne, but was made a ditinct parifh, by aet of parliament, in the year $1 / 4 \mathrm{r}$, and comprizes the townhips of Over-Knutsford, NetherKnutsford, Bexton, Ollerton, and Toft.
Wullian de Tabley, who was lord of both the Knutsfords, about the year 1292, granted a charter of privileges to his burgeffes of Knutsford, which is printed in fir Peter Leiceiter's Hiftory of Bucklow hundred; this William, about the fame time, procured a charter for a market on Saturday, which ftill continues, and a fair for three days, at the feltival of St. Peter and St. Paul ; the charter was confirmed to William 'Tabley the younger, $133^{2}$; this fair alfo is Atill continued; there is another on the 8th of Nov. and a third has been eftablifhed within thefe few years on the 23 d of Aprit; none of them are noted as great marts for the Gale of any particular commodities. A charter for a Wednefday's market at Over-Knutsford, on Knutsford-Booth, was granted in 1335, to Ellen Legh, with a fair on Tuefday and Wednelday in Whitfun-week; this market has been long difcontinued, but the fair is ftill held.
.Knutsford is not a corporate town, but it appears that its chief officer was called a mayor in the reign of king Edward I.; it has now no peculiar government. The quarterfeffions for the county are held in this town at Midfummer and Michaelma: In the year 1777, an account having been taken of the population of Knutsford, it was found that there were 375 familics, and 1674 inhabitants; annual average of deaths for the ten years then preceding had been only one in forty, beirg thout the fame proportion as Hi the city of Chefter, and very much below the ufual average of towns. According to the returns made to parliamest, under the population act in ISOr, there were then 543 families in Over and Nethrr-Kausford, and 2372 inhabitants, of whom $7^{\$ 2}$ were emplojed in trade, manufactures, or handicraft. A manufacture of thread has been long eftablifhed in this town. There is no cotton factory,

## K N Y

but a great deal of cotton fpinning and weaving is dunc in private houfes.

Under an act of parliament paffed in the year 174 t , Knutsford was made a diltinct parim and vicarage, and the anciert chapel in Nether-Kintstord taken down; the new parifh church, then built in the 'Tentry-croft, was confecrated in the year $174+2$ and dudicated to St. John the Baptitt; the patronage is velled, by the act, in the lords of Over-Knutsford, Nether-Kinutsferd and Ollerton, 'I'oft, and Bexton, who prefent in rotation. Knutsford is divided into two parts by a fimall rivulet, and from the relative fituation, thefe divifions are called Upper and Lower. Annual races are held in the vicinity of this town. Immediately in the neighbourhood are fome feats dillinguilhed for their antiquisy and picturefque features. F"o the north is Tatton-hall, the feat of Wilbraham Eiererton, efq. a large fone manfion, recently erected from the deligns of Samuel Wyatt, efq. The adjoining park comprizes about 2000 acres of land, fome of which is annually in tillage. Welt of the town is 'Tabley houfe, the feat of fir John F. Leticefter, bart., a large brick manfion, in a fpacious park, which is ornamented with a large lake and fine foreft trees. The houfe is particularly noted for its nuble gallery of pictures, all executed by Englith artilts. Lyfons's Magna Britannia, visl. ii. 4to. 18 ro.

KNUTWEIL, a bailiwick of Switzerland, in the canton of Lucerne.

KNUTZEN, MATHIAs, in Bigrapby, a native of Oldenfworth, in the duchy of Slefwich, was educated at Konigherg, in Prulina. He is the only perfon on record who openly profefled and taught the principles of Atheifm. It has been afferted that he had, at one time, 1000 difciples in the different parts of Germany. 'They affumed the title of "Confcipntiarians," becaufe they maintained that people were bound to lay alide all confideration of God and religion, and to follow the dictates of reafon and confcience alone: Reafon, faid Knutzen, teaches every man the three fundamental principles of the law of nature: "to hurt nobody" - "to live hone?ly"-and " to give to every man his due." In the year 1674 , he difperfed a Latin letter, and two dialogues in German, explanatory of his doctrines, which affumed that there was neither God nor devil: that reither magiltrates nor prielts were to be regarded, and that there is no life but the prefent. Mufreus publifhed an anfwer to his Letter and Dialogues, as weil to refute the abforcity and wickednefs of his fyltem, as to contradict the fact relpecting the number of the difciples. He probably died in contempt, as no notice is taken of the latter part of his life by hiftorians. Moreri, Bayle.

Knutzen, Martin, a profeffor of philofophy in Pruffia, was born at Konigtberg in the year 1yI3. He filled, for fome years, the philurophical chair in the univerfity of his native place, and occupied the polt of librarian. He died in 1751, when he was only about thirty-eight years of age. He was author of feveral learned works, of which the prin. cipal are, "Syltema Caufarum Efficientium ;" "Elemenca Philofophice Rationalis, Methodo Mathematico demonAtrata;" "Theoremata de Parabolis infinitis;" and "A Defence of the Chrittian Religion." "This lalt is faid to be a very excellent piece, and one that is honourable to his virtues and talents.

KNYSNA, in Geography, an arm of the fea on the coaft of Africa, in the colony of the Cape of Good Hope, at the ditance of about 18 reif s to the weitward of Plettenberg's bay, which, in the opinion of Mr. Barrow, may one day become an important dtation. He has given a plan of it in the fecond volume of his "Travels in Southern Africa,"

The tide fets into it through a uarrow paflige, or portal, as into a dock. The deptit of water, and great extent of it, running into the centre of very fine foreft, render it a molt eligible place for building and repairing thips. Veffels of 500 tons a:d upwards, deeply laden, may pals the portal, and thofe that are much lager might be buil in it and fent out light, to be completed in Plettenberg's bay. 'The forelts contain feveral different kinds of durable and well. grown timber fit for that valuable purpofe, as well as abundance of mafts and yards.

KNYSZYN, a town of the dachy of Warfaw; 3/5 miles N of Bi ilk.

KOADGWAH, a town of Hindooftan, in the circar of Jenhat; 20 miles W.N.W. of Gujurat.
 culiarities of which have been defcribed by Mr. E. Home in the Phil. Tranf. for 1809 , part. ii. 'The koala imhahits the forelts of New Holland, about 50 or fo miles to the S.W. of Port Jackfon, and was firt brought to that place in dugutt, 1803 . It is commonly about two fee: long and one high, in the girth about one and a half foot : it 1s cosered with fine foft fur; lead-coloured on the back, and white on the belly; the ears are fhort, erect, and pointed; the eyes gencrally ruminating, fometimes fiery and menacing; refembling the bear in the fore part of its body; it has no tail ; and its pofture is commonly fitting. The New Hollanders eat the flefh of this animal, and are therefore diligent and active in the purfuir of it ; afcending the loftieft gum trees, and following the animal from bough to bough, till at length they are able either to kill it with the tomahawk, or to take it alive. In the day time the koala feeds upon the tender fhoots of the blue gum tree, and in the night it defcends, and prowling about, fcratches the ground in fearch of fome particular roots. It feems to creep rather than walk; when incenfed or hungry, it utters a long thrill yell, and affumes a ferce and menacing look. Thefe animals are found in pairs, and the mother carries the young on its fhoulders. The koala appears foon to form an attachment to the perfon who feeds it. Thefe animals feem to form the intermediate link between the opoftum and kanguroo. See Wompat.

KOAMAROO, CAre, in Geography, the S.E. projection of land at the entrance of Queen Charlotte's Sound, on the illand of Tavai-Poenanimoo, one of the New Zealand illands. S. lat, $41^{\circ} 34^{\prime}$. E. long. $176^{\circ} 30^{\prime}$.

KOANG-TCHEOU, a town of Corea; 150 miles S. of King-kitao. N. lat. $35^{\circ} 6^{\prime}$. E. long. $125^{\circ}+1^{\prime}$.

KOB , in Zoology. See Antelope Lerwia.
KOBA, in Gcography, a town of Africa, in Kullo. In. lat. $12^{\circ} 20^{\circ}$. W. long. $9^{\circ}$ - Alfo, a town of Arabia, in thes province of Hedsjas ; three miles N.W. of Midina. - Alfu, a town of Turkeftan; yo miles E. of Toucat.

Koba of Buffon, in Zoology, Anfelope Kobe, is referred by Gmelin, with fome hefitation, to Antelork Pygarga, (which fee); but Pennant refers the koba to the fipecie:; we are now to dercribe ; i.e. his Senegal antelope, the Cervus temamaçama of Seba, the antilope Bubalis of Pallas, la grande vache brunne of Adanfon. The horns are thick and annulated, very clofe at the roots, much bent in the middle, then approaching and receding at the ends, which are fmooth, fharp, and bent backwards. This animal inhabits Senegal ; it is a large fpecies, feven feet long; the head is Irge and clumfy, with large ears, feven inches long; the horns are feventeen inches long, and are furrounded wish fifteen prominent rings ; the head and body are of a light reddifh-brown colour, with a narrow black lif down the hind part of the neck; the rump is dirty waite ; there 28 a dujky mark on each knee, and dobove each fetlock joimt

## K O B

the tail is about a foot long, and is covered with longifh black hairs.

KOBdCK, in Georraphy, a town of Sclavonia, on the Save; 20 miles E.S.E. of Belgrade.-Alfo, a town of Africa, in the kingdom of Yani.

KOBAD, a diltrict of Perfia, in the N.W. part of Farfinam.

KOBAK, a town of Sweden, in Weft Bothmia; feven miles N.W. of Umea.

KOBAN KUpri, a town of Turkifh Armenia; 27 miles E. of Erzerum.

KOBELNIKA, a town of Auftrian Poland, in Galicia; 34 miles W. of Lemberg.

KOBELWIES, a town in the canton of St. Gallen, in Switzerland, at the foot of the Kamor. About two miles above Kobelwies are the caves known by the name of the Cryfal Caves. Thefe are difficult of accefs, the only poffible mode of entering them being in a creeping pofture. From the firft of thefe caves you defcend into the fecond, and afcend again in order to arrive at the third, out of which iffues a brook, which fupplies forty baths at Kobelwies. The interior of the cares is fudded all over, not with rock cryftals, but with calcareous \{par, which is partly coated with a yellow kind of clay ; it is found white and of an afhgrey colour, feparates into brilliant large grains with a fimooth furface, and when burnt yields the fineft and white it fort of lime which is applied for the purpofes of art. The water iffuing out of the caves is very clear; it is impregnated with lime and fulphuric acid, and the baths it fupplies (efpecially when taken warm) are very efficacious in the cure of the ague prevailing in the marfhy parts of the country tordering on the Rhine.

KOBEN, a town of Silefia, in the principality of Glo. gau, on the Oder. N. lat. $51^{\circ} 31^{\prime}$. E. long. $16^{\circ} 26^{\prime}$.

KOBI, a town of Ruffia, in the government of Caucafus; 60 miles S.E. of Ekaterinograd.

KOBIELE, a town of Lithuania, in the palatinate of Troki ; 20 miles N.N.E. of Grodno.

KOBIELEN, a town of the duchy of Warfaw ; 28 miles W. of Kalifh.

KOBIL, a town of Ruffia, in the government of Peterfburg, on the E. coaft of the Tchud hoi lake; 2q miles N . of Pikov.

KOBILINKAIA, a town of Ruffia, in the country of the Coflacks ; 156 miles E.N.E. of Azoph.

KOBIN, a town of Perfia, in the province of Segeflan; 30 miles S. of Zareng.

KOBINIKI, a town of Lithuania, in the palatinate of Wilna; 52 miles E.N E. of Wilna.

KOBRESIA, in Botany, fo called by profeffor Willdenow, in honour of a nobleman at Vienna, named de Kobres, whom he celebrates as an eminent promoter of natural hif . tory. - Willd. Sp. Pl. v. 4. 205.-Clafs and order, Monoecia Triandria. Nat. Ord. Calamaria, Lim. Cyperoidece, Juff.

Gen. Ch. Mate, Cal. the inner fcales of a catkin, each oblong, flightly concave, fingle-flowered, permanent, fometimes wanting. Cor. none. Stam. Filaments three, capillary, erect, lunger than the calyx; anthers vertical, linear, erect.

Female, Cal. the outer fcales of the fame catkin, rather larger, fheathing, elliptic-oblong, fingle-flowered, permanent. Cor. none. Pift. Germen fuperior, triangular ; It yle cylindrical, fhort ; Atigmas three, briftle-fhaped; downy. Peric. none, except the permanent fcales. Seed one, triangular, pointed, hard, naked.

Eff. Ch. Male, Calyx the inner fcales of an imbricated catkin, folitary. Corolla none.

## K O B

Female, Calyx the outer fcales of the fame catkin, fleathing, permanent. Corolla none. Stigmas three. Seed triangular, naked.
Obf. This genus differs from Carex in the want of a tunic to the feed, which is fo remarkable in that, and has been called fometimes a corolla or nectary; as well as in the difpofition of the flowers. Thefe in Kobrefict ftand in pairs, the males being interval, and fmaller. In one known inflance only they want their fcale or calys, fo that there is no feparation between the flamens and pittil, and the flowers become apparently united, or hermaphrodite. Three fpecies only are known.

1. K. firpina. Willd. n. 1. (Carex Bellardi; Allion. Pcdem. v. 2. 264. t. 92. f. 2. Schkuhr. Car. 12. t. D. f. 16. C. myofuroides; Villars. Dauph. v. 2. 194. t. 6. See Carex, n. 15.)-Spike folitary, fimple, cylindrical. - Native of dry clevated fpots on the mountains of Savoy, Dauphiny, Italy, Carinthia, Styria, and the Tyrol, flowering in July and Augult. We have gathered it high on Mount Cenis, in company with the able botanift whofe name it bears. Linneus had fpecimens from Italy, which he never defcribed. Mr. Davall found this plant on the mountain of Valforey, though Hailer has it not. The root is perennial, tufted, confifting of numerous blackif, zigzag fibres, running deep into crevices of rocks. Stems nu. merous, a fpan liigh, or lefs, fimple, naked, round, itriated, fmooth, erect or fightly curved, compofing denfe tufts, with numerous, fheathing, brown, polifited radical fcales, Leaves radical, erect, fhorter than the ftems, narrow, acute. involute, rough-edged. Spike terminal, folitary, erect, about an inch long, obtufe, flender, of from ted to twenty pair of flowers, mof lax in its lower part. Glumes brown, fhining, with membranous edges, awnlefs. Schkuhr figures but two ftigmas; we find three, as all other writers defcribe them. The permanent glumes, invefting the feed, look like the torn tunic of a Carex, as Villars reprefents them. That of the male flower is much the fmalleit and molt membranous.
2. K. caricina. Willd. n. 2. (Carex hybrida; Schkuhr. Car. t. Rer. f. 161. Willd. Schoenus monoicus; Sm. Eng. Bot. v. 20. t. 1410.)-Spike compound, denfe, fomewhat ovate; (pikelets alternate, imbricated.-Native of Mount Cenis, in rather moilt muddy fpots, flowering in Auguft ; gathered by the writer of the prefent article in 1787. Mr. Dickfon obferved it in the county of Durlam in 1 /99. The Rev. Mr. Harriman mentions the mountain of Cronkley, and the neighbourhood of Widdy bank, in Teefdale forelt, as its particular ftations. At the fuggeftion of the late Mr. W. Brunton, it was referred in Eng. Bot. to Schoenus, proving, on examination, no Care.. Its habit and fize are much like the preceding, except that the fems grow lefs crowded or tufted, and are ftouter, and the leazes fhorter, fomewhat broader, as well as more fpreading. The fipike is effentially different, being compofed of four or five alternate, fhort, elliptical fpikelets, making all together an ovate figure. Glumes rather more pointed, keeled, and lefs membranous, than in the foregoing fpecies. Stigmas three. Seed elliptic-oblong, triangular, pointed, horny.
3. K. eyperina. Willd. n. 3. (Carex hermaphrodita; Jacq. Coll. v. 4. 174. Ic. Rar. t. 615.)-Umbel twice compound, leafy; fipikes cyiindrical ; fpikelets fpreading. Male flowers without their proper calyx. - Jacquin received this from the Caraccas, where it grows in wet fituations, and it flowered with him in the fove at Vienna, from May to Auguft. The habit is that of a Cyperus, or a Kyllingia. Root perennial. Stems annual, triangular, fmooth, about two feet high, with feveral long, theathing, linear, roughifl leaves, bulf an inch broad at their bafe, and many fmaller
ores at the umbel, which confifts of numerous, fimple, or compound Italks, hearing various thick but lex jpikes. Thefe are compofed of mumerous fpikelets, fpreading horio zontally, each linear lanceolate, flender, a quarter of an inch long, and confiling of four or five, apparcutly hermaphrodite, imbricated flowers. It feems to us, however, that they are really pairs of flovers, of which the male wants the glume or calyx, which fuppofition is juftified by the analogy of the other fpecies. The culour of the whole plant is reprefented by Jacquin, as a rearly uniform pale green.Stigmas three. Seed oblong, triangular, pointed, brown. S.

KOBRYN, in Gcography, a town of Lithuania, in the palatinate of Brzefc ; 28 miles E. of Brzelc.

KOBYN, a town of Lithuaniz, in the palatinate of Brzefc; 34 miles E.S.E. of Brzefc.

KOCHEISKAIA, a town of Ruffia, in the government of Irkutk, on the Ilga; 28 miles N.W. of Vercholenfs.

KOCHIA, in Botany, fo named by Dr. Roth, and adopted by Mr . R. Brown, in honour, as we prefume, of a German botanilt, John Frederick William Koch, author of a periodical work on economical plants, printed at Magdeburgh in 1797 and 1798 , in octavo. It may alfo commemorate Jofeph Matthias Koch, who pubhihed on agriculture at Vienna in 1767 , recommending falt for manure; an opinion perhaps to be adopted "cum grano fulis ;" but as this plant belongs to a faline tribe, he may, under fuch limitation at lealt, be faid to have merited the diltinction as well as fome profeffed botanilts.-Brown Prodr. Nuv. Holl. v.r. 409.-Clafs and order, Pentandria Digynia. Nat. Ord. Holeraces, Linn. Atriphices, Jufl. Cbenopociea, Decandolle and Brown.

Eff. Ch. Calyx inferior, of one leaf, in five fegments, having appendages at their backs when in fruit. Corolla none. Seed one, depreffed, enclofed in the wiagred calyx.

Two £pecies only are mentioned by Mr. Brown as natives of the fouth coait of New Holland.

1. K. brevifolia. Leaves cylindrical, feffile, fmooth. Stem fhrubby, much branched, erect and woolly. Appendages of the calyx dilated and membranous
2. K. aphylla. Shrubby and leaflefs. Branches divaricated and bent downwards; the young ones fpinous. Spikes lateral. Calyx woolly; its appendages when in fruit membranous.

There feem to be many more fecics in other parts of the world, as Mr. Brown advifes a divifion of the genus into Kochia, properly fo called, the fpecies of which have the appendages of their calyx awl-fhaped and fininous, their feeds deltitute of albumen, and their embryo cloven at the bafe ; and Willemetia, whofe appendages are membranous and dilated, their feeds furnifhed fparingly with albumen. This diffcrence however, refpecting the albumen, in plarits fo nearly akin, fhews how little any character is to be trufted abfoutely. The abfence or prefence of albumen forms one of the moft effential marks of diffinction with writers on natural orders, and, on account of the difficuley of its deteetion, might feem more impofing and authoritative to the pnlearned than it really is.

KOCNI, in Geography, a town of Walachia, on the Ardgis: 15 miles N , of Buchareft.
KOCYCK, a town of Poland, in the palatinate of Lublin; 24 miles N. of Lublin.

KOCZARAWAC, a town of Poland, in the palatinate of Braclaw ; $4^{8}$ miles S.S.W. of Braclaw.

KOCZMYN, a town of Lithuania, in the palatinate of Novogrodek; 28 miles N. of Sluck.

FOCZOWA, a town of Poland, in the palatinate of Kiev; 22 miles S.S.E. of Bialacerkiev.

KODAJA, a town of Arabia, in the province of Neds. jed; 50 miles W. of Janama.

KODAL.I.Y, a town of Hindoofan, in Myfore; 27 miles E. of Chinna Balabaram.

KODbA-I'AIL, in Botany, the Indian name of the Linnxan Piffia Stratiotes. Sice Řhecde Hort. Mal. v. xi. 63. t. 32, and Plum. Nov. Gen. 30. t. 39

KODDE, Vander, in Biography. There were three brothers of that name, viz. John, Adrian, and Gilbert, inhabitants of Warmond, near Leyden, who are entitled to notice from their having been founders of a religious community known by the ame of Collegiants, which fee. The founders paffed their days in the obfcurity of a rural life, but were faid to be men of eminent piety, well ace quainted with facred literature, and enemies to religious controverfy. Gilbert was an elder of the Remonittrant church at Warmond, and poffeffed a flucnt elocution. In the year 1619, when the perfecution of the Calvinilts had driven the Remonitrants from their churches, the thee brothers propofed that meetings fhould be held of members of the charch at Warmond, at which one or more of their number fhould read a chapter or two out of the Bible and pray ; and if any perfon had any thing to offer by way of exhortation, inftruction, or the editication of others he fhould be at liberty fo to do. Hence they foon inferred the inutility of the minifterial profeffion, as the people were fufficiently qualified to teach and inftruct one another. From this origin Sprung a fect, or community, already referred to, confilting of perfons of all fects which fpread very widely over the Dutch provinces. Morheim's Ecclef. Hitt

KODEN, in Geogruk ${ }^{2}$, a town of Lithuania, in the palatinate of Brzefc; is iniles S. of Brzefc.

KODGIA-HISAR, a town of Afiatic Turkey, in the province of Diarbekir; 10 milles S. of Merdin.

KODGIA-SiłEHR, a town of Natolia; 12 miles N. of Kiutaja.

KODIAK, a range of iflands, confifing of one large; bearing this name, and feveral fmaller, in the North Pacific ocean, extending about 120 miles in length from S.W. to N.E., and about 40 miles in breadth ; above 20 miles from the W. coaft of America, and 30 S . from the entrance into Cooke's inlet. N. lat. $56^{\prime} 45^{\prime}$ to $5^{8} 28^{\prime}$. E. long. $206^{\circ}$ $12^{\prime}$ to $208^{\prime} 45^{\prime \prime}$.

KODJA. See the next article.
KODJAKANS, or Kodjas, a numerous clà?s of per* fons in the Ottoman empire. particularly in the capital, which holds the middle ran between the military men and the lawyers, and which is become fufficiently powerful, fincethe influence of the Ulemas has declived, as the divan is compofed of them, and as fome of thes ob:ain fiefs, military rank, and governments. Almoft all the minitters, all the agents ia the different adminitrations of the capital, the cuftoris, and the mofques; all the principals of offices, all the fecretorics, all the clows, all the fchool-maiters; in a word, all the writers from the fimple "kiatib," who copies books, petitions, or me:norials, and him who applies himfelf to writing parely and correctly the language, to the "reiso effendi," who is at the heze of them, are all diftinguifhed by the name of Kodja, and mak:e part of that fort of corporation. The art of tranfcribing the national books, and efpecially the kordn, is a kind of nurfery for this clafs of perfons. The Maffulmen are indebted to the Kodjas for a great number of works, which they hold in high eftimation, relative to the Arabic and Perfian languages, philofophy, morality, Mahometan hiitory, and the geography of their provinces; and among them are generally found the moft intelligent

1tatefmen, or thofe whe are mutl capable of ferving as minillers.

KO1)I-HISSAR, a town of Natolia: 13 miles N of Kianguri- - Nllo, a town of Ahatac 'Turkey, in Aladulia, 18 miles N. k . of Sivas.

KODMA, a town of Perfia, in the province of Ferman; $t o$ miles N. of Kermanthir.

KODMAN゙入, a towa of Walachia; so miles S. of Kordedearda.

KODNIA, a town of Ruffan Poland, in Voilymia; yo miles $S$. of $Z y$ tomiers.

KOEG. Sce Dagzbuther.
KOEI, or KOEP-YANG, a city of China, of che firt clafs, and capital of the province of Koci-tcheou. It is a fmail vity, being only about three miles in circuit ; its hondes are partly of earth, and partly of brick, and as the river that approaches it is not navigabie, it is a place of no trade. It was once the refidence of the ancient kings ; the remains of temples and palaces announce its former nagnificence; but the monuments of grandeur are mouldering into rums. Within its juridiction there are three towns of the fecond order, and four of the third; about it are many forts. N. lat. $26^{\circ} 30^{\prime}$. E. long. $106^{2} 19^{\prime}$.

KOEI-TCHEOU, the fmallelk prosince of China, bounded on the N. by Sc-tchuen, on the E. by Hou-quang, on the S. by Quang-fi, and on the W. by Yun-nan. The whole country is almoft a defert, and covered with inacceffible mountaius; fo that it may be regarded as the Siberia of China. The inhabitants are independent and ferocious. The Mandarins and governors, who are fent into this province, are fometimes difgraced noblemen, for whom the emperor wifhes to provide; the garrifons are entrufted to their charge, in order to overawe the country; but no troops of the empire are found fufficient to fubdue the intractable mountaineers of this province. Many efforts have been made for this purpofe, forts have been erected, and troops fent to conquer them; but they retire within the faltneffies of their mountains, and feldom iffue forth, but to dettroy the Chinefe works, or ravage their lands. Neither filk tuffi, nor cotton cloths, are manufactured within this province; but it produces a plant, refembling our hemp, of which they make cloth for their fummer dreffes. It has mines of gold, filver, quickfilver, and copper; and of the laft metal, they make thofe fmall pieces of coin, which are in circulation throughout the empire. This province contains 10 cities of the firlt clafs, Koei-yang being the capital, and $3^{8}$ of the fecond and thitd. Some of thefe cities, which are conftructed of earth and brick, and which may be faid to refemble heaps of cottages, are fituated on the banks of agreeable rivers and in fertile vallies; and though a quantity of land might be found in this province, which by proper cultivation would yield a confiderable produce, the Chinefe are fo awed by the mountaineers, that they dare not leave the neighbourhood of their fortreffes.

Koei-tcheou furnifhes the beft horfes in China; an immenfe number of cows and hogs are raifed here, and wild poultry, of a molt exquifite talle, are every where to be found. Sir George Staunton eftimates the population of this province at $9,000,000$.

Koes-tcireou, a city of China, of the firf clafs, in the province of Se-tchuen; feated on the banks of the great river Kincha, or Yang-tfe-kiang, and forming the key to the province with a cuftom houfe for receiving the duties of the merchandize which is brought thither. Its trade is great,
and of courfe it is opulent. Its jurifdiction comprehends one city of the fecond clafs, and sine of the third. The adjacent country is mountainous, but is rendered fruitful by th indufty of its occupiers, who are unvolifhed hufbandmen. The neighbourbood affords great quantities of muks, and feveral fprings from which filt is procured. Orange and lemon trees are very common. N. lat. $35^{\circ} 10^{\prime}$. E. long. 1:91 $14^{\prime}$

KOLLCOTTI, , town of Thibet, on the Ganges; 30 miles $S$ of Gangurti.

KOELI:, a ridge of mountains between Sweden and Norwav.

KOEI.PINLA, in Botany, fo named by profefor Pallas, in the third volume of his $\mathrm{R}_{\mathrm{n}} \mathrm{Gi}$ an Travels, p.755. t. L. I. fis. 2, in memory of his "highly meritorions friend," Alexander Bernard Koelpin, Profeffor of Phyfic at Stetin, in Pomerania, author of feveral botanical tracts. Pallas fubmits this genus to the decition of thofe who, as he modeftly fays, take the lead in botany. Few are more worthy to do fo than himfelf, and his Kcelpinia is eltablifhed as a genus by Schareber and Willdenow, though they found themfelves obliged to adopt a different name, this identical genus being the Rhagadiolus of Cxefalpinus, Tournefort, Vaillant, Juffieu, and Gærtner, confounded by Linnæus under Lapfana. The name they have retained feems to us expreflive and unexceptionable, though Ambrofini furcly gires a wrong explana. tion of its meaning. See Riacadiolus.

IOELREUTERIA, a genus named by Laxman, in the Memoirs of the Peterfburg Academy, in honour of John 'Theophilus Kölreuter, M.D. profeffor of Natural Hiftory at Carlfrhue, born in the year i 733 , author of fome differtations relative to the plants about Tubingen, and of feveral experiments relative to vegetable fecundation.-Laxman. in Nov. Comm. Petrop. v. 16. 561. t. IS. Schreb. 731, Willd. Sp. Pl. v. 2. 330. Mart. Mill. Dict. v. 3. Ait. Hort. Kew. ed. 2. v. 2. 351 . L'Herit. Sert. Angl. 18. Juff. 45 I. Lamarck. Illuttr. t. 30S.-Ciafs and order, Odindria Monorynia. Nat. Ord. Tribilata, Linn. Sapindi, Juff.

Gen. Ch. Cal. Perianth inferior, of five, ovate, obtule, concave, membranaceous, unequal leaves, afcending towards the upper fide, gaping below. Cor. Pctals four, equal, afcending towards the upper fide; the two lower ones oppofite : claws cylindrical, fraight, the length of the calyx: borders lanceolate, recurved at the top, fpreading. Nectary compofed of four erect, deeply cloven fcales, affixed to the claws of the petals, forming: a crown to the orifice; with three glands between the famens and pitil. Stam. Filaments eight, awl-fhaped, erect, affixed to the columnar receptacle $i$ anthers oblong, obtufe. Pi/f. Germen fuperior, oblong, triangular, ftanding upon the columnar receptacle; ftyle fimple, three-fided, alcending, as long as the petals; Atigma trifid, fpreading, fmall. Peric. Capfule oblong, of three cells, and three valves, the partitions from their centre: Seeds in pairs, attached to the partition, one of them generally abortive.

Eff. Ch. Calyx of five leaves. Coroila of four petals, irregular. Nectary of four cloven fcales, and three glands. Capfule of three cells, with two feeds in each.

1. K. faniculata. Willd. n. I. La'Herit. Sert. Angl. t. 19. (Sapindus chinenfis; Linn. Suppl. 228.)-A nat tive of China, hardy with us, flowering in July and Augult. -Stem arboreous, upright, round, fmooth, branched, fix or feven feet high. Brancbes fcattered, twitted; the younger ones glandulous and dotted. Buds conical, imbricated. Leaves on long, club-fhaped, channelled foot-Italks, unequally pinnate, with about fix pair of ovate, laciniated, fer
rated,
rated, acute, flat leanets. Panicles terminal, more than twice compound, loofe and fpreading. Flowers three or mure on erch partial ftalk, greenifh and in themfelves not very confpicuous. Some male flowers being intermixed among the reft, have induced Schreber to refer the genus to Polysumia.

## KOEMPFERIA. See Kemprima.

KOENIG, Samuel, in Biograply, a learned phitufopher, diltinguifhed by his mathematical abilities, was a Siwifs by birth. He filled the chair of philofophy and natural law in the univerfity of Franeker, whence be removed to the Hague, where he had the appointment of librarian to the fladtholder, and to the princefs of Orange. He was elected a member of the Academy of Sciences at Berlin, but was afterwards expelled from that body, on account of an attack upon Maupertuis the prefident, charging him with plagiarifm. The learned in every part of Europe felt interefted in the difpute. Koenig publifhed an "Appeal" written with much animation, which procured him many fupporters. He died in 1557 , leaving behind him the character of being one of the belt mathematicians of the age. He was author of feveral other pieces. According to Voltaire " he was a great metaphyfician, a good geometrician, and, what is of itill greater moment, a very good man."

KOENIGIA, in Botany, fo called by Linnæus in honour of his difciple Dr. John Gerard Koenig, a native of Courland, born in 1728, who in 1765 difcovered this plant in Iceland, and after having inveftigated the vegetable productions of that dreary country, and of its circumyacent feas, vifited the richer climes of India, where he died at Jagrenatpour, in Bengal, in 1785. His communications have greatly enriched the coliections of Europe, efpecially thofe of Linnæus, Retzius, and frr Jofeph Banks. The fine Bankfian library contains his botanical manufcripts. His letters to Limex as are very numerous and infructive.-Linn. Mant. 3. §ichreb. 57. Willd. Sp. Pl. v. I. 490. Mart. Mill. Dict. v. 3. Ait. Hort. Kew. ed. 2. v. I. 183. Jufl. 83. Lamarck. Illuitr. t. 5 r. Gærtn. t. 128 . -Clafs and order, Triandria Trigynia. Nat. Ord. Holeracce, Linn. Polygonex, Juft.

Gen. Ch. Cal. Perianth inferior, in three deep, ovate, concave, permanent fegments. Cor. none. Stam. Filaments three, capillary, fhorter than the calyx ; anthers roundifla. Pijl. Germen fuperior, ovate; thyles none; ftigmas three (often but two), clofe together, downy, coloured. Peric. none. Seed folitary, ovate, as long as the calyx.

EIT. Ch. Calyx in three deep fegments. Corolla noue. Seed folitary, ovate, naked.
I. K. iflandica. Linn. Mant. 35. Fl. Dan. t. 4iS. Native of Iceland, from whence fir Jofeph Banks brought feeds to Kew garden in 1773, and where Mr. William Jackfon Hooker obfersed it on his late eventful vifit to the fame country, of which he has favoured the public with fo pleafing and unaffected a narrative. This humble plant is chielly ca'culated to attract the fcientific botanitt, being an aunual, fcarcely two inches high, with a few alternate, obovate, or fpatulate, entire leaves, and fmall, green, fafciculate, terminal flowers. The whole herb is fmooth, a little fucculent, turning red in decay, or from expofure to much light, like its allies the tribe of Docks and Sorrels.

KOERTEN, 'Joavin, in Biograpby, was born at Amflerdam in 1650 . She had a fine tafte for drawing in water colours and for embroidery. She alfo modelled in wax, and made artificial ornaments and flowers; bit her chief excellence confifled in cutting out figures in paper with fciffors only, ald her portraits and landfcapes, in this way were fo mued -Vol. XX.
talked of that foreigners from all countries rifited Amferd an to fee them, among whom was Peter the Great of Ruliza She made a magniticent difplay of her art for the confort of the cmperor Ieopold, confithing of trees, arms, eagles, \&ec. for which fhe was very handfomely paid. She died ia 1715.

KOETEKOIE, in Gcograply, a fmall ifland in the Enft Indian fea. S. lat. 4 38. E. long. $133^{\prime}$ ' ${ }^{\prime}$ '。

KOEWAK, a town on the $S$. conff of the inand of C ram. S. lat. $3^{\circ} 1^{\prime} \mathbf{\prime}^{\prime}$ E. long. $129^{\prime \prime}$ I $8^{\prime}$.

KOF, a town of Japan, in the ifland of Niphon; 27 milee S.E. of Nigata.

KOFEL, a town of the county of Tyrol, on the borders of the Vicentin; near which is a celchrated pafs, with a fort erected on a high and ftcep rock, in which is a fpring of water for the fupply of a fmall garrifon, which can onls enter by means of pullies. The road below is fcarcely wid, enough for two carriages. On the lide oppofite to the for: is the precipitous bank of the Brenta; 21 miles E. of Trent.
KOFEZ, mountains of Perfia, between Mecran and Kerman.
KOGETIN, a town of Moravia, in the circle of O1mutz; 14 miles S. of Olmutz. N. lat. $49^{\circ} 20^{\prime}$. E. long. $17^{\circ} 15^{\prime} \cdot$

KOGL, a town of the duchy of Stiria; 17 miles N.N.W. of Rakefpurg.

KOGONG, a town of Africa, in the country of Sierra Leone. N. lat. $10^{\circ} 45^{\prime}$. E. long. $122^{\prime} 12^{\prime}$.

KOHAU'T, a town of Candahar; 130 miles S.E. of Cabul. N. lat. $33^{\circ} 5^{\prime}$. E. long. $70^{\circ} 20^{\prime}$,

KOHHEL, a town of Arabia, in the province of Yemen; ro miles N. of Dcbin.

KOHLBERG, a town of Bavaria, in the principality of Sulzbach ; If miles N.E. of Sulzbach.

KOHLMEISE, in Ornitbology', the Colenoufe of Pertnant, \&c. See Panus ater.

KOHLMULEN, in Ichthyography, a mame given by fome to the afelius flavefcens, or yellow cod, called by others blank and gelbe. See Gadus Pollachius.

KOHLRABI, in Agriculture, the name of a fort of tur. nip cabbage, which is probably capable of being cultivated to advantage as an article of cattle food, though it is not yet much known to the farmers of this kingdom. It has the eatable part, or bulb, above the ground upon the ftem, and there are two varieties, the green and the blue, which are both equally good and hardy in their nature.

In the raifing of plants of this kind, the feed fhould be fown at the fame period as for the common cabbage, and the plants, when of proper growth, be tranfplanted out in the fagre manner about the beginning of June, allowing good diflances both between the plants and rows. In performing this work, it is advifed to cut oif about one-third of the roots of the plants, care being taken to plant them fufficiently deep in the ground, as by this means the bulb grows to a much larger fize without becoming tough.

Plants of this fort furceed beft on fuich foils as are not too much difpofed to moifture. This plant is found to withftand the feverity of froits much better than the Ruta baga, or Swedifl turnip. And it is further obferved, that in the botanical garden at Brompton, fome of the plants weighed feven or eight pounds ; and that though many of them were notched and hacked on purpofe for the experiment, the turnip remained perfectly found and uninjured, while a bed of Swedifh turnips near them was quite roten. The faccharine quality of it is equally remarkable, and both its leaves and bulb are very ufctul as kirchen vegetables.

## K O K

In our own trials, we found it to fland the feverity of the winter without the leaf injury, and to be perfectly well tafted, though the bullos did not increafe to a large fize. It has every appearance of being a varicty of the turnip cabbage. But few experiments have, however, yet been made upon it, cither in regard to its culture or application as a green cattic fodder.

KOHMU, in Gcegraphy, a town of Bengal; nine miles N. of Torec.

KOHONE, a town of Africa, in the kingdom of Burfali. KOHTAUM, a town of Bengal; is miles W. of Doefa.

KOH-ZERDEH, mountains of Perfia, in the province of Chufillan, bordering on the Irak. Sce Hemzamara.

KOJA-KIZ, a town of Kharafm, near lake Aral ; 18 miles N.E. of Urkonje.

KOIDANOW, a town of Ruffian Lithuania; 15 miles S.W. of Minsk.

KOJEND, or Kogend, a town of Greater Bucharia, on the left bank of the Seir, on the borders of T'urkeltan. In 1220, it was taken and plundered by Jenghiz Khan, after a brave defence; 120 miles N.E. of Samarcand.

KOIRVIRAH, a town of Perfian Armenia; 18 miles S. of Erivan.
KOISJU, a town of Japan, in the ifland of Ximo; 26 miles W. of Naka.

KOIVIST'A, a town of Ruffia, in the govermment of Viborg; 20 miles $S$. of Viborg.

KOK ANO, a town of Poland, in the palatinate of Brachaw; 28 miles $N$. of Braclaw.

KOKAR, a finall inaud of Sweden, in the Baltic, about 30 miles S.E. from the ifland of Aland. N. lat. $59^{\circ} 58^{\prime}$. E. long. $20^{\circ}+6^{\prime}$

KOKERWARA, a town of Hindooftan, in Guzerat ; 15 miles N.W. of Amedabad.

KOKETARRA, a town of Hindooflan, in the circar of Gangpour; 16 miles N.E. of Pada.

KOKLOT, a fmall inland on the E. fide of the gulf of Bothnia. N. lat. $62^{\circ} 17^{\prime}$. E. long. $21^{\circ} 25^{\prime}$.

KOKOB, in Zoology, the name of a fpecies of ferpent found in the Welt Indies, and yery fatal by its bite. It is fmaller than our viper, and of a brown colour, variegated with green and ted fpots.

KOKONOR, Tartars of, in Geography, a tribe of Tartars, who are, by nation, Eleuthes or Kalmucks, and Subjects of the emperor of China, and who occupy an extenfive country to the W. of China, and she province of Chen-fi, from which they are feparated by lofty mountains. See Kalaucks.

Kокомо,, or Kokorol, Lake, is the largett in T"artary; it is about 20 leagues in length, and 10 in breadth, and is fituated between $3^{\circ}$ 40' and $37^{\circ} 10^{\prime} \mathrm{N}$. lat. and $100^{\prime}$ and $101^{\circ}$ E. long.

KOKORE, a town of Hindooftan, in the circar of Kischwara; 45 miles E.N.E. of Shajehanpour.

KOKORO, the eaftern branch of the Senegal river, which riles about N, lat. $11^{\circ} 50^{\prime}$. W. long. $6^{\circ} 40^{\prime}$, and joins the wefteriy branch about N . lat. I 4 .

KOK ORY, a town of Moravia, in the circle of Prerau; fix miles N.W. of Preratu.

KOKRA, a lown of Hindooftan, in the circar of Ruttunpour; 20 miles S . of Ruttunpour.
KOKURA, a fea-port town of Japan, on the N. coaft of the ifland of Ximo; furrounded with walls, and having a citadel, it is a place of extenfive trade, but the harbour is nearly choked wish fand. N. Lat. $33^{\circ} 50^{\prime}$. E. long. $130^{\circ}$ $20^{\prime}$.

## K O L

KOLA, a fea-port town of Rufla, in the government of Archangel, fituated near the North fea, on the river K ola, forming a bay at its mouth, in which is a confiderable fifhery for whales, feadogs, and other fifh, which the inhabitants cure for fale. N. lat. $68^{\circ} 52^{\prime}$. E. long. $32^{\circ} 26^{\prime}$. According to Mayer, it is 420 feet above the level of the fea. The thermometer was once, in May 1769, at 73'. -Alfo, a town of European Turkey, in Servia; five miles S. of Semenaria.-Alfo, a town of T'urkifh Armenia; 40 miles N.E. of Kars.

KALABOORA, a town of Hindooltan, in Oriffa; 20 miles N.E. of Sumbulpour.

KOLAH, a town of Natolia; 36 miles N.E. of AlahSehr.

KOLAR, a town of Africa, in the kingdom of Burfali, near the coall of the Atlantic. N. lat. $13^{\circ} 5^{\circ}$. W. long. $15^{\circ} 55^{\prime}$.
KOLASSIN, a town of Dalmatia; $2 \&$ miles S.E. of Moftar.
KOLAY, a river of Cochinchira, which runs into the Chinefe fea, N. lat. $13^{\circ} 51^{\prime}$ 。 E. long. $10 S^{\prime} 54^{\prime}$.

KOLbe, or Kolbex, Peter, in Biography, was born at Dorfas, a village in the principality of Baireuth, of which place his father was a judge, and afterwards a receiver of taxes. When he had attained the firlt principles of knowledge, he was fent to Nuremberg to purfue his maturer ftudies. Here he lived fome time in grat poverty, being unknown, and having brought with him a fingle dollar only. In 1696, he was received into the houfe of Eimart, a great altronomer, under whofe directions, and by whofe aid, he made confiderable progrefs in the fciences. He entered himfelf at the univerfity of Halle in the year 17 co , and in the following year he difputed "De Natura Cometarum," after which he gave a courfe of lectures in mathematics and philofophy. He was introduced to baron von Krofie, privy counfellor to his Pruffian majefty, to whom he became fecretary, and whom he accompanied in his travels. It being known that he had a great defire to vift forvign countries, a propofal was made to him to go to the Cape of Good Hope, which he gladly embraced. Here he remained ten years, making obfervations on the country and the people, till he was afflicted with the misfortune of blindnefs, which came on without any external injury. He now returned to Europe, and by means of medical affittance he fo far recovered his fight as to be able to read with the affittance of glaffes. In 1716, he inferted in the Acta Eruditorum a treatife "De aquis Capitis Bonæ Spei." This work introduced him into farther notice, and he was invited to travel with two Autrian counts, but his paffion for foreign countries had fublided, and he preferred remaining at home, and taking upon himelf the office of rector of the fchool of Neuftadt. He difcharged the duties of his fituation with much diligence till the year 1526, when he died, in the fiftyfecond year of his age. His bufinefs, as an inltructor, had not prevented him from publifhing his great work, entitled "A Defcription of the Cape of Good Hope," in folio, with twenty-four plates. This work was tranflated into the Dutch language in 1727 ; and at London, into the Englifh, in 1731. It. was afterwards abridged, and publifhed in French in three yols. 12mo. Kolbe has been charged with, recciving information without much examination, and with having publifhed, as true, many falfe and incredible fories; but when the proper deductions are made that fevere criticifm has fuggefted, there fill remains much important in. formation with regard to a country, which, at that time, was fcarcely known. Gen. Biog.

KOLBEN-

KOLBENDORF, in Geography, a town of Bohemia, in the circle of Konigingratz ; nine miles N.N.W. of Trautenau.
KOLCHY, a town of Poland, in the palatinate of Volhynia; 52 miles $N$. of Zytomiers.

KOLEI-HISAR, a town of Afiatic Turkey, in the government of Sivas; 45 miles N.N.E. of Sivas.

KOLEN, a chain of mountains, extending between Norway and Swedifh Lapland, and atterwards bending, in the form of a horfe-fhoe, on the S. of Finmark.

KOLGAPARI, a town of Ruffia, in the government of Olonetz; So miles N.N.W. of Olonetz.

KOLIAKOV, a town of Ruffia, in the government of Simbirk, on the Sura; 80 miles W.S.W. of Simbirk.
KOLIAZIN, a town of Ruffia, in the government of Tver, on the Volga; 68 miles E.N.E. of Tver.

KOLIKUNDA, a town of Africa, in the kingdom of Jeniarrow.
kOLLMA, Kolyara, or Kompma, a river of Ruffia, which rifes in the Stanovoi-Krebet, almoft over-againit Ochotk, and after receiving feveral other rivers, partichlarly the Omolon, forms a multitude of iflands, and, by means of four broad arms, flows into the Frozen ocean, N. lat. $71^{\circ} 25^{\prime}$. E. long. $15^{2} 24^{\prime}$.

KOLIN, a town of Bohemia, in the circle of Kaurzim, on the Elbe; 30 miles E.S.E. of Prague. N. lat. $49^{\circ} 5^{\prime \prime}$. E. long. $15^{\circ} 1^{\circ}$.

KOLIVAN, Kolyvas, or Kolhyvan, a city of Ruffia, and capital of the government of the fame name, fituated ou the Oby, near the mouth of the Berda; known before the inflitution of this government under the name of "Berdfkoi oftrog:" Kolyvan is fanous for the filver mines difcovered in its vicinity. They lie between the rivers Oby and Irtifch, near the mountains which feparate Siberia from the Chinefe empire, or rather from the territory of Kalmucks dependent on the Chinefe. They were difcovered in the year 1725 or 1728 , and appropriated to the crown by the emprefs Elizabeth in $17+4$ They produced annually, between 1749 and 1762 , from 8000 to 16,000 pounds of filver; between 1763 and 1769 , from 20,000 to 32,000 ; and fince that period to 1778 , from 40,000 to 48,000 . The filver contains upwards of three per cent. of gold; the fe. paration of whicle is made in the imperial laboratory at Peterburgh. Upon the whole, it appears from the accounts of the board of mines, that they have produced, from their difcovery to the year 1786 , about $3,520,000$ pounds of filver, and 48,000 pounds of gold, which yield, at an average, a produce of 50,000 pounds of filver, and 1600 pounds of gold per annum. The mines and founderies of Koljvan employ nearly 40,000 colonits, befides the peafants in the dillriets of Tomfk and Kufnetz, who, in licu of paying the poll-tax in money, cut wood, make charcoal, and traniport the ores to the founderies. In the year 1765 , a mint was eftablifhed at the foundery of Sufunfk, for the coinage of the copper fupplied from thefe mines, the greater part of which had been, till that period, of no ufe. Pieces of one, two, five, and ten copecs (the copec being nearly equal to a halfpenny) are ftruck and difperfed over Siberia. Of this currency, the amount of 500,000 roubles is annually coined, which is fufficient for reimburling the pelltax, paying the miners, tranfporting the ore, purchafing the lead, which muft bé brought from Nerfhinfe, and defraying the expence of fending the gold and filver as far as Toholks. The filver melted in the founderies is conveyed on large fledges twice a year ; the firft convoy fets off in the beginning of winter, and reaches Peterfurgh a little after

Chriftmas; the fecond in the middle of winter, and arrives there towards fpring. Kolivan is diflant 480 miles S.S.E. of Tobolfk. N. lat. $54^{\circ} 20^{\prime}$. E. long. $81^{\prime} 20^{\prime}$. Coxe's Travels in Ruffia, vol. iii.

Kolivan;, Kolyvan, or Kollyzan, is alfo a government of Ruffia, bounded on the N. by the government of Tobolik. on the E. by that of Irkutk, on the S. by China, and on the W. by Tartary; about 720 miles in Jength, and from 240 to 360 in breadth. This government was formerly included in that of Tobollk; it contains five diltricts, qiz. Kolyvan, Semipalat, Birfl, Kufnezk, and Kralfnoiarlk.

Kolivan, or Kollyvan, is alfo the name of a range of mountains, conftituting the principal pert of the Altay mountains, or the proper ore-mountains of Altay. (See Altar.) The Kolhysanovos-krefenfioi mountains derive their appellation from the adjacent lake Kolhyvan, which has given its name to the whole chain between the Irtifch and Oby, as well as to the government, and from the f.ith copper-mine, called Vofkrefenfoi. Thefe mountains are bounded on the $S$. by the granitic ridge, which parts them from the Korbo-likinkroz, which fee. They are confined to the E. by the deep valley in which the line of the prefent firepolls is drawn, and by the lofty Tigeretzkoi fnow-mountains; and bounded on the N. by the river Thary fh, whofe courfe is accompanied by conliderable high fchift and chalk mountains; towards the W. they lofe themfelves in the north-weftern Steppe. The greateft elevation of thefe mountains is the Simnaia-fopka, or Blue-mountain, which is computed to afcend 28 I 4 Parifian feet above the level of :he fea. At the middle and greateft height, this range confifts of a motlly coarfe granite, compoled of Spatum compeftre, quartz, and blackih mica. In the angle formed by the little Biela with the great Biela, at the foot of the Blue mountain, are found fchitus and chalk-fone, in which latter are fome little cavities, containing lapis calcareus ftalactites. From the little Biela the mountains rife agaia toward the fouth, elevating themfelves to the Revennaiafopka, or Rhapontic fummt, which is furrounded by the ore-mountains, and confifting of fchiffus corneus, mixed fparingly with mica fpathola and crumbs of mica cam. peltris, in which latter are a few fmall hoilows, in which are found ftalactites. Towards the welt, from the Blue mountail, runs the granite-mountain range, in bulk from 15 to 30 verts, interrupted by a multitude of vallies, procceding 100 verts to the Alay, and there uniting with the Alaikoi granite-hills. The northern foot of this graniteridge runs under powerful fchitus and chalk mountains, in and between which the two firft Kolhyvan mines were dug. Another mighty ridge of granite runs from the Blue moun. tain northwards to the river Tharyfh, under-run on the weftern dide by fchiltus and chalk. The component parts of thefe granite ridges are various. In fome parts the feldfpar, in others the quartz, has the afcendant. In one place the component parts are coarfe, and then fo delicate and $f_{0}$ poor in micx, that one might be induced to take the granite proceeding from them for fand-ftone. This track of mountains is uncommonly rich in filver, copper, and zinc ores. Tooke's Ruflia, vel. i.
KOLKI, a town of Poland, in the palatinate of Val. hynia; 22 miles N.N.E. of Lucko.

KOLKOTOVATOI, an ifland in the Cafpian fea, near the W. coaft. N. Iat. $4445^{\prime}$.

KOLLAT, a town of European Turkey, in Bulgaria ; 72 miles E.S.E. of Driltra.
KOLLOW. See Killow.

## K O L

KOLI.UVI, a conntry of Africa, between Arben and Calhna, inhabited by the Tuarick.

KOLKYRITE. Under this name an argillaceous forfil is mentioned in Kariten's Mineralogical Tables, which is found at Stephani-Schacht, near Shemnitz. Dr. Townfon, we fuppofe, is one of the firlt naturalifts who obferved it there. This mineral fubltance, which was firlt confidered as pure alumine, is light, very friable, and fnowwhite; it foils the fingers, and adteres Atrongy to the tongue, which laft property has procured it the name of kollyrite (from kolyrion of Diofcorides and Pliny.) According to Klaproth's analyfis of the Hungarian kollyriie, it contits of

| Alumine | 45 |
| :--- | ---: |
| Silica | 14 |
| Water | 41 |
|  | 100 |

This fubfance, which may be confidered as a purer variety of clay, has alfo been found, by Frieneben, at Weiffenfels, in Thurisgia, in a ltratum of fand-ftone.

According to Bronguiart, it has a tolerable degree of tenacity, and the water it abiorbed is feen to ooze out on the application of preffure, but it retains the liquid with fuch force, that more than a month is required to dry even a fmall quantity of it. By deficcation, it feparates into bafaltic prifms, like-ftarch, lofes half of its weight, and becomes very light.

KOLMOGOR, in Geograply, a ditrict of the government of Archangel, fituated on the Dwina.

KOLNO, a town of the duchy of Warfaw; So miles N.E. of Warfaw.-Alfo, a town of Lithuania, in the palatinate of Brzefc ; 88 miles E. of PinR.

KOL $\Theta$, a lake of Ruffia, in the government of Archangel; 28 miles S. of Archangel. Alfo, a town of the duchy of Warfaw; 24 miles N.E. of Kalifch.

KOLOCKEN, a town of the duchy of Courland ; 32 miles N.E. of Piltyn.
KOLOGRIN, a town of Ruffia, in the government of Koftroma, on the river Unza; 116 miles N.E. of Koftroma. N. lat. $5^{8^{\circ}} 5^{\prime \prime}$. E. long. $44^{51} 4^{\prime}$.

KOLOMNA Moseva, a town of Ruffia, and difrict of the government of Mofcow, about five verlts from its junction with the Occa; the fee of a bifhop; $4^{8}$ miles S.E. of Mofcorr. This town is reckoned to contain about 60,000 inhabitants.

KOLONEI, a town of Auftrian Poland, in Galicia, on the Pruth; 86 miles S.S.E. of Lemberg.

KOLOR, a town of Africa, in the kingdom of Woolli; 20 miles E.N.E. of Medina.

Kolosvar. See Colosvar.
KOLOZ, a town of Tranfylvania; 14 miles S.S.E. of Hunyad.

KOLPAK, a town of European Turkey, in Beffarabia; 40 miles W. of Akerman.

KOLSKOI, a town of Ruffia, in the government of Archangel, on the E. fide of the Dwina; 96 miles S.S.E. of Archangel.

KOLTER, one of the Faroer iflands.
KOLTYNIANY, a town of Lithuania, in the palatinate of Wilna; 32 miles $E$. of Wilkomierz.-Alfu, a town of Samogitia; 28 miles N.W. of Rofienne.

KOLLVEREID, a town of Norway; 95 miles N.N.E. of Dronthein.

KOLUMBATZ, a town of European Turkey, in Macedonia; 6 S miles N . of Akrida.

## K O M

KOLZUMM, or Colsum, anciently Clyina, (which ice, ) a town of Egypt, which formerly exifted near the E. coalt of the Red fea, but the fea has long fince left the coatt ; and the town has been deftroyed. From Volney we learn, that the name is fill attached to a hillock of fand, bricks, and flones, on the coalt of the Red fea, about 300 paces to the N. of Suez: whereas D'Arville places it 16 miles S. of Suez.

KOM, or Kiusas, a large and populous city of Perfia, in the province of Irak, at the foot of high mountains, and near a confiderable river, which is loft in the great falt defert. When Chardin vifited it, the houfes were computed at 15,000 ; and the chief manufactures were white earthen ware, foap, and fword-blades, fabres, and poniards. The walls are lofty, and the town has feven gates. The public fquares are fmall ; the grand bazar crofles the town from one gate to the other; and there are others, which are furnithed with coffee-houfes, and hops of various kinds. Here are a celebrated mofque, and an afylum for debtors, who are protected and fupported. One of the mofques is highly efteemed by the Perfians, on account of the fepulchres of fhah Sefi I. and fhah Abbas II., and alfo that of Sidy Fa. tima, grand-daughter of Mahomet. Thefe tombs are frequented by pilgrims from all parts of Perfia, who refort hither once a year to pay their devotions, and are fupported by a fund affigned to this purpofe. The city is governed by a vifier, and is the refidence of a khan. The adjacent country is fertile in rice and fruit; 150 miles N . of Ifpahan. N. lat. $34^{\circ} 20^{\prime}$. E. long. $51^{\circ} 14^{\prime}$.

KOMA, a town of Lithuania, in the palatinate of Wilna; 42 miles S. of Braflaw.-Alfo, a town of Per!:a, in the province of Khorafan; 227 miles N.N.E. of Herat.

KOMANA, in Botary, an arbitrary name given by Adanfon to $H_{y p e r i c u m ~ m i s n g g y n u m ~ o f ~ o t h e r ~ a u t h o r s, ~ w h i c h ~}^{\text {a }}$ he eftablifhes as a genus, on account of its folitary ftyle. Jufien, however, ailerts that this fuppofed fimile fyle is compofed of five, clofely united. The capfule is defcribed as of one cell, but we have never feen it at all advancing towards maturity, fo as to form an opinion on the fubject. See Hypericum and Knifa.
Komasis, in Georraphy, a town and abbey of Walachia: is milcs S . of Bucharelt.-Allo, a diftrict of Africa, on the Slave coalt.
KOMANGO, or Amango, one of the Friendly ines; 5 miles E. of Annamooka.

KOMARA, a town of Hindoofan, in Myfore; 65 miles E.N.E. of Harponelly.

KOMA RNA, a town of Auitrian Poland, in Galicia; 24 miles S.S.W. of Lemberg.

KOMBAH, a town of Africa, in the country of Gago ; 170 miles E. of Kaffaba. N. lat. $11^{\circ} 25^{\prime}$. E. long. $2^{\circ} 30^{\circ}$.

K OMBO, a kingdom of Africa, near the Atlantic, $S$. of the Gambia.

KOMBREGUDU, or Combreco-A vou, a kingdom of Africa, fituated on the banks of the river Falemi, about N. lat. $13^{\circ} \mathrm{Io}$. W. long. $10^{\circ}$.

KOMCHA, or Komsina, a decayed torn of Perfia, in the province of Irak, celebrated for its garden3 and dovehoufes, and degraded by the bad character of its inhabit. ants; 39 mile $S$. of I[pahan.

KOMENTIN(, the name of two towns in the ifland of Borneo ; one 45 miles N . and the other 15 miles S.S.W. of Negara.

KOMMANICK, in Ornitleclegy, the German mame for the large-cretted lark, common in many part3 of Germany;, but not knawn in England. See Alavda crigherso

KOMOL, or Comol, in Geograpby, a fet-port town of Nubia, with a fmall but fafe harbour in the Red fea. N. lat. $22^{\circ}+5^{-1}$. E. long. $35^{\circ} 15^{\prime \prime}$.

KOMRI, AL, a mountainous ridge in the interior part of Africa, called alfo the "Mountains of the Moon," terminating the country of Donga. N. lat. 7

KONAPOUR, a town of Hindooftan, in the country of Sanore ; 50 miles E.N.E. of Goa. N. lat. $15^{\circ} 45^{\circ}$. E. long. $743^{\circ}$.

KONDOZ, a town of the Greater Bucharia; 60 miles N.W. of Anderab. N. lat. $36^{\circ} 50^{\prime}$. E. long. $67^{\circ} 22^{\prime \prime}$.

KONDRA, a town of Bengal ; 36 miles S.W. of Doefa.

KONDUR, a town of Hindooflan, in Dowlatabad; 100 miles S.E. of Aurungabad. N. lat. $1 S^{\prime} 5 t^{\prime}$. E. long. $77^{\circ} 30^{\prime}$.

KONEVETZ, a fmall ifland of Ruffia, in lake Ladoga; 60 miles N.N.E. of Peterfburg.

KONEZKOI, a town of Ruffia, in the government of Vologda, on the Vim ; 56 miles N.E. of Yarenk.

KONG. See Goxumi.
KONGA, a town of Africa, in the kingdom of Loango.
KONG-FORS, a town of Sweden, in Welt Bothnia; 16 miles N.W. of Unea.

KONGHELL, Koxasitele, or Kong elf, a town of Sweden, in the province of Wett Gothland, on an illand in the Gotha; formerly the capital of Norway, and refidence of kings, but now decayed; 10 miles N of Gotheborg.

KONGSBACKA, a fea-port town of Sweden, in Halland; 13 miles S. of Gotheburg. N. lar. 57 30'. E. long. $125^{6}$.

KONGSBERG, or Conisberg, a town of Norway, celebrated for its filver mines. It flretches on both fides the river Lowe, which, in its courfe through the town, falls in a feries of fmall but picturefque cataracts over the bare rocke. "The crags which border the town are in fome parts naked, in others clothed with wood, and intermixed occafionally with flips of corn and pafture; neverthelefs, the prominent Features of the circumjacent fcenery are ruggednefs and horror. Kongłerg contains about 1000 houfes, including thole of the miners, and 6000 inhabitants. The mines are dittant from the town two miles They were difcovered and opened during the reign of Chrittian IV. Thirty-fix mines, fays Coxe, are now working; the deepelt is $6 \rho_{2}$ feet perpendicular. The matrix of the ore is the faxtm of Linnæus; the filver is extracted according to the ufual procefs, either by fmelting the ore with lead, or by pounding. Pure filver is occationally found in fmall grains, and in finall pieces of different fizes, feldom weighing more than four or five pounds. One mafs has been found which weighed 409 marks, and was worth 3000 rix-dollars ( 6001 .) ; this piece is preferved in the cabinet of curicfities at Copenhagen. Formerly thefe mines produced annually 70,0001 . ; in $1769,79,000 \%$; at prefent, (fays Mr. Coxe) they yield only from 50,000\%. to $54,000 \%$ The expences, it is faid, generally equal, and fometimes exceed the profits. The largelt piece of money fruck at Kongforg is only eight fkillings, or four-pence.

KONGSWINGER, a town of Norway, in the province of Chriftiania; 42 miles N.E. of Chrittiania. N. lat. $60^{\circ}$ 52'. E. long. $128^{\prime}$.

KONG-TCHANG, a city of China, of the firft clafs, in the province of Chen-fi, feated os the ba:ks of the river Hoci, and furrounded by very high mouatains. This city is very populous, and has great trade. A tomb is fhewn liere, which the Chinefe pretend to be that of Fo-hi. The jurifdicion of this city extends over three others of the fe-
cond clals and feven of the third. N. lat. $34^{\wedge} 56^{\prime}$. E. ionge $104^{\prime \prime} 19^{\prime}$.

KONI, a town of Imircta; 30 miles S.W. of Cotatis.

KONJADA, Gros, and Kkin, two towns of Prumia, in the palatinate of Culm; the former 12 miles N.N.W. of Stralburg; and the latter if miles.

KONIAWA, a town of Lithuania, in the palatinate of T'roki: 36 miles N.E. of Grodno.

KONIECPOLE, a town of Poland, in the palatinate of Braclaw; 60 miles S.E. of Braclaw.

KONigingratz, or Kbalowe Hradecz, a city of Bohemia, and capital of a circle of the fame name, feated on the Elbe, built in the year 782 , and the fee of a bifhop, under the archbihop of Prague; 58 miles E. of l'rague. N. lat. $50^{\circ} 10^{\prime}$. E. long. $15^{\circ} 39^{\prime}$.

KONIGSBERG, a large anc beautiful city and fea-port of Pruffia, fituated on the river Pregal, which has feven bridges; founded in 1255, rebuilt in another fituation in 126 t, and well fortified in 1526 , by a rampart about feen Englifh miles in circumference. The rampart inclofes the gardens, the large cattle moat, with fome meadows and fields. The number of houfes is about 3 sioc, and of inhabitants about 60,000 . This city properly confits of three towns that are joined together; viz. Altitadt, Lubenicht, and Kneiphof, and of feveral fuburbs. Altitadt, or the old town, coatains 16 Atrects, and 550 houfes, of which more than 100 are malt-houfes and brewhoufes. It is embellifhed with fix gates, two itrong-built towers, and four bridges. Lobemichit, built about the year 1300 , was formerly called Neuftadt, or the new town. Kneiphof is the moit modern, as it was founded in 1324. This ftands on an ifland formed by the river Pregel, the buildings of which are erected on piles. of alder-trees, which by length of time are become as hard. as iron. It has five large gates, and 13 ftreets. The cathedral of this town has a famous organ, which confits of 5000 pipes, and was finihed in 1721 . The univerfity was founded, in 154t, by the margrave Albert, and has 3 S profeffors, exclufive of the tutors. The number of itudentsin 1802 was 300. The town-houfe is a fine building, where the magiftrates of the three towns, which were incorporated in ${ }^{1724}$, meet every day. The ftrong citadel, called "Frederickfourg," was built in $1 \sigma_{57} 7$, and directly faces Kneiphof, at the conflux of the two branches of the Pregel. This fort is a regular fquare, furrounded with broad ditches and the river Pregel, which is there increafed by the canal or dyke, called "Kupferteifch." In the citadel are a church and an arfenal. Konsforg has always ranked high in commerce and fhipping, and was formerly one of the Hans towns. Its trade is ftill flourithing, by means of the river Pregel, which is here navigable, and from 120 to $2 \neq 0$ feet in breauth. In 1752,493 large fhips, and 373 floats of timber, arrived in this port, belides fmaller veffels. A colony of French Calvinilts excepted, the inhabitants of Konigherg are chiefly Germans of the Lutheran perfuafion. In 1753 , this city was taken by the Ruffians, and in ISO7 by the French. N. lat. $54^{\prime} 43^{\prime}$. E. long. $20^{\circ} 38^{\prime}$.

Konicsbere, or Klinkowice, a town of Silefia, in the principality of Troppau; 13 miles S.E. of Troppau. -N . lat. $49^{\circ} 40^{\prime}$. E. long. $18^{\circ}$ 10.

Konigsberg, a town of Brandenburg, in the New Mark; ${ }^{2}+$ miles N.N.W. of Cuttrim. N. Iat. $53^{2}$ 2! E. long. $13^{\circ} 33^{\prime}$-Alfo, a town of Germany, in the principality of Coburg, fituated on the fide of a mountain, on which is an ancient cafte; 20 miles S.S.W. of Coburg. N. Hit. 50 t'. E. long. $10^{\circ} 45^{\prime}$.

LONICS.

## K O N

## K O N

KONIGSBRONN, a town and convent of Wurtem. berg; 20 miles N.N.E. of Ulm.

KONIGSEGG, a principality of Germany, comprehending Konigfegg-Rothenfels, and Konigfegg-Aulendorf. 'The former poffeftes the county of Rothenfels and lordhip of Stauffers; and the latter the county of Konigfogg, and lordfhip of A ulendorf. The lordhip of Konigfegg confits ouly of an ancient catle, 8 miles N.W. of Ravenfpurg, and a few hamlets.

KONIGSEK, a town of Bohemia, in the circle of Bechin; 10 miles E.S.E. of Neuhaus.

KONIGSFELD, a town and citadel of the duchy of Berg; 26 miles S.S.E. of Cologne.-Alfo, a town of Bavaria, in the hifhopric of Bamberg, on the Auffses; 10 miles N.E. of Bambery

KONIGSFELDEN, a bailiwick of Switzerland, in the canton of Berne, fituated between the town of Bruck and the river Reufs. The monaftery of this place, belonging to the monks of St. Francis and the nuns of St. Claire, founded in comnemoration of the death of the emperor Albert, who was affaffinated in 1308 by his nephew John, duke of Swabia, became very rich by grants from the houfe of Auftria, and other nobility.

KONIGSHEIM, a town of Germany, in the county of Wertheim; $1+$ miles $S$. of Wertheim.

KONIGSHOF, a town of Bohemia, in the circle of Konigingratz; ${ }^{\text {I }}+$ miles N . of Konigingratz.

KONIGSHOFEN, a town of the duchy of Wurzburg, on the Tauber; 20 miles S.S.W. of Wurzburg.-Alfo, a town of the duchy of Wurzburg, on the Saal; 38 miles N.E. of Wurzhurg. N. lat. $50^{\prime} 12^{\prime}$. E. long. $10^{\prime} 27^{\prime}$.

KONIGSLUTTER, a town of Weltphalia, in the principality of Wolfenbuttel, fituated on a ftream, called the "Lutter;" 12 miles N.E. of Wolfenbuttel. N. lat. $52^{\circ}$ $7^{\prime}$. E. long. $10^{\circ} 5^{\prime \prime}$.

KONIGSTEIN, a town of Germany, and capital of a county of the fame name, with a caftle built on a rock; If miles N.W. of Francfort on the Maine.-Alfo, a town of Bavaria, in the principality of Sulzbach, near Sulzbach. -Alfo, a fortrefs of Norway, in the diocefe of Chrittiania, built for the defence of Frederickftadt.-Alfo, a town of Saxony, in the margraviate of Meiffen, fituated on the left fide of the Elbe, with manufactures of linen and woollen. It is fituated on a mountain, and rendered, as it was fuppofed, impregnable. It is acceffible only in one place; and fupplied with water from a very deep Spring in the mountain; 16 miles S.E. of Drefden.

KONIGSTUHL, i.e. King's Cbair, a head-land on the N.E. coaft of the ifland of Ufedom, in the Baltic. N. lat. $5+^{\circ} 37^{\prime}$. E. long. $13^{\circ} 58^{\prime}$.

KONIGSWALD, a town of Bohemia, in the circle of Leeitmeritz; 13 miles N.N.W. of Leitmeritz.

KONIGSVALDE, a town of Brandenburg, in the New Mark; 22 miles E. of Cuftrin. N. lat. $52^{\circ} 25^{\prime \prime}$. E. long. $15^{\circ} 26^{\prime}$.

KONIGSWERT, a town of Bohemia, in the circle of Pilfen; 12 miles W.N.W. of Topel.

KONIN, a town of the duchy of Warfaw; 20 miles N. of Kalifch. No lat. $52^{\circ} 6^{\prime}$. E. long. $18^{\prime} 15^{\prime \prime}$.

KONINCK, or Koning, David de, in Biograpby, a painter of birds, animals, and ftill life. He acquired the principles and executive powers of the art under the tuition of John Fytt ; whofe jealoufy is faid to have been excited by the praifes beftowed upon his difciple.

On this account De Koninck left him, and travelled to

Italy, from Antwerp, where he was born. He arrised in Rome in 1668, having refufed engagements to paint upon his journey, oftered him by the duchefs of Bavaria and the court of Vienna. In Rome he was highly honoured. Baldinucci, who lived at the time, fpeaks of him as employed by the greatell among the nobles there; and receiving commiflions from foreign kings and fovereign princes.

His works and manner refemble thofe of Fytt, with whom, on his return to Antwerp, he was a conftant competitor. But he is not fo perfect, his effects are not fo brilliant, nor is his touch fo frec. He died in 1687: his age is not known.

Koninck, or Koning, Philip de, a portrait painter, who, having ftudied in the fchool of Rembrandt, proceeded in his courfe with great fuccefs, obtaining in early life a good reputation, and maiutaining it in the great number of pictures which he produced. His ftyle is, neceffarily, almoft an imitation of that of his matter. It is too fafcinating for a man that had once obtained poffeffion of the court to quit it eafily. His likenefles were efteemed, and he had great choice and varicty of attitude. He is among the number of thofe whofe portraits are honoured with a place in the gallery at Florence. He died in 1689, at the advanced age of 70 .

KONINGH, Solomos, a portrait and hiftoric painter of the Flemifh fchool. He was the difciple - of Vernando and Moojart, and rofe to a certain degee of eminence, but not among the firtt clafs.

KONI'T, or Cosir. Profefors Retzius and Schumacher deficribe under this name a calcareo-liliceous rock of a whitifh-grey, or white colour, found in Norway, Iceland, \&c. It has only been feen in detached pieces, moft of which bear the marks of being rolled. It is faintly glimmering; in fome pieces its lultre approaches to the vitreous, and even the unctuous luftre. Its fracture is uneven, flat conchoidal, fometimes obfoletely foliated, fometimes even and £plintery, not unlike that of fome varieties of horn-ftorie. The fragments are indeterminately angular. The varieties having an unctuous luftre, and obfoletely foliated fracture, are tranilucent at the edges. Its hardnefs is far fuperior to that of common compact limeftone, and it even ftrikes fire with the fteel. It is not eafily frangible. Specific gravity 2.8. When reduced to powder, and thrown on burning charcoal, it emits a greenifh light, but it is not phofphorefcent from friction. It effervefces with diluted nitric acid, and is partly diffolved in it : the remainder is filiceous earth.
The proportion of the calcarcous and filiceous earth, of which the konit confifts, is not yet afcertained.

Upon the whole, we know too little of this mineral fubftance to affign it its proper place in the fyftem. Haily refers it, with a query, to his quarz-acathe calcifere, which is the filicicalce of Sauffure. See Haîy and Brongn. vol. i. P. 326.

The fpecimens of conite defcribed by Schumacher were from Iceland; the one which we had an opportunity of examining came from Kenrudvern, near Dramen, in Norway:

Among the many new names which a modern writer on rocks is defirous of palming upon the world, we have alfo that of konite, which, without mentioning that it has been previounly given to a different rock, he applies to the variety of compact lime-ttone, called freefone.

KONITZ, in Geograply, a town of Germany, in the county of Schwart\%burg-Rudolftadt; where are mines of filver and copper; 6 miles E.S.E. of Rudolitadt.-Alfo, a baili.
a bailiwick of Sivitzerland, in the canton of Berne--Alfo, a town of Moravia, in the circle of Olmutz; 15 miles W. of Olmutz. - Alfo, a town of Pruffia, in Pomerelia; 8 miles E. of Schlockaw.

KONKODOO, a country of Africa, bounded on the N. by Banbouk, on the E. by Gadou, on the S. by Worada and Jallonkadoo, and on the W. by Satadoo; about 60 miles from N , to S ., and 40 from E . to W. N. lat. $12^{\circ} 10^{\prime}$ to $13^{\circ} 10^{\prime}$. W. long. $9^{\circ}$ to $10^{\prime \prime}$.

KONN, a town on the N. coalt of the ine of Timer. S. lat. $8^{\circ} 18^{\prime}$. E. long. $126^{\circ} 16^{\prime}$.

KONNARUS, a name given by Agathocles in Athenxus to a plant of Arabia, which the defcription fhews to be the fame with the faduc of the later Arabians, the fruit of which is calied nabac or nabech. See Consiarus.

This tree is the lotus of Diofcorides, and the acanthus of Virgil, whofe berries he mentions. The fruit of this tree is like a cherry, but fmaller, and is ground to powder by the Africans when dried. It is very well known to all who are acquainted with the writings of the old phyficians, that the berries of the lotus or nabac were ground down, by the Egyptians and other nations where they grew, to a fine powder for medicinal ufes. They were altringents, and ufed both externally in poultices and fomentations, and internally in decoctions aaid other forms where altringents were required.

KONNO, in Geograpby, a town of Japan, in the ifland of Niphon; 70 miles N.W. of Meaco.
KONOE, one of the Faroer iflands; 2 miles N. of Bardoe.

KONOS, a town of Afiatic Turkey, in Natolia; 20 miles N.E. of Degnizlu.
KONOTOP, a town of Ruffia, and diftrict of the government of Novogorod Sieverfkoi, feated on a rivulet falling into the Seim. N. lat. $51^{\circ} 5^{\prime}$. E. long. $33^{\circ} 34^{\prime \prime}$.

KONSAN, a town of Africa, in the country of Sierra Leone. N. lat. $10^{\circ} 44^{\prime}$. W. long. $12^{\circ} 15^{\prime}$.

KONSBERG. Sce Kongsberg.
KONSTANTINGRAD, a town of Ruffia, in the government of Ekaterinoflaf, on the borders of Turkey. N. lat. $49^{\circ} 15^{\prime}$. E. long. $34^{\circ} 52^{\prime}$.

KONTOP, a town of Silefia, in the principality of Glogav; 15 miles E . of Grunzberg.

KOOCH , a town of Hindooftan, in the country of Agra; 60 miles E. of Gwalior. N. lat. $26^{\circ}$. E. long. $399^{\circ} 35^{\prime}$.

KOOHANGAN, a fmall illand in the Sooloo Archipelago. N. lat. $63^{\prime}$. E. long. $121^{\circ} 18^{\prime}$.

KOOJAR, a town of Africa, in the country of Woolli; 54 miles E. of Medina.

KOOLASSLAH, a fmall inand in the Sooloo Archipelaro. N. lat. $6^{\circ} 22^{\prime}$. E. long, $120^{\circ} 38^{\prime}$.
KOOLBARY, a town of Hindooftan, in Golconda; 35 miles S. of Combamet.

KOOLIKORRO, a town of Africa, in the kingdom of Bambarra, on the Niger; which is a great falt-market; 330 miles S.W. of Sego.

KOOLUCONDA, a town of Hindooftan, in Myfore; 33 miles N.E. of Nagamungalum.

KOOMAR, a town of Hindooftan, in Bahar; 13 miles E N.E. of Bahar.

KOOMBOO, a town of Africa, in the kingdom of Tenda. N. lat. $12^{\circ} 42^{\prime}$. W. long. $12^{\circ}$.

KOOND, a town of Hindooftan, in Bahar; 17 miles N. of Saferam.

KOONDA, a circar of Bengal, bounded on the N.E. by Balar, on the E. by Ramgur, on the-S. by Toree, and on
the W. by Palamow ; about 25 miles long, and 16 broal: the capital is Koonda; 92 miks S. of Patua. N. lat. ${ }^{2} 4^{\prime}$ $11^{\prime}$. E. long. $84^{\prime} 4^{\prime \prime}$.

KOONI, a town of Japan, in the ifland of Niphon; 30 miles N. of Tomu.

KOONIAKARY, a town of Africa, in the country of Woolli ; 48 miles E.N.E. of Medina.-Alfo, a town of Africa, in Kafion. N. lat. $14^{2} 36$. W. long. $8^{2} 5^{\prime \prime}$.

KOONJOOR, a circar of Hindooftan, in Oriffa, between Gangpour and Mohurbunge, the capital of which, of the fame name, is 86 miles N.N.W. of Cattack.

KOONKA, a town of Bengal; 25 miles W.S.W. of Ramgur.
KOONTI, in Hindoo Mytbological Hifory, is the mother of three of the five Pandus, whole wars are related in the Mababarat; which fee. See alfo Pandu.

KOORBAH, in Geography, a town of Hindooftan, in the circar of Ruttunpour; 20 miles E . of Ruttunpour.

KOORGUNGE, a town of Bengal; 22 miles E. of Boglipour.

KOORKARANY, a town of Africa, in Bondou; 50 miles W. of Fatteconda.

KOORNHERT, Theodone, in Biography, defcended from a refpectable family at Auntterdam, was born in the year 1522. He was brought up to the profeffion of an engraver, which he foon abandoned, to travel into Spain and Portugal, but on his return home, an imprudent marriage forced him to take up the graver at Harlem, to fupport himfelf and wife. His leifure hours he employed in reading and improving his mind in various. ways, in the hope that knowledge might fit him for a better employment than that in which he was labouring. We accordingly find him admitted a notary in 1561, and in the following year he was appointed fecretary to the city of Harlem, and in 1564 he was made fecretary to the burgo-malters of that city. In this character he was frequently fent to the prince of Orange, governor of Holland, with whom, and with other perfons of confequence, he confulted refpecting the means of maintaining the liberty of his country. Through him, the famous petition of the Confederates was prefented to the ducheis of Parma in 1566. He was alfo the author of the firt manifefto which the prince of Orange publifhed in his camp, intitled "An Advertifement to the Inhabitants of the Low Countries for the Law, the King, and for the Flock." The part which he took in politics excited againf him the refentment of the government of Bruffels, by whofe directions he was fent to the Hague, where he fuffered a long and cruel imprifonment. He at length obtained a hearing, and, fuccefsfully vindicating himfelf, he was fet at liberty; but he found it neceffary to withdraw from the power of his enemies, and went to the county of Cleves, where he again maintained himfelf by his profeffion as an engraver. When, in the year 1572, the States of Holland had taken the refolution to affert their liberty againll the tyranny of the Spaniards, Kooornhert returned to his own country, and was appointed fecretary to the ftates of the province: finding, however, the people prejudiced againft him, for avowedly vindicating the principles of toleration in refpett to the Roman Catholics, he refigned his poft, and withdrew to Embden. It does not appear that he was a Catholic himfelf, but he formed the project of uniting all perfons of all fects, by way of interim, till God fhould be pleafed to raife reformers, in all refpects like the apoitles. His plan being, that only the text of God's words fhould be read to the people without comment or explication, and without prefcribing any commandment, or prohibition, but at molt by way of advice. In 1578 , he returned to Holland, where

## K 00

the engaged in a controverfy with two mininters of Delft at Leyden, concerning the characteriftics of the true church. He foon proved too powerful for his antagonifts, who charged him with the defign of making a fchifm among the poople, and who obtained an order that he fhould not be pernitted to publifh any thing in print conserning the difputc. He was alfo forbidden to trouble the minilers of Delft with letters, or otherwife, upon pain of the utmolt Feverity. Being thus effectually filenced, the minifters in different towns of Holland directed their attacks agaiuft him from the pulpit, reprefenting him, by name, as a heretic, an impious fellow, and a free-thinker. He petitioned to be lieard in his own defence, but was refufed, and ordered to comport himfelf peaceably and dutifully, in which cafe he fhould be fecure from danger. This he regarded as the introduction of a new inquifition, or force upon confeiences in Holland. Koouhert was ever, and at all times, the confiltent friend to liberty of confcience, and the firm opponent to whatever could abridge the right of free difcuffion; for his zeal and intrepidity in this caufe, he was contiuually haraffed by bigots and the government of the country: he had, however, a mind that could not be fulsdued, and he made ufe of his pen, in various tracts, to vindicate the principles which he efpoufed. Among his other literary antagonifts was the celebrated Lipfius, who, in a treatife on civil goverument, maintained that only one kind .of religion fhould be tolerated in one Itate, and that perifons who held different opinions, and who endeavoured to bring others over to their party, ought to be punined. "Mercy," fays the profeffor, "has no place here, caullics and amputations muft be made ufe of, it being better that one limb Thould perifl than the whole body.". In anfwer to thefe perfecuting tenets, Kooruhert publihed his treatife, intitled .6 The Procefs, or Trial of Heretic-killing, and Force upon Confcience," which he dedicated to the magiftrater of Leyden. Thefe, however, to gratify Lipfus, gave notice officially, that they did not accept the dedication, and that the author had, by it, done them neither fervice nor honour. Koonhert died at Gouda in 1590, in the 6Sth year of his age. Grotius expreffed a high efteem for his character, and an ardent hope that his judicious labours would be ufeful to his country and the world. He is claffed by Pontanus among the learned men of the city of Amiterdam, and as one warmly attached to the interelts of piety and truth. Hadrian Janius, in his defcription of Holland, calls him a man of divine underitanding: he adds, that Fortune was his enemy, and he thinks that he fuffered himfelf to be nade ufe of by God " as a voluntary demolifler of the murthering prifon of confciences." Àn edition of all his works was publithed in $\mathbf{1} 530$, in three volumes folio. Byyle. Gen. Biog.

KOOROO, in Geography, a town of Africh, in the country of Foota. N. lat. 10' 8. W. long. 10' $20^{\prime}$.

KOORTA, a town of Bengal; 35 miles W. of Nagore.
KOORUMBAH, a town of Hindooltan, in Dowlatabad; to miles E. of Poorunder.

KOORWEY, a town of Hindonftan, in the route from Agra to Oojein, connected with another town called "Bo. rafn," on the banks of the Betwa. Thefe towns are of confiderable fize, and at the former is a large fonc-fort. They are inh.bited by Patans, who fetiled here about 100 years ago, in the time of Aurungzebe. The revenue of the prefent Nawab is faid to be between one and two lacs of rupees, which is fequeftered for the payment of a debt to the Mahrattas.

KOOS, a town of Japan, in the ifland of Niphon; 45 miles S.E. of Jetfen. - Alfo, a town in the ifland of Xmo: \& 5 miles E S.E. of Udo.

## K O R

KOOTAKOO, a town of Africa, in Fooladoo. N. lat. $13^{\circ} 30^{\circ}$. W. long. $70^{\circ}$.

KOOTY, a town of Hindooftan, in Bahar; $\varepsilon_{4}$ miles S.S.W. of Patna. N. lat. $24^{\circ} 23^{\prime}$. E. long. $84^{\prime} 43^{\prime}$.

KOPACZOW, a town of Poland, in the palatinate of Braclaw; $7^{2}$ miles N.W. of Braclaw.

KOPAN, a town of Hungary; 18 miles W.S.W. of Symontornya.

KOPANITZ, a town of Sclavonia; 21 miles S.S.W. of Efzek.

KOPASH, a town of Dageflan; 45 miles N.W. of Derbend.

KOPIGOWKA, a town of Poland, in the palatinate of Braclaw, on the Bog; 6 miles S.W. of Braclaw.

KOPIL, a town of Lithuania, in the palatinate of Ncvogrodek; 45 miles S.E. of Novogrodels.

KOPIN, a town of Poland, in Podolia; 28 miles N. of Kaminiec.
KOPOLET, a fea-port of the principality of Guriel, on the Black fea. N. lat. $41^{\circ} 35^{\prime}$. E. long. $41^{\circ} 22^{\prime}$.

KOPORE, a town of Ruflia, in the gulf of Finland; 32 miles W. of Peterfburg.

KOPYL, a town of Lithuania, in Novogrodek; 16. miles N.W. of Sluck.
KOPYSS, a town of Ruffia, and diftrict of the government of Mohilef, fituated on the Dnieper.

KORA, a town of Ruffia, in the government of Irkutik, on the Ilga; 36 miles N.W. of Vercholenfk.-Alfo, a town: of Africa, in the kingdom of Jemarrow.

KORACHORYNCHUS Indicus, in Ichthyology, the name of a fea-filh of the Eaft Indies, called by the Dutch the raevenbeck. It has its name from its nofe refembling the beak of a raven or crow, and is about feven inches long ; its back and tail are red, and its belly yellow ; it has alfo, on each fide, two pale yellow longitudinal lines, running from the gills to the tail. It is a wholefome and well-tafted fifh. Ray.

KORALLEN-ERTZ, i. e. Coral-Ort, a name given by the miners of Idria, in Friaul, to a variety of bituminous fhale, with tuberculated fhining furface, and containing much hepatic and fome other mercurial ores. See Mercury.

Koramo, or Curamo, in Geggraply, a town of Africa, in the kingdom of Benin.

Koran. See Alcoran.
KORASAN, or Chorasan, a province of Perfia, terminating it in the NE. is bounded on the N. by Charafm and the country of the Ufbeck Tartars, on the N.E. by the Gihon or Oxus, on the E.by Bucharia and Candahar, on the S. by Segeftan and the lake of Zeré, or Zurra, the Aria palus of antiquity, and on the W. by the province of Mazanderan and the Cafpian fea ; about 450 miles in length and 420 in breadth. This country formerly comprehended Margiana in the north and Ariana in the fouth. It was conquered by Timur Bec in the year 1396, and granted by him to his fon Mirza Charoe, together with Mazanderan and Segeltan. The principal towns are Herat, Kenef, Talekan, Merwah, Zaweh, \&c.

KORBETH,

## K O R

KORBETH, a town of Perfia, in Irak; 126 miles $S$. of Hamadan.

KORBI-LA-HOU, a town of Africa, on the Ivory Coait.

KORBOLE, a town of Sweden, in Helfingland; 53 miles W.N.IV. of Hudwick fwall.

Korbolikinskoi Mountain, a mountain of Ruffia, part of the range of Kolivan (which fee), which has its name from the brook Korbolikha, which runs through it. It is enclufed from the S., E., and W., by granite mountains; but on the N.E. is bounded by the great Biela, together with fchift and chalk mountains. It confilts, except in fome few points, which are covered with fea-bottom materials, for the molt part of clay, fchitt, marl-wacke, lapis corneus, and quartz, here and there underlaid by granite and porphyry. Although the height of thefe mountains, between the origin of the Korbolikha and the little Biela, is confiderable, yet the mountain on the great Bied, fuch as the Revennaia-Sopka, and the Karaulnaia-Sopka, remarkably dittinguifh themfelves on aceount of their fingle fummits. The mineral of this mountain confifts of a fchiftofe marlwacke and horn-fchit, in which here and there hornblende and crumbs of feldfpar are to be met with. The chain of mountains, in conjunction with the north-weftern and foutheaftern rivers of the Revannaia-Sopka, the Blue mountain, and the Kolhyvan granite mountain, and in the fouth-eatt, affer they have encompaffed the kliut fheffkoi majak, terminate at the foot of high granitic fnow mountains. The Revennaia-Sopka is the higheft point of thefe mountains, being eftimated at 2213 Parifian feet higher than the Slangenberg; it is faid not to confift of granite, but of firm horn-fchiftus. In this Korbolikinfkoi tract of mountains, the riohelt of all the Altay mine-works are carried on. See Kolivan and Altaf.

KORCHELLEN, a town of the duchy of Warfaw; 52 miles N. of Warfaw.
KORCHINO, a town of Ruffia, in the government of Nizegorod; 80 miles S.S.W. of Niznei Novgorod.

KORCK, a town of Norway, in the diocefe of Drontheim ; nine miles S.W. of Romidal.

KORCZANY, a town of Samogitia; 24 miles IW.N.W. of Miedniki.

KORCZICK, a town of Poland, in Volhynia; $1 ;$ miles N.E of Oftrog.

KORDEDEARDA, a town of European Turkey, in Walachia; 8o miles N.W. of Bucharelt. N. lat. $45^{\circ} 15^{\prime}$. E. long. $24 \quad 24^{\prime}$.

IORRDOFAN, a country of Africa, between Dar-Fûr and Sennaar, fubject to the fultan of Dar-Futr, by whom it was conquered in 1795. Mr. Brown informs us in his "Travels in Africa, Egypt, and Syria," that an inveterate animofity fubfifts between the natives of Dar-Fûr and thofe of Kordofan; infomuch that wars have been almoft continual between the two countries, as far as the memories of individuals extend. One of the caufes of this holtility appears to be their relative pofition; the latter lying in the road between Dar-Fûr and Sennaar, which is confidered as the moft practicable, though not the direct communication between the former and Mecca. Nor can caravans pafs from Suakem to Fûr, unlefs by the permiffion of the governors of Kordofan. The jealoufy of trade is, therefore, in part the origin of their unvaried and implacable animofity. A king, of the name of "Abli-Calik," is the idol of the people of Kordofan, where he reigned fome years ago, and was renowned for probity and juftice. The kings of Kordotan had been deputed by the mecque of Sennaar, till after the death of the fon of Abli-Calik, when it was ufurped by VoL XX.

Fur, in confequence of the weaknefs and diffentions of the go. vernment at Sennaar. The people of Kordofan are reported to be not only indifferent to the ainours of their daughters and filters, but even attached to their feducers. The father ur brother will even draw the fiword againf him who offends the "Refik," or companion of his daughter or filter. Kordofan extends from N. lat. $12^{\circ}$ to $1+40^{\prime}$, and from L:. long. $29^{\circ} 25^{\prime}$ to $32^{\circ} 30^{\prime}$ 。
KORDYN, a town of Poland, in the palatinate of Kicy ; 44 miles W.S.W. of Kier.

KOREPSKOL, a cape on the N. coaft of Ruflia, in the North fea; 124 miles N.W. of Archangel.

KORIAKI, an oltrog of Kamfclatka, on the Awatika; 27 miles W. of Awattka.

KORIAKS, the denomination of a people who inhabit the northern parts of the Penthinikui gulf, and of the peninfula of Kamtichatka, near and amony the Kamtichadales, Tungufes, Lamutes, and Tfchukthes. 'They are fuppofed to derive their name from the word $\mathrm{K}^{\prime}$ ra, which is their language fignities a rein-deer. The great likenefs they bear to many illanders of the Eallern ocean, and to the neareit Americars beyond the ftrait, afford reafon for fuppoling that they, and alfo the Tfchukthes, are the primitive poifeffors of thefe coalts; who cirther came over frum the continent of America, or were feparated from it by the probable infractions of the fea, and the confequent divilion of the two quarters of the world. With refpect to number they are about equal to the Kamtfchadeles, who, according to the enumeration of 1760 , amounted to about 3000 males, though it is not unreafonable to conclude, that their number is in reality three or four times larger. According to Lefleps the Koriaks are fuppofed not to exceed 2000 famlies. Theie people are divided into two claffes, viz. the wandering and the fixed Koriaks. The latter iuhabit the northera part of the itthmus of Kamtfchatka, and the whole conlt of the eallern ocean, from thence to the Anadyr. The country of the former ftretches along the N.E of the fea of Ochotik, to the river Penfkina, and weftward towards the river Kovyma. The fixed Koriaks have a ftrong refemblance to the Kamtfchadales; and, like them, depend altogether on fishing for fubfiltence. Their drefs and habitations are of the lame kind. They are tributary to the Ruffians, and under the diltrick of the Ingiga. The wandering Koriaks occupy themfelves entirely in breeding and pafturing deer, of which they are faid to poffers immenfe numbers; fo that it is not unufual for a fingle chief to have a herd of 4 or 5000. They defpife fifh, and live altogether on deer. They have no balaigans, and their only habitations are like the Kamtfchadale jourts, with this difference, that they are covered with raw deer-kins in winter, and tanned ones in fummer. Their gedges are drawn by deer, and never by dogs; which, like the latter, are always fpayed, in order to be trained to this bufinefs. The draft deer palture in common with the others; and when they are wanted, the herdfman makes ule of a certain cry, which they inftantly obey, by coming out of the herd. Captain King was informed by the prielt of Paratounca, that the two nations of the Koriaks and the Tfchutiki fpeak different dialects of the fame language; and that it does not bear the lealt refemblance to the Kamtichadale. According to the account of Leffeps, the manners of the fixed Koriaks are a compolition of duplicity, mitruft, and avarice; and they are faid to have all the vices of the northern nations of Afia, without the virtues. Robbers by nature, they are fufpicious, cruel, and iscapable either of pity or benevolence. Perfidious and favage in their difpolition, they are in a flate of M
perpetual

## K O R

## K O R

perpetual hoftility with their neighbours; and hence every individual is led to cherifh a ferocious fpirit. Hence alfo they acquire an inflexible courage, and glory in a contempt of life. Supcritition alfo impofes upon them a law which obliges them to conquer or todie. The vicinity of the Ruffian fettlements has hitherto produced no change in the mode of life of the refident Koriaks. Their commercial intercourfe with the Ruffians merely feem to render them more avaricious and more addicted to plunder; and they refit every attempt of civilization. The wandering Korinks were for a long time more intractable. Their regular occupation is hunting and filhing, and when the feafon dues not allow of their purfuing it, they fleep and fmoke, and indulge themfelves in drunkennefs. Their paffion for flrong liquors has led them to inrent a drink, equally powerful with brandy, which is fearce and dear, and which they extract from a red mufhroom, known in Ruffia as a ftrong poifon, under the name of "moukhamorr." With a preparation of this they entertain their guefts for one, two, or three days, till their fock is exhaulted. The features of a majority of the Koriaks are not Afiatic; but they might be confidered as Europeans, if it were not for their low ttature, ill fhape, and the colour of their fkin. Others of them have the fame characteriftic outlines with thofe of the Kamtfchadales. Among the women particularly, there are very few who have not fank eyes, flat nofes, and prominent cheeks: the men are almof wholly deftitute of beards, and have flort hair. The women carry their children in a fort of arched balket, in which the infant is placed in a fitting pofture, and fheliered from the weather. When a Koriak dies, his relations aflemble, crect a funeral pile, and place a portion of the wealth of the deceafed, and a ftock of provifioss, confifting of rein-deer, fifh, brandy, and whatever elfe they conceive will be wanted by him for his journey, and prevent his Itarving in the other world. The body is exhibited in his beit attire, and lying in a kind of coffin; and after receiving the adien of his attendants, who have torches in their hands, they haften to reduce it to ahes. They wear no mourning, as they feel only the regret of a temporary abfence, and not of an eternal feparation; and the funcral pomp generally terminates in the intemperate ufe of liquor and tobacco. Death is regarded by them as a paffage to another life, in which other joys are referved for them. They acknowledge a fupreme being, the creator of all things, whofe refidence is the fun; but they neither fear nor worfhip him. Goodnefs, they'fay, is his effence; and it is impoffible, as all good proceeds from him, that he frould do any injury. The principie of evil they coufider as a malignant ipirit, who divides with the fovereign good being the empire of nature. To this evil fpirit they pay refpect, and perform their devotion, in order to pacify his wrath, and to avert the calamities which he iuflicts. Accordingly they offer him, as expitary facrifices, various animals that have begun to exift: rein deer, dogs, the firft fruits of their hunting and fifhing, and the moft valuable of their poffelions. Stipplications and thankfgiving conftitute their devotional exercifes. His votaries have no temple nor fanctury. This imaginary god is worfhipped in all places; and they conceive that he hears their prayers in the folitude of the defert, as well as in fociety; and that he is rendered propitious by their indulging to drunkennefs in their jourts: for, ftrange as it may feem, drunkennefs is among thefe people a religious practice, and the bafis of all theii folemmities. See Kamtsmatka and Tschutsky.

KORKAN, or Jorjan, a flat diftrict on the ealt fide of the Cafpian fea, fubject to great heat, frequent inundations, and an unwholefome air; but the foil is fertile, and produces dates, wine, cotton, filk, and corn.

KORKINA, a town of Rufia, in the government of Tobolik; 20 miles S.W. of Ifchim.

KORKUB, a town of Perfia, in Chufiltan; 30 miles W.S.W. of Jondifabur.

KORMAND, a town of Hungary, on the Raab; 52 miles S. of Vienna.

KORMESHTY, mountains of Ircland, in the count $\boldsymbol{y}$ of Mayo; 17 miles N.W. of Caflebar.

KORMUDSEH, a town of Perfia, in the Farfiftan; 100 mites S.TV. of Schiras. N. lat. $28^{\prime} 37^{\prime}$.
KORNBURG, a town of Stiria, on the Raab; 24 miles S.E. of Cratz.

KORNDYCK, a fmall ifland of Holland, in the Meufe, with a town of the fame name; about 7 miles W.N.W. of Willemftadt.

KORN-NEUBURG, a town of Auftria, on the north fide of the Danube, oppofite to Clofter-Neuburg; 8 miles N. of Viemna. N. lat. $48^{\circ} 19^{\prime}$. E. long. $16^{\prime \prime} 40^{\prime}$.

KORNOCK, an ifland near the weft coaft of Weft Greenland. N. lat. $6 \mathrm{I}^{\circ} 38^{\prime}$. V. long. $47^{\circ} 40^{\prime}$.

KOROL, a town of Hindooftan, in Guzerat; 20 miles E. of Baroach.

KOROLOVETZ, one of the eleven diftricts of the government of Novogorod Severkoi in Ruffia, fituated on a rivulet falling into the Defna; 40 miles S.E. of Novogorod Severfkoi.
KOROMANTEES, a general appellation given in the Britifl. Welt Indies to mot of the negroes purcliafed on the Gold Coalt, from Koromantyn, one of the carliell of ous factories on this part of the African coaft; which is now become an infignificant village, or factory, in poffeffion of the Dutch. It is fituated in the kingdom of Fantyn, two miles from the fort of Anamaboe. The Koromantyn or Gold Coaft negroes are diftinguifhed from all others by firmnefs both of body and mind, a ferocioufnefs of difpofition, and, at the fame time, activity, courage, and a kind of fubbornnefs, which prompts them to enterprifes of difficulty and danger, and enables them to meet death, in its molt dreadful forms, with fortitude or indifference. Many of them had been flaves in Africa, and others had been engaged in perpetual holtility with one another; and they were, therefore, prepared for endeavouring, even by means the moft defperate, to regain the freedom of which they had been deprived. Accordingly they have been difpofed to excite or to encourage rebellion. This was the cafe in Jamaica in the year 1760 . The firmnefs, and intrepidity, and contempt of death, which are dilting ififhable in adults, brought from the Gold Coant, are vifible even in boys at the age of ten years. Edw. W. Indies, vol. ii.

KOROP, a town of Ruffia, and diftrict of the government of Nuvogorod Severkoi, feated on the left hhore of the Defna.
KOROROFAH, a country of Africa, fituated ealt of Wangara
KOROTCHA, a town of Ruffia, and diftrict of the government of Kurfk, feated on a rivulet of the fame name, that falls into the Donetz; 44 miles E.S.E. of Kurfk.

KOROTOIAN, a town of Ruffia, and diftrict of the government of Voronetz, fituated on the Don; 20 miles S . of Voronetz.

KOROVA, a fmall ifland in the fea of Ochotk; 240 miles E. of Ochotk. N. lat. $5920^{\circ}$. E. long. $150^{\circ} 40^{\circ}$.

KORPIKYLA, a town of Sweden, in Welt Bothnia; If miles N.N.W. of Tornea.

KORPILAX, a town of Sweden, in Tavafland; 68 miles N.NE. of Tavalfhus.

KORPO, an inand of Sweden, in the Baltic, near the 2

## $\mathrm{K} O \mathrm{R}$

fouth-we? coaft of Finland, of an oral form, about 20 miles in circuit; having on the north-welt coalt a town of the fame name, and Ceveral villages. N. lat. $60^{\prime \prime} 9^{\prime}$. E. long. $21^{\circ} 25^{\circ}$ 。

KORPONA, a town of IIungary; 28 miles N.N.E. of Grau.

KORS, a town of Perfia, in the province of Adirbeitzan ; 80 miles S.SE. of Erivar.

KORSA, a :own of Hindoottan, in the fubah of Dclhi; 26 miles W. of Delhi.
KORSAKI, or Corsac, in Zoology. See Fox.
KORSEC, in Geography', a town of Poland, i: Volhynia; 32 miles E. of Lucko.

KORSENIEC, a town of Lithuania; 60 miles E. of TVilna.

KORSEWALAN, a fmall ifland in the Eaft Indian rea. S. lat. $7^{\circ} 39^{\prime}$. E. long. $128^{\circ} 40^{\prime}$ :

KORSNAS, a town of Sweden, in Eaft Bothnia; 25 miles S.S.E. of Wafa.

KORSOER, a fortified town of Denmark, lying at the mouth of a fmall bay, forming a well-protected harbour, on the Great Belt. It has a few good houfes, which belong to merchants, \&ec. Some trade is carried on from hence up the Baltic, and in the vicinity. The fortifications are in ruins, and the town is chiefly inhabited by fifhermen and feafaring people. The breadth of the Great Belt between Forfoer and Nyeborg is about 22 miles.

KORSUN, a town of Poland, in the palatinate of Kiev; 44 miles S.S.E. of Bialacerkiev.

KORSZANY, a town of Samogitia; 25 miles N.W. of Midniki.
KORTCHERA, or Kertchef, a town of Ruffia, and difrict of the government of Tver, on the Volga.

KORTHOLT, Christian; in Biography, a native of Holttein, was born at Burg, in the inle of Femeren, in the jear 1633. Having acquired the rudiments of learning, he was, at the age of lixteen, fent to Slefwick, where he purfued his ftudies tro years; and from this place he went to the college of Stettin, made great proficiency in learning, and obtained high applaufe by the able manner in which he maintained two thefes. He continued his literary ftudies at Roftock, to which place he removed in 1652 ; and afterwards he delivered lectures, in his own apartments, on logic, metaphyfics, and Hebrew. In 1656 he took his degree of doctor in philofophy, after which he went to fludy at the uniserfity of Jena, where he diftinguifhed himfelf by his academical acts, and by his private lectures on philofophy, the oriental languages, and divinity. In 1661 he went to the court of Schwerin, at the invitation of the duke of Mecklenburg, in whofe prefence, as well as in the prefence of a great number of the nobility, he difputed two days on theological topics with two learned Roman Catholics, one an Aultrian, and the other a Pole: and on a fimilar invitation he difputed, in the following year, with a Roman Catholic of Paris. On thefe occafions he acquired univerfal applaufe from the auditors. In 1662 he was nominated to the chair of the Greek profeffor at Roftock, and took his degree of doctor of divinity. From thence he removed to Kiel, became fecond profefor of divinity, and afterwards vice-chancellor and firt divinity profeffor. In 1680 the duke of Holttein beftowed upon him the profeflorfhip of ecclefiaftical antiquities, and, in 1689 , declared him vicechancellor for life. Five times he had the honour of being nominated vice-rector at Kiel; and it is univerfally allowed that he performed the duties of his various pofts with great ability and perfeverance. He died in the year 1694 , at the age of fixty-one, much refpected and honoured by his friends

## KOS

and the univerfity of Kicl. To the republic of letters he had been an ornament by a number of curious, learned, and ufeful works; the titles of which are given in Moreri, and alfo in l3ayle, to which the reader is referred for further information.

KORTISJARVE, in Geography, a town of Sweden; in the province of Wafa; 43 miles E N.E. of Wafa

KORTRIA:ET, a polt-town of America, in Delaware county, New York, in which are 1513 inhabitants.

KORTSCHIN, a town of Poland, in the palatinate of Sand mirz; 40 miles S.W. of Sandomirz.
KORTY, a town of Africa, in Sennaar, on the borders of the Nile, where the caravans quit the river, and turn to the Defert, in order to avoid the pirates of the Nile; 60 miles E. if Dongolu.

KORYSOWA, a town of Polard, in the palatinate of the Kier ; 32 miles S.W. of Kiev.

## K O T

KOTCHENGSKA, a town of Ruffia, in the government of Irkutk, on the Ilim; 60 miles W.S.W. of Orlenga.

KOTCHUG, a town of Ruffia, in the government of Irkutk, on the Lena; 16 miles E. of Vercholenk.

KOTELNA, a town of Poland, in the palatiinate of Kiev; 60 miles W.S.W. of Kiev.

KOTELNITCH, a town of Ruffia, and dillrict of the government of Viatka, on the Viatka; 36 miles S.W. of Viatka.

KOTIAKOF, a town of Ruflia, and diftrict of the government of Simbirf, on the right fide of the river Sura.
KOTIGNOW, a town of Poland, in Podolia; 34 miles N. of Kaminiec.

KOTINGHY, a town of Hindooftan, in the circar of Ruttunpour; 36 miles N.E. of Raypour.

KOTLAN, a town and capital of a difrict of the fame name, in Great Bucharia; 200 miles S.E. of Samarcand. N. lat. $38^{\circ} 10^{\prime}$ E. long. $68^{\circ} 36^{\prime}$.

KOTMANA, a town of Walachia, near the fource of a river of the fame name, which runs into the Danube; 45 miles N.W. of Bucharelt.

KOTNA, a town of Great Bucharia, on the Gihon ; 40 miles $S$. of Bokhara.

KOTNAR, a town of Moldavia; 24 miles W.S.W. af Jafly.

KOTO, or Lampt, a fmall and barren diftrict of Africa, on the Slave Coaft, in the Whidah country, extending about I8 miles along the Atlantic: the land is flat and the foil fandy. Slaves have been the chief article of trade with the Europeans. The chief town is called Koto, or Verku.
KOTONA, a town of Hindooltan, in Mewat; 25 miles N.N.W. of Cotputly.

KOTOO, one of the fmall Friendly illands, furrounded by coral reefs, and fcarcely acceffrble by boats ; not more than $1 \frac{1}{2}$ mile, or two miles long, but not fo broad. The N.W. end of it is low, like the iflands of Hapaee ; but it rifes fuddenly in the middle, and terminates in reddifh clayey cliffs at the S.E. end, about 30 feet high. In that quarter the foil is of the fame fort as in the cliffs; but in the other parts, it is a loofe black mould. It produces the fame fruits and roots which are found in the other inands: it is tolerably cultivated, but thinly inhabited. The water is dirty and brackih. The burying places are neater than thofe of Hapaee; 16 miles N. of Anamooka. S. lat. $19^{2}$ $5^{\prime}$. E. long. 185 In'. $^{\prime}$.

KOTRA, a town of Lithuania, in the palatinate of. Troki; 15 miles E.S.E. of Grodno.

KOTROU, a town of Africa, on the Ivory Coaft.
KOTSKA, a town of Ruffia, in the government of Irkutfk, on the Tungufka; 140 mi'es N.N.W. of Ilimfk.

KOTLA, or Kotail, a circar of Hindooftad, in Mal. wa; bounded on the N. by Rantampour, on the E. by Yohud and Chandaree, on the S. by Kitchwara, and on the W. by Meywas, or Oudipour. It is croffed in the centre by the river Jeful, - Alfo, a town, which is the capital of the circar, feated on the Jeful. This town is of confiderable extent, of an irregular oblong form, inclofed with a ftone wall and round battions. It contains many good flone houfes, and feveral handfome public edifices. The palace of the rajah is an elegant itructure. The flreets are paved with flone. It has, on the W., the river Chumbul, and on the N.E. a lake, fmooth and clear as cryflal, which, on two fides, is banked with ftone, and has, in the middle, a building called "Jug-mundul," which is confecrated to. religious purpofes. Near the N.E. angle of the town, and:
only feparated from the lake by the road, is the "Chetrea," or maufoleum of one of the knights. In front of this handfome building are placed feveral ftatues of horfes and elephants, hewn out of Honc. To the fouth of the city, about three furlongs beyond the wall, is a place confecrated to the celebration of Rum's vietory at Lanka. Behind this, in a recumbent polture, is an enormous thatue of earth, which reprefents the dxmon "Rawoon." On the day of celebration the principal people affemble; and the fire of the guns is directed againtt the earthen wall, which make a breach in it, and deface or demolifh the image of Rawoon. The revenue of Kotah is 30 lacks of rupees; out of which is paid, though not regularly, a tribute of two lacks yearly to Sindiah, and as much to Holcar. N. lat. $25^{\circ} 15^{\prime \circ}$ E. long. 76 20'. Aliat. Ref. vol. vi.

KOTTIMBEL, a fmall inand in the Red fea, N. lat. $17^{\circ} 57^{\prime}$. E. long. $41^{\circ} 25^{\prime \prime}$.

KOTTIS, a town of Auftria; io miles S.E. of Zwetl.
KOTTOCOMB, a town of Africa, in Bornou; 75 miles S. of Bornou.

KOTTOKOLEE; a town of Africa, and capital of a country of the fame name, in Negroland. N. lat. $13{ }^{\circ}$ E. long. $5^{\circ}+0^{\prime}$.

KOTUL, a town of Hindooltan, in Bundelcund; 20 miles S. of Pannah.

KOTY, a town of Bundelcund; 18 miles S. of Callinger.
KOTZENAU, a town of Silefia, in the principality of Lignitz; 16 miles $\mathrm{N}:$ W. of Lignitz.

KOU, a town of Turkifh Armenia; 30 miles S.E. of Akalziké.

KOUAKAND, a town of Turkeltan, on the Sirr ; 60 miles S. of Tafhkund.

KOUANG-SI, or Quang-si, a city of China, of the firtt clafs, in the province of Yun-nan. N. lat. $24^{\circ} 40^{\prime}$. E. long. $103^{\prime} 28^{\prime \prime}$.

KOUANG SIN, or Koang-sin, a city of China, of the firlt clafs, in the province of Kiang-fi. This city is furrounded by mountains, many of which are lofty, and abound fome of them with forefts, and others with fine cryftal ; the country, however, is fertile and well inhabited; many of the mountains are cultivated, and are no lefs pro. ductive than the molt fertile plains. They make a very good paper in this city, and the belt candles in the empire. N. lat. $28^{2} 27^{\prime}$. E. long. $117^{\circ} 44^{\prime}$.

KOUANIN, in the Clinefe Language, the name of a tutclary deity of women. The Chinefe make great numbers of the figures of this deity in white porcelain, and fend them to all parts of the world, as wall as keep then in their own houfes. The ligure reprefents a woma 1 with a child in her arms. The women, who have no children, pay a fort of adoration to thefe images, and fuppofe the deity they reprefent to be of power to make them fruitful. It has been fuppofed, by many Europeans, that thefe images were meant to reprefent the Virgin Mary, with our Saviour in her arms; but this is an idle opinion; the Chinefe having been fond of this figure in all times that we have an account of. The ftatue always reprefents a handfome woman, very modeftly attired.

KOVAR, in Geography, a town of Hungary; 16 miles N.W. of Biltritz.

KOVARABAD, a town of Great Bucharia, in the kingdom of Balk; 90 miles W. of Balk.

KOUCHO, a town of Africa, in Upper Guinea, on the river Scherbro; 36 miles from the fea.

KOUDJEH, a town of Afiatic Turkey, in Natolia ; 48 miles W. of Kiutaja.

## KOU

KOUDRA, a town of Hindooftan, in Bahar; 27 miles S. of Burwah.

KOUDUR, a town of Hindooftan, in Dowlatabad ; y mi'cs N.N.W. of Beder.

KOUE-HOA, a city of China, of the firlt clafs, in the province of Yun-nan. N. lat $23^{\circ} 26^{\prime}$. E. long. $103^{\circ} 56^{\prime}$.

KOUEIT, Grisn, Cathem, or Kadhema, a feaaport town of Arabia, in the province of Lachfa, fituated in a bay of the Perlian gulf, and governed by a fcheich, who is vaffal to the fcheich of Lachía, but occationally alpires to independence. Whenever the fcheich of Lachfa advances with his army, the citizens of Koueit re:reat with their effects into the little ifland of Feludsje. 'The inhabitants are chicfly occupied in finhing, and particularly for pearls; in which bulinefs they are faid to employ more than Sco boats. N. lat. $27^{\circ}$ 40'. E. long. $49^{9} 10^{\prime}$.

KOUEI-TE, a city of China, of the firft clafs, in the province of Ho-nan, fituated in an extenfive and fertile plain, between two large rivers ; but ius order to render it opulent, it wants an increafe of inhabitants and trade. The air is pure, and the fruits, efpecially oranges and pomegranates, are excellent. The inhabitants are diftinguifhed by their mildnefs and hofpitality. The jurifdiction of this city comprifes feven towns. N. tat. 34 ? $30^{\circ}$. E long. $115^{2} 29$.

KOU-HISAR, a town of Aliatic Turkey, in Caramania; 12 miles N:W . of Akferai.

KOVINSKOI, Niznei, Sred, and Verchnei, towns of Ruffia: the firlt, on an iffand in the river Kolima, N. lat. $69^{\circ} 40^{\circ}$. E. long. 156.24:-the fecondy in the government of Irkutik, on the Kolima, N. lat. $65^{-2} 5^{\prime}$. E. long. 153? I4':-the taft; in the fame government, on the fame river, N. lat. $66^{\prime 1} 5^{\prime}$. E. long. $149^{\prime} 14^{\prime}$.

KOUKOU, or Kougov, a town of Afia, in the kingdom of Gaaga; the refidence of a powerful king in the twelfth century.

KOULIK, in Ornithology. See Ramphastos Pizerivorus.

KOULI-KHAN, Tifamas, or Nadir Schait, in Biography, was born in the province of Khorafan: his fatherwas chief of a branch of the Afghans, which rank defcended to Nadir when he was a minor, but his uncle ufarped the government. On this he entered into the fervice of the Beglerbeg, governor of Mufcada, in Khorafan, who gave him the command of an army fent againft the Tartars. Nadir, on this nccafion, gave fignal proofs of his prowefs and military fkill; he gained a complete victory with an inferior force, and took the Tartar general prifoner. For this able conduct, the Beglerbeg appeared extremely grateful, and, at firt, treated Nadir with great diftinction, but at length he became jealous of his afpiring fipirit, and refufed to promote him in the army as he had promifed, and when Nadir complained of his breach of faith, he caufed him to be baftinadoed. Driven to defperation, he joined a banditti of robbers, and committed great ravages. The Afghans having made themfetves matters of Ifpahan, and the Turks and Mufcovites ravaging other parts of Perfia, Schah Thamas. applicd te Nadir for affiftance. He, without hefitation, entered into the fervice of the fchah; but one of his firft actions was to murder his uncle who had ufurped his title. For his great fervices againilt the Turks, he was ennobled with the title of khan, and honoured with other ditinctions; neverthelefs, he depofed Thamas, and placed a fon of that prince on the throne by the name of Abbas III. to whom he became regent. Under a prince, fix months old only, Kouli-khan meditated to be the real fovereign of Perfia. He difpofed of every thing according to his own pleafure : he defeated the Turks, and obliged them to fue for peace. Within a few months the prince died,

## K O Z

died, and Kouli-khan was elected to the vacant throne, and on his acceffion affumed the name of Nadir Shah. His reign was marked with a high degree of glory, but his government was to the laft degree defpotic. In the year 1739, he conquered the Mogul empire, making himfelf matter of Delhi, where he acquired immenfe riches. He there affumed the title of emperor of the Indies, but difgraced himfelf by ordering a maffacre of the inhabitants of Delhi, in revenge for an infult offered to fome of the troops. The project was difcovered, and the profcribed party aftembled with a view of taking revenge. They were furrounded by a powerful army, which was devoted to the fchah. It was neceffary to force a confidential guard, and they were neither acquainted with the lituation of the emperor's tent, nor knew how to dittinguifh it from the relt. Defpair, however, enabled them to furmount every obftacle. Five of them rufhed into the pavilion, and the emperor was inflazitly known by the glitter of the ornaments with which he was covered. In defending hinfelf he dew two of the confpirators, when a third gave him a mortal wound. He exclained "fpare me, and I will pardon all." "No," replied the fourth, "thou haft never fhewn metcy to any, and we will fhew none to thee." They then difpatched him, and fevered his head from his body. This event took place in 1747 . Univer. Hitt.

KOUM, in Geography, a town of Thibet; 15 miles N. of Darrnadijira.
KOUNDGI-AGHIZ, a town of Afratic Turkey, in the government of Sivas, on the coalt of the Black fea; 15 miles N.W. of Samfoun.

KOUNMEON, a town of Birmah; 48 miles N. of Ava. N . lat. $22^{\circ} 33^{\prime}$. E long. $97^{\circ} 5^{\prime}$.

KOUPHOLITE, in Mineralogy. See Prennite.
KOURAH, in Geography, a town of Natolia; 44 miles W. of Kiutaja.

KOURATTY, a town of Hindooftan, in Dowlatabad; 15 miles W. of Carmulla.
KOURESTAN, a town of Perfia, in Lariftan ; 36 miles 5. of Tarem.

KOURMA, or Kurma, a fmall town of Dar-Fûr, W. by S . of Cobbé, at the ditance of 12 or 13 miles.

KOVROF, a town of Ruffia, and diftriet of the government of Volodimir, on the river Kliafma; 24 miles E . of Volodimir.
KOUROU, a river of Guiana, which runs into the Atlantic, N. lat. $5^{-1}$. W. long. $53^{\prime \prime} 3^{\prime \prime}$.

KOUS. See Cous and Apollinis Urbs.
IOUSSIE, a river of Africa, which runs into the Atlantic, S. lat. $30^{\circ} 12^{\prime}$. E. long. $17^{\circ} 50^{\prime}$. This river is the northern boundary of the colony of the Cape of Good Hope.
KOUSSIS. Sec Kaffers.
KOUTA, a town of Hindooltan, in Vifiapour ; 10 miles N. of Merritch.

KOUXEURY, in Icthtbyology, a firh found in the lakes of South A merica, whofe palate is employed by the Indians for polifhing their carvings in wood. It is unknown to which genus this fifit belongs.

IFOWAI, in Geograpby, a town of Afia, in the province of Adirbeitzan; 120 miles W. of Tauris.

KOWAL, or Cowal, a town of Poland, in the palatinate of Brzefc ; 16 miles E . of Brzefc.

KOWAR, a town of Africa, in the kingdom of Burfali, on the river Gambia, which formerly had a large traffic in flaves.

KOWARSKO, a town of Lithuania, in the palatinate of Wilna; 10 miles N . of Wilkomierz.

KOWEL, a town of Poland, in Vollynia; 25 miles N.W. of Lucko.

KOWERO, a town of Sweden, in the government of Kuopio ; 8o miles E.S.E. of Kuopio.

KOWNO, or Kowne, a town of Lithuania, in the palatinate of Troki, at the conflux of the rivers Wilna and Niemen, containing eleven churches, one of which is Lutheran; 40 miles N.IV. of 'Troki. N. lat. $54^{\circ} 54^{\prime}$ '. E. long. $23^{\circ} 45^{\prime}$.
KOWRA, a town of Birmah ; eight miles N. of Raynangong.

KOWRAH, a town of Hindooftan, in Guzerat; so miles S. of Gogo.

KOWROWA, a village in Karakakooa bay, rendered infamous by the murder of captain Cook. See Cook, and Karakakooa.

KOYAHT, a fmall American ine, at the S. end of Wamhington's iffe, at the entrance of a ftrait feparating a fmall ine from the larget.

KOYDANOW, a town of Lithuania, in the palatinate of Minft; 16 miles S.W. of Minfk.

KOZAK, Join Sophroyius, in Biography, a phyfician of fome celebrity, was a native of Bohemia, and practifed his profeflion at Bremen during a feries of forty-five years, and died there on the 30 th of January 1685 , at the age of 82. He was an admirer of Robert Fludd, the rofycrucian, and adopted many of his fanciful notions in bis writings. He left the following works: "Difcurfus Phyfici quatuor, de rerum naturalium principiis, de generationum et tranfplantationum modis, morborum caufis et fpeciebus, methodo curationum," Bremen, 1631.-" Anatomia vitalis Microcofmi," ibid. 1636.--" Tractatus Spagyrici de Phlebotomis et de Fontanellis," ibid. 1655.-"Tractatus Medicus de Sale, ejufdemque in corpore humano refolutionibus falutaribus et noxis,", Francfort, 1663. - "Tractatus de Hæmorrhagià," Ulm, 1666. Eloy. Dict. Hirt.

KOZANGRODEK, in Gegrapby, a town of Lithuania, in the palatinate of Brzefc; 4? miles E. of Pinfk.

KOZAR, a town of Perfia, in the province of Adirbeitzan; 75 miles W. of Tabris.

KOZDAR, a town of Afra, in the kingdom of Can. dahar, on the borders of Perfia; 1 So railes S.S.E. of Candahar. N. lat. $30^{\circ} 30^{\prime}$. E. long. $67^{5} 15^{\prime}$.

KOZELSK, a town of Ruffia, and difrict of the government of Kaluga, feated on the left fide of the fmall river Shifdra, which falls into the Occa; 36 miles S.S.W. of Kaluga.

KOZELUCH, Join Anthony, in Biography, mufie director in the Metropolitan church at Prague, was born at Wellwarn, in Bohemia, 1738. He fludied and lived privately many years at Prague, long before he obtained any profeffional honours or preferment. His firft advancement was to the place of chapel-mafter of Chrilt-church, and the next, in 1784 , was that of organitt of the dan kirk or cathedral. He afterwards diftinguifhed himfelf as a compofer both for the church and theatre. Among his productions for the latter are his Italian operas of Demofoonte, and Alefiandro nell' Indie, by which he very much increafed his reputation. It is a pity, fays Gerber (Mufical Lexicon) that more of his works have not been publihed!

Kozeluch, Leopold, a celebrated harpfichord-mafter and compofer for that inftrument at Vienna, was born at Wellwarn in 1553. He had learned the principles of mufic regularly at 18 years old, and the art of finging. At 19, he was brought to Prague, where he ftudied at the fame time compofition and the harpfichord. But before he was 18, he produced fpecimens of his gerius and talents. In

## K R $\Lambda$

1771, he publihed his firf effay at compofition, in a ballet for the Prague playhoufe. This was followed by 24 others and two pantomimes. After this he was invited to Vienna, where he eltablinhed limfelf, and whence bis fame and works were circulated all over Europe, with thofe of Vanhal, Hadyn, and Mozart. His ftyle is more eafy than that of Emanuel Bach, Haydn, or Mozart ; it is natural, graceful, and flowing, without imitating any great model, as almolt al! his contemporaries have done. His modulation is natural and pleafing, and what critics of the old fchool would allow to be warrantable. His rhythm is well phrafed, his accents well placed, and harmony pure. He publifhed 20 or 30 different fets of harplichord and piano-forte fonatas, fome with and fome without accompaniments, which were not only in high favour with the ladies of Vienna, but with female dilettanti all over Europe. The adagios and violin accompaniments to all his pieces have been univerfally admired. If any one fet of his fonatas was more in favour at Vienna than another, it was his 12 th fet. He was the firlt in Vienina who publifhed duets for two performers on onekeyed inftruments, and feveral of them are exceilent. He publifhed likewife a duet for two harpfichords, or pianofortes, with many concertos for the harpfichord à grand orcheffra.

Nor has he confined himfelf to inffrumental mufic; he has fet a French comic opera, Le Muret ; Didone abbandomata, a ferions opera in Italian; Mofes in Egypt, a grand oratorio, in Italian, 1787 , the beit for the widows and chi'dren of decayed muficians, that had been compofed for that fociety. The fame year he was engaged, by a fociety of 150 fubfcribers, to compofe for the Italian opera: and for the national theatre, or German playhoufe, he compofed airs, cantatas, and ballets without end. In $1_{7} 8 \mathrm{I}$, on the death of the emprefs queen, he compofed the mufic to a very pathetic dirge. Jofeph and his Brethren, a cantata, with a harpfichord accompaniment only. Pfeifel's cantata for Mad. Paradis, his fcholar in $\times 784$, with innumerable leffons and concertos exprefsly for that blind but admirable performer ; 15 fongs to German words, and cantatas in Italian, with accompaniments for two French horns, two violins, hautbois, tenor, and bafe; three fymphonics, various fets of trics, and quartets; two concertos for clarinets, and two for the violoncello.

KOZIN, in Geography, a town of Poland, in Volhynia; 24 miles S. of Lucko.
KOZLAN, a town of Bohemia, in the circle of Rakonitz; 12 miles S.W. of Rakonitz.

## KOZLOV. See Koslof.

KOZMODEMIANSK, or Kusmodemiansk, a town of Ruffia, and diftrict of the government of Kazan or Cafan, on the Volga; 100 miles N.IV. of Kazan.
KOZU, a town of Poland, in the palatinate of Volhynia; 56 miles E. of Lucko.

KRABBEN, a finall ifland in the Atlantic, near the coalt of Guiana. N. lat. $0^{\circ}$ so'. W. leng. $57^{\circ} 50^{\prime}$.

KRAFT, Geonge Wolfgane, in Biograpby, a celebrated mathematician, was born at Dutlingen, where his father was paftor. He received a good education, but applied himfelf chiefly to geometry and natural phioiophy, in which he made great progrefs under the celebrated Buifinger, whofe friendfip and patronage he enjoyed. In 1728 , he took his degree of matter of arts, and almoft immediately fet out for Peterburgh, and was appointed teacher, in that city, of mathematics in the New college, founded by the Imperial Academy of Sciences. At the end of five years, he was appointed a profeffor of natural philofophy. He was, in confequence of his great reputation, recalled to his
native country, which obliged him to folicit permiftion to relign his profeflorfhip. This was accompanied with the moft diftinguifhed teftimonies of high efteem; the academy elected him an honorary member, and fettled upon him a handfome penfion. He quitted Peterfburgh in 174t, and arrived at 'Tubingen, where he entcred on his office as profeffor of mathematics and natural philofophy, which he retained till his death in 1754 . He was autlior of many very valuable works, among which are "Intitutiones Geometrix fublimioris;" "Prælectiones Academicæ publicæ in Phylicam "Theoreticam;"" De vera experimentorum Ilhyficorum conflitutione ;" "De HIydroftatices Principiis generalhbus."

KRAGG Stone, a rock found near Belfaft, belonging to the fletztrapp formation, but which, together with thofe rocks called wacke and mullen, is kept dilkinet from bafalt by Mr. Kirwan, who gives the following defeription of the kragg flone. Colour greyifh-red or reddifh-grey, exceeding porous: the pores often filled with various cryftallizations. Luftre and tranfparency none. Fracture uneven and earthy ; fragments 2 ; hardnefs from 5 to 7 . Spec. grav. 2.3i4. Feels rough and harfh; gives a yellowifhgrey itreak. At ${ }_{3} 3^{\circ}$ it ineited into a reddifh-brown porcelain mafs. It is often mixed with globules of magnetic iron-ltone, which adds confiderably to its fpecific weight.

Wacke, mullen, and kragg (Mr. Kirwan adds) have been by molt writers confounded with what he confiders as trap; but their colour, Specific gravity, and fulibility, fhew that they mult be diftinguifheci.

KRAGLIKIU, in Geography, a town of Moldavia; 95 miles N.N.W. of Jaffy.

KRAGOJEVA, a town of Servia; 45 miles N.E. of Novibafar.

KRAGOWATZ, a town of Servia; 30 miles N.N.W. of Belgrade.

KRAKA, a town of Walachia, on a confiderable lake, that communicates with the Danube; 30 miles S.S.E. of Buchareft. N. lat. $44^{\circ} 5^{\prime}$. E. long. $26^{\circ}$.

KRAKAN, a fmall ifland on the W. fide of the gulf of Bothnia. N. lat. $63^{\circ} 30^{\circ}$. E. long. $19^{\circ} 33^{\prime}$.

KRAKATOA, a fmall ifland in the ftraits of Sunda. S. lat. $6^{\circ} 6^{\prime}$ E. long. $105^{\circ} 21^{\prime}$.

KRAKAW, or Krako, a town of the duchy of Meck. lenburg, on a lake ; 10 miles N. of Guftrow.

KRAKEN, in Zoology, a marine animal of moft fupen. dous magnitude, faid to have been feen in the northern feas, and particularly near the coafts of Norway and Swzeden. The exiftence of fuch an enormous creature is attel.ted by bifhop Pontoppidan, who, in his "Natural Hittory of Norway," affords an entertaining, if not a very fatisfactory and accurate, account of this furprifing creature. From his details we learn the kraken lies in the deeper parts of the fea, in eighty or one hundred fathoms water, and at fome leagues from land. This mighty, and as it feems unwieldy mafs of aimmated fubftance, very rarely rifes near the furface; whent it does, the calmelt fea becomes troubled to a valt diftance around it, the heaving billows point out the more immediate fpace in which it will emerge, and when it has rifen, thofe parts vifible above the furface of the water affume the afpect of fo many iflands, variable in dimenfions as well as thape, at every motion of the kraken. The form of this enormous being is compared to that of a crab; the back or upper part, (fo far as can be probably eftimated,) is faid to be a mile and a half in circumference, (or, as fome affirm, even more.) Its limbs, and of thefe it is furnifhed with feveral, are truly gigantic, appearing, when elevated above the water, as thick and long as the mafts of veffels of a moderate fize, and are befides endowed with fo much Arength,

## K R A

Shat with one of thefe it can feize on boats and the fimaller kinds of veffels, and drav them under water. The defcent of this montter froms the furface of the fea to the bottom, is faid alfo to be not lefs terrible than its rifing, fince it occafions a fiwell and whirlpool fo violent and irrefiftible, that fhips of the lar gelt burthen, drawn within its vortex, inevitably fink into the abyfs of the waters, and fink to rife no more.

Thefe, and various other circumflances equally calculated to excite altonifhment, are related of the kraken by the learned prelate before mentioned, the particulars of which have been differently received. many having phaced an implicit confidence in his relations, and others as Itrenuoufly determining to reject them ats ates unworthy of belief. In julfice to Pontoppidan, we Mould obferve, however, that though we are principally indebted for our knowledge of the kraken to this writer, it muft be undertood that the exitence of fuch an animul as the kraken is not teltified on his authority alone; nor is it in his volumes only that details fo marvellons have appeared; his accounts in general are in a greater or lefs degree corroborated by feveral northern writers, and with fuch internal evidence of truth, that we camot rejcet their reports as wholly fabulous, or conceive the kraken to be the mere creature of fiction. Still we mult receive their obfervations dcliberately; we may, and certainly do, on their veracityo admit the probable exittence of a marine animal, fuch as the kraken is deferibed, of a fize very far furpaffing that of the whale, and confequently, of any amimal at prefent known, but here we paufe ; we have yet to be informed how far the truth has really been exaggerated as to the actual magnitude, and powers of this tremendous creature. As to the nature of this being, that particular appears to be pretty clearly defined; we have litite doubt, if any confidence can be placed in the confeffedly imperfect deferiptions left us hy different authors, that it is a creature by no means analogous either to the whale tribe, or any kinds of tifhes; it is affuredly, on the contrary, one of the mollufca order or family of worms peculiar to the fea. Denys Montfort, a writer who feems to have confidered its nature with attention, believes it to be a fort of fepia, an idea not improbable, or perhaps rather, fhould fortune ever favour the naturaliff fo far as to decide the point in quefion, it nay prove to be one of the medufe tribe; this we fuggef, though we flould itill rather be inclined to imagine it an animal of a diftinct genus not at prefent afcertained, as being .mof likely partaking in fome degree of the characters both of the genera Seria, and Medusa, and yet not ftrictly appertaining to either. See Sepia and Medusa.

KRAKO, in Geography, a town of Sweden, in the pro .vince of Upland; 17 miles N. of Upfal.

KR.i INON, a fmall ifland on the W. fide of the gulf of Buthinia. N. lat. GI 33'. E. long. 17' 9'.

KRALAMI, a town of Bofnia, near the river Mifan ; 34 mites S. of Serajo.

KRALITZ, a town of Moravia, in the circle of Ol.mutz: 8 mites $S$. of Olmutz.

KRALOVAVELFKA, a town of Sclavonia; 30 miles W.N W. of Pofzera.

KRdLOWIDWUR, or Koniginhof, a town of Boheniaz, in the circle of Konigingratz, on the Elbe; 13 miles N. of Konigingratz.

KRALOTVITZ, a town of Bohemia, in the circle of Rakonitz; 13 miles S.W. of Rakonitz.-Alfo, a town of Buhenia, in the circle of Czaflau; 16 miles S.W. of Czafau.

KR MMER, in Biography. See the next article.
ISRAMERIA, in Botany', received its name from Lin-

## K R A

nsus, in commemoration of two German botanile, John George Heury Kramer, the father, and W Hiam Henry, the fon, both of whom flourifed towards the middle of the lait century. The former, a phyfician to the army, publifhed at Drefden, in 1728, an anomalous arrangement of plants, partly by the fyttem of Rivinus, and partly by that of Tournefort, dividing them according to the months in which they flower. This fame book, amended and enlarged, was reprinted at Viema in $17+4$, interfperfed with various remarks upon the technical terms of botany, anecdotes of what happened to the author in various journeys, and, according to Haller, many fabulous abfurdities. He was alfo author of other botanical tracts.-The latter (William Henry) publifled at Viemna, in 1756 , a catalogue of the animals and plants of Auftria.- Linn, in Loefl. It. 195 Gen. 63. Schreb. 86. Wild. Sp. Pl. v. 1. 693. Mart. Mill. Dict. v. 3. Juff. 425 . (Ixine ; Loefl. MSS.) Clafs and order, Tetrandria Monogynia. Nat. Ord. uncertain, poftibly Lomentacea, Linn. Legumino $\sqrt{\text { a }, ~ J u f f . ~}$

Gen. Ch. reformed. Cal. Perianth infurior, of four or five oblong, acute, unequal, fpreading leaves, internally coloured, deciduous. Cor irregular, much fhoter than the calyx, of five petals; the three uppermoft with long claws, reflexed, and a fmall ovate limb, which is fometimes wanting in the middle one; two lowermolt ovate, concave, feffile, at each fide of the germen, fcarcely fpreading, much horter than the others. Stam. Filaments four, at the upper fide of the germen, awl-flaped, parallel, afcending, two of them rather floorter than the reit ; anthers terminal, finall, ovate, crect, opening by two terminal pores. Pif. Germen fuperior, feffile, ovate; ftyle awl-fhaped, afcending, nearly equal to the flamens; ftigma fimple, acute. Peric. Legume? glubofe, of one cell, not burlting, arred on all fides with barbed projecting brilles. Seed folitary, ovate, hard, fmooth.

Eff. Ch. Calyx of four or five leaves. Petals five ; the three uppermolt with long ciaws ; two lowermott feffile, ovate. Fruit globofe, prickly, of one cell. Seed folitary.

Obf. It docs not appear that Linnzus ever faw this genus; all that he fays of it being taken, not very exactly", from Loefling; nor is there a fpecimen in his berbarium. Neither does Mutis feem to have known any thing of it, when he fent Linnreus a defcription of the Acena, Mant. 2. I45, under the denomination of "Kramerie affinis " fcr thefe two genera have nothing in common, except a flight coincidence in their artificial characters, not founded in nature. This Acena indeed was never feen by Linnzus, being adopted entirely from his friend's account. It is, with great judgment, referred by Juffieu to his own matural order of Rofacce, after Ancijfrum, with which Krameria has no relationflip whatever. - The defeription and figure of a fecond fpecies of Kranieria, in Cavanilles, have enabled us to form fome idea of its natural affinitics, hitherto left in the dark, as well as to venture on a reformation of its generic charackers; though all this is done from the above authorities alone, without infpection of any fpecimens. The genus in queltion will not conveniently go into any of Juffieu's prefent fections of the Leguminnfa, but a comparifon of its anthers with thofe of Caflia, its hard ovate feed, and its anomalous corolla, will, we prefume, confirm thofe more obvious indications which have led us to the above conclufion, notwithflanding the ftrange and peculiar feed-veffel.
Only two fpecies have hitherto been defcribed by authors, both natives of South America.

1. K. Iaina. Linn. Sp. Pl. 177--Leaves all fimple. Calyx four-cleft.-Gathered by Loefling near the town of Comana, on the coalt of the Caracaos, latitude about $10^{\circ} \mathrm{S}$. The inhabitants

## K R $\Lambda$

Inimbitants call it Cartillo Brive, or rather, as we prefume, Cordillo Breva, Teafel Fig, from the hape of the fruit and its barbed briltles. Whether there be any thing vilcid in its habit, which might induce its difcoverer to adopt the Greek name Ixine, does not appear from his delerijution here fubjoined. "Roots fibrous. Stoms lhrubby, procum. bent in their lower part, and fpreading every way, but foon afcending and wand-like: their branches fcattered and srect. Leaves alternate, lanceolate; the upper ones linear, acute, nearly feffle. Fiocuers alternate, in a termirial (leafy) clufter, their ftalks axillary, fursifhed about the middle with two fmall acute linear bracteas. Calyx of a roly purp'e. Upper petals pale at the tios, lower ones rugofe, dark purple. The plant itfelf is of a brownifh hoary lue."
2. K. cytifoids. Cavan. Ic, v. 4. Gr, t. 302.-Leaves ternate ; the floral ones fimple. Calyx five-cleft.-Found by Lewis Née, near the town of Cimapán in New Spain, efpecially on the hill commonly called del carpintero, bearing flowers and fruit in September.- The flon is fhrubby, three fect high, with a grey bark: its branches numerons, altarnate, downy when young. Leaves alternate, on longifh, downy, compreffed foot-Italks, ternate; leafiets elliptical, feffile, entire, downy. Flowers forming a fimple clulter at the end of each branch, with a fimple elliptic-lanceolate leaf at the bafe of each of their ftalks, and a pair of fmaller ones above the middle, the falks all fingle-flowered, rather longer than the leaves, and downy. Calyz externally downy, internally of a violet red. Stamens equat, red, inferted into the receptacle, all at the upper fide of the germen, and within the upper petals, which latter therefore cannot, as Cavanilles fuggefts, be abortive filaments. The lower petals are dark violet ; the central one of the three upper is elongated, taper-pointed, and recurved, not dilated at the fummit like the others. Gernen hairy. Frait globular, the fize of a currant, cowny, muricated on all fides with longifh projecting briftles, barbed at their points only with three or four fharp reflexed teeth. S.

KRAMERSIKY, in Geography, a town of Pruflia, in the procince of Ermeland; $I_{5}$ miles S. of Heilfberg.

KRANICHFELD, a town of Saxony, in the principality of Altenburg; 12 miles S.E. of Erfurt. N. Izt. $50^{\circ} 43^{\prime}$. E. long. $11^{\circ} 4^{\prime}$.
KRANOWITZ, a town of Silefia, in the principality of Troppau; 11 miles N.E. of Troppau. N. lat. $49^{\circ} 55^{\prime \prime}$. E. long. $18^{\circ}$.

KRANTZ, Alrert, in Biography, a native of Hamburgh, of whofe early life we have no information, became profeflor of canon law and theology in the univerfity of Roflock, and afterwards refor of it about the year I 482. He took his degree of doctor of divinity in 1490, and then removing to Hamburgh was elected dean of the cathedral there. He obtained great reputation for his abilities and prudence, and was confulted on various occafions. Of fuch confequence was his opirion reckoned, that in the year 1500 , the king of Denmark and the duke of Holtein made him their umpire in a difpute with the people of Dithmarfh. He died in 1517 , leaving behind him a claracter for integrity and indultry in his refearche;. His works are, "Chronica Regnorim Aquiloniorum Danix, Sueciæ, Norvegix:" "Vandalia, five Hiftoria de Vandalorum origine :" "Metropol is, five Hiftoria Ecclefiattica de Saxomia." Moreri.
KRAPERNA, in Geography, a town of Ruffia, and dittrict of the government of 'Tula.

KRAPINA, a town of Croatia; 8 miles W. of Agram. KRAPPITZ, or Krzapkowitz, a town of Silelia, in the principality of Oppeln, near the Ober; 12 miles S. of Oppeln. N. lat. $50^{\circ} 25^{\prime \prime}$. E. long. $17^{\circ} 52^{\prime}$ 。

in 5526 , at Grebern, in the bifhopric of Bamberg. He received his claffical education at UIm, where he acquitted himiedf with fo much credit, that the magiltrates of the city allowed him a pention to affift him in his future fludies. He went to Strafburg, and added to his former acquifitions theology and the Hebrew language. He afterwards undertook the dircction of the public fchool-at Memmingen, which he rendered celebrated by adopting the methods purfued at Strafourg. In 1559, he was appointed profeflor of moral philofoply and the Greek language at the univerfity of Tubingen, where he refided till the time of his death, which happened in $160 \%$. He publifhed a great number of works, grammatical and critical, with orations, Greek and Latin, but his molt valuable publication is entitled " TurcoGrecix libri octo," containing an excellent collection of pieces relative to modern Greece, with the language and litcrature of which he was well acquainted. He was author Jikewife of Annales Sue vici, ab initio rerum ad annum, $1594{ }^{\circ}$ " A very flort time before his deceafe, and forefecing that the time of his departure was at hand, he gave an entertainment to the academical body, and prefented to them, as a memorial of his efteem, a valuable gold goblet. Moreri.

KRAUTHEIM, in Geography, a town of Germany, on the Jaxt ; 34 miles N. of Heilbronn.
KRAW, Iftbmus of, the narrow part of Lower Siam, between the Indian lea and the gulf of Siam, about $7 \circ$ miles wide. N. lat. $9^{\circ}$ to $12^{\circ}$. E. long. $98^{\circ} 20^{\prime}$ to $99^{\circ} 30^{\prime}$.
KRAYSK, a town of Lithuania, in the palatinate of Wilna : St miles E. of Wilna.

Kreese. See Chisse.
KREIBITSCH, in Geography, a town of Bohemia, in the circle of Leitmeritz ; 24 miles N.N.E. of Leitmeritz.
KREMENTCHUK, a town of Ruffia, and difrict of the government of Catharinenflaf or Ekaterinoflav, on the Dnieper; $3^{8}$ miles W.N.W. of Ekaterinoflav. N. lat. $49^{\circ}$ E. Iong. $33^{\circ} 10^{\prime}$.
KREMINIEK, a town of Poland, in Volhynia; $3^{6}$ miles S. of Lucko.
KREMPE, a fmall tewn of Hollein, formerly fituated on the banks of the Elbe and ftrongly fortified, but now only remarkable for the height of its fteep'e, which ferves as a mark for feamen, fituated between Itzehoe and Gluckftadt; 3 miles N . of the latter.

KREMSIER or Kremerziz, a town of Moravia, in the circle of Prerau, on the Morawa, belonging to the bifhop of Olmutz ; 17 miles S. of Olmutz. N. lat. $49^{\circ}$ I $7^{\prime}$. E. long. $17^{\circ}{ }^{20^{\prime}}$.

KREMSMINSTER, a town of Auftria; 12 miles W. of Steyr.
KRENENSKAIA, a town of Ruffia, in the country of the Coffacks, near the Don; 216 miles N.E. of Azoph.

KRESABAD, a town of Hindooftan, in Bundelcund ; 28 miles S.S.W. of Pannah.

KRESTA, a fmall ifland near the S . coaft of Nova Zembla, in the ftraits of Waigats. N. lat. $70^{\circ} 32^{\prime}$. E. long. $59^{\circ} 20^{\prime}$.

Kresta, St., a gulf or bay of Ruffia, in the north part of the Anadirdkaia gulf. N. lat. $65^{\circ} 20^{\prime}$ to $65^{\circ} 4^{\prime}$. E. long $180^{\circ} 34^{\prime}$ to $181^{\circ} 24^{\prime}$.
KRESTIAI, an ifland in the Frozen fea, at the mouth of the Lena, of a triangular form, having its mean diameter about 12 miles. N. lat. $77^{\circ} 42^{\prime} . \mathrm{E}$. long. $16^{3} 14^{\prime}$.

KREUPEL, a fmall ifland near the W. coalt of Borneo, N. lat. $3^{\circ} 47^{\prime}$. E. long. $112^{\circ} 25^{\prime}$.

## K R I

KREUSBACH, a town of Aultria; 9 miles S.S.E. of St. Polten.

KREUTZBURG, a town of Ruffia, in the government of Polotfk, on the Duna; 60 miles E.S.E. of Riga.

KREWITZ, a town of the duchy of Mecklenburg; 10 miles E. of Schwerin. N. lat. $53^{\circ} \cdot 4^{\prime}$. E. long. $\left.11^{\circ}{ }^{\prime \prime}\right)^{-1}$ 。

K $\vec{R} E W O$, a town of Lithuania, in the palatinate of Wilna; 42 miles S.E. of Wilna.

KRICHEVSKAIA, a town of Ruflia, in the government of Archangel, on the Dwina; 16 miles S. of Kolmogori.

KRIEbeL Kraykueit, the German appellation of the difeafe faid to awife from cating the feeds of the raphanus, and thence called Raphania by Linnæus and others. Sce that article: alfo Engot and Ignis facer.

KRIEGSTETTEN, in Geography, a bailiwick of Swizzerland, in the canton of Berne.

KRIENS and Hore, a bailiwick of Switzerland, in the canton of Lucerne.

KRIGIA, in Botany, named by Schreber, apparently in honour of Dr. David Krieg, a German phyfician, mentioned in the preface to the third volume of Ray's Hiforia Plantarum, who is there faid to have accompanied Mr. William Vernon, fellow of St. Peter's college, Cambridge, in a botanical excurfion through the province of Maryland. In this journey they difcovered and collected fome hundreds of new and rare plants, many of which are defcribed in the work of Ray, above cited. Schreb. 532. Willd. Sp. Pl. v. 3. 1618 - Clafs and order, Syngenefia Polygamia Equalis. Nat. Ord. Compofita Semifoofoulofi, Linn. Cichoracea, Juff.

Gen. Ch. Common calyx fimple, cylindrical, of about ten, lanceolate, erect, acute, equal leaves, fhorter than the corolla. Cor. compound, fomewhat imbricated, uniform, each flower hermaphrodite; proper, of one petal, tongue-fhaped, linear, truncated, five-toothed. Stam. Filaments five, capillary, very fhort; anthers cylindrical, tubular. Piff. Germen nearly ovate; ftyle thread-fhaped, the length of the flamens; ftigmas two, reflexed. Peric. none; common permanent calyx ovate, at length reflexed. Seeds folitary, five-fided, ftriated, with a membranaceous crown of five, roundifh, erect leaves; down capillary, confitting of five long rough britles, alternating with the crown. Recept. naked.

Eff. Ch. Receptacle naked. Calyx fimple, of many leaves. Seed-down of five membranaceous leaves, with tive alternate briftles.
I. K. virginica. Willd. (Hyoferis virginica; Linn. Sp. Pl. if38. Michaux Boreal-Amer. vo 2. 88. Lamarck in Journ. d'Hift. Nat. v. 1. 222. t. 12.)-A native of Virginia and Pennfylvania, found even from Canada to Florida.The habit of this plant is very fimilar to that of a ftarved Dandelion. Radical leaves at firft ovate, then lanceolate, and at length lyrate, acute, fmooth. Stalks naked, fingle-flowered, thrice as long as the leaves. Calyx perfectly fimple, not imbricated, of ten lanceolate leaves. Flowers deep yellow. Seeds fquare, crowned with five flort, rounded, membranous fcales, and as many alternate, long, rough, ftraight brifles.

KRIJINAGUR, in Geography, a town of Hindooftan, in Mewat; 18 miles N.N.E. of Alvar.-Alfo, a town in Agimere; 15 miles E.N.E. of Roopnagur-

KRIKA, a diftrict of Africa, in the kingdom of Calbari.

Krim. See Crim, Crimea, and Tacrida.
KRINK, a town of Itria; 12 miles S.S.E. of Capo. d'Iftria.

KRIS,

## K R I

K R I

KRIS, the denomination of Indians that inhabit the banks of lake Chriltineaux, who can raife 1000 warriors.

KRISHNA, in Hindoo Mythology, one of the avataras, or incarnations of the god Vifhnu, in which he is faid by the fectaries, who exclufively worfhip him under this name, to have magnified himfelf in a degree of power and glory far exceeding any other of his forms. They maintain, indeed, that under the other avataras, he aflumed only an anf(r, or portion of his divinity, while Krifhna was Vifhnu himfelf in mortal mould. A numerous fect, called Gokalaita, from Gokala, one of Kriflha's names, worfhip him exclufively, or conjointly with his confort Radha: this lect are immeafurably lavift in their praifes, and vehement in their adoration of this deity, while other fects of Hindoos call Krifina an impious wretch, a mercilefs tyrant, an incarnate demen, now expiating his crimes in hell. As information is received from thele different defcriptions of zealots, fo confequently will it differ in the account of the character and actions of this motley perfonage, of whom as much is recorded as of any of the Hindoo deities. His life and actions have occupied the attention of many volumianus writers; and if taken literally he led a life of exceffive libertinifm, but his followers maintain fuch appearances to have been the refult of maja, or delufion, for that in reality his life was chafte and holy. The Gita Govinda, a beautiful poem by Jayadeva, is a feries of myitical rhapfody in praife of Krifhna, and a relation of his loves with his confort Radha, and although warm, and indeed loofe, in a degree not admitting of literal tranflation into our language, is faid to be purely myftical, and to mean the "reciprocal attraction between the divine goodnefs, and the human foul." This poem has been finely tranflated by fir W. Jones, and appears in his works, and in the third volume of the Afiatic Refearchcs. The fame fubject is myftically handled in the tenth book of the Sri Bhagavata, a life of Krifhna, not hitherto tranfated, fo much venerated among cestain fects, as to be efteemed as the eighteenth Purana. (See Jayadeva, Mystical Poetry, Sri-Bhagavata, and Purana.) Moft of the extravagant tales related of Krifhna, may be refolved into a continued folar allegory, for he is a perfonification of the fun, and correfponds with the Apollo of the Greeks. (See Kaliya.) His mortal parents were Vafu-deva and Devaky. He was foftered by an honeft herdfman named Ananda, or the happy, and his amiable wife Yafuda; and paffed his youth in dancing, fporting, and piping among a multitude of young Gapas, or cow-herds, and Gopias, or milk-maids, from whom he felected nine as favaurites. As a fpecimen of the tales of the Bhagavata, it may fuffice to relate, that on one occafion the Gapia, his playfellows, (that is, the Mufes) complained to Tafuda, that he had pilfered and ate their curds; and being reproved by his Softer mother, he defired her to examine his mouth, in which, to her juft amazement, the beheld the whole univerfe in all its plenitude of magnificence. Another of his miraces is given under Ka/ya, which fee.

Innumerable are the estravaganzas related of Krifhna, whom fome French writers have impioufly compared with Jefus Chrift. On this fubject the following paffage orcurs, in Moor's Hindoo Pantheon, whence chiefly this article is taken. Defcribing a plate of Krifhna deftroying Kaliya, " It has," he fays, "been furmifed by refpectable writers, that the fubject here reprefented has reference to an auful event figuratively related in our fcriptures, and Krifhat is not orly painted, as feen in the plates, bruifing the head of the ferpent, but the latter is made to retort by biting lis heel. Among my images and picturcs of this deity (and they are very numerous, for he is enthufiaffically and
extenfircly acored, and his hithory affords great fcope for the imagination) I have not one original, nor did I ever fee one, in which the fnake is biting liriflna's foot; and I have been hence led to fuipect, that the plates cmaraved in Europe of that action are not folely of Hindoo inmention or origin. I may eafly crr in this infance; but I am farther Atrengthened in the fulpicion, from never having heard tl:fact alluded to, in the many converfations that I lave hell with Brahmans and others on the hiftory of this avatara.
"Sonnerat was, I believe, the firft who extubited limana cruning a fnake: how, otherwife would he or any ore kit it fo eafily and obvioufly, as by ftamering on it head? No. can the reptile in any mode retort but by bitins the fee of its affailant. Zeai formetimes may have in its refults the: fame effects as infidelity; and one cannot help latrentime that a fupertruchure requiring fo litte fupport, fhould b encumbered by awkward buttrefles, fo ill appied, that th... would, if it were poffible, diminifin the thability of til building that they were intended to uphold. Of this deferiytion were the zea'ous refearches of lome nifhionartes, wh: $m$ Brahma and Sarafwati eafily found Abraham and Sarais; and the Chrittian Trnity is as readily difcovered in the monftrous Trimurtiof the Hindoos." (See Saraswatiand Thmurti.) Of this defoription aifo, I am difpofed to think, are the attempts at bending !o many of the events of Krifhna's life to tally with thofe real or typical of Jefus Chrift's. That Krifhna, according to his hittorians, pafted a life of a molt extraordinary and incompreheníble rature. may be admitted; and that his name, and the general outline of his ftory, exited long anterior to the birth of our Saviour, is very certain, and probably to the time of Homer. His miracles are amazing, but ridiculous; a term that may, perhaps, be applied to a majority of the legends detailed with fuch protixity in the modern poem, the Sri Bhagavata. He is reprefented as the meekell, tenderelt, and molt benerolent of beings ; till, however, he fomented the terrible war defcribed ia the Mahabarat : he wafhed the feet of the Brahmans: he exhibited an appearance of excefine libertinim: but it was, they fay, all maya. or delufion, for he was pure and chaste in reality ; he uplifted meuntains, raifed the dead, (fee Kasya,) delcended into hell, and performed fuch motley exploits, as induced fir William Jones (Af. Ref. i. 27.) to think that "the \{purious gofpels, which abounded in the firtt ages of Chriitianity, were carried to India, and the wildeft parts cf them repeated to the Hindoos, who engrafted on them the cid fable of Ke「ava, the Apollo of Greece."

Krihna has eight regular wives affigred him, whofe names are 1. Rukmeni or Radha, an incarnation of Lakfhmi ; 2. Yanuminti ; 3. Kalenderi, a water nymph, daughter of Surya, or the Sun; 4. Satyavama; 5. Lakihmeni; 6. Mitraviada; 7. Satya; 8. Vrundi. Of thefe fomething is faid under their names refpectively. He beffdes attached to him 16,000 women that he found virgins in the ample feraglio of a five-headed tyrant, who, for his manifold crimes, Krifhna flew. The legendary tales defcriptive of thefe events are of great length and va:iety. Each of thefe 16,008 women bore him ten fons, and each fuppofed herfife the exclutive favourite of her lord. Kama, the god of love, is faid to have been the offispring of las firit wife Rukmem ; and in this broth he was named P'radyama. (See Fama.) On the death of Krihara, Rukmeni became a fati dee Sat1), and, with feveral cther of his wives, bunted herfif, with a view to an immediate reunion with her lord in Vaikontha. See Vakontina.

Krifhna's names, like other. deified perionages, are ne merous. He being Vifhnu, they enjoy fereal in comN 2.
mon.

## K R I

mon, Murari, Meri, Madhava, and Baghavan, among them; Govinda, Copala, Gokala, are derived from his occupation of herdfman ; Gopinatha, or the Gopia's god ; Murlidur, the tracful; Kecfiu, Kefava, or Kefavi, are faid to refer to the fineneds of his hair; Varyimali to his peudant calland; Tadava, Vurfhncya, and Vafudeva, to this tribe and tomily.

Ifo is unarely manted of a clack line colour ; his name Karuaderotes tlins; and wifh four arms; elegantly drefled ; . 1 : wotuton of jwels, and often playing on a pipe. ? : Stes of himate given in the Hindru linthoon, from in= res and pictures, and many legends are there wisteck, con wited wh their fubjects. In the Gita Govidal ho is anas cuferben. "His azure breat glitered with
 lean Yamuna, iwter perfold with curls of white foam. From his graceful waill hlowid a pale yellow robe, which refemLe delle gelden chit of the water lily featered over its biuc petals. His paffin was inflamed by the glanets of TRadha's cyes, which played like a pair of water birds with azure plamage, that fyort naar a fuil blown lotes, on a peol in the feafor of dew. Bright ear-rings, like two funs, difplayed, in full expantion, the Howers of his cheeks and lips, which glikened with the liquid radiance of fraiks. His locks, interwoven with bofioms, were like a cloud varicgatcd with moon-beans; and on his forchead flone a circle of edorous eils, extracted from the fandal of Malaya, like the moon juit appearinc on the dully horizon; while his whole body feemed in a llatne, from the blaze of unnumbered gems."
In that very curious work tranlated by Mr. Wilkins, entitled Bhaydvat-Giza, Arjun, the fon of Pandu, addreffes Krihna as "the fupreme Brahm: the moft holy; the moft hi h god; the divine being before all other gods; without hirth t the mighty lord; god of gods; the univerfal lord." In different parts of the Gita he fays of himfelf, " 1 am , of things tranfient, the beginning, the middle, and the end: the whole world was fpread abroad by me in my invifible form. At the end of the period kalpa (fee Kalpa) all things return into my primordial fource; and, at the begimning of another kalpa, I create them all again. I am the creator of ail mankind, uncreated, and without decay. There is not any thing greater than I , and all things hang on me, as precious gems on a fring. I am the underflanding of the wife, the glory of the proud, the itrength of the ftrong. I am the eternal feed of all nature; I am the father and mother of this worid, the grandire and the preferver; I am death and immortality; I am entity and nonentity; I am never failing time ; I an all-graiping death, and I an the refurrection.""I am the emblem of the immortal, and of the incorruptible; of the iternal, of jaltice, and of endicfs blifs."-"Neither the fun nor the moon, nor the fire, enlighteneth that place, whence there is no return, and which is the fupreme mantion of my abode."

Sanjay, one of the interlocu:ors of the Gita, defcribes Frimina, as he revealed his " million forms divine," to Arjun, "covered with every marvellous shing - the eternal god, whofe countenance is turned on every tid:. The glory and amazing iplendour of this mighty being may be likened to the fun, riting at once into the heavens with a thoufand times more than ufual brightnefo. The fon of Pandu then belaeld within the body of the god of gods, flanding turetiner, the whole univerle divided forth into its valk variety." Arjun, territied at this wondrons exhibition, exchuins - "Thout art the fapreme being ! Ife thee withont beginning, withon midhe, and wihout end; of valour intinite, cif arme imamerable; the fun and noon thy eyes; thy mouth a flaming fire; and the who world flumg with thy refleted glorg.

## K R I

Having beholden thy dreadful teeth, and gazed on thy countenance, emblem of time's latt fire, I know not whick way to turn; I find no peace. Have mercy then, O god of gods! thou manfion of the univerfe! and fhow me thy celeftial form, with the diadem on thy head, and thy hands armed with the club and chakra. Affume then, O god of a thoufand arms! image of the univerfe! thy four-armed form." -Krifnna is here, as ufual by his feetaries, identificd with Vinnu, and as "cmblem of time's latt fire," and other paffages of the above extracis, is apparently alluded to in the charaker noticed under Kalya, as the ruling Kalfva-rupi, or Chronus.
It is believed by fome of the moft refpectable refearchers into Hindoo theology, that the worhip of Krifhna, Rama, and other deified perfonages, is modern compared with the inflitutions of the vedas (fee Veds), in which no mention is made of fuch deitics. As noticed under the article JaganaTiAA, ore of the names of Krifina, he is principally worfhipped at that extenfively revered temple. Under Jambavanti is reJated a legend of this frolicfome deity, who efpoufed a bear of that name. (See alfo Kaxsa.) Many plates, and legendary particulars and fpeculations, are given of Krifhns and his extravagant hiltory, in the work whence this article is taken, to which we refer the reader defirous of farther information thereon.
The name of Krifhna is varioufly written in European languages: Crifhna, Criftna, Kruitna, Kifhna, Kiftnah, Quixena, Kifhen, \&c. and is differently pronounced in $\bullet$ different provinces of Iudia.

KRiss, See Creese.
KRITANTA, a name of Yama, the Hindoo Pleto. Kritamala is the name of a river connected with the hifory: of this perfonage under fome of his forms, and may have a common origin. See Yama.

KRITIKA, in Afironomy, the Hindoo name of the Pleiades, refyecting which their poetical'mythologilks have related many pleafing tales, every thing connected with Hindoo fcience being veiled in allegories. This conttellation perfonified is, as one of the mantions of the moon, or Soma (fce Soma), fabled to be a beautiful nymph receiving the incontant deity in his noctumal wanderings. (See Naksuatra.) The fix Kritikas are feigned alfo to have been the wet-nurfes of Kutikya, as mentioned under that articie. Other legends make them the wives of the Rilhis, who, anoug other characters, are made to thine the feven brighth flars in Urfa major; but being unequal in namber, farther fables became neceffry to recomelle the difference, and an attronomical legend is related in the Hindoo lanthcon, affording a fpecimen of the manaer in which the Brahunans have buried, in mytholegical fictions, hitlorical or fcientific facta, and of the coincidence of thofe fictions with the tales of wellern fabulilis. "It is related that Agni, or Pavaka, the ardent deity of fire (fee Pabaka), was charitably and gallantly difpofed to communicate a portion of his warmth to thefe ladies, wives of the frozen Riflhis; and fituated as they were in the artic circle, their complacency to fuch a comfortable fuitor is not furpriling. But it is faid that he had not, in fact, complete fuccels, for that his wife (fice Swama), dreading the refentment of the boly Rithis, aliumed fuccefively the flape and counterance of each of their defirable wives, and thus perfonifyiag them, fatisfied her hufland's ardour. Arundhati, however, the wife of Valifita (fee Vasishita) having always been exemplar; as to toliuefs and fanctity, was not fufpected on this ualuckjo occation; but the other fix Rinks, in confuguence of fuandalous reports, not only diimited their fparking fpoules, but, litee ereat bears, drove them out of the urctice circle, and they now thine the pleiades.

## K R O

It would appear that they had qualified themfelves for wetnurfes, and accordingly nurfed young Kartiky, as noticed under that article, or were entrufked with his education, and were placed by him in the zodiac." In this wild tale we fee an allufion to the difappearance of the feventh Itar of the Pleiades. Arundhati, the wife of Vafifhta, is retained by him. The tar called by his zame is in lat, $6 r^{\circ} \mathrm{N}$. and the is the fmaller flar near him. They are proverbial for conflancy; and attrologers carefully watch their motion, as their influcnces are variouly modified: whatever newly married couple fee them in an aufpicious conjunction or pofition, are furely to live happily together for a hundred years. Peurile as thefe ftories appear, they are matched by others that we have been taught to liften to with more attention perhaps than they deferve. "The Pleiades, acording to mythologits in the welt, were entruited likewife with the education of Bacchus (who, acording to Macrobius, was the fame with Mars, or Kartikya), and ou that account he tranflated them into heasen. According to thofe writers they fuffered a real bodily pollution; and the feventh, fays Hyginus (Poct. Aftro. p. 47 I.) left her fifters and fled to the regions of the heavens: and this is the Arundhatiof the Hindoos. Hin. Pan. p. 88.

KRIVENA, in Geography, a town of European Turkey, in Bulgaria, on the Danube ; 33 miles E. of Nicopoli.
KROBE, or Sulcava, a town of the duchy of Warfaw; 32 miles S. of Pofen.

KROEPELEIN, a town of the duchy of Mecklenburg ; 12 miles W. if Roltock.
KROKEI, a town of Sweden, in Eait Gothland: in miles N.E. of Nordkioping.

KROKINOW, a town of Samogitia; 22 miles E. of Rofienne.

KROKY, a town of Samogitia; is miles S.E. of Rofienne.

KROLENDORF, a town of Auftria; 16 miles Erof Steyr.

KROMAYER, Joms, in Biograpby, a learned German divine, who acquired a very high reputation as a preacher, and was appointed chaplain to the court of the duchefs dowager of Saxony. The duke Weimar afterwards nominated him fuperintendant-general of the churches in that diftrict, and the fenate of that city chofe him as paftor of their church. He died at the age of fixty-feven. He was author of "Harnonia Evangelitarum ;" "Hiftorix Ecclefialticx Compendium ;" "Specimen Fontium, Scripture facre apertorum ;" "A Paraphrafe on the Prophecy and Lamentations of Jeremiah," \&c. \&cc.

Kromayer, Jerome, nephew of the preceding, was brought up chiefly at Leipfic, where he tools his degree of M.A. in $163_{2}$. From that time he became lecturer on logic, rhetoric; natural philofophy, and aftronomy. In 16 +3 , he was appointed profefior of hiftory and oratory in the leffer coliege of princes, at Mifnia. Four times he was called to the office of dean of the univerfity; twice he prefided as prochancellor, at the creation of malters, once he was chofen rector; and in the leffer college he was honoured three times vith the poit of provoft: He filled feveral other high pofts in the univerfiy with great advantage to the place, and died at the age of lifty, in the year $16 \%$. He was author of "Commentaries on duvers Parts of the Holy Scriptures;" of an "Ecclefialtical Hittory," and other works.

KROMI, in Geograply, a town of Ruffis, in the goverment of Orel ; 16 miles S. of Orel.

## $K R U$

KROMME, a river of Africa, forming a bay at it mouth in the Indian fea, S. lat. $34^{\circ} 6^{\prime}$.

KRONENBURG. See Cronenbung.
KRONHAMN, a fmall ifland on the W. fide of the gulf of Bothia. N. lat. $62^{\circ} 25^{\prime}$. E. long. $17^{\circ} 26^{\prime}$.

KRONOBY, a town of Sweden, in the government of Ulea: feven miles S. of Gamla Karleby.

KRONORN, a fmall ifland on the W. fide of the gulf of Buthnia. N, lat. $63^{\circ} 27^{\prime}$. E. long. $19^{\circ} 8^{\prime}$.

KRONOTSKOI Noss, a cape in the northern part of Kamtfchatka, about which the land is very high. N. lat. $54^{\prime \prime} 4 z^{\prime}$. E. long. $162^{\circ} 17^{\prime}$.

KROPPA, a town of Sweden, is the province of Warmeland; 30 miles N.E. of Carlitadt.

KROPPENSTADT, a town of Weftphalia, in the principality of Halberfadt; nine miles E.N.E. of Halberitadt.

KRUG, Locis, in Biography. See German School of Engraving.
KRUGLIKIN, in Geograply, a town of European Turkey, in Moldavia; 12 miles S. of Choczin.
KRUMPACH, a town of Autria; 20 miles S. of Ebenfurth.
KRUPA, a town of Poland, in Volhynia; $60^{\circ}$ miles E. of Lucko.

KRUPKA, a town of Lithuania, in the palatinate of Mink ; 50 miles N.E. of Minfk.

FRUPULIK, a town of European Tuikey, in Macedonia; $8+$ miles N.N.W. of Saloniki.

KRUSCHIN, a town of Pruffia, in the palatinate of Culm; $2+$ miles E. of Culm.

KRUSZWICA, or Kuctswicza, a town of Poland, in the palatinate of Brzefc; 28 miles W. of Brzefc. This place deferses to be recorded, as it was the birth-place of

Piaf,

Piait, who, occupying the flation of a private citizen, was elected king of Poland in 842 .

KRUTA亡A, a town of Ruffia, in the government of Tobolik, on the Irtiich; 36 miles N. of Omfk.

KRUTEN, a town of Courland; 32 miles S.S.IV. of Goldingen.

KRUTOGORSKOI, an oftrog of Ruffia, in Kamtfchatka. N. lat. $54^{\circ} 50^{\prime}$. E. long. $155^{\circ} 54^{\prime}$.

KRUWOTOW, a town of Aufrian Poland, in Galicia; 22 miles S.E. of Halicz.

KRYLOW, a town of Galicia; 10 miles N. of Belz.
KRYOLITE, or Cryolite; Alumine fluatée alcaline, Haïy. The colour of this mineral is fnowowhite, fometines brownifh-yellow, by the admixture of a fmall portion of iron ochre.

It occurs maffive, generally in angular fragments with faiut ftrix, indicating a rhomboidal nearly cubical nucleus; fecondary forms have not yet been obferved.

Its lultre is vitreous, often inclining to pearly.
Fracture imperfectly foliated, fmooth in one direction, and uneven in another.

It is tranflucent even in fragments of confiderable fize; fmall pieces approach to tranfparent, and when immerfed in water for fome time become completely fo.

It is foft, fo as to be feratched by fluor, particularly in the principal direction of the laminx.

It is eafily frangible.
The fpecific gravity of kryolite is 2.928 ; that of a fmall fragment immerfed in water for twelve hours was 2.94 I , Schumach. Haüy ftates it to be 2.949; Karlten 2.957; and Andrada 2.969.

Before the blow-pipe it foon melts, (though certainly not with fufficient eafe or rapidity to warrant the incorrect appellation of kryolite, fuppofed to be derived from that circumitance;) and is afterwards converted into a white opaque pearly flag, of a flightly alkaline tafte. With borax an opaque pearl is formed, which, fome time after cooling, hews a degree of deliquefcence. It is not operated on by the muriatic and nitric acids, but is diffolved by concentrated fulphuric acid under developement of greyifh-white vapours that corrode glafs.

Profeflor Abildgaard, who was the firlt who analyzed this mineral, which had before been mittaken for a fubftance related to barytes, found it to be compofed of alumine and fluoric acid. Vauquelin, who examined it after him, obtained the fame refults, and both chemifts accounted for the fmall proportion of alumine which they found, by the poffibility that part of the earth might have been carried off by the fulphuric acid. Klaproth was enabled to afflgn the true caule of the apparent difproportion by the difcovery of a confiderable proportion of foda, till then but little known as an ingredient of ftony fubitances. His analyfis, and the fubfequent one by Vauquelin, have given the following refults.

Klaptr. Beitr. Vauquelin A. de Ch.

| Alumine | 24 | 21 |
| :--- | ---: | ---: |
| Soda | 36 | 32 |
| Fluoric acid and water | 40 | 47 |
|  | 100 | 100 |

The only place where kryolite has been hitherto found is Greenland; but nothing is known relpecting its geognotic fituation. Werner, we are told, has adopted this mineral as a fpecies of a genus of his, called the Hallite genus, which is
to comprehend fuch fubftances as bear great refemblance to foffil falts, without poffeffing all the requifte characters to entitle them to be enumerated as fuch.

KRZEMIEN, in Geograpby, a town of the duchy of Warfaw ; 34 miles S.W. of Bielik.

KUGNA,

## K U H

## $K \mathrm{UH}$

KUGNA, a river of Beffarabia, the waters of which begin to expand into a lake at Tobak, 30 miles from its union with the Danube.
KUHDEAL, a town of Bengal; 34 miles W. of Ramgur.

KUHESTER, a fea-port of Perfia, at the entrance of the Perfian gulf; 36 miles W. of Ormus.

KUHISAR, a town of Caramania; 15 miles N.W. of Akferai.

KUHMOIS, a town of Sweden, in the province of Tavaltland; 39 miles N.N.E. of Tavathus.

KUHMONIEMI, a town of Sweden, in the government of Ulea; 50 miles E.S.E. of Cajana.

KUHN, Joachim, in Biography, a learned critic, fon of a rich merchant at Gripfiwaide, in Pomerania, was born in 1647 . He ftudied at the univerfity of Jena, and after vifiting feveral parts of Germany, was appointed, in 1669 , principal of the college at Oetingen in Suabia. In 1676, he was chofen profeffor of Greek and Hebrew at Stralburg. He died in 1697 , and after his death appeared his "Queftiones Philofophire ex facris Veteris et Nov. Teit. aliifque fcriptoribus." He is well known in the learned world by his editions of Elian, Paufanias, and Diogenes Laertius.

KUHNAU, Johaxn, the fon of a tifherman of Gryfingen, a town near Altenberg, on the borders of Bohemia, four miles diftant from Dre〔den, was a learned and fkilful mufician of the higher clafs, among thofe who have formed and eltablifhed the German fchool of mufic, particularly in the ecclefiattical ftyle, and in organ playing.

In the ycar 1684, he was organit of the church of St. Thomas at Leipfic; and while in that ftation, he wrote a differtation "De juribus circa muficos ecclefiafticos," and afterwards defended it againft the cenfures of his adverfaries.

In 1689, he publifhed leffons for the harpfichord in two volumes, and in 1696 feven fonatas, entitled ellabici Jfrucbte, fruits of the keys or of keyed inftruments ; and in 1700, fix fonatas, entitled wibluthe Mifari, a bible narrative. Here Luftig of Groningen, in a Dutch treatife entitled "Inleiding tot de Murikkunde," takes notice of this work, and fays that it is a lively reprefentation, in mufical notes, of David manfully combating Goliah. In the fame year ( 1700 ) Kuhnau, to filence the clamours of fome ignorant men of his profeflion, who, envying his merit and reputation, had libelled him, he wrote a mall tract, which he entitled "The Mufical Quack, or Mountebank." In the fame year (1700) Kuhnau was appointed direcior myffices of the univerfity of Leipfic, in whicis flation he died in ${ }_{1722}$, in the 63 d year of his age; and was fucceeded in that honourable polt by John Sebailtian Bach. Kuhnau was celebrated immediately after his death in a Latin difcourfe by a count palatine and magiltrate of Merfeberg for his Akill, not only in mufic, but theology, laweloquence, poetry, foreign languages, algebra, and mathematics.

Matthefon, in his life of Handel, as the highelt praife he could beltow on his performance, fays, that he was even more powerful on the organ than the famous Kuhnau of Leipfic, who was then (in Handel's younger days) regarded as a prodigy.

KUHNFELD, in Geography, a town of Bavaria; 17 miles S.S.W. of Bamberg.

KUHNIA, in Botany, fo named by Linnrus, after his pupil Adam Kühn, a native of Pennfylvania, who travelled to Upfal for the fole purpofe of improving himfelf in natural hittory, and brought this plant with him for the examination of Linnæus; in whom it excited confiderable attention, as having diltinct anthers, though in every other refpoct ap-
pearing to belong to the clafs Syngenefia. Arduino, who had obtained the fame from Siberia, had referred it to Eupazorium, noting the peculiar Atructure of its anthers, which he defcribes as "divided into two or three bodies," or fets. He further adverts to the feathery feed-down, as differing from Eupatorium; and Linnæus remarks that the leaves, !es ing alternate, afford another diftinction, as to habit. On thefe grounds Kubnia was eltablifhed as a genus in ${ }^{7}$ P ${ }^{c}$ rrtandria Monogynia. So it remained till Gxertuer, in his 2d vol. P. 4II, having acquired another fpecies, which he miftook for the original, and finding its anthers firmly united info a tube, took upon him to fay that the Linnitan character of Kubnia was "altogether fictitious," and that the genus, differing from Eupatorium in having an evidently feathery feeddown, thould be referred to the Critonia of Browne; fee Browne's Jamaica, 490 and 314. Now this Critonia is Eupatorium Dalea of Linnæus, a true Eupatorium, with oppofite leaves and a brittly feed-down, routh indeed, but by no means feathery, as is abundantly evident in Browne's own fpecimen now before our eyes. But the author laft mentioned defcribes it "pappo ramofo," which it feems Gærtner adopted upon trult. We are well aware that the diftinction between feathery and rough feed-down, is only a difference in degree; but by this many good genera are difcriminated, and upon it, as a technical character, Kubnia muft chiefly depend ; for more recent examinations have found other examples of diftinct anthers in compound flowers, witnefs feveral fpecies of Tufflaga, and one of Siegefockia; and as the genus in queltion has, according to the above authors, one fpecies with united, and another with more or lefs ditinct anthers, it is beft placed with its natural allies in the Syngenefag, to which clals we fhall follow Willdenow in removing it.-Linn. Gen. 95. Schreb.. 129. Willd. Sp. Pl. v. 3. 1772 . Mart. Mill. Dict. v. 3. Juff. I77. Lamarck. Dict.v. 3. 370 . Illultr. t. 126. (Critonia ; Gærtn. t. 174; but not Browne Jam. 490.)-Clafs and order, Syngenefía Polygamia cqualis. Nat. Ord. Compofite difcoidea, Linn. Corymbifera, Juil.

Gen. Ch. Common Calyx oblong, imbricated; fcales linear-oblong, erect, unarmed, unequal ; the outermoit fharpeft and fomewhat ovate; innermoft bluntifh, flightly membranous at the end. Cor. compound, uniform, difcoid; florets from 10 to 15 , all equal, perfect, fertile, of one petal, funnel-fhaped, with a regular, five-cleft, erect border. Stam. Filaments five, capillary, very fhort ; anthers oblong, either all united into one tube, or into two or three fets, or entirely diftinct, each opening at the top, with a projecting lip. Pif. Germen oblong, furrowed; ityle thread-haped, longer than the corolla, cloven down to the top of the anthers ; ftigmas two, flightly club-fhaped, bluntifh, fpreading. Peric. none, except the permanent calyx - Seeds folitary, oblong, angular, rough ; down feffile, long, feathery Recept. naked.

Eff. Ch. Receptacle naked. Down feathery, feffile. Calyx imbricated, oblong. Sţ̧le prominent, cloven half way down, divaricated.

Obf. If the above characters be finally judged fufficient to eftablifh Kulnia, the word feathery muft be flruck out of the character of the feed-down in Eupatorium; fee that article.
I. K. eupatorioides. Linn. Sp. Pl. 1662. Linn. fil. Dec. 21.t. 11. (Eupatorium alternifolium; Ard. Spec. Alt. 40. t. 20.) -Leaves lanceolate, toothed, ftalked. Anthers feparate. - Native of Pennfylvania, from whence feeds-were brought to the Upfal garden in $1_{7} 62$, and the plants they produced, kept in the green-houfe, flowered the fame year in November. Root fibroas, perennial. Stems feveral, herbaceous, a foot and half high, erect, round, leafy, mi-

KUKERPEH, a town of Natolia; 32 miles W. of Boli.
KUKI, a town of Japan, in the ifland of Niphon; 70 miles N. of Meaco.

KUKKAISTENMAA, a fmall ifland on the E fide of the gulf of Bothnia. N. lat. $60^{\circ} 53^{\prime}$. E. long. $21^{\circ} I^{\prime}$.

KUKU, an extenlive country of Africa, bordering on the defert of Libya, and partaking of its nature. It lies to the N.E. of Tagua and Bornou, and on the N.E joins to Al Wahat. Its capital of the fame name is fituated at 20 journies to the N. of Kauga, and about 250 miles N E. of Bornous. N. lat. $21^{1} 45^{\prime \prime}$. E. long. $24^{\circ} 45^{\prime}$. A river runs from N. to S. by Kuku, and is received into a lake at a great diftance from it; perhaps the lake of Kauga; and the river itfelf may form a part of that, which is faid to run near Angini, a city eight days' journey from Matthan, and fix from Tagua, and towards Nubia and the Niger ; confequestly to the S.E. of Matthan, and appazentily not far to the northward of Kauga.

KUKUS, a town of Bohemia, in the circle of Komigingratz, famous for is baths; 11 miles N. of Kon: ginn $^{\text {in }}$ gratz.

KUL, or Kool, a Turkifh term, probably fignifying a flave or fervant.

Meninfky telis us, the name is given to all the foldiers in the Ottoman empire, particularly to thofe of the grand
feigniors gurd, and the infantry. The captains of the infantry, and thofe who command the guards, are called kût zabylders, and the foldiers of the guard kapa killtri, i.c. Maves of the court. Others inform us, that alld who hold any places depending on the crown, or reccive wages from it, in a word, all who are, in arfy meafure, the grand feignior's fervants, take the title of hith, cr Rcol, i.e. Jlave, as more creditable than that of fubject; even the grand vizir and the baflaws valuc themflives upon it. A kûl, or flave, of the grand feignior, has authority to abufe any who are only his fervants; but a fubbect, who fauld affront a Eûl, or flave, would be feverely punithec. The kûls are entirely devoted to the will of the grand feignior, and look on it as a kind of martyrdom, that merits heaven, when they die either by his order, or in the execution of his commands.

KULALI, in Gcograpby, an inland of Ruffia, in the Cafpian fea. N. lat. 45 :

KULB, a town of Aufria; 10 miles S.S.W. of St. Polten.

KULBAEVA, a town of Ruffia, in the government of Upha; 48 miles E. of Menzelinik

KULDATZKOI, a town of Rufla, in the government of Irkuth, on the borders of China; So miles S.W. of Selegink.

KULEBAKINA, a town of Ruffia, in the government of lrkurfk, on the Lena; 20 miles S. of. Kirenk.

KULEbRUN, a town of Pruffia, in the province of Oberland; 12 miles $S$. of Elbing.

KULEBUGAGE, a town of A fatic Turkey, in Caramania; 40 miles N . of Tarfus.

KULICHOW, a town of Aufrian Poland, in Galicia; 10 miles N.N.E. of Lemberg.

KULING, a town of Grand Bacharia, in the kingdom of Balk ; 30 miles N.E. of Balk.

KULLA, DAR, a fmall country of Africa, fituated to the S.W. of Dar-Fûr. The natives of Kulla are partly. negroes, and partly of a red or copper colour. Their language is nafal, but very fimple and eafy. It is faid they worfhip idols. They are very cleanly, to which the abundance of water in their country contributes, and they are remarkable for honefty and even punctilious in their tranfactions with the Jelabs. They have ferry boats on the river, which are impelled partly by poles, partly by a double oar, like our canoes. Slaves are obtained in Dar-Kulla, either by violence, or by the following method. The fmalleft trefpafs on the property of another is punifhed, in this country, by enflaving the children or young relations of the trefpaffer. The leaft offence in this way is followed, after previous proof, by the forfeiture of a fon, daughter, nephew, or niece of the offender to the perfon aggrieved. Accidents of this kind are continually happening, and produce a great number of flaves. A commiffion to purchafe any thing in a diftant market, not exa ly fulfiled, is attended with a like forfeiture. Dut above all, if a perfen of note die, the family have no idea of death as a neceffary event, but fay that it is effected by witchcraft. To difcover the perpetrator, the poorer natives, far and near, are obliged to undergo expurgation by drinking a liquor, which is called in Dar-Fû "kilingi," or fomething that refembles it; and the perfon on whom the fuppofed figns of guilt appear, may either be put to death, or fold as a flave. The people of Kulia are ftrangers to venercal complaints, but are fubject to the fmall-pox. In that part of the country that is vifited by the Jelabs, there is a king; the reft is occupied by fmall tribes, each of which is ruled by the chief who happens to have moft influence at the time. .The "Kumba," or pimento tree, is found there in fuch

## K U M

plenty; that a rotal or pound of falt will purchafe four or live mid, each mid about a peck. The trees are fo large, from the quantity of water and deep clay, that canoes are hollowed out of them of fufficient capacity to contain 10 perfons. The Jelabs of Bergoon and Fûr fometimes journey to this country in order to procure flaves. The chief article they carry hither is falt, 12 pounds of which are eftimated as the price of a male flave, about 12 or 14 years of age. A female brings three founds more, whimfically computed by the natives, as a pound for the girl's eyes, another for her nofe, and a third for her ears. If copper be the medium, two rotals are eltcemed equal to four of falt. "Hoddûr," a large fort of Venctian glafs beads, and tin, are in great eftimation. Of the latter they make rings, and other ornaments. Brown's Travels in Africa, p. 30, 8 vo.

Kulla, a town of Sweden, in the province of Upland; 17 miles N.E. of Stockholm.-Affo, a town of Sweden, in Abo; 10 miles E.S.E. of Biorneborg.-Alfo, a town of Hindooltan, in Guzerat; 60 miles S.WT of Gogo.

KULLAPOLLAM, a town of Hindooltan, in the circar of Guntoor; 32 miles N.N.E. of Mootapilly.

KUMI, in Geograply, an inand in the Eaf Indian fow, the molt wenterly in a clufter of fix or feven othicrs, from which it is feparated by channels from eipht to ten leagues wide, between luormofa and Japan, feen by M. la Peroufe, who did not land upon it. Thefe iftanders are acither Japanefe nor Chinefe, but feem to be a mixture of hoth people. They were covered with a flirt and a pair of cotton drawers. Their hair, tucked up on the crown of the head, was rolled round a bodkin, which appeared to the voyagers to be gold. Each of them had a dayger, the handle of which was alfo gold. Their canoes were made of hollowed trees, and they were awkward in the management of them. Veffels that had been lorg at fea might procure wood, water, and provifions in this ifland, and alfo tiade here in a fmall degree. But as it is fcarcely three or four leagues in circumference, its population does not probabily exceed four or live hundred. N. lat. $24^{\circ} 33^{\prime}$. E. long. $123^{\circ}$ 16'. Peroufe's Voyage, vol. ii.
KUMINGE, a town of Sweden, in the government of Ulea; 1 I miles N.E. of Ulea.

KUMISS, or Koumiss, a kind of liquor made in 'Tartary, ufd by the natives as their common beverage, and often ferving them inftead of all other food. It is faid to be fo falutary and nouriming, that the Bafchkirs, though emaciated in winter, return to the ufe of it in fummer, and become flrong and fat. The Ruffians have borrowed it from the Tartars, and ufe it medicinally. It is made with fermented mare's milk, according to the following receipt, communicated by Dr. Grieve in the Edinburgh Philofophical Tranfactions, vol. i. p. 181, as he obtained it from a Ruflian nobleman, who vifited that part of Tartary where it is made, for the fake of the medical ufe of it :-" Take of frefl mare's milk, of one day, any quantity ; add to it a fixth part of water, and four the mixture into a wooden veffel; ufe then, as a ferment, an eighth part-of the foureft cow's milk that can be got: but at any future preparation, a fmall portion of old koumifs will better anfwer the purpofer of fouring; cover the veffel with a thick cloth, and fet it in a place of moderate warmth; leave it at relt twenty-four hours, at the end of which time the milk will have become four, and a thick fubltance will be gathered on the top: then with a ftick, made at the lower end in the manner of a churn-ftaff, beat it till the thick fubftance above-mentioned be blended intimately with the fubjacent fluid. In this fituation, leave it again at relt for twenty-four hours more; after which pour it into a higher and narrower vefel, refembling a churn, where the agitation muft be repeated as before, till the liquor appear to be perfectly homogeneous; and in this flate it is called koumifs, of which the tafte ought to be a pleafant mixture of fweet and four. Agitation murt be employed every time before it be ufed."- To this detail of the procefs the nobleman fubjoined, that, in order to obtain milk in fufficient quantity, the Tartars have a cuftora of feparating the foal from the mare during the day, and allowing it to fuck during the night: and when the milk is to be takcn from the mare, which is generally about tive times a-day, they always produce the foal, on the fuppofition that fhe yields her milk more copioufly when it is prefent.

To the above method of making koumifs, our author las added fome particulars taken from other communications with which he was favoured by Tartars themfelves. According to the account of a Tartar who lived to the foutheaft of Orenbourg, the proportion of milk and fouring ought to be the rame as above; only, to prevent changing the veffel, the milk may be put at once into a pretty high and narrow veffl; and in order to accelerate the fermenta-

## K U M

tion, fome warm milk may be added to it, and, if neceflary, more fouring.--From a Tartar whom the doctor met with at the fair of Macarieff upon the Volgä, and from whom he purchafed one of the leathern bags which are ufed by the Kalmucks for the preparation and carriage of their koumifs, he learned that the procefs may be much fhortened by heating the nilk before the fouring be added to it, and as foon as the parts begin to feparate, and a thick fubftance to rife to the top, by agitating it every hour or oftener. In this way he made fome in the doctor's prefence, in the face of twelve hours. Our author Jearned alfo, that it was common among fone Tariars to prepare it in one day during fummer, and that with only two or three agitations; but that in winter, when, from a deficiency of mares' milk, they are obliged to add a great proportion of that of cows, more agitation and more time are heceflary. And though it is commonly ufed within a few days after the preparation, yet when well fecured in clofe veffels, and kept in a cold place, that it may be preferved for three months, or even more, without any injury to its qualities. He was told farther, that the acid fermentation might be produced by four mills as above, by a four pafte of rye flour, by the rennet of a lamb's ftomach, or, what is more common, by a portion of old koumifs; and that in fome places they faved much time, by adding the new milk to a quantity of that already fermented; on being mixed with which, it very foon undergoes the vinous change.
It was according to the procefs firft mentioned, however, that all the knumifs which the doctor employed in onedicine was prepared. It has beea found ferviceable in hectics and in nervous complaints; and our anthor relates fome very ftriking cafes which the ufe of it had completely cured. All thofe who drank it, our author informs us, agreed in faying, that, during its ufe, they had little appetite for food; that they drank it in very large quantities, not only without difgult, but with pleafure; that it rendered their veins turgid, without producing languor; that, on the contrary, they foon acquired from it an uncommon degree of fprightr linefs and vivacity; that even in cafes of fome excels, it was not followed by indigeftion, headach, or any of the fymptoms which ufually attend the abufe of other fermented liquors.

The utility, however, of this preparation as a medicine, fuppofing it completely afcertained, would among us, as our author obferves, be greatly circumfcribed by the fcarcity of mares' milk in this country. "Hence," fays he, inquiries will naturally be made, whether other fpecies of milk admit of a fimilar vinous fermentation, and what proportion of fpirit they contain. As thefe have never been the object, however, of my attention, I will here give the fubftance of what I have been able to learn from others refpecting that which is the moft common, the milk of cows.
"Dr. Pallas fays, that cow's milk is alfo fufceptible of the winous fermentation, and that the Tartars prepare a wine from it in winter, when mares' milk fails them; that the wine prepared from cow's milk they call airen; but that they always prefer koumifs when it can be got, as it is nocre agreeable, and contains a greater quantity of firit ; that koumifs, on diftillation, yields of a weak Spirit one third; but that airen yields only two ninth parts of its whole quantity, which fpirit they call arika.
"This account is confirmed by Oferetfowky, a Ruffian, who accompanied Lepechin and other academicians, in their travels through Siberia and Tartary. He publifhed lately a differtation on the ardent foritit to be obtained from cow's milk.

## K U N

"From his experiments it appears, that cow's milk may be fermented with, or even without, fouring, provided fufficient time and agitation be employed; that no fpirit could be produced from any one of its conllituent parts taken feparately, nor from any two of them, unlefs inafmuch as they are mixed with fome part of the third; that the milk with all its parts in their natural proportion was the moft productive of it; that the clofer it was kept, or, which is the fame thing, the more difficultly the fixed air is allowed to efcape during the fermentation, (care being taken, however, that we do not endanger the burlting of the veffel, the mare fpirit is obtained. He alfo informs us, that it had a fourér fmell before than after agitation; that the quantity of fpirit was increafed, by allowing the fermented liquor to repofe for fome time before diftillation ; that from fix pints of milk, fermented in a clofe veffel, and thus fet to repofe, he obtained three ounces of ardent fpirit, of which one was confumed in burning ; but that from the fame quantity of the fame milk fermented in an open velfel, he could fcarcely obtain an ounce."
KUMLA, in Georraply, a torn of Sweden, in the province of Nericia; 7 miles S. of Orebro. - Alfo, a town of Sweden, in Ealt Gothland; 10 miles S.S.W. of Nord-kioping.-Alfo, a town of Sweden, in Sudermanland; 25 miles IV. of Stockholm.

KUMLINE, a fmall ifland in the Baltic, between the continent of Finland and the ifland of Aland, with a town uponit. N. lat. $60^{\circ} 17^{\prime}$. E. long. $20^{\circ} 37^{\prime}$.

KUMO, a town of Sweden, in the government of Abo, on a river of the fame name; 23 miles S.E. of Biorneborg.

KUMRI, a chain of lofty mountains in Africa, in which are the fources of the Nile and Bahr Kulla, lying, according to Browne, in N. lat. 7', and probably running acrofs the conriuent.

KUMUK, a province bordering on the Cafpian fea, part of the territory included between the rivers Terek and Kur, and lying between the Terek and Koifu, comprehends a fertile plain watered by thefe rivers, as well as the Akfai and Kafma, and the next adjoining mountains to the well. It is under the government of feveral Kumuk Begs, of whom the two moit powerful refide in the cities Akfai and Endors, (called by the Ruffians Androwka,) at the foot of the mountains; and is inhabited by the Kumuk and Nogai Tartars, and by Armenian and Georgian merchants, who dwell in the cities. In winter the Lefgians defcend likewife with their herds from the mountains into the plain; for the liberty of doing which they pay a tribute. The Nogai Tartars keep numerous herds, and dwell in moveable felthuts, near the walls and banks of the rivers and canals. The length of this province is about 11, and the breadth 8, German mites. The Kumuks are vaffals to Ruffia.

KUNA, a town of Lithuania; 15 miles S.E. of Braclaw.

KUNASSYR, one of the Kurile iflands, 150 vertts long, and 50 broad, and entirely furrounded by mountains with lofty fummits; but in the middle of the ifland are low plains. Firs, larches, birch, \&c. grow here. At the fouthern extremity, a flat fandy beach extends from the lofty mountains, where the fea brings up a fpecies of pearlbearing mufcle in valt abundance; fome of the fize of a de-fert-plate. The ifland has lakes and broad ftreams that abound with fifh. It is inhabited by Kurils, who are rated at 41 perfons.

KUNCKEL, Jour, in Biograpby, a celebrated chemift, was born at Hufum, in the duchy of Slefwick, in the year 1630. He was originally intended for the practice of phar-

## K U N

macy; but having applied himfelf with equal diligence to the flndy of chemiltry and metallurgy, he obtained great. reputation for his fkill in thefe departments, and was appointed chemint to the elector of Saxony. He afterwards went to the court of Frederic William, elector of Brandenburg, with a fimilar appointinent; and fubfequently to that of Charles XI. king of Sweden, who gave him the title of confeller metallique; and, in 1693 , granted him letters of nubility, under the name of Kunckel de Loewenttern. He was elelled a member of the imperial Academia Naturæ Curioforum, under the name of Hermes III. He died in Sweden, in March 1703.

Kunckel laboured in the practical purfuit of chemical knowledge for upwards of lifty years, and obtained nextraordinary fkill in the art. His patrons defrayed the expence of all the operations which he chofe to undertake; and, as directer of the glafsworks, he had many opportunities of exercifing his talent of acute obfervation. His theoretical knowledge, however, was very imperfect: for it is allowed that he was altogether d.:ltitute of the leaft tincture of philofophy, and was even faid to have been one of the fearchers for the philofopher's tlone. He is now principally known as the difcoverer of phofphorus, which he prepared from urine, and which bears his name in the fhops. He was the aurhor of feveral works, written in German, in a very bad ftyle, and with as little method as the reft of the alchemifts. His treatife "On Phofphorus" was printed at Leipfic in 16,-8, and his "Art of Giafs-making" in 1689. Two or three of his efliays have been tranllated into Latin. Eloy. Dict. Hift.

KUNDAL, in Geography, a town of Bengal; 20 miles S.E. of Comilah.

KUND $\rightarrow$ LLAH, a town of Hindooftan, in Dowlatabad; io miles E S.E. of Tooliapour.

KUND AWILSA, a town of Hindooftan, in Cicacole; 20 miles S.W. of Cicaco!e.

KUNDERA, a town of Hindoottan; 35 miles W. of Ponuah.

KUNDJEH, a town of Turkih-Armenia, on the Euphrates: 65 miles S. of Erzerum.

KUNDOZERSKAIA, a town of Ruffia, in the government of Archangel ; $12 S$ miles $S$. of Kola.

KUR.

## K U R

KUR, n river of $\Lambda$ fia, the ancient Cyrus (which fee), vifes in the Caucafian mountains, and purfuing a rapid courfe through Georgia, Schirwan, \&e. falls into the Cafpian fea, 70 miles S.S.W. of Baku. In the vicinity of this river the tand is fubjeet to inundations, and overgrown with high rich grafs; towards the fea it is brackifh and barren, but fertile fowards the mountaiss. About if miles upwards from its mouth, the Kur receives from the right the Aras, or ancient Araxes; and there on the left bank is fituated a large vill.ge, named Dfchawat. After its junction with the Aras, the Kur is about 70 fathoms broad, and only fo far navigrable; the rocks in the bed of the river hindering the navifration higher up. At about four German miles from the fea, it branches out into a number of arms, the rorthernmoft and futhernmolt of which are the mott coufiderable. The iflasds thus formed belong to Schirwan. On the n=rthern main arm lies the town of Sallian, which properly confits of a number of villages extending along the river, and owes its profperity to the uncommonly productive fihery of the Kur; for this river abounds with fturgeon and other fifh. Between the Kur and the Terek lies a tract of land, zlong the Cafpian fea, extending in lencth from the 30th to the $44^{\text {th }}$ degree of N. Latitude, and of various breadth, though for the molt part inconfiderable in proportion to its length. This tract contains fomewhat more than 2500 French fquare miles, and is divided into three provinces, viz. Kumak, Dagbefan, and Shirwan, of which the firlt is now dependest on Ruffia, and the two latter on Perfia. See eanch refpectively.

KURA, a finall ifland in the Cafpian fea, with fteep thores round it. N. lat. $39^{\circ}$.

KURABAD, a town of Candahat; 8 miles W. of A:tock.

KURAGGI, a town of Japan, in the ifland of Niphon; 45 miles N.N.E. of Jedo.

KURCH, a town of Natolia; 34 miles W. of Sinob.
KURDIUMI, a town of Ruffia, in the government of Saratof, on the Volga; 16 miles N.N.E. of Saratof.

KURGAN, a town of Rufia, and diftrict of the government of Tobolils. on the river Kurgan; 68 miles S.W. of Yalatorovk. Alfo, a river of Afia, which rifes in Khorafan, and rans into the Cafpian fea, W. of Aftarabat.

KURIAT, a town of Arabia, in the country of Oman, at the mouth of a river of the fame name, which runs into the Arabian fea, S. of cape Kuriah; 20 miles S.E. of Mafcat. Kuniat, Cafe, or Ras Kuriat, a cape on the coalt of Arabia. N. lat. $23^{\circ} 27^{\prime \prime}$. E. lonz. $57^{\circ} 50^{\prime}$.

KURJAUN, a town of Hindooltan, in the circar of Gohud; 35 miles S.IV. of Gwalior.

KURIKK 1 , a town of Sweden, in the government of Wafa; 36 miles N.E of Chrillineftadt.

KURILA, a town of Sweden, in Eaft Bothnia; 20 milcs S.TV. of Brahe?tad.

KURILAUT, a town of Kharafm; 60 miles S.S.E. of Urkorje.

KURILE, or KUricskot, Ifands, a chain of iflands, ruming in a S.W. direction from the fouthern promontory of the peninfula of Kamtfchatka, or the Kurilloy Lopatka, to Japan, extending from N. lat. $5^{\circ} \mathrm{t}$ to $45^{\circ}$. They obtained this name from the inhabitants of the nelghbourbood of Lopatka, who being themfives called uriles, gave their own name to thefe inands, on firit beconing a quainted with them. Some of them are inhabited and wooded, others quite bare and rocky, and a few that are volcaric. According to Spanberg, they are 22 in number, without reckoning the fmall ones. Of the two Kurile iflands that be neareit to Lopatka, the frif accounts were brought to

Ruffia in the year 1713 . The others have been fucceffively known from that period to 1779 , by means of Ruffian mariners, who, at the time, put them under contribution to the crown. The 22 inands are Shoomthu or Shoomfka, Poromuhhir, or Paramoufir, Sherinki, Ma-kan-Kur-Affey, Anakutan, Ar-Amakutan, Syakutan, Ikarma, Thiicinkutan, Mufyr, Rach-koke, Mutova, Ralfagu, Uffaflyr, Ketoi, Semuflyr, Thirpa-Oi, Urup, or Ooroop, Etorpu, Kunaflyr, Thikota, and Matmai. Amakutan is diltant from the fourth illand (in the order of ent:meration) 35 verlts; it is about 100 vertts long and 15 broad; has three elevated fummits of mountains, of which two have exhaufted craters; the wood is ferubbed and fcarity ; red foxes are pretty numerous, but on the coalt are few feabeavers, Scc. Several itrears of hard water flow from it into the fea. From this Ar-Amakutan is dittant fix verits : its length is twenty verits and breadth ten; in the centre of the ifland is a rocky mountain, which was formerly a volcano, and towards the ftrait between it and the fifth ifland, on the eaftern fhore, ftards another, which is reperted to have been a burning mountain. This ifland is uniuhabited, and is only vifited by the Kurils, on account of the chace, as it abounds with foses; and on the fhores are fea-lions and fea-otters. Ikarma is about 12 verlts from the feventh ifland, and is eight verlts long. Upon it is a volcano, which occafionally emits flames; the fhore is fony, prefenting here and there a fulphureous fpring. It has neither lakes nor ftreams; and with refpect to wood and animals, it is in the fame ftate with Syafkatan. For an account of the other iflands, fee the relpective articles. Of thefe 22 Kurile iflunds, the firlt 21 are fubject to Ruffia; and all of thefe d., not pay tribute. The inanders are reported by their miffionary, the paftor of Paratounca, who vilits them once in three years, to be a friendly, hofpitable, generous, humane race of people, and excelling their Kamtfchadale noighbours, not lefs in the formation of their bodies than in docility and quicknefs of underltanding. Of thefe illands it is faid, that four only are inhabited, and their population is eftimated at 1400 perfons. The inhabitants are generally hairy, wear long beards, and live eatirely upon feals, fifh, and the produce of the chace. The more foutherly and independent iflanders fometimes pafs in canoes the channel that feparates them from the Ruffian Kuriles, in order to give fome of the commodities of Japan, fuch as filk, cottor, iron, Scc. in exchange for furs, dried fifh, and oil. The inhabitants of as many of the iflands as are brought under the Ruffian dominions are, at prefent, converted to Chriftianity; and probably the time is not very diftant, when a friendly and profitable intercourfe will be brought about between Kamtfchatka and the whole of this chain of illands; which will be followed by a communication with Japan itfelf. Thefe iflands extend from N. lat. $42^{\circ}$ to $51^{\prime}$... Tooke's Ruff. Emp. vol. i. Cook's Third Voyage, vol. iii.

KURISONDA, a town of Aliatic Turkey, in Caramania; 60 miles N.N.E. of Tocat.

KURISSIMA, a town of Japan, in the ifland of Xicoco; 16 miles W. of Ijo.

KURK, a town of Candahar; 25 miles E. of Cahul.
KURKIN, a town of Bengal; 11 miles N.E. of Ramgur.

KURKUMBA, town of Hindooflan, in the circar of Ruttunpour; 32 miles E. of Ruttunpour.

KURKUNA, a town of Hindoottan, in the circar of Surgooja; 25 miles NE. of Surgooja.

KURISTAT, a town of Sivecen, in the province of Nyland; 18 miles W. of Heling fors.

İURMa. See liogrma.
KURMA

## K U R

KURMAVATARA, in Mythology, the fecond of the ten incarnations of the Hindoo god Vifhnu, of which the follow. ing account is given in the Hindoo Pantheon. "The fecond grand avatara of Vifhnu, in the form of a tortoife, evidently refers alfo to the deluge. In that of Matfya, or the fifh, (fee Matsyavatara,) we find the neceffity of a deluge to cleanfe the world from its finful taints. By the demon Hyagriva having ftolen the Vedas while Bralma was dofing, we inuft underitand the dereliction of mankind from the doetrines and conduct preferibed in the frriptures, and the criminal indifference of their paftors. The preferving attribute of the deity interpofed, faved a remnant of creatures from deflruction, and by recovering the fcriptures, reclaimed mankind to purity of faith and conduct. For the purpofe of reltoring to man fome of the comforts and conveniences that were lolt in the flood, Vifhnu is fabled to have become incarnate azain in the form of a tortoife; in which fhape he fultained the mountain Mandara placed on his back to ferve as an axis, whereon the gods and demons, the vaft ferpent Vafoky ferving as a rope, churned the ocean for the recovery of the amrita, or beverage of immortality." (See Kerv.) Plate 49, of the Hindoo Pantheon exhibits this prozefs, where Vifhnu is feen in his place with the two other great powers oppofed to the Afuras, or demons; and appears again on the fummit of the mountain, and again beneath it in the form of the tortoife. The hifory of this avatara forms an epifode in the Mahabarat, and Mr. Wilkins has introduced a fine tranflation of it in his elegrant verfion of the Gita, where, however, the metamorphofis of Vifhnu into the turtoife is not directly mentioned. But fach is the ufual mode of telling and receiving the ftory, which is one of the moft popular, both in recitation and painting, aniong the monftrous mafs of fubjects derived from the copions Pantheon of the Hindoos.

Kurma, or Koorma, is the Sanfcrit appellation of the avatara. Among the Muhhrattas, and others in the weftern parts of India, it is more commonly called Katch, that word, or Katchiva, meaning, like Kurma, a tortoife or turtle. The refult of the operation, in wiew to which the incarnation appears to have occurred, was obtaining from the churned ocean fourteen articles, ufually called fourteen gems, or chaterdefa-ratana; in common language chawda-ratny; ufually thus enumerated: 1. the Moon, Chandia or Soma; 2. Sri or Lakihmi, the goddefs of fortune and beauty; 3. Sura, wine, or Suradevi, the goddefs of wine; 4. Oochifrava, an eight-headed horfe; 5. Kuftubha, a jewel of ineftimable value ; 6. Paryata or Pariyata, a tree that £pontaneoully yielded every thing defired; 7. Surabhi, a cow fimilarly beautifu! ; 8. Ih hanvantara, a phyfician, or the god of phyfic; 9. Iravat, the elephant of Indra with three probofci; 10. Shank, a hell cohferring victory on any one who flould found it; 11. Danufha, an unerring bow; 12. Bikh, poifon, or drugs ; 13. Rhemba, a beautiful woman, correfponding in many points with our popular Venus; 14. The Amrita, or beverage of immortality, which appears, though Lait obtained, to have been the primary object of this churning procefs; the other gems appear to have been obtained incidentally.
Under moft of the articles whofe foreign names occur in this, fome notice is taken of them, and we refer thither refpectively and generally for farther information thereon.

KURMDYA, in Geography, a town of Bengal; 55 miles S.S.W. of Doefa.

KURMJKI, a town of the principality of Georgia; 305 miles S.E.: of Teflis.

KURMYK, a town of Ruffia, and diftriat of the go.
vernment of Sinbbirf, on the Sura; 104 miles N.W. of Simbirk!

KUROPATNIKI, a town of Auftrian Poland, in Galicia; 45 miles E.S.E of Lemberg.

KUROSAKI, a town of Japan, in the illand of Ximo; ${ }_{27}{ }^{7}$ miles N. of Taifero.
KUROW, a town of the duchy of Holltein; 9 miles N.N.W. of Lubeck.

KURRA, a river of Hinduoftan, which runs into the Beema; 32 miles $N$. of Vifiapour.

KURRABAGEI, a town of Candahar, in the province of Glizzni; 20 miles W.S.W. of Ghizui. N. Iat. $33^{\circ} 30^{\circ}$. E. long. $67{ }^{\circ} 59^{\prime}$.

KURRERA, a town of Hindooltan, in the circar of Gohud; 12 miles S.S.E. of Narwa.

KURRIGOORA, a town of Bengal; 45 miles S.S.W. of Docfa.

KURRYA, a town of Bengal; 30 miles S.E. of Palamows.

KURSK, a government of Ruffia, which was formerly part of that of Bielgorod; comprehending 16 dirtricts: it is bounded on the N. by the government of Orel, on the E. by that of Voronetz, on the S. by Voronetz and Kharkof, and on the W. by Tchernigof; about 112 miles from N. to S., and generally ico from E. to W., extending? however, by a narrow part, about 12 miles. wide, 40 miles further weft.-Alfo, the capital of the above-mentioned grevernment, on the river Tukar, which falls into flie Seim or Sem. N. lat. $53^{\prime} 40^{\circ}$. E. long. $3^{6} 24^{\prime}$.

KURSY, a town of Hindooftan, in Candeifn; 45 miles S.W. of Burhanpour.

KURTACULAC, a town of Afiatic Turkey, in Alzdulia; 25 miles S.E. of Adana.

KURTAPOUR, a town of Hindooftan, in Lakiore; 10 miles S. of Jallindar.
KURTCHI, an order of foldiery among the Perfians.
The word, in its original, fignifies army, and is applied to a body of cavalry, condifing of the nobility of the kingdom of Perfia, and the polterity of thofe conquerors, who placed Ifmael Sophi on the throne. They are in number about eighteen thoufand men.

Their commander is called latibji bafchi, which was formerly the firlt pott in the kingdom; equivalent to a conftable in France.

KURTUS, in Icbtbyology, a genus of the jugulares, confifting only of a fingle fipecies, called Indicus from its being an inhabitaut of the Indian feas. The body in this genus is carinated each fide, the back elevated, and the gill-membrane furnihhed with two rays. The fpecies known fubfitts on crabs and fhells, or teltaceous animals: the body is fhort, flender, golden, and appearing as if covered with filvery plates: the head is large, compreffed, and obtufe; eyes very lurge, with black pupil, and iris above blue, beneath white; mouth large; jaws with numerous teeth; tongue fhort and cartilaginous; lateral line ftraight, and commencing above the pectoral tin; firft ray of the dorfal and ventral fins hard, and two firt of the anal fpinous.

KURU, in Geograply, a town of Sweden, in the government of Abo; 63 miles E.N.E. of Biorneborg.

Kuru, in Hindoo Myythological Legends, was the brother of Pandu, who was the father of the five heroes of the Mahabarat. Kuru had a hundred fons, whofe contefts with the Pardus are the fubject of that poem, which is a continued allegory of the ftruggles between man's virtues and vices, perfonilied in the offspriug of the brothers. Sce Maliababat, and Paxdu.

KURUMA.

## K U S

KURUMA, in Geograpbs, a town of Japan, in the iffand of Ximo ; 16 miles E.N.E. of Ikua.

KURYMA, a town of Hungary; 12 miles N.E. of Szeben.

KUSA, in Botany, the fpecies of grafs poa cynofuroides, efteemed by the Hindoos very faced and myftical, and ufed by the Bralumans in many of their facred or fuperititious ceremonies. Among this race of fabulift fome poctical legend exitts, accounting, in their way, for cvery fubjeet and allufion in their complex mythology and theogony. Of the kufa grafs this is related in the Hindoo Pantheon. "S Some legends make Garuda the offspring of Kafyapa and Diti. (See Kasrapa.) This all-prolific dame laid an egg, which, it was predicted, would produce her deliverer from fome great affiction: after a lapfe of five hundred years, Garuda or Superna (fee Surerna) fprang from the egg, fliw to the abode of Indra, extinguified the fire that furrounded it, co:cquered its guards, and bore off the amrita, (fee Kummavatara,) which enabled him to liberate his mother, at that time afflited in captivity. A few drops of this immortal beverage falling on the kufa, it became a grafs eternaly confecrated; and forne frakes, greedily licking up the anbroffia, fo l.cerated thair tongues with the fharp blades of the grals, that they have ever fince remained forked: but the boon of eternity was infured to them alfo by their thus partaking of the immortality-conferring. fuid. (See Kete.) This caufe of frakes having forked tongues is till popularly, in the tales of India, attributed to the above greedinefs." P. 341 .

KUSAMO, in Geograpby, a town of Sweden, in the government of Ulea; 85 miles $\mathbf{E}$ of Tornea.

KUSBAH, a town of Hindooftan, in lenares; 22 miles V.N.IV. of Benares.

KUSCAN, a town of Perfia, in the province of Segeltan ; 21 miks N.E. of Kin.

KUSCARI, a town of Mingrelia; 30 miles N.N.E. of Anarchia.

KUSCHAIL, a town of Ruffia, in the government of T'obolfk; 28 miles S. of Tomk.

KUSHA, a town of Poland, in Podolia; 32 miles E. of Kaminiecz.
KUSHAL, Kusiel, or Kutbal, a fortrefs of Afia, in Kuttore. N. bat. $35^{\prime} 17^{\prime}$. E. long. $70^{\circ} 39^{\prime}$.

KUSHKAT, a town of Great Bucharia; 72 miles W. of Kojend.

KUSKO, a town of the duchy of Warfaw ; 18 miles W S.W. of Kalifch.

KUS.KHUSER, a town of Perfia, in Farfitan; 31 miles N . of Schiras.

KUSMA, a fmall town of Arabia, ftanding upon a high hill, in the province of Yemen, inhabited by free Arabs; 50 miles E. of Hodeida. The mountains, which extend far into the country, produce coffee.

KUSSI, a town of Japan, in the ifland of Niphon; 65 miles N.E. of Jedo.

KUSSNACHT, a bailiwick of Switzerland, in the canton of Zurich.-Alfo, a town of Switzerland, in the canton of Schweitz, near which is a chapel, erected on the fpot where William Tell flew the Auftrian goveruor ; Io
mites W. of Schweitz.

KUSSOOR, a town of Hindooftan, in Lahore ; 26 miles W.N.W. of Firofepour.
KUSTANGI, or Chiustengi, a town of European Turkey, in Bulgaria, on the Black fea, formerly called Confantia, N. lat. $44^{\circ} 30^{\prime}$. E. long. $28^{\circ} 37^{\circ}$.

KUSTER, LUDOLPH, in Bicgrapbj, was born in $16 \%$,
at Blomberg, in Weftphalia, of which town his father was a macyifrate. He ftudied under his elder brother at the Joachim college of Berlin, and was afterwards appointed tutor to the two fons of the count Schwering: On quitting that flation, with a penfion, he went to Frankfort on the Oder, and there publifhed, in 1696 , his "Hiftoria Critica Homeri." He was promifed a prufefferfhip in the univerlity of Joachim, and till that fhould be vacant he refolved to travel, and vifited Leyden and Utrecht ; at the latter place he delivered a courfe of lectures on the law of nations, and publifhed his "Bibliotheca Librorum." He then went to England, and thence to France, for the purpofe of collating MSS. for a new edition of Suidas. Having furnifhed himfelf with many very valuable materials and fragments for his work, from the king's library, he returned to England. Here he lived in great familiarity with Bentley and other learned men, and upon the publication of his work, which was printed partly at the expence of the univerfity of Cumbridge, he was honoured with the degree of doctor of laws. Several advantageous offers were made him if he would remain in England, but he was called back to Berlin, and inftalled in the profefforfhip promifed to him. The fituation did not anfwer his expectations, he was rendered uncomfortable by difputes refpecting his falary, and by having incurred the fufpicion of being addicied to the principles of Arianifn, fo that in a fhort time he found it expedient to retire to AmAterdam. Here be was reduced to abfolute poverty by the failure of his banker. He afterwards went to Antwerp, embraced the Catholic religion, and was rewarded by a pen. fion from the king, and with an admiffion into the Academy of Infcriptions. He died at the age of forty-fix. He was a great malter of the Latin tongue, and wrote well in it ; but his chief excellence was his ikill in the Greek language, to which he almoft entirely devoted himfelf. Befides the works already referred to, he publifhed "J Jamblicus Porphyrius, et Anonymus apud Photium de Vita Pythagorx ', A new edition of Dr. Mill's Greek Teftament. "Ariftophanes Gr, et Lat." "De vero ufu verborum mediorum," which has been much efteemed as a grammatical treatife.

KUSTUBHA, in Hindoo Legends, is an ineftimable gem, of which many wonderful tales are related. It is one of the fourteen precious things recovered from the ocean when churned for the amrita, by gods and demons, in the Kurmavatara; which fee.

KUTALI, in Geography, a fmall inland, in the fea of Marmora. N. lat. $40^{\circ} 30^{\circ}$ E. long. $27^{\circ} 22^{\prime}$.

KUTAN, a town of Hindooftan, in Oude; 30 miles E. of Kairabad.

KUTATS, a town of Japan, in the ifland of Niphon; 25 miles E. of Meaco.

KUTINA, a town of Sclavonia; 33 miles W.N.W. of Pofzega.

KUTSCHINA, a town of Servia; 16 miles S.S.W. of Orfova.

KU-TSING, a city of China, of the firft rank, in the province of Yun-nan; furrounded with mountains, about which the foil is fruitful. Its jurifdition comprehends five towns of the fecond clafs, and two of the third. The inhabitants are induftrious in cultivating the ground. N. lat. $25^{\prime} 34^{\prime}$. E. long. $103^{\circ} 27^{\prime}$.
KUTSKOI, a town of Ruffia, in the government of Ir-: kutn, on the Kuta, where it joins the Lena; 60 miles E. of Ilimk. N. lat. $5^{6} 40^{\prime}$. E. long. $123^{\circ} 20^{\prime}$.

KUTTENBERG, or Kutna-Hora, a town of Bo. hemia, in the circle of Czaflau, famous for its filver mines, formerly
formerly abundant, difcovered by a monk in 1237; 4 miles N. IW. of Craflau. N. lat. $49^{\circ} 5^{\prime \prime}$. E. long. $15^{\circ}$ 19'.

KUTTOORE, a tract of country between the N.E. part of Cabul, and the N.W. of Cachenire, now fubject to Candahar. This tract borders on the N. of Sewad, Bijore, Puckholi, \&ec. It has obtained from the Mahometans the name of Caferifan, or land of infidels, and is claffed by the people of Hindooitan as a dependency of Cafhgar. It occupies nearly the place of Peolemy's Comedi, and anfwers to it in defcription, being entircly mountainous. An authur, cited by Renuell, ftates that Kuttore contains a great number of towns and villages, and is exceedingly populous Its principal towns are Towkul, called alfo Showkul, and Jourkull; thefe being the refidence of its rulers. It abounds in fruits, fuch as grapes, plumbs, \&c. It likewife yields rice, wheat, and other forts of grain. The natives are exceedingly fond of wine and hog's flefh; although their country is wellftocked with cows and goats. They have a dittinct language not at all refembling that of any other people; and their arms confift of the bow and arrow, the fabre and the fling. Another author fays, that they are, for the moft part, idolaters; that they are of a robult make, and that their complexion is a mixture of red and white.

Kutrore is allo a town and fortrefs in the above deferibed country; 100 miles N.E. of Cabul. N. lat. $35^{\prime}$ $27^{\prime}$. E. long. $70^{\circ} 17^{\circ}$.

KUTTRY. See Rajpoots.
KUTTUHDUA, a fmall ifland in the bay of Bengal, near the coalt of Aracan, inhabited chiefly by fifhermen. It is well wooded. N. lat. $21^{\circ} 52^{\prime}$. E. long. $91^{\circ} 45^{\prime}$.

KUTUM, a town of Hindooltan, in Benares; 10 miles N.E. of Bidrigur.

KUTZABAR, a town of Perfia, in Mazanderan; 40 miles S.W. of Fchrabad.

KUVA, a fmall town of Perfia, S. of Derbent; the refidence of a khan.

KUVERA, in Hindon Mytho'ogy, is the regent of wealth, correfponding with the Plutus of the weftern Pantheon. He is defcribed, in refpect of externals, as a mere man, gloomy, felfihh, and deformed ; but as a magnificent deity, refiding in the fplendid city Alaka, and borne through the $\mathbb{R} y$ in a grorgeous car, called pufpaka, or flowery. He is alfo called Viteffa, Paulaftya, and Dhanada; and as the fon of a fage named Vifrava, he is culled Vifravana, a name likewife of Ravena, half brother, by the fame father, of Kuvera. (See Ravena.) His fervants and companions are the Yakfhas and Guhyakas, into whofe filthy forms tranfmigrate the fouls of thofe men who in this life are addicied to fordid and bafe paffions, or abforbed in worldly profperity. The term Guhyaka is derived from gub (ordure) a word retained in feveral dialects. He has a confort named Kauveri, which fee; but neither would be invoked by a Hindoo, for the boon of riches, but Lakfomi, which fee.

The Hindoos have affigned regents to each cardinal and intermediate point of the compafs. (See Marut.) Kuvera rules the north.

KUWANA, or Quano, a fea-port of Japan, in the province of Owari.

KUYALI, a town of European Turkey, in Romania; 27 nilcs E.S.E. of Filippopoli,

KUYNDER, a fea-port town of Holland, in Friefland, on the W, lide of the river of the fame name, at its entrance into the Zuyder fee; 23 miles S. of Lewarden. N. lat. $53^{\circ} 4^{3}$. E. long $56^{\circ}$.

KUYP, or Cuyp, Albert, in Biograpby, a painter who ranks among the beft and moft original artilks. He was born at Dort in. 1606 , and was the fon of Jacob Gerritz

Kuyp, a landfcape painter of much merit. From his father he firlt learnt the rudiments of the art; but furpatied him infinitely in his progrefs. He was one of the moll agreeable painters that ever lived; imitating with the greatelt perfection the purity and brilliancy of light. No artilt ever reprefented the atmofphere which furrounds all objects more completely than Cuyp; not even Claude : and in the effect of fun-fline, none ever approached him. The fimpleft fcenes and combinations of objects were fufficient for him to exert his talents upon; and he never failed to give an intereft to them by the Iweetnefs of his colour, and the beauty of his light and fhade.

Little or nothing is known of his life. His works are numerous, and therefore he mult have lived long; for they are of fo highly finifhed a quality that he mult have given much time to them.
In the various collections among the nobility in England, works of his thine with almoit unrivalied luftre; and are not very uncommon. At the marquis of Staffurd's is a very fine one of the landing of prince Maurice at Dort. There are alfo feveral others of great merit.

KUZNETCHICHA, in Geograply, a town of Ruffra, in the government of Simbirti, on the Volga; 16 miles N.E. of Simbirfl.

KUZNETZK, a town of Ruffia, and difrict of the government of Saratof, feated on a rivulet, falling into the Sura; 96 miles. N.N.E. of Saratof.
Kuznetze, a town of Ruflia, and difrict of the goverument of Kolyvan, fituated on the river Tom, oppolite to the mouth of the Kondama; built in 1618 , on a place whither the Tartars generally reforted, and colonized frem Tomfk, and fome other towns. It contains about 300 houfes, and the inhabitants are chiefly employed in the manufacture of iron; 188 miles E.S.E. of Kolyvan. N. lat. $53^{\circ} 40^{\circ}$. E. long. $86^{\prime} 49^{\prime}$.

KUZNETSKOI Moustains, a range of mountains, forming one of the fub-divifions of the Ruffian fhare of the Altaian mountains, the other being the Oby and the Yeniffey. See Altai.

KUZNIK, a town of Ruffia, in the government of Viatka; $4^{8}$ miles S.S.W. of Glazov.

KUZOMEN, a town of Ruffia, in the government of Archangel, on the coalt of the White fea; 124 miles N.W. of Archangel.

KUZREKA, a town of Rufla, in the government of Archangel, on the N. coaft of the White fea; 140 miles S.S.E. of Kola.

KWASSITZ, a town of Moravia, in the circle of Hradifch ; 14 miles N. of Hradifch.

KWdSSOWA, a town of Poland, in Volhynia; 28 miles N . of Zytomiers.

KYANITE, or Cyanite, Wern.; Difthène, Haüy; Sappare, Sauflure. Other names derived from fancied refemblances, are blue-fhorl, blue talc, blue mica, foliated beryl, fapphir fpar, blue feldfpar, \&c. Hauiy's name implies the power this fubftance poffefles of acquiring both vitreous and refinous electricity; all the other denominations are expreffive of its characteritic.

Colour, which is generally azure-blue, light Pruffian blue, or fmalt-blue; but it is alfo feen blueifh-grey, milky, greyifh. and greenih-white, and more feldom feladon, and other thades of blueith-green. Thefe colours are either uniform or mixed : the bluein-grey, flriped or flamed with various. fhades of Pruffian blue, is the moit common mixture.

It occurs mafive, diffeminated in blunt-edged pieces, and cryftallized. The following are the modifications we are acquainted with: 1. The oblique quadrangular primm, (which
(which appears alio to be the primitive form of this fubHance, ) with two oppolite fides very narrow, which give the cryital a contracted tabular form. 2. The lateral edges formed by the acute angles of the preceding cryitals, intercepted each by a plane, or trumeated: this plane is generally very narrow. 3. The lateral edges formed by the obtufe augles of N 1, intercepted each by a plane, or truncated. This modification appears to be very fearce. 4. Four of the terminal edges of $\mathrm{N}^{2}$, intercepted each by a plane, which, if they met in a point, would form a four-fided pyramid. This we have obferved in a fmall cryltal included in rock-cryllal.

Thefe cryllals, efpecially thofe from Mount St. Gothard, are not unfrequently feen as twin-cryttals, or macles.
They are moltly middle-fized, but alfo fmall, and very fmall; and occur imbedded, either fingly, or in groups, interfecting each other. They are not unfrequently feen curved and twilted, as if they had fuitained preffure, when not yet hardened.
The internal, and generally alfo the external luftre of the cyanite is fliming and felendent; it is a perfectly pearly luitte.
The longitudinal fracture of the cryitals is foliated, with two-fold cleavage, one of which is much more diftinct than the other. In the uncryttallized varieties the fracture is broad, Atraight, or curved-radiated, fometimes pafling into foliated. The fragments are fplintery, wedge-fhaped, or even approaching the rhomboidal figure. The wedge-fhaped diftinct concretions, in which it occurs, are often grown together in all directions.

The maflive cyanite is faintly tranflucent; but the cryftals are often perfectly tranfparent: refraction fimple.

It is femi-hard, nearly foft : a ftecl needle eafily fcratches the broad planes of the cryftals, but not the narrow and truncating planes.
It is nightly flexible, but not elafic: and eafily frangible.

Its fpecific gravity is ftated to be 3.517 by Sauffure, 3.622 (the Siberian) by Herrmann, and 3.092 (the bluein-grey var. from Tyrol) by Kirwan.

The following are the refults of the analyfes made of this fubitance.

The two following analyfes differ fiom the preceding, particulariy in the abfence of magt efia and lime:

Laugier.

| Silica - | 38.5 |

Cyanite is infufible before the blow-pipe, a property which, according to Saufure, renders it a convenient fupport for fubitances to be tried by that inftrument.

This fubftance is found only in primitive mountains, imbedded in mica flate and talc flate, accompanied by granatite or flaurolite and garnets, with now and then iron ochre, iron pyrites, calcareous fpar, \&c. In Moravia and Saxony it occurs in fmall groups imbedded in a variety of a primitive rock called weifs-llein, or white-ftone.

Its principal localities are Switzerland (efpecially at Airolo, ons the fouth fide of Mount St. Gothard) ; Saltzburg and Tyrol (in the Zillerthal); Carinthia (on the SauAlpe); Scotland (Aberdcenthire, near Banchory, and in the Mainland, one of the Shetland inlands); France (in the neighbourhood of Lyons); it has alfo been found in Norway, in Siberia, in Brafil, \&cc.

When cut and polifhed it refembles in colour fome varieties of fapphir, and fpecimens of it are fometimes exhibited under this name; but, not to mention the frix always obfervable in the interior of cyanite ftones, their inferior luftre, and comparative foftnefs, will foon clear up all doubts refpecting their nature.

Sauflure has endeavoured to introduce the name Sappare for this mineral, and he tells us, that in Scoiland it is known by that appellation. Some authors lave lately criticifed this name as being derived from the bad pronunciation of the word fapphire, with whith the cyanite is faid to have been confounded by the perfon who pointed it out to Sauflure: but this is a miltaken notion, the name fappare being known to occur in feveral old works on mining; and as it appears to have been a very vague fort of name, it is not inprobable that it may alfo have included the fubject of this article.
KYBAR, in Geograply, a town of Norway; 6 miles S.S. W. of Wardhuy's

KYBURG, a bailiwick of Switzerland, in the canton of Zurich.

KYDREBAD, a town of Hindooltan, in Oude ; $\delta$ miles N.E. of Fyzabad.

KYHOLM, a fnall ifland of Denmark, near the ifland of Samfoe.

KYL, a town of Sweden, in the province of Warmeland ;' 25 miles S.E. of Carltacit. - Allo, a town of Sweden, in the province of Nericia; 8 miles N.TV. of Orebro.

KYLA, a town of Sweden, in Warmeland; 23 miles S.W. of Calitadt.

KYLE of Durnefs, a bay on the N. coalt of Scotland, at the mouth of the river Durnefs: the entrance, W. of Farout head, is in N. lat. $58^{\circ} 40^{\prime}$. W. long. $4{ }^{\circ}+2^{\prime}$.

Kyle of Rhea, a marrow itrait between the ifland of Sky, and the main land of the county of Invernefs. N. lat. $57^{\prime}$ $15^{\prime}$. W. long. $5^{\circ}+0^{\prime}$.

Kyle Scozuie, a bay on the W. coatt of Scotland, and county of Sutherland. N. lat. $5^{\circ} 16^{\prime} . W$. long. $5^{\circ} 5^{\prime}$.

KYLLINGIA, in Botary, fo called by Rottböll, in: metnory of his countryman, Peter Kylling, a Dane, who, in 16S8, publifhed at Copenhagen, the Viridariun Danicum, which is a catalogue in Latin, Dznifh, and German, of the

## K Y L

native plants of Denmark, making 174 quarlo pages. Rottb. Gram. 12. Lint. Fil. Nov. Gram. Gen. 24 . to 1. Am. Acad. v. 10. 2. 24. t. I. Suppl. 11. Schreb. 40. Willd. Sp. Pl. v. 1. 256. Mart. Mill. Dict. v. 3. Ait. Ifort, Kew. ed. 2. v. 1. 125. Brown. Prodr. Nov. Holl. V. 1. 218 . Juff. 27. Lamarck Illuftr. t. 3S.- $\mathrm{Cl}_{\text {ars }}$ and order, Triandria MTonogynia. Nat. Ord. Calamaria, Lim. Cyperoidee, Juff.

Gen. Ch. Flowerrs aggregate, in an oblong fcaly head. Cal. Glume of two unequal valves, compreffed, nearly fingle-flowered, fingle-feeded; valves lanceolate, chann:lled, acute, much fhorter than the corolia. Cor. Glume of two unequal valves, conprefied, larger than the caly geeled, fpreading; the larger lanceolate, folded, very aute, embracing the fmaller. Stam. Filaments three, awl-fhaped, flat; anthers terminal, linear, erect. Pijf. Germen fuperior, obovate, compreffed, gibbous at one of its edges, without any brifles at the baie; flyle thread-fhaped; ftigmas two or three, capillary. 'Peric, none, except the permanent corolla. Seed oblong, triangular, beardlefs. - The fame calyx fometimes contains alfo either a male or a neutral flower.

Eff. Ch. Flowers aggregate, in an oblong, imbricated, head. Calyx of two valves. Corolla of two valves. Seed without briftles at the bafe.
This genus, adopted from Rottboll by the younger Linneus, had by his father been confounded with Schocnus, which its flowers in fome meafure refemble; but the habit, efpecially the aggregate, long, floral leaves, are akin to Cyperus. In the Supplementum four fpecies are defined; Willdenow has eight ; and a new one, K. intermedia, is defcribed by Mr. Brown in his Prodromus, as found at Port Jackfon, New South Wales.-Ther are all natives of warm countries, chiefly in the Eaft or Weft Indies, and moift fituations. Their roots feem to be perennial. Their herbage is nender. Stem fimple, triangular, ftriated, and roughifh. Leaves narrow, roughedged. Heads pale or whitifh, terminal, ufually feffile, among the floral leaves, cither folitary or feveral together, roundifh or oblong, confifting of numerous, fmall, denfely crowded flowers, whofe glumes are more or lefs ribbed or friated, deftitute of awns.

Examples of this genus are,
K. monocephala. Rottb. Gram. 13.t.4. f. 4. (Schoenus coloratus; Linn. Sp. Pl. 64.)-Stem flender, triangular. Head globofe, feffile, folitary. Floral leaves three, very long:-Native of both Indies. Root creeping. Stems-folitary, a fpan high, bearing two or three leaves at the bafe, and three as long at the top, accompanied fometimes by a fmaller one. The head of flowers is fcarcely bigger than a large pea, whitifh, very denfe.-Thryocephalon nemorale of Forfter, from Otaheite, appears to be precifely this plant.
\&. K. triceps. Rottb. Gram. 14. t. 4. f. 6. (Scirpus glomeratus; Liun. Sp. Pl. ed. I. 52. Schrenus niveus; Sylt. Veg. ed. 13. 8I.)-Heads about three together, cluftered, feffile, fomewhat ovate,-Native of both Indies. Rather larger than the laft, of which, in the ad edition of Species Plantarum, it is made a variety, but it is a fmoother plant, and the cluifered rather lefs globular heads dittinguifh the prefent fpecies.
K. insompleta. Jacq. Coll. v. 4. Ior. Ic. Rar. t. 300Umbel compound. Spikes numerous, cylindrica!. Calyx of one valve. - Native of the Caraccas. This is a very large fpecies, with a fharply triangular fems three or four fect high, very long floral leaves under the general umbel, and many fmall leaves under the partial ones. The numerous cluttered beads, or rather fiikes, are oblong, various in

Vol. XX.
fize, greenifh, of numerous fpreading foucers, whofe calyx, according to Jacquin, has but one valve.
K. moaoceth, sia, triseps, and umbellafa, are cultivated in the floves at kn, where they flower in fummer or autumn. but probably excite little attention, except among curious botanilts.

KYI, , or Kyela, in Geography, a fea-port on the W. coaft of the illand of Celebes, with a fpacious harbour. S. lat. 1 ' 15 .
KYMIITS, an ifland in the Baltic, near the coaft of Finland: 20 miles long, and from one to two broad. N. lat. 6016.

KYMMEN, a river of Finland, which fows from the lake of Pejend, or Pejana, into the centre of the gulf of Finland.

KYNE, a town of Sweden, in Eaf Bothnia; is miles N.E. of Wafa.

## Kyneton. See Kineton.

KYNTO, a lake of Rufiis, in the government of Olonetz, about 48 miles long, and from 12 to 16 broad. N. lat. $65^{\circ} 40^{\circ}$. E lorg. $28^{40^{\circ} .}$

KYPER, Albert, in Bicgrapby, a pliyfician, was born at Konigfberg, in Pruffir, and probably took the degree ot M. D. at Leyden, where he was fludying in the year 1642 . He was afterwards chofen firlt prof flor of phylic, in the new medical fchool eftabliibed at Breda in 1646: but he quitted this ftation two years afterwards, in order to take poffeffion of a medical chair, to which he was elected, at Leyden ; an appointment which he held till his death, which occurred in September, 1655, at the time when he was rector of that univerlity. He publifhed feveral works. "Methodus Medicinam ritè difcendi et exercendi," Levden, 1642. "Intitutiones Phylicx," ibid. 1647. "Anthropologia, corporis humani contentorum, et animæ naturam et virtutes, fecundum circularem fanguinis motum, explicans," ibid. 1647, \&c. "Inflitutiones Medica ad hypothefin de circulari fanguinis motu compofitæ," Amfterdan, 1654. "Collegium Medicum, xxvi. Difputationibus breviter complectens que ad Inflitutiones pertinent," Leyden, i655. This volume contained affo fome mifcelianeous and political tracts. Eloy. Dict. Hitt. de Med.

KYPHONISM, Kyphonismus, or Cyphonifmus, an ancient punifhment, which was frequently undergone by the martyrs in the primitive times; wherein the body of the perfon to fuffer was anointed with honey, and fo expofed to the fun, that the flies and wafps might be tempted to torment him. This was performed in three manners; fometimes they only tied the patient to a flake; fometimes they hoited him into the air, and füfpended him in a bafket; and fometimes they ftretched him out on the ground, with his hands tied behind him. The word is originally Grees, and comes from xupx", which fignifies either the fake to which the patient was tied, the collar fitted to the neck, or an infrument wherewith they tormented him ; the fcholialt on Aritophanes fays, it was a wooden lock, or cage; and that it was called fo from xumisu, to crook or bend, becaufe it kept the tortured in a crooked bowing połure; others take the xu $\sum_{w}$ for a log of wood laid over the criminal's head to prevent his ftanding upright: Hefychics defcribes the $x: \hat{q} a v$ as a piece of wood, whereon criminals were itretched and tormented. In effect, it is probable the word might fignify ali thefe feveral things. It was a generical name, whereot there were the ipecies.

Suidas gives us the fragment of an old law, which penifhed thofe who treated the laws, with contempt, with kyphonifm for the fpace of twenty days; after which they were to be precipitated from a rock, dreffed in womea's habit.

KYRA,

KYRA, in Gcograply, a town of Hindooftan, in Rohilcund; 20 miles $S$. of Budavoon.

KYRADAW, a town of Hindooftan, in Malwa; 7 miles S.W. of Kimlaffa.

KYRADEE, a town of Bengal ; 14 miles W.S.W. of Curruckdeagh.

KYRALFALVA, a town and caftle of Hungary ; 12 miles S.W. of Sivat.

KYRANTY, a town of Bootan ; 60 miles S. of Taffafudon.

KYREZYCE, a town of Poland, in the palatinate of Volhynia; 56 miles N.W. of Zytomiers.

KYRIE, in Ecclefiafical Arufic, the firft word of every mals in mufic. It furnifhes, with eleifon, the only articulations of the firft movement of all maffes ancient and modern. Kyrie, the vocative cafe, implics. O Lord, and joined with elifon, is equal to "Lord have mercy on us." Kyrie, in fpeaking of a mafs in mufic, is often ufed fubftantively, as "there is a well written kyrie in that mafs or dervice."

KYRILA, in Geography, a town of Sweden, in Eaft Bothnia ; 36 miles E.N.E. of Chriftiantadt.

KYRITZ, a town of Brandenburg, in the Mark of Pregnitz; 40 miles N.W. of Berlin. N. lat. $52^{\circ} 26^{\prime}$. E. long. $12^{\circ}{ }^{2} 6^{\circ}$.

KYRKAS, a town of Sweden, in the province of Jamtland; 7 miles N.E. of Ofterfund.

KYRKSTATT, a town of Sweden, in the province of Nyland ; 16 miles W. of Helfing.
KYRO, a town of Sweden, in North Finland, on a lake of the fame name; 42 miles E . of Biorneborg.

Kyro, Lille, a town of Siweden, in Ealt Bothnia; 12 miles E.S.E. of Wafa.

Kiro, Stor, a town of Sweden, in Eaft Bothnia; 20 miles S.E. of Wafa.

KYSCHAW, a town of Pruffia, in Pomerelia; 32 miles S.E. of Dantzic.

KYSTIS, Kurbs, in Anatomy. See Cystis,
KYTEE, in Gcography, a town of Bengal; 12 miles S. of Burdwan. N. lat. $23^{\circ} 3^{\prime}$. E. long. $88^{\circ}$.-Alfo, atown of Hindooftan, in Bahar; 28 miles S.S.W. of A riah.

KYTEKIEHL, or Kytzbuhi, a town of the county. of Tyrol; 45 miles N.E. of Infpruck.

KYUQUOT, a large found or bay on the N.W. coaltof N . America, having on one fide of it Robert's ifland. N. lat. $50^{\circ}$. W. long. $127^{\circ} 20^{\prime}$.

KZILKAN, a town of Afiatic Turkey, on the 'iligris; 21 miles N. of Tecrit.

KZIKEN, a town of Afatic Turkey; 15 milcs W. of Merdin.

## L.

LEL, a fomi-vowel, or liquid confonant, making the 1. eleventh letter of the Englifh alphabet, and always preferving the fame found.
The $l$ is pronounced by applying the tongue to the palate.

Pafterat obferves, that $l$ was frequently ufed among the ancients for $b$, as in cilliba for cibilla; for $d$, as alipe for adipe; for $c$, as mutila for mutica; for $n$, as arvilla for arvina, belle for bene, colligo for contigo; for $r$, as fratellus of frater, balatrones for baratones; for $f$, as ancille of am and ciffum, equilio for equifio; for $t$, as equifelis, for equifetis, Thelis for Thetis. See D, T, \&c.
The $l l$ is a modern contrivance, and was never ufed among ancient Roman authors: they wrote alium, not alliizm; macelum, not macellum; polucere, not pollucere.

The $l l$ of the Greeks was fometimes changed by the Romans into $l i$, as in $\alpha \lambda \lambda \lambda_{0} u x i$, futio ; $\alpha \lambda \lambda 0 ;$, aliuss ; fun 久o., folium: $r$ has alfo been turned into $l l$; as hira, illa ; furare, fatullare ; \&c. and $l$ into $x$, or sill; as ala, axilla; mala, maxilla; velum, vexillum; $d$ was alfo ufed for $l, n$ for $l l$, and $r$ for $l$. See R, \&c.

L is allo frequently ufed inftead of $d$, as in Ulyfes, from the Greek Oeverus, in that Eolic dialect rivernso Thus
alfo for dautia, we fay lautia; for dacruma, lacryma, \&c. See D.
There are feveral people, for inftance, the Chinefe in Afia, the Illinois in America, \&c. who cannot prowounce the $r$, but always change it into $l$. Thus, when any of them have been baptized by the name of Petrus, Francijcus, \&c. they always pronounce it Petlus, Flancijcus, \&ec. See R.

Among the Saxons the $l$ was afpirated, and the Spaniards ${ }^{\prime}$ and Welfh ufually double it at the beginning of a word, which 18unds nearly the fame with our blor $f l$. At the end of a monofyllable it is always doubled, except after a diphthong. The monofyllables in which it is doubled, as kill, vill, full, were originally written kille, wille, fulle, and when the $e$ firft became filent, and was afterwards omitted, the $l l$ was retained, to give force, according to the analogy of our language, to the foregoing vowel. In a word of more fyllables it is written fingle. It is fometimes inferted before $e$, and founded feebly after it, fo as to be almolt mute; as table, Jouttle.
The figure of our L we borrowed from the Latins, they from the Greeks, and they again from the Hebrewe, whole
lamed is much like our L, excepting that the angle in fomewhat more acute.

L was alfo a numeral letter among the ancients, and is ftill fo in the Roman cyphering, figuifying fifty; according to the verfe,
"Quinquies $L$ denos numero defignat habendos."
When a dafh was added at the top, thus, $\overline{\mathrm{L}}$, it flood for ffty thoufind.

L was ufed for fifty, being half a C , which fignified a hundred, and was formerly written thus L , which, according to Paiquire, makes two LL, the one upright, the other inverted.

The French Louis-d'ors have a crofs on them, confilting of cight $L$ 's interwoven, and difpofed in form of a crofs. The letter L is marked on the money coincd at Bayonne. The epuchas on Greek medals are ufually written with the ancient lambda, L; which, according to the tradition of the antiquaries, ftands for Avxoうzuvos, a poetical word, unknown in common fpeech, lignifying anno, and which it is probable was more ufed in Egypt than Greece.

L as an abbreviature ftands for Lucius; and LLS. for a fetterce. In Englifh, it denotes a pound iterling.

LA, in $M_{u f f}$, is the fixth found of the Guido fcale. See Gabmux, and Solmigation.

LAAB, or Lava, in Geography, a town of Auftria, on the river 'Taya; 26 miles N. of Vienna. N. lat. 48' $39^{\prime}$. E. long. ' $16^{\circ} 16^{\prime}$.

LAADSTEE, a town of Norway; 112 miles N. of Bergen.

LAAGE, a town of Mecklenburg ; i4 miles S.E. of Rotrick. N. lat. $55^{\circ} 5^{5^{\prime}}$. E. long. $12^{\circ} 30^{\prime}$.

LAALAND, or Laland, an illand of Denmark, fituated at the entrance into the Baltic, from the Great Belt ; about 50 miles long, and 20 in its medial breadth, and reckoned the molt fertile fpot in the Danifh dominions. It produces variety of grain, particularly wheat, and alfo peafe; and is chiefly appropriated to the cultivation of corn. Its woods, in which it is not deficient, are more frequent in the ealt, than on the weft fide of the ifland. As its fituation is low, the air is damp and the climate is infalubrions. Of all the inhabitants, the clergy are molt liberally provided for, according to their rank. The nobility are numerous, and poffefs large eftates with fine houfes. This ifland, like Tealter, has a peculiar governor; but both are under the fpiritual jurifdiction of the bifhop of Funen. The capital is Nafkow. N. lat. $54^{\circ} \cdot 40^{\prime}$ to $55^{\circ}$. E. long. $10^{\circ} 59^{\prime}$ to ${ }^{1} 1^{\circ} 5^{2}$.

LAALGUNGE, a town of Hindooltan, in Oude; 25 miles E. of Manichpour.

LAARET, an ifland in the Ealt Indian fea, about 50 miles in circuit. S. lat. $6^{\circ} 4^{8^{\prime}}$. E. long. $132^{\circ} 3^{\prime}$.

LAAS, or Loscir, a town of Carniola, with a citadel ; 23 miles E. N. E. of Triefte. N. lat. $45^{\circ} 5^{\prime}$. E. long. $2+25^{\prime}$.

LAASPHA, or Laspa, a town of Germany, in the connty of Witgenftein; 64 miles E. of Cologne. N. lat. $50^{\circ} 53^{\prime}$ E. long. $8^{\circ} 30^{\prime}$.

LAB, a town of Germany, in the bihopric of Wurzburg ; 6 miles I.S.E. of Volkach.

LABAAR, a town of Hindooftan, in the fubalh of Agra; 75 miles S.S.E. of Agra.

LABACCAN, a northern province of Celebes, which, together with Bougero and Sageree, are the plains lying between Tello and Tanete, the proper granaries of Celcbes.

Labacean has one native regent, who has the appellation of " Crain."

LABADIDA, a town and diftrict of Africa, on the Guld Coalt.

LABADIE, Jons, in Biography, a celebrated enthufian, was born at Bourg, in Guienne, in the year 1610; when he was fix years old he was fent to Bourdeaux to be inflructed in the Jefuits' fchool, and was at an early age admitted into the order, of which he continued a member fifteen years: He was fo highly eftemed for piety and learuing, that it was with the utmof difficulty he obtained his difmiffion what he afked for it. At length he quitted the fociety and ber came an itinerant preacher. The aulterity of his maners, his great zcal, and affected piety, procured him many admirers wherever he went. At Amiens he obtaired a canonry, but being detected in fome criminal intrigucs, the bilhop ordered him to be arrefted; he, however, efcaped. and concealed himfelf at Paris. On this and fome other parts of Labadie's conduct, Bayle makes the following remarks, which, in fome degree, are probably applicable to religious enthufiatts of other countries befides France: "I do not," fays the biographer, "warrant the certainty of all thefe facts, but I affirm that it is very probable, that fome of thofe firitual devotces, who make prople belicre that a ftrong meditation will ravifh the foul, and hinder it from perceiving the actions of the body, have a mind to toy with their devout fifters with impunity, and to do ftill worfe. In general, there is nothing mure dangerous to the mind than too myftical and too abiltracted devotions; and, doubtlefs, the body in that cafe runs fome hazard, and many are glad to be deceived." Labadie became a director of a convent of nuns, among whom he introduced a new rule, and the notions of the Quietifts, with additions of his own, vir. that the fcriptures. were not neceffary to falvation: that outward worlhip is of no avail : that all prayer ought to be mental ; and that there are two churches, that of Chriltians in degeneracy, and the other regenerate. About the year 1650 , Labadie renounced the Romifh religion at Montauban, at the fame time declaring he had contemplated this meafure more than fifteen years. His converfion excited much converfation and many difcuffions among the Catholics; feveral attempts were made to engage him to return to the bofom of the true church, but without producing any effect on his mind. His licentious practices were now expofed, and probably very much exaggerated: the Proteftants, proud of fo important a convert to their caufe, would litten to none of the accufations, and he was chofen pattor of the reformed church at Montauban in the year 1651 . Here he exercifed the duties of the minilterial office for eight years, and then, on accoount of fome difputes on fubje:ts which he was unable to juitify, he went to Geneva. Here his devout manners and popular preaching gained him a valt multitude of adherents, but by others every means was taken to drive him from the town, and in 1666 , the fe peop's accomplifhed their purpofe, by procuring an invitation to be fent to him from the Walloon church at Middleburgh, the capital of Zealand, which he readily accepted. Hie made many converts is this place, aniong whom was the celebrated Anna Maria Schurman, of Utrecht, whofe great learning rendered her fo famous in the republic of letters during the feventeenth century. Labadie fent difciples to propagate his doctrines, and to gather contributions in different parts of Holland, on which accouvt he was obliged to withdraw to Eirfurt, the capital of Thusringia, and from thence to Altona, where he died at the age of fixty-four, in the year $167+$. Ajter his death, the community fettled at Wjevert, in North Holland, where it

## L AB

found a peaceful retreat, and foon fell into oblivion. Labadic was author of many works which are full of mylticifm : but they carry evident marks of a lively and glow. ing imagination. Bayle, Motheim.

LaDADIST'S, or Labbadists, in Escleffafical Hijfory, a fect of religionits, followers of the opmion of Jean de Labadie, who lived in the 17 th century, and was conteniporary with Mademoifelle Bourignon.

Some of his tenets were, that, r. God could and did deceive men. 2. That in reading the feriptures, greater attention fhould be given to the internal infpiration of the Holy Spirit, than to the words of the text; that the fcripture was not fufficient to lead men to falvation, without certain illuminations and revelations from the Holy Ghoft; and that the efficacy of the word depended upon him that preached it. 3. That baptifin ought to be deferred till mature age. 4. That the good and the wicked entered equally into the old alliance, providing they defcended from Abraham, but that the new admitted only fpiritual men. 5. That the obfervation of Sunday was a matter of indifference. 6. That Chritt would come and reign a thoufand years on earth. 7. That the eucharit was only a commemoration of the death of Chrift; and that though the fymbols were nothing in themfleses, jet that Chrilt was fpiritually received by thofe who partook of them in a due manner. 8. That a contemplative life was a fate of grace, and of divine union during this life, the fummit of perfection, sic. 9. That the man whofe heart was perfectly content and calm, half enjoys God, has familiar entertainments with him, and fees all things in him. 1o. That this ellate was to be come at by an entire felf-abnegation, ty the mortification of the fenfes and their objects, and by the exercife of mensal prayer. He allo maintained, that the faithful ought to have all things in common, and that there is no fubordination or diftinction of rank in the church of Chrilt. It is faid that the Brownifts, and afterwards the Quakers, offered to connect themietves with this fectary, but were rejected. See Journs des Sçavans for Ottober, 1727, where we have fome account of Labadie and his followers, which were moltly women; and with fome of whom, it has been faid, he took criminal liberties.

LABAREES, in Geagraphy, a town of Spain, in the provice of Afturia; 12 nules W. of Santillana.

LABARIFERI, among the Romons, Atandard bearers, who carried the labarum.

LABARIUM, a lonfenefs of the teeth.
LABARUM, in Antiquity, the banner or flandard borne before the Roman emperors in the wars.

The labarum confitied of a long lance, or pike, with a flaff at the top, crofling it at right angles; from which bung a rich ftreamer, of a purple colour, adorned with precoous itones, and curioully inwrought with the images of the reigning monarch and his children.

Till the time of Conftantine, this flandard had an eagle painted upon it; but that emperor introduced in lien of it a crofs. Accordingly, the fummit of the pike fupported a crown of gold, which inclofed the my iterions monogram, at once exprefive of the fi, ure of the crofs, and the initial letters of the name of Chrift, as reprefented under the article Cross. The fafety of the labarum was entrufted to 50 guards, of approved valour and fidelity; their ftation was marked by honours and emoluments; and fome fortunate accidents foon introduced an opinion, that as long as the guards of the labarum were engaged in the execution of their office, they were fecure and invulncrable, amidit the darts of the enemy. This ftandard the Romans took from

## $L A B$

the Germans, Dacx, Sarmatæ, Pannonians, Sce, whom they had overcome.
The name labarum was not known before the time of Conflantine; but the ftandard itfelf, in the form we have defcribed it, abating the fymbols of Chriltianity, was ufed by all the preceding emperors.
In the fecond civil war Licinins felt and dreaded the power of this confecrated banner, the fight of which, in the dittrefs of battle, animated the foldiers of Conflantine with an invincible enthutiafm, and fcattered terror and difmay through the ranks of the adverfe le, ions. Eufebius (in Vit. Conitantin. 1. ii. c. $7,8,9$.) introduces the labarum before the Helvic expedition; but his narrative feems to indicate that it was never fhewn at the head of an army, till Conllantine, above 10 years atterwards, declared himfelf the enemy of Licinius, and the deliverer of the church. The Chrittian emperors, who refpected the example of Conftantine, difplayed in all their military expeditions the flandard of the crofs; but when the degenerate fucceffors of Theodolius had ceafed to appear in perfon at the head of the armies, the labarum was depofited as a venerable, but ufelefs, relic in the palace of Conftantinople. Its honours are ftill preferved on the medals of the Flavian family. Their grateful devotion has placed the monogram of Chrift in the midft of the enfigns of Rome. The folemn epilhets of, fafety of the republic, glory of the army, reftoration of public happinefs, are equally applied to the religious and military trophies; and there is ftill extant a medal of the emperor Conitantius, where the ftandard of the labarum is accompanied with thefe memorable words, "By this sign thou shalt conquer."
The derivation and meaning of the word labarum, or laborum, which is employed by Gregory Nazianzen, Ambrofe, Prudentius, Sc. Itill remain totally unknown; in fpite of the efforts of the critics, who have ineffectually tortured the Latin, Greek, Spanilh, Celtic, Teutonic, Illyric, Armenia, \&c. in fearch of an etymoogy.

Some derive the word from labor, as if this finihed their labours; fome from su入aคเเน, reverence, picly; others from
 barum has afforded very ample matter for criticifm, and has been difcourfed of by Fuller, Alciatus, Cujas, Gyraldus, Lipfius, Meurfius, Voffius, Hoffman, Valois, Du-Cange, \&c.

LABAT, Johx Bartist, in Biggraphy, was born at Paris in 1663: at the age of twenty he entered into the Dosninican order, and made his profeffion in 1685. Having completed his itudies he became profefor of phlofophy at Nantz, after which he was, in r693, fent by his fuperiors to America as a miffionary. He returned to Europe in 1705, and being landed at Cadiz, he travelled through Spain and Italy, where he refided fome years. During this period he cmployed himfelf in drawing up a narrative of his obfervations, which he publifhed at Paris, in 1722, with the title " Nouveau Voyage aux Ines de l'Amerique, \&c." in fix volumes. A fecond edition was given to the world in eight volumes, in the year 1741. He was author likewife of "Travels in Spain and Italy," in eight volumes : and he edited the following, viz. "New Relation of Weflern Africa," 5 vols. : "Voyagcs of the Chevalier Merchais to Guinea:"" "Hiftorical Relation of Weftern IEthiopia :" and "Memoirs of Chevalier d'Arvieux," in 6 vols. Labat died at Paris in 1738. Moreri.

LABATA, in Geography, a town of Spain, in Aragon; 10 miles E. of Huerca.
LABATIA, in Botany, named by profeffor Swartz, in memory of Joha Daptift Labat, a Donuinican monk, who,
between

## L A B

between the years 1700 and 2713 , invelligated the plants of Africa and the Well Indies, of which he drew up numerous deferiptions, colle eting every thing memorable refpecting their economical ufes, and their modes of cultivation and preparation. Haller fpeaks of him as a flrewd man of bufinefs, rather than an able naturalift--Swartz. Prodr. 32. Fl. Ind. Occ. v. 1. 263. Schreb. 700. Willd. Sp. Pl. v. I. 623. (Chetocarpus; Schreb. 75. Poutcria; Aubl, Guian. v. 1. 85. Juff. 156. Lamarck [llultr. t. 72.)-Clafs and erder, Tetrandria Monozynig. Nat. Ord. Bisornes, Linri. Guaizcans, Juff.

Gen. Ch. Cal. Perianth inferior, permanent, of four leaves; the two oppofite ones crect; two finaller ovate, obtufe, concave, internal. Cor. of one petal ; tube fomewhat bell-fhaped, fhorter than the calys: limb in four minute, erect, bluntifh, equal fegments, with two oppofite, fmaller, intermediate, lanccolate ones. Stam. Filaments four, the length of the corolla, erect, awl-flaped, clofe to the piltil; anthers erea, pointed. Pi/h. Germen fuperior, roundifh, minute; fyle awl-fhaped, equal to the famens; ftigma fimple, obtufe. Peric. Capfule large, roundih, rough, of four cells and four values. Seeds folitary, oblong, compreffed.

Eff. Ch. Calyx inferior, of four leaves. Corolla fomewhat bell-haped, four-cleft, with two fmaller intermediate fegments. Capfule of four cells. Seeds folitary.

1. L. feflitiffora. Sw. Fl. Ind. Occ. t. G.-Flowers feffile. Leaves filky- Found by Swartz in bufhy parts of the mountains of Hifpaniola. ' The fem is fhrubby, fix feet or more in height, erect, fmooth, with a greyifh rulty bark; the branches alternate, ftraight, bearing upright, round, rufty finaller branches. Leaves alternate, ftalked, oblonglanceolate, pointed, entire, wavy, rigid, two or three inches long, elegantly ribbed and veined bencath; the young ones thining and filky, with a golden rufty hue; the older more filvery. Footfalks Gort. round, rulty: Flowers axillary, Eeffile, mofly folitary, whitifh, very fmall. Fruit the fize of a nutmeg, roundifl, rough and rulty, the internal partitions vellow. Sometimes there are but two cells and as many feeds, the fruits of this natural order being liable to vary greatly in the number of their divifions. The flowers appear in May and June; the fruit ripens in December and January.
2. L. pedunculata. With. n. 2. (Pouteria guiannenfis; Aubl. Guian. 8. 33.) - Flowers ftalked. Leaves fmooth Native of woods in Guiana, where it is called by the Indians Pourounn- Pouteri. Aublet found it bearing both fowers and fruit in November. The trunk, according to this writer, is 40 feet high, and a yard in diameter, with a rough reddifh hark, and hard, clofe-grained, white wood; the branches long and fubdivided, leafy at their extremities. Leaves obovate, pointed, entire, fmooth, three or four inches long, on foot-Italks nearly half that length. Flowers fmall, greenifh, on fhort fimple axillary ftalks, two or three together. Fruit oval, hard, rough with rigid thort hairs, red internally, as is likewife the fkin of the feeds.

LA BATIE NEUVE, in Geograpiyy, a town of France, in the department of the Higher Alps, and clief place of a canton, in she diftrict of Gap. The town contains 200, and the canton $313^{\circ}$ inhabitants, on a territory of 125 kiliometres, in cight communes.

LABBE, Philip, in Biography, was born at Bourges in the year 1607 , and at the age of fixteen he entered the fociety of the Jefuits, and became diftinguifhed as a teacher of the languages, of rhetoric, and philofophy, in the college of his native place. He was afterwards profefior of moral sboology at Paris, where he refided till his death, which

## 1. $A B$

happened in 1606. He was reckoned a man of profound learning, and indefatigable induttry. He was author of many works, of which feveral relate to the hiltory of his own order ; the molt important is "A Gencral Collection of Councils," with notes, in feventecen vols. fol. His grammatical work for the ufe of fludents in the lanouagen, en. titled 6" Eruditæ Pronunsationis Catholici Indices," has been frequently reprinted in this country. The edition by Edward Leedes is well known in our fchools. It object is to point out the quantity of Latin proper names of perfons, places, \&c. Moreri.

Labbe, in Orailbology. See Lares parafiticus.
I.ABBOCK BAy, in Grugrafby, a bay on the N.E. coaft of the illand of Burneo. N. lat. $62^{\prime}$. E. long. $115^{\circ}$ $55^{\circ}$.

LABDACISM, A\% ${ }^{\circ}$ oniono , in Rhetoric, the tor frequent repetition of the letter $L$, as fol et lura luci lucrborit, and alla levi latea.

LabDANUM, in the Materia Medica. See I.adanem.

LABDARA, in Gcostapby, a fmall inland in the gulf of Venice. N. lat. $44^{\circ} 14^{\circ}$ E. long. 15 19'.

LABEL, a long thin brafs ruler, with a fmall fight at one end, and a centre-hole at the other ; commonly wfed with a tangent line on the edge of a circumferentor, to take altitudes, sc.

Label, in Law, is a narrow flip of paper, or parchment, affixed to a deed or writing, in order to hold the appending feal. Any paper annexed by way of addition, or explication, to any will or teltament, is alfo called a label, or codicil.

Among apothecaries likewife, the llip of paper round their phials, containing directions how to ufe the medicine, is called a abel.

Label, in Heraldry, a kind of addition to the arms of the heir or firlt fon, to diltinguif him from the others. See File.
Although the file or label be ufed as a diftinction of houfes, it is neverthelefs properly placed by Holme, as an ordinary, becaufe it is varioully borne and charged.

The label is efteemed the moft honourable of all differences; and is formed by a fillet ufually placed in the middle, and along the chief of the coat, without touching its extremities. Its breadth ought to be a ninth part of the chief.

It is adorned with pendants fomewhat like the drops under the triglyphs in the Doric frieze. When there are above three pendants, the number mult be fpecified in blazoningo. There are formetimes fix.

The label, varioufly charged, is the difference generally affixed on the coats of arms belonging to any of the royal family; when his majefty frall think fit io command that arms be granted them.
labella Leporixa, in Surgery. See Hare-lip.
LABELLED Line, in Heraldry, a term ufed by fome to exprefs the line in certain old arms, called more ufually urdée or champngne. Others apply the fame word to exprefs the patce or dove-tail line, called alfo the indlave line by Morgan. It fomewhat refembles the joint called a dovetait by our joiners, and its points, as they proceed from the ordinary, whether chief or fefs, refemble the ends of labels. See Urdíd and Patee

LABEO, C. Antistius, in Boography, an eminent Roman lawyer, the fon of one of the perfons who confpired againlt the life of Julius Cæfar, was a difciple of Trebatius, and lived under Auguftus. He became a very learned man, preferved a free and independent fpirit under the rule of a defpot, and thewed on various occafions that he had not for-

## LAB

gotten, nor was carelefs of the liberties of his country. Iits great rival in jurifprudence was Atcius Capito, and 'Tacitus, fpeaking of thefe two rivals, calls them" the two ormaments of peace in their age:" he however celcbrates the incorrupt freedom of the latter, which was the caufe of his rifing no higher than the pretorfip; while the obfequioufnofs of the former was rewarded with a confulate. Labco divided his time between bufinefs and fudy, fpending fis months at Rome, in giving advice and attending to public duties, and living the other fix in a country retreat. He wrote a number of books chiefly relating to jurifprudence. Aulus Gellius refers frequently to the commentaries of Labco, on the twelve tables. Suetonius, Lempriere.
labro, in Icbtbyolony, a name given by the old Latin writers to the fifh ufually called cheilon and chelon. See Cyprinus Labeo.

LABER, in Geography, a town of Bavaria, in the principality of Newburg'; nitse miles W.N.W. of Ratifon.

LABERIUS, Decinus, in Biography, a writer of dramatic pieces, fimilar in fome refpects to our pantomines, was a knight by birth. He was fixty years of age when Julius Cxfar, in the plenitude of his power, urged him, by the promife of a liberal reward, to appear on the flage, in one of his nwn pieces. The poet confented with great reluctance, and thewed his refentment during the acting of the piece, by throwing fevere afperfions upon Julius Cxfar, and by broadly hinting at the tyranny and defpotifm of which he was guilty. In pronouncing the following line, he fixed the eyes of the whole affembly upon the ufurper:

> "Neceffe eit multos timeat quem multit timent,"
> "Many he dreads in turn, whom many dread."

Cxfar reltored lim to the rank of knight, which he lad lof by appearing on the ftage, but he could not fo eafily reftore lim to the good opinion of his friends. When he went to take his feat anong the knights, no one offered to make him room, even his friend Cicero farcaltically faid "Recipifem te nifi angulté federem ;" I zwould make you room if I were not fo much crowded: to which Laberius repllied, "Mirum fi angulcé fedes, qui foles duabus fellis federe," I wonder you hoould be crowded, aubo ufually fit upon two feiths at once; alluding to the orator's meannefs and duplicity, during the civil wars between Ceffar and Pompey. Laberius died in the year 44, B.C. Some fragments of his poetry remain, and are given in Mattaire's Corpus Poetarum : the sitles of his feveral pieces are preferved in Aulus Gelliuso Horace alludes, but without any refpect to the onimes of Laberius, this was, probably, rather in contempt of the fecies poetry, than the author.

LABES, iu Geography, a town of Hinder Pomerania; 30 miles S. of Colberg. N. lat. $53^{\circ} 39^{\circ}$. E. long. $15^{\circ} 39^{\prime}$.

LABEZ, a province, fometimes called a kingdom, of Algiers, S. of Boujeah.

LaBIA, or Lies, in Anatomy. See Deglutition.
LABIAL, a term in the French kaw, ufed in the fame fenfe with oral.

Labial Letters, anong Grammarians, are thofe whofe pronunciation is chiefly effeced by the motion of the lips. B3y which they fand contradiltinguifhed from palatal, dental, guttural, \&cc. letters.

Labtal Offers are fuch as are only made by word of mouth, or even by writing, where there is no valuable coninderation. In courts of equity thefe are not regarded.

LABIAI.IS, in Afrutomy, an epithet given to certain parts belonging to the lips, as the arteries, veins, glands, $\stackrel{5 c}{ }$.
LABIATE, in Botany; a natural order of plants, fo
called, after Tournefort, from labium, a lip, in allufion to the fhape of the corolla, which refembles the mouth and lips of an animal. This order, the 39 th of Juffieu's fyftem, and the fixth of his eighth clafs, is equivalent to Linnæus's 42 d natural order, Vcricillatio; or to the Didynamia Gymno/pernia of his artificial fyltem; except that the latter neceffarily excludes fuch genera of lalieita as have but two ftamens, and which are therefore referred to his fecond clafs, Diandria.
The characters of Juffieu's cightly clafs are-"Cotyledons two. Corolla of one petal, inferior." (See Gentinnte.) 'He defines the order in quellion thus.

Calyw tubular, either equally five-cleft, or two-lipped. Corolla tubular, irregular, generally two-lipped. Stamens four, two longer and two norter, fituated under the upper lip of the corolla ; in fome cafes only t two, the others being abortive. Germen four-lobed; ftyle folitary, fpringing out of the receptacle, between the lobes of the germen; ftigma cloven. Secds four, naked, erect, affixed to the receptacle by their bafe, and concealed in the permanent calyx. Embryo deftitute of albumen. Stem quadrangular, oppofitely branched, for the moft part herbaceous, but fometimes fhrubby. Leaves oppolite. Flowirs oppofite, often bracteated, or attended by britles, folitary or whorled, corymbole or fiiked, terminal or axillary.

The fections are four.
r. Stamens two fertile, two abortive. This contains Lycopus, Ametbylea, Cunild, Ziziphora, Monarda, Rofmarinus, Salvia and Collinjonita, to which are added by Mr . Brown (Prodr. v. 1. 501.) Wcflringia, Smith's 'Tracts, 27\%. t. 3, Alicrocorys, Hucmigenia and Hemiandra of Brown; fee the two latter articles in their places.
2. Stamens four, all fertile. Upper lip of the corolla wanting, or nearly fo.- Ajuga of Limmous, (which Juffieu choofes to call Bugula after Tournefort), and Teucrium, with Anifiomeles a new genus of Mr. Brown's.
3. Stamens four, all fertile. Corolla with two lips. Calyx five-cleft.-Sulureit, "Ifyflopus, Nepcta, Perilla, Hypfis, Lavandula, Sideritis, MTeilha, Glecboma, Lamium, Galeob/is, Betonica, Stadyys, Ballota, Mairubium, Leonurus, Pblomis and Molucellla, to which are to be added Eilbolizia (fee that article), and Leucas of Burmann and Brown.
4. Stamens four, all fertile. Corolla with two lips. Calyx two-lipped.-Chinopodium, Origanum, Thynus, Thrmbra, Mrliffa, Dracocephalum, Horminum (now reduced to Melifa), Melittis, Pleitrantbus (which is Germanca of Lamarck and Juflieu), Ocymum, Trichohema, Prunilla, Scuiellaria, Prafum and Phrymat, with Cbilodia and Cryphia of Brown, and Proffanthera of La Billardiere.
The plants of this natural order are, for the molt part, agreeably aromatic, or bitter, none of them poifonous. The root is generally perennial. Flowers of various colours, feldom fragrant in themfelves, except as they partake of the aromatic quality of the herbage. The ftamens and figma are, as Linnæus obferves, fo well fheltered, in moft inftances, from the rain, while the air has free accefa at the fides, that impregnation rarely fails. Mentha, however, forms an exception, the ftamens being prominent, and the corolla open; and as its feeds are fcarcelv ever prolific, no plant has a more ample increafe by the roots.

LABIAU, in Geography, a town of Pruffia, in the province of Samland, with an ancient cafle, on the Deim; 20 miles E.N.E. of Konigforg. N. lat. $54^{\circ} 10^{\prime}$. E. long. $22^{\circ}$. $15^{\prime}$.

LABIEZ, a town of the duchy of Warfaw; $3^{2}$ miles N. of Gnefna.

LABINIE, in Natural Hifory, a term ufed by the authors who have written of Switserland, and other mountainous

## I. $\Lambda B$

tarous countries, to exprefs thofe val matles of fow, which fometimes fall frotn the hiils and bury houfes, or even whole towns; and when hardened by the frolts, as is often the cafe, into folid fubltances, they overthrow woods, villages, and whatever flands in the way of their courde, as they roll down the fteep fides of the precipices in their way. Sume authors have alfo extended the word to a larger fenfe, and made it exprefs the falling of vall rocks, or parts of moun. tains, and their rolling down in the fame manner into the flat country: this is a mifchief very frequent in the fame places, after frolts, and often very fatal. See Glaciens.

LABIUM, in Anatomy, a term given to various parts in the body, which, from their prominent figure, admit of being compared to the lips. Thus the labia pudendi are the two folds of תkin which bound the external female organs of generation laterally: (See Generntion.) The edges of the crilla of the os innominatum are called its labia.

Iabivin Leporinum, in Surgery. See Hare-hir.
LABO, in Geograpby, a town on the W. coalt of the ifland of Sumatra, which chiefly trades in pepper. N. lat. $3^{\circ} 20^{\prime}$ 。

LABOMAS, a town of the illand of Cuba; feren miles S.E. of Spiritu Santo.

LABON, a town on the W. coaft of Sumatra, cclebrated for gold duft and camphire; but the inhabitants are referved in their traffic with ftrangers: 150 miles S.S.E. of Acheen. N. lat. $3^{\circ}$ 10'. E. long. $96^{\circ} 40^{\prime}$.

LABOON, a ditirict of Sumatra, on the banks of the river Cattown, bounding the country of the Rejangs on the N. or inland fide. - Alfo, a town on the E. cualt of the illand of Borneo, feated on a peninfula that projects into the fea. N lat. $5^{\circ} 9^{\circ}$ E. long. $119^{\circ} 5^{\prime}$.

LABOR, a town of New Navarre; 280 miles S.E. of Cafa Grande.

LABORATORY is a place furnifhed with chemical apparatus, and entirely devoted to the different operations of chemiltry, whether on the fcale of chemical manufacture, or for the purpofe of experimental refearch." In the piefent article, however, we fhall contine ourfelves to the latter, fince it is more proper to defcribe the apparatus ufed in the large way under the manufacture of the refpective articles. Although many of the molt diltinguithed labourers in chemical fcience have been content with fuch apparatus as they have made themfelves, or converted from the common domeftic utenfils; it mult, neverthelefs, be obvious, that they would have fucceeded better with well contrived and appropriate apparatus, and their refearches woulds in all probability, have been much more extended.

Every; chemical experimenter will find a confiderable advantage in fo much reechanical talent, as will enable him to make, or repair at leaft, the moft common of his apparatus. For this purpofe he ihould poffefs a fet of mechanical tools, fuch as a lathe and vice, with files and rafps for metal and wood. The tools for making ferews, as well in the lathe as by the forew-plate and tafs, will alfo be neceffary. To thefe hould be added a fmall forge, anvil, and hammer, for the purpofe of forging fmall articles. A fet of brazier's and tinman's tools will be found very ufeful, and a little experience will enable the operator to make any article of tin or copper, which is not very complicated. In addition to the above, the glafs-blower's lamp and bellows will be of effential fervice for fealing and bending glafs tubes, and other purpoles.

Some of thefe may appear unneceffary, efpecially in large towns, where the different artifts may be found, but it will be ftrongly in the recollection of all who have had occafion to get apparatus made, that they can feldom get them conflrusted to

## 1. $\mathrm{A} B$

their with, although they Rand by the arti?. The want of proper tools, and a little mechanical dexterity, have frequently prevented or put an end to experimental inveftierstions of confiderable importance. Independent of the apartment containins the mechanical apparatus, the chemit will require at leait one diltinct room for a laboratory. Two rooms, however, fhould be employed when it is conveniert. The principal room of the laboratory fhould be on a grould floor, for feveral reafons. A furnace for great heat fhould be in a low room, in order to have the greatext length of chimney. The aft-pit of this furnace fhotald terminate in a cellar under the laboratory, in order that the air may enter perpendicularly, and of the loweft poffible temperature. See Funnace.

That fide of the laboratory allutted for furnaces fhould have an arch projecting into the room about three or four feet, and of fuch beight that a perfon maj freely walk under it. In the ligheft part of this arched portion mutt be an opening into a chimney diftinct from the reft, and built up in the fame fteck.

It will be found more convenient to ufe portable furnaces for moft purpofes, having none fixed but for producing very gret heats, upon a lagerer fcale, and what are generaily denominated melting furnaces.

The iron chimney of the portable air-furnace may be car ried to any height, and placed under or within the chimney, ufed for the efcape of fmoke and vapours.

A chimney with a funnel may, in the fame way, be pleced over the mouth of the portable blalt furnace, invented by: Mr. Aikin. This furnace may be fo contrived that when the body of it is removed, the bafe may from a forge hearth, which will be found very ufeful. For the varietics of furnaces ufed in the laboratory, fee Fursice.

On another fide of the laboratorv mult be placed a ftone trough or fink, joined to a tub or ciltern of water, which can be filled and emptied at pleafure, by means of a itop-cock over it, and a plug in the bottom. Over the fink-llone thould be fufpended a rack for holding betties and glaftes to drain after wafhing. On the fame lide may be placed a. large block of wood or flone, for the purpofe of holding a; mortar or anvil occafionally.

A third fide of this room muf be occupied by cupboards and fhelves, for holding the difierent apparatus of glafs and. earthen ware, and for the d:fferent fubitances hereafter to be. mentioned.

The fourth fide, which flould be the lighteft, mult be provided with a table the whole leagth of this fide, in the front of which, down to the floor, fhould be a number of drawers for holding all the dry fubltances. 'This table is for making the experiments upon, and for holding the appa. ratus in ufe at any time.

If poffible, every laboratory fhould be joined to a fecond room, howerer fmall it may be, in which to perform the very nice and delicate experiments, and for keeping a few books, and choice initruments of metal, lich as balances, \&c.. This room fhou'd be kept very clean and dry, and as free as pofible from feam and the fumes of acids.

If any part of the furniture require to be painted, the paint fhould be made with fulphat of lead, fince it is not acted. upon by acids. This fubltance has been ufed by Dr. Henry not only for this purpole but for repairing broken glals and labelling bottles. The following are the moit particular apparatus with which a laboratory fhould be furnifted.

Mortars.-Thefe are of various kinds, caft-iron, bronze, fteel, and Wedgewood ware. The calt-iron mortar is gene. rally ufed for vegetainle fubltances, and fuch as are not liable to grind off the iropo, The hardoefs. of this inftrument is
much increafed by caftine the interior furface upon a metal mould, of the greater weight the better.

The hardnefs of the bronze mortar, which is generally ofed for the fame purpoles, may be increafed by the fame means.

The fteel mortar is ufed for reducing very hard minerals into fmall bits, fitted for grinding in the mortar of agate. It confilts of a cylinder of hardened iteel, with a flat bottom, and a peftle of the fame made to fic the mortar, accurately, from top to bottom. It is ufed by putting the pieces of the mineral into it, and ftriking the pefle with a hammer. $13 y$ this means it can be reduced into tolerably fmall particles, without grinding off any portion of the mortar.

Hardened fteel mortars of the common fhape would be of great ufe, but it would be difficult to harden fo large a mafs without cracking. It might perhaps be made by welding a plate of calt Iteel upon a thick piece of iron, and afterwards working it into the required thape, and polifhing it in the infide. If the fubftance is not very particular, it may be ground in a mortar of Wedgewood ware. If, on the contracy, it be very hard, the matter from the mortar will be liable to be mixed with the powder. In this cafe the agate mortar is much to be preferred; fome ftones are, however, fo hard as to act upon the agate. In this inftance, the matter to be ground fhould be weighed before and after grinding, and the increafe of weight may be fafely deemed filex, and allowed for in the analylis accordingly.

Balance. -This inttrument is of great importance to the analytical chemilt, and ought to weigh ico grains to the $7^{1}$ th of a grain. A very matterly account of the principles and conltruction of the balance will be found under the article Balance.

It will be almolt unnecellary to ob?erve, that fo delicate an inftrument fhould be okept in a feparate apartment from the laboratory where fumes of acids do not prevail. It fhould be clofely thut up in a glafs cafe having a fliding door in the front. The ftrings to which the fcales are fufpended, fhould be of fine gold or filver cord, and the rcales of filver or platina, and very thin. One of the fcales ihould be provided with a loofe pan of very thin platina, and balanced with the other, for the purpofe of holding the fubltance to be weighed. The weights for chemical fubftances fhould be reckoned in, and marked with grains and decimals of grains.

Lamp.- This valuable inttrument is a very great improvement upon the fand-bath. Its heat is regular, and may, by means of the concentric wick, be made of fufficient intenfity for moft purpofes. Its greatelt advantage, however, confilts in the facility with which it can be applied or withdrawn without lofs of time. See Lamp.

For nice and delicate purpofes, where the heat of the lamp is required, alcohol, inftead of oil, gives an intenfe and fteady heat, and is not very expenfive when a proper veffel is ufed for burning it. The latter kind of lamp is particularly adapted for a public lecture.

Fig. I. Plate XVI. Chemiffry, is a ftand fupporting the lamp, and at the fame time the fubitance to be heated, and the connecting apparatus A B is a frame of wood. F a pillar of wood or rron, fmooth and cylindrical throughout, fo as to admit of the fliding rings, fuch as ${ }_{o}^{\pi}$, to move freely without Shaking. C is the Argand lamp, having a chimney at o of iron. This chimney confilts of two concentric tubes, connected together by fmall wedges of baked clay, or fome other incombuftible fubitance which is a bad cosductor of heat. This contrivance not only economizes the heat, but keeps the outer tube fo cool, that it may be taken hold of with the fingers. In this lamp the wick is raifed by the forew,
inftead of the rack, which is performed by turning the chimney round.

The funnel-fhaped ring D is an improvement upon the common ring ufed for fupporting the retort. It confilts of a number of conical hoops, one fitting upon the other, fo as to hold different fized retorts. The fmalleft hoop is about two inches in diameter, and the largeft, which is attached to the fliding part, about five inches. The conical furface directs the heat to the retort, which on the common plan only ferves to annoy the fingers and face of the operator, and at the fame time heats the neck of the retort, where the condenfation of the vapour fhould take place: $f$ is a retort fupported by the ring: $g$ is a flider, having two prongs at $p$ to keep the retort from falling fideways: E is a receiver to receive the contents of the retort, which may be either ufed alone, or with Woulfe's bottles $a, b, c$, hereafter to be defcribed. G is a fland, with three inclined prongs of woed to fupport receivers of different fizes, and which may be placed at different clevations by means of the fcrew $n$.

Retort.-Fig. 2. This is a chemical utenfil of very arcient origin, and is the moft fimple apparatus for ditillation. Retorts are of glafs, earthen-ware, and metal. Thofe of glafs are fometimes of green glafs, particularly when fuch heat is employed in the naked fire, as might foften the more fufible white glafs. 'Thofe of Aint-glafs fhould be as thin as poffible, in order to avvid breating by an unequal expanfion. When the retort is provided with a glafs itopper, as at $a$, it is faid to be tubulated.

This appendage is neceffary only, when fome fluid, fuch as an acid, has frequently to be added, or when it would be difficult to get the materials into the mouth of the retort. In order to add any fluid from time to time while the procefs is going on, the veflel (fig. 3.) called an acid bolder is made to lit in the place of the ltopper of the retort, the part $d$ being ground to fit the fame. The acid is put into this veflel, and let into the retort, by a little at once, through the glafs itop-cock $c$.

When the retort is ufed for purpofes of diftillation, the neck is fitted or luted into the neck of the receiver (fig. 4) This receiver is ufed for the difillation of liquids, the vapours of which are ealily condenlible, fuch as water or alcohol. When the vapours, coming over, are accompanied with elaftic fluids, which are incondenfible, the receiver ( fg .5 .) is better adapted. If the elaftic fluid be of no importance, and inoffenfive, it may efcape at the conical itopper of the latter vellel every time the preffure is fufficient to raife it. It is, however, fometimes neceffary to collect the gafeous fluid. In this cafe the bended tube (fig. 6.) is put into the place of the dtopper (fig. 5.), the other end terminating in a pneumatic apparatus where the gas is collected. In the diftillation of very volatile liquids, fuch as ether, it is fometimes neceffary to remove the receiver to a diftance from the retort, by placing between them an intermediate veffel, (fig. 7.) called an adopter. The receiver (fig. 8.) is employed for collecting the product of different degrees of ftrength by the application of the bottle $b$.

In the diltillation of fubitances, which require a greater heat than glafs will bear, earthen retorts are employed. They are of the fame fhape with thofe already defcribed, and fhould be made of the materials with which crucibles are made. This fort of retort is generally ufed for the dittillation of phofphorus. If its texture be not clofe, the phofphorus will efcape in vapours through the pores. This, however, may be prevented by covering the furface with fome glazing material. Iron retorts, from their great firmnefs, are well adapted for diftiling fuch fubitances as will have no.

## LABORATORY.

chemical action upon them. Hence they are unfit for diftilling fulphur, phofphorus, and acids, but are extremely proper for ammonis, mercury, and pitcoal. A retort of Icad is ufed for the diltillation of fluoric acid, owing to that acid combining with the filex of glafs.

Woulfe's Apparetus. - In the diftillation of fubftances which are merely to be raifed into vapour by heat and condenfed by cold, the retort, or Atill, with the receiver and the proper means of producing cold, are the only apparatus neceffary. There is another diltinct branch of diftillation, in which the product is a gas, which is incondenfible at the common temperature, and requires to be abforbed by water, or by fome other fubttance diffolved in that liquid.. In thefe proceffes, therefore, the temperature and fize of the receiving veffels are not of fo much importance as the expofure of the gafeous product to the greatelt foffible quantity of the abforbing tiquid. Before the difcovery of this moft ufeful apparatus by Mr. Woulfe, from whom it takes its name, the common retort and receiver were ufed for all purpofes. The elaftic fluids were in confequence either compreffed, and the operator was conitantly in danger of being injured by the burting of veffels, or, to remedy that evil, they were fuffered to efcape, and he was perpetually annoyed by the fuffocating fumes which were fet at liberty.

In fig. I. the retort contains the materials for furnifhing the elaflic fluid to be abforbed by fome liquid contained in the receiver E , and the fucceeding bottles $a$, $b, c$, with their connecting tubes $r, b, t: v$ conflitutes the Woulfe's apparatus. A certain portion of the gas is taken up by the liquid in the receiver E . The excefs paffes through the tube $r$ to the bottom of the liquid into the fecond receiver, by which another portion of the gas is abforbed. The refidual gas paffes along the tube $b$ to the third receiver, which gives the gas a third chance of abforption. In this way it may be made to pafs through any number of bottles, according to the greater or leffer facility with which the gas is abforbed. The lait tube v, which is provided with a column of mercury, conveys the remaining gas, which is prefumed to be unabforbable, into the atmofphere, or it may be collected by a jar in the pneumatic apparatus. When the gas ceafes to be furnifhed from the retort, in a quantity equal to the abforption in the receiving veffels, a retrograde motion will begin to take place. Atmofpheric air will enter at the tube $v_{0}$. The liquid in the laft receiver will be forced by its preffure into the preceding one, and if the abforption were to become complete, the whole of the liquid would be carried into the firt receiver, and from thence to the retort. This evil has been very completely removed by what is called a tube of fafety $f, l, x$.

Fig. 1, -The bulb $l$ contains as much mercury as will be contained from $q$ to $x$, fo that when the gas, from defective abforption, accumulates in E, till its force is equal to the preffure of fuch a column, the excefs of gas wall bubble through the mercury into the atmofphere. On the contrary, when the abiorption of the gas exceeds its evolution, the preflure of the atmofphere, to refore the cquilibrium, will caufe the mercury to occupy the ball $l$, and common air will bubble through it into the veffel E. Although this ingenious contrivance completely prevents any evil arifug from the inequality of internal preflure, it is very objectionable, owing 20 its delicate ftructure, on which account it is conltantly liable to be broken.

We are indebted to Mr. Knight for a great improrement on the tube of fafety. This confits in having a valse of glafs, fimilar to that of the Nooth's apparatus (dcferibed telow'), placed between the firft and fecond vefiel, to that the liquid in the fucceeding bottle can never have a retrograde motion. To this valve there is no other objection than the

VoL. XX.
difficulty of getting it made in places difant from the metro. polis, and its liability to be falt, efpecially in making cryftalline falts, fuch as the oxymuriat or carbonat of potath.

The fame objection which we have made to the tube of fafety, we arc forry to fay applies to the whole of the Woulfe's apparatus. 'The connecting tubes ave with very great difitculty ground into bottles, which makes the apparatur very expentive, and then are fo liable to be broken, as to render it frequently ufelefs.

We have before linted, that the effential part of fuch an ap. paratus, is to expofe the greatelt polible quantity of the sas and the liquid to cach other in a given time. In the Woulfe's bottles, this advantage does not obtain in fo great a degreas might be effected in a fimpler apparatus. We flall here fubjoin a defcription of an apparatus of this kind, anfwering all the purpofes to which the Nooth's and Woulfe's apparatus are feparately applied. Although it has not been before made known, it has been ufed with great fuccefs by the writer of this article, and will no doubt be found an acquifition to the experimental as well as the manufacturing chemitt.

Fig. 9. Plate XVII. Chemifry, is a reprefentation of the apparatus for the abforption of gafes. A is a retort from whence the gas is furnifhed, connected with the firft bottle B, which contains the liquid to be inpregnated, and into which the tube $a$ is ground, reaching near to the bottom, fo that when the gas enters this vefel, the liquid will be raifed into the bottle C ; at the fame time the tube will be conftantly filled, with the exception of the fpace occupied by bubbles of gas paifing through it. If the gas is not all abforbed during its paflage through this tube, the excefs will pafs down the tube $b$ into the bottle D , which aifo contains the abforbent liquid. The fame takes place in this bottle which is obferved in that of B. The liquid afcends into the bottle E, the gas following it as before. The refidual gas, fhould there be any; may either be conveyed into another bottle fituated like D, or may be collected in a pneumatic trough, or efcape through the tube of fafety $e$.

This apparatus was invented for the purpofe of making the oxymuriats of the earths, for which it is admirably adapted. The earths which are mixed with the water being conftantly at the bottom, if not kept in agitation, the abforption is very flow and imperfect. In this apparatus no agitation is neceffary. The earth, which is at the bottom of the veffels B and D , is firft raifed into the tubes $a$ and $c$, and becomes as much expofed to the gas as any part of the liquid medium. The tubes $a$ and $c$ are each about two feet long, but they do not require to be fo long for molt experiments of this kind. Their diameter is about $\frac{1}{2}$ inch, fo that in the courfe of about one minute, no lefs than about nine ounces are brought in contact with the gas, independent of the circular furfaces in the bottles.

In the cominon fized Woulfe's bottles, the tubes through which the gas enters feldom dip more than three inches into the fluid, fo that we may fafely rate the apparatus propofed as equal to at leaft eight of Woulfe's bottles. Thefe bottles are the fame with thofe of Woulfe's; the tubes are inuch fimpler, and being Atronger are lefs liable to break. Another great advantage is that of its not requiring a tabe of fafety. The great facility with which it can be applied tio all the purpofes of the Nooth's apparatus, as well as the Woulfe's, and with much more effect, will be foon appreciated. Under the article Woulfe will be found the defcription of a differently conftructed apparatus. See Plate V. Chemiffry.

Nooth's Apparatus. - This is reprefented in fig. Io. Plate XVI. it conlitts of three velfels fitted together by Q
grouns

## LABORATORY.

ground joinings. It differs in its ufe from the Woulfe's, in being folely adapted for impregnating water and other bodies, with luch gafes as are difengaged from their combinations without heat, fuch as the carbonic acid, and fulphuretted hydrogen. The lower veffel A contains the fubtance from which the gas is ohtained, fuch as carbonat of lime; the fulphuric acid being introduced occafionally at $d$; the gas enters the veffel B through the glafs ralve $a b$. This is magnified in fig. 12. The tubes $b$ and $d$ ate at firft in one piece and ground into the part $a e$; the portion $c$ is then cut away, to make room for the hemiipherical valve, the under fide of which is ground flat, to fit the end of the tube $b$. The valve, on being raifed by the gas, inftantly falls and prevents the water from defcending into the lower veffel. The air then enters the liquid in B, fir io. through fmall holes to difperfe it as much as poffible. When the gas accumulates in B , a portion of the liquid is driven up into the veffel C , the bubbles of air following it tending ftill more to prompte the abforption. The air in C , if not abforbed, will at certain intervals raife the conical itopper $e$. This fopper fhould be fo heavy as juft to rife before the veffels would burtt, and fhould be fo conical as not to ftick in the leaft degree. After the liquid is impregnated it is drawn off at the cock D .

Fig. 11 . is a fimpler and better apparatus for this purpofe, invented by Dr. Hamilten. It is fimpler, becaufe the veffels are fewer, and the valve, which is complicated and liable to be falt, is difpenfed with; and it is better becaule the gas comes in contact with more of the liquid in a given time, and confequently the abforption is effected fooner. The gas is furnifhed by the retort $B$, ground into the veffel $A$. From the latter the abforbing liquid is raifed into the veffel C , fiil the air bubbles go through it, and if not abforbed paffes out at $d$. This apparatus wants nothing more than a tube of greater length, for the gas to pafs through, to make it complete.

In comparing the two laft with that of fig. 9, the latter will be found ruuch fuperior even to that of fig. II .

Gufometer and Gas Holder. - The difference between thefe two veffels, conlifts merely in one having the means of meafuring the quantity of gas which it contains at any time, and the other not, while both are employed as gas holders.

The gafometer was made a very expenfive and magnificent apparatus by the celebrated Lavoiner, at the tine he profecuted his experinents upon elaftic fluids. This infrument, much fimplified, we fha 1 defcribe in fig. 3 3. Plate XVII. A is a veffel comtaining water or fome other liquid, which will not be acted upon by the gas to be held in it. $B$ is a veffel inverted in the velfel A , and capable of moving up and down in it. E and F are cords by which the veffel 13 is fuipended, ihe weights and pullies being concealed in the tube C D. Fig. If is a fection to thew the interior parts of this apparatus. K $L$ is an interior veffel of the fame fhape, with the velfel $B$ fuldered to the bottom of the velfel $A$, fo that no water or othor liquid in A can communcate with the infide of it. This is done for the fake of ufing lefs of the liquid employed, which in the mercurial gafometer is very defirable, as well for the fake of economy, as making the apparatus more portable; $a$ is a pipe paffing through the middle of the veffel $\mathbb{K} L$, and communicates with the tubes $o$ and $d$. The air is introduced at the foop-cock $\varepsilon$, and pafing along the pipes o and $a$, raifes the veffel 13 , which is counterpoifed by the weights $r$ and $q$. Thefe weights are condacted down the middle of the tube CD , by the fmall pullies $x$ and $y y$. The tube $d$, which, with that of $o$, is common to the tube $a$, is to let the air out of the gafumeter at the fop cock $f$, fo that the air paffes through $a$, both in its entry and its exit : 5 , for . 13, is a fexible tube, ferving to con-
duct the air to a pneumatic trough for examination, or for . ufing the blowpipe when the veffel contains oxygen. This apparatus is provided with a graduated fcale G, which tells the number of cubic inches contained in it. It is this feale which coultitutes it a gafometer, without which it would be fimply a gas-bolder.

The mercurial gafometer is on the fame plan with the above, but the materials mult be unfufceptible of the action of the mercury. The veffels are generally made of cattiron. The outcr and the fixed inner velfels may be calt in one piece. 'I'he moveable velicl may be of the fame metal, or of glafs. The pipes mult be of wrought iron, and aecurately ground into the calt iron. Two gafometers with water, and one with mercury, will be indifpenfable in experiments in gafeous chemitry.

A very ingenious apparatus, anfwering the common purpofes of gas-holder and gafometer, and in many inftances the pneumatic trough, has been invented by Mr. Pepys. It confifts of a tin veffel A, fig. 15, and a pan or tray B. connected with it by pillars. The pipe a opens into the middle of the tray, and proceeds in a contrary direction near to the bottom of the veffel $\mathrm{A}: v$ is another pipe which alfo communicates with the tray, and juit enters the veffel A: $r s$ is a glafs tube cemented firmly into two brafs fockets, which communicate with the top and bottom of the veffel $A$. This tube is graduated, and fhews how high the water ftands in the veifel, and confequently tells the quantity of air contained in it. The veflel A is firlf filled with water by opening the cocks $a$ and $v$, and fhutting that of $n$, C being clofed at the fame time. The tray is now filled with water, which defcends through the tube $a$ into A, while the air in the fame efcapes at the opening into the tray, from $v$. When the veffel A is full of water, the cocks $a$ and $v$ muft be clofed, and the plug may be taken out of C. If the veffel and pipes be air-tight above, no water will be difcharged at C , fince this pipe is inferted at fuch an angle into A, that the lowelt part of the outer end is higher than the highelt part of the inner end. The next thing is to fill the veffel with gas, and for this purpofe the neck of a retort, or other tube from which the gas is to proceed, fhould be introduced at $c$ till it paffes the inner end of the fame. The gas will rife in bubbles into the upper part of the veffel, while the fame quantity of water will run out at the pipe $C$ into an open veffel placed under it. When the water ceafes to run out, and air-bubbles efcape at C , the tube from whence the gas was furnifhed may be withdrawn, and the fcrew-plug put in its place.

In order to transfer the gas from this veffel into a jar, the tray mult be filled with water, and alfo the jar, which muft then be placed over the aperture from $v$. On opening the ftop-cock $\sigma$, that of a being previoufly opened, the air will afcend into the jar, while the fame quantity of water will defcend into the veiTel A , to fupply its place.

This apparatus may be ufed for feveral other purpofes. A bladder may be tied to the flop-cock $n$, which being opened at the fame time $a$ is opened, the bladder will be filled with the gas. A flexible tube may be fcrewed on the fame ftop-cock for making experiments with the blow-pipe: The gafometer, fis. 13 , will be found better for the-blowpipe, on account of the equable preffare in the apparatus lalt defrribed.

Pneunatic Trough - This is a fimple trough or citern made of tin or copper japanned, and is ufed for collecting different gafes. The fize is gencrally about is inches long, 12 wide, and 12 decp. Fig. Y6. Plate XV1. reprefents this trough. A is a fliding finelf which can be taken out. It is formed of two plates laid together; the under plate is made fo concave, that when thic convex fide tonches the upper plate in the middle, they are diltant at the edges about one inch.

A rim

## LABORATORY.

A rim being foldered round the two gives the fhelf the ap. pearance of a folid, concave on the under fide and flat on the upper lide.

Any gas coming from the retort B , paffing under the fhelf in any lituation, mult be determined to the round hole in the middle; which is atout half an inch wide. The trough, when ufed, is filled with water about an inch above the fhelf, the jar C being filled with the fame, and placed over the aperture through which the bubbles afcend. The ftand D, having a foot of lead or iron, will be found very ufefui for fupporting a retort or other veffel in thefe expcriments. When a number of veffels are occupying the fhelf, and frequently fome are very tall, and of frmall diameter; it will be found neceffary to fupport them to prevent their being thrown over. This may be effected by having a number of fupporters of different lizes, fuch as A. This is better reprefented in fig. 17. At $d$ is a focket to fit the pins which furround the fhelf; $n, o$, are fpringing claws to embrace the glafs.

In making experiments upon gafes, a number of veffels, fuch as fig. IB, will be neceffary. Thele are generally called eudiometer tubes, fome of them are graduated into cubic inches, for the purpofe of meafuring the volume of gas ufed, or refulting from any experiment. See Eudiometry.

Befides the trough already delcribed, which is ufed with water, it is necefliary to be provided with one for mercury. Indeed the latter is abfolutely indifpenfible when the gafes, which are the fubject of experiment, are abforbable by water: fuch as the muriatic acid gas, and ammoniacal gas.

Fig. 1g. is a view of the mercurial trough; it is genexally made of a folid block of fome hard wood, or of marble; or it may be made much neater, and with lefs labour, of pieces of wood joined together, clofely and firmly by iron fcrews. The firft cavity, a eb, may be about eight inches long, four inches broad, and one inch in depth : the fecond or lower cavity, $d$, fhould be about $6 \frac{1}{2}$ inches long, $1 \frac{3}{4}$ wide, and the fame depth : $c$ is a fmaller cavity, about $\frac{3}{4}$ of an inch wide, $\mathrm{I} \frac{1}{2}$ long, and one inch deep. The cavity $d$ is intended to receive the glafs jar, $f i g .20$, for the purpofe of filing it with mercury: $a, b$, are fmall cavities in which to introduce the fingers for the purpofe of raifing the jar . when full of mercury. The cavity at $c$ is to place the inverted jar over, for the purpofe of introducing any gas into it. The fide $a c$ anfwers as a fhelf to relt the inverted jars upon: fig. 21. is a ring of iron, with a leg to flip into holes on the hide of the trouch, for the purpofe of fupporting the jars, which would otherwife be liable to fall on account of their fmall bafe.

Eudiometer.- Formerly the ufe of this inftrument was confined to the analylis of the atmofphere. It has now, however, become of great importance in gafeous chemiftry, and bas been conliderably improved within thefe few years.

In order to afcertain the nature of, and to diftinguifh the difterent gafes, chemilts have generally recourfe to fome fubflance capable of abforbing the gas under examination. The eudiometer is the vefiel which contains, or communicates with the fubflance which is to abforb the gas, and the tube being graduated marks out the quantity abforbed, and fhews how much of that particular gas was peefent.

The firlt inltrument of this kind, adapted to general purpofes, was invented by Dr. Hope, of which a defcription will be found under Eunometry; Under the fame article will be found Mr. Davy's eudiometer for the analyfis of the atmofphere.

Mr. Pepys has lately invented a very good cudiometer : it differs from Dr. Hope's in the bulb, which holds the abforbing liquid, being an claftic gum bottle inflead of glafs.

A glafs neck is tied into the neck of the bottle, into which the graduated tube is ground. When this cudionieter 13 ufed, the elaftic bottle is filled with the ahforbing liquid (lime water, for inftance), and the fube filled with the gas under examination (fuppofed to be carbonic acid), introduced into the neck.

On agitating the liquid to mix it with the gas, as the abfurption goes on, the chaltic bottle collapfes, by the atmofpheric preflure, and the liquid occupics the place of the abforbed gas in the tube.

The only objection to this cudiometer is its want of flexibility, and this varying under different circumftances, fo that the denfity of the contained air can never be accurately known. The writer of this article has done away the above objection, by uling a bag of oited filk inttead of this elaftic gum bottle. The filk mutt be very well coated, and the coating completely dry.

The eudiometer of Volta, which is found very ueful is the prefence of the eleatric machine, is alfo called the detonating for. It is ufed with oxygen to detect the prefence of hydrogen, and vice vier $\int a ̈$. This inftrument, fig. 22 , corifitts of a very thick glais tube A B, havirg two bits of metal $a, b$, paffing into the tube oppotite to each other, the inner ends being feparated from each other a fnall diftance, fo that an electric fpark paffing between them, may be capable of inflaming hydrogen with oxygen.
The gas to be examined is introduced into this jar, and the electric fpark paffed through it. If hydrogen and oxygen be prefent, in fufficient quantity, they will explode, forming water, and producing a diminution of volume equal to the original bulk of gafes which have eritered into combination. In the exploficn of thefe gafes the water or mercury is apt to be thrown in various directions by the coniculfion. We are indebted to Mr. Pepys for an ingenious method of preventing this evil. The tube A B is fecured to the iron itand D E by means of a focket' C. D is an iron tube containing a fpiral fpring, fimilar to that of the fpring Aeel-yard. The rod $d$, which acts upon the fpring, is faftened to the foot E, which is fo heavy as not to be raifed by the force exerted upon the fpring. When the detonation of the gafes takes place, the force is exerted equally upon the inftrument and the liquid, in which it is immerfed, when they are both at liberty. Inftead of being all exerted upon the latter, it caufes the tube to rife, the fpring in the focket D giving way; and thus prevents the liquid from being difperfed. All the gafeous bodies containing hydrogen can now be analyfed by this inftrument. Dr. Henry has difcovered that ammonia, which does not appear combuftible, can be exploded with oxygen : its hydrogen forming water with that fubtance. See Eudiometry.
$E$ vaporating $V^{F}$ cffis. - Thefe are of metal, earthen-warè, and glafs. 'They are generally made broad and thallow, az feen in fig. 23, in order to expofe a greater evaporable furface. During the evaporation of any liquid, a current of air fhould conttantly be paffing over its furface. This object can be eafily attained by placing the veffel under the mouth of a chimney into which there is a conliderable draught. By this means alfo the vapour is prevented from coming into the room.

Thefe veffels are of filver for expelling the water from: alkalis, and of glafs, or Wedgewood ware, for acids and forge folutions of falts.

Sand and Water Batbs.-The fand bath, although fuperfeded by the Argand lamp, for dittillations in the fmall way, is, neverthelefs, very ufeful for digefting fubftances fubjected to folution, and for evaporation. Its heat is much more. regular than the naked fire, but it may fometimes be too
hot for fubtances which are liable to be decompofed, fuch as infufions of vegetable or animal matters. The mott ufcful fand bath is made of a plate of caft iron, under which the flame of a fire plays, and a rim of calk or wrought ircn laid upon it and filled with fine Calais fand.

A fand-bath frequently confifts of an iron difh or pan made to fit the mouth of a furnace. Sce Fivneace,

When an uniform heat, not higher than 212 of Fahrenheit, is required, or when it will be fufficient, the water bath is found lighly wfeful. Inftead, however, of placing the fubflance to be heated in a veffel of boiling water, which was formerly the cafe, the bath may be heated with fteam at any diftance from the boiler. This bath may be a veffel of any flape, having a cavity for fteam on the outfide, thickly covered with flamel, or any bad conductor of heat, and the inlide filled with fand. This hath is admirably fitted for the evaporation of folutions of animal and vegetable fubilances, and for drying precipitates and other fubftarices liable to be deconpoled or changed by great hcat.

Mattrus.-This is a veffel ufed for making folutions of fubftances. It is generally of a fpherical form, flattened at the bottom, as feen in fig. 24, having a long neck to allow the fluid to condenfe and return into the veffel. This ufeful apparatus is made of glafs, and thin at the bottom, in order to prevent its breaking. The common Florence flafk is a good fubftitute for the mattras. A fmaller veffel of this kind is ufed for boiling a lefs quantity of any liquid; thefe are called proof glaffes. See fig. 25 .

Precipitating Glafts. - See fig. 26. -Thefe are tall cylindrical veffels, in which precipitations are performed, in order to collect the feparated matter into lefs room. In wa/hing precipitates it is found, that when hot water is poured into the g'afs, if the bottom be thick it is liable to break. This cvil has exifted more or lefs in all the precipitating glaffes in gencral ufe. In making this veffel at the glafs-houfe, the part to form the bottom fhould be blown out thin, like the mattras, and then pufhed inwards to make it ftand firmly. Very fmall veffels in this fhape are ufed for fmall quantities of any fubitance. Thefe are called teft glafes.

Gas bottles, fuch as fig. 27, are vefels for obtaining hydrogen, carbonic acid, and other gafes. The materials, fuch as water and zinc filings, are introduced into the bottle A. The fulphuric acid being put into the bottle B , the plug $b$, which is ground into the neck $d$, can be raifed to let in the acid as it may be wanted. The gas efcapes through the crooked tube C , which may be put under the fhelf of the pneumatic trough.

Funnels are ufed generally for filtration; they are commonly, and always ought to be ribbed for this purpofe, in order to form channels between the paper and the glafs, which greatly facilitates the procefs. In lieu of a ribbed filter, it is common to place a number of ftraws, or pieces of glafs, between the paper and the veffel, which anfwers very well.

The feparatory funnel, fog. 34, is ufed for feparating fluids, fuch as water and oil, which do not mix from the difference in fpecific gravity.

The following articles are alfo effential to the laboratory, which it will be unneceffary to defcribe.

Thermometers and a barometer. Bottle for afcertaining the Epecific gravity of liquids.

A common ftill to furninh diftilled water.
A fmall one of filver for nice purpofes.
The different blow-pipe apparatus, with platina, fpoon, and leaf platina.

A filver crucible, and one of platina.

Crucibles and crucible tands of earthen ware. Sce figs. 2g, 30 , and 32 .

Muffels and cupqls. See figs. 28 and 33.
lron retort and jointed tube for procuring oxygen gas. Fis. 35.

Glafs jars of different fizes for collecting gafes.
Filtering paper, and papers coloured with litmus, turmeric, and red-cabbage.

A general affortment of glafles, to filter liquids into, \&c.

An affortment of earthen veffels for common purpofes. Thofe made of the fame materials as the foda water bottles are to be preferred.

Capfules of glafs, and watch-glaffes. The former may be cut ont of broken retorts and receivers with a fimall hot iron.

Glafs tubes of different fizes, and a fpirit lamp for bending them.

Glafs and porcelain rods and fpoons for itirring acids, \&c.
Jars of glafs and earthen ware, with grooves round the top, for luting them clofely from the air. Thefe fhould be ufed for containing falts in cryftals.

Ruled paper for labels; copal varni:h to cover the fame,
to keep off the dampnefs and fumes of acids.
Sheets and wires of different metals.
Silk and thread of different ftrength.
Stands inade of wood or rufhes, for fupporting veffels with round bottoms.

Iron ladles of different fizes.
Hammers, fhears, and plyers.
Corks, bladders, and fponge.
Tongs of various forms.
Files, diamond, and magnet.
Lutes, linen, cloth, and tow. See Lute.
The following philofophical apparatus;
Air-pump for condenfing and exhaulting.
Syringes, microfcope, and burning lens.
Electric machine and Galvanic apparatus.
Zinc plates and wire, for minor experiments.
Hydroftatic balance and hydrometer.
We fhall conclude this article with a lift of the chemical fubftances neceffary to be kept in a chemical laboratory. Thefe are divided into wet and dry fubitances. The firt of thefe muft, of neceffity, be kept in well-ftopped hottles. The latter fhould alfo be kept in bottles, the necks of which fhould be wider than thofe for liquids.

Subftances in common ufe fhould be kept in larger quantity than thofe which are kept as mere fpecimens, or only ufed occafionally and in fmall quantity.

> Liquids in common Ufe.

Sulphuric acid, pure.
Nitric acid, pure.
$\longrightarrow$, common.
Muriatic acid, pure.
Acetic acid.
Water faturated with ammonia.
Solution of potafh.
carbonat of potafh.
potafh.
--. fuper-carbonat of potafh.

- foda, and carbonat of foda.
carbonat of ammonia.
Lime water.
Diftiled water.

Alcohol, pure.
-, common.
The bottles in which the above are kept fhould hold from a pint to a quart each.
After a change of temperature in the air from cold to hot, we find at the tops of bottles, about the flopper, a quantity of the liquid which has dittilled up to the Ropper, and been forced out by the expanfion of the air in the bottle. This is very troublefome, efpecially with acids, and may be remedied by giving to the mouth of the bottle a flight funnel fhape, which forms a recefs for the liquid.
The following are the dry fubitances in common ufe.
Oxyd of mangancfe, and common falt.
Filings and rods of iron, tin, zinc, copper, and lead.
Chalk and powdered marble.
Quick lime, pipe clay, and fand.
Magnefia, common and calcined.
Sulphurets of potafh, iron, and lime.
I linglafs and nutgalls.
Brazil wood and turmeric.
Calcined platter of Paris, and bone athes.
Black flux and white flux, See Flux.
Charcoal powder and faw-duft.
Sulphat of lead, as a body for lutes.
Nitre in cryitals.
Borax and alum.
The following are bodies in folution, ufed as tefts and kept in fmall quantities, in bottles from one to two ounces in fize. The bottles fhould be flaped at the mouth as above recommended, and the dianeter fhould be half the height in the cylindric part.

Oxymuriat of mercury. Phofphat of foda.

| Fluat of potafh. |
| :--- |
| ammonia. |
| Borat of foda. |
| Carbonat of potafh. |
| $\quad$ foda. |

Acetat of potalh.
———barytes.
—_frontian. alumine. -_ filver. --C copper Oxyacetat of iron.
Oxalat of foda and ammonia. Succinat of ammonia. Tartrat of ammonia. Pruffiat of potafh and iron. lime and iron.
Pure gallic acid in alcohol. Infufion of galls in alcohol. - of litmus.

Acetic acid, pure.
Hydrofulphuret of potah.

The following fubftances fhould be kept in the folid ftate, and free from the contact of air and moiture:
Sulphat of iron kept in alcohol.
Muriat of lime.
Oxymuriat of potafh.
Barytic earth.
Strontian earth, and all purc earths.
Pure potafh.

- Coda.

Potaffum and fodium, kept in naphtha. See Porassiex and Sodies.

Sulphurets of potafh, iron, and lime.
Phofphuret of lime.
Phofphorus.
Pyrophorus.
It is alfo proper that the chemift fhould poffefs as great a varicty of all the known chemical bodies as polible, both fimple and compound. They are worth poffefing even as a matter of curiofity. But they will be highly valuable in giving a familiar knowledge of the different fubltances which the experimentalift may expect to mect with, and enable hira to diftinguifh them from what may be new.

Laboratory of an Ho/pitah, is a place where the chemical, \&c. remedies are made up.
Laboratory, in a Camp, is a tent were the fire-workers and bombardiers prepare their works, drive their fufees, fix their fhells and carcafes, make quick-match, \&c.

LABORDE, M. DE, in Bicgraphy, author of an ample and comprehenfive work, entitled "Eflai fur la Mufique, ancienne et moderne," publifhed at Paris 1780 , in four vols. 4to. The accumulation of curious materials for this publication is fuch, as nothing but a long and unwearied diligence could amafs. It has, however, frequently giver us much concern, in confulting this work, to fee the fipirit of fy ftem operate fo ftrongly on the author, as to affeet both his candour and confiltence. The critique upon mufical writers in the third volume, feems only a vehicle for general cenfure of all that have not fubfcribed to the fundamental bafe of Rameau, the triple progreflion of the Abbé Rouffier, and praife of all that bave. There is no middle ftate, no mufic or mufical merit of any kiad, theoretical or practical, unfanctioned by thefe dogmas. But will M. de Laborde venture to affert, or can he even believe, that till thepublication of Ramenu's "Syftème de la Baffe fondamentale," and the Abbé Rouffier's "Memoire fur la Mufque des Anciens," there was no good mufic in the world, or that all which has been produced fince, by innumerable great mafters in feveral parts of Europe, who never ftudied or heard of either, is execrable? That there are great method and merit in the fyltems of both thefe theorilts, no candid judges of the fubject will deny; and perhaps there are few who will not grant that the principles of harmoay have not been formed into a code, equally luminous and ufeful to ftudents, by any other writers, and yet will not fhut their ears to all mufic not built upon their principles. The inconfiftency of individually praifing Italian compofers in fuch glowing terms, and yet feizing every opportunity to cenfure and fneer at Italians and foreigners in genzral, prove thework to have been compiled by perfons of different principles. What a coil is made (v.iii. p. 690.) about a fharp. fifth ufed merely as an appoggiatura, or note of tafte, with. which the bafe or harmony has nothing to do, and which, therefore, has no effect on the modulation! And yet M. de Laborde can bear the quinte fuperflus, and have patience to give a rule for its ufe in compofition! Can any one fincerely praife the compofitions of Piccini, Sacchini, and Paefiello, who is difgufted by thofe happy licences, in which the wery foul of Italian mufic confifts?
M. de Laborde gives us his mufical creed in pretty plain. terms, (v. iii. p. 639.) in anfwerto a remark of Mr. Jamard, who expreffes his furprife, that "the Italans, without any formal fyttem, compofe better mufic than the French, who are in polfeffion of the true prisciples of harmony." This. M. de Laborde is fo far from granting, that, on the contrary, he is certain the French mufic, with refpect to counterpoint, is infinitely fuperior to the Italian; and that the Italians fur-
pale the French in nothing but dramatic mufic, which is not like other mufic, fubfervient to the laws of counterpoint!"We will allow," continues he, "that the Italians are fuperior to us in melody; but they in return mult granc, that with refpect to barmony we write in a manner fuperior to them in correctnefs, purity, and elegance.". What! fuperior to Leo, Féo, Durante, Abos, Jomelli, Caffaro, aud Manna? But neither melody nor harmony, alone, can conftitute good mufic, which conlifts in the union of both; and melody without harmony, or harmony without melody, is as imperfect as a man with one arm, or one leg, to whom nature has originally given two.

With refpect to all the feuds and contentions lately occafioned by matic in France, they feem to have annihilated the former difpolition of the inhabitants to receive delight from fuch mufic as their country afforded. There are, at prefent, certainly, foo many critics, and too few hearess with a dif. pofition to be pleafed in France, as well as elfewhere. We have feen French and German foi-difant commificurs liften' to the molt exquifite mufical performance, with the fame fang-froid as an anatomitt attends a diffection. It is all analyfis, calculation, and parallel; they are to be wife, not pleafcd. Happy the pcople, however imperfect their mufic, if it gives them pleafure! But when it is an eternal object of difpute; when each man, like Nebuchadnezzar, fets up his own peculiar idol, which every individual is to fall down and worflip, or be thrown into the fiery furnace of his hatred and contempt, the bleffing is converted into a curfe.

LABOUR, in Agriculture, the work which is neceffary to be performed upon a farm, in order to render it fruitful and productive. It is of various kinds, and for the molt part either performed by hired fervants or day labourers. Where proper attention is paid by the farmer, to fee that the labourer underftands his bufinefs, \&c. agricultural labour is probably, in general, beit done by the piece; or what in fome places is termed tank-work. The expence or price of labour varies conliderably in different diltricts, from particular circumftances ; fuch as the fituation, the fate of manufactures, the condition of agriculture, the facility of getting employment, and the manner of living. See LaBOƯRER.

In the Survey of the County of Middlefex, it is ftated, that agriculture may very properly be confidered as the art of manufacturing the foil, and unqueitionably ranks the liigheft in the clafs of manufactures ; fince it not only makes a greater return for the labour beltowed, than all the relt put together, but it is alfo of the firlt necelfity, the demands for its products being urgent and irrefiltible. Any other manufactory, Mr. Diron remarks, may be laid down at pleafure, but agriculture mult be fupported, as it is the hinge upon which both our lives and actions turn; and the ultimate and only certain refource of the itate, both for men and money.

In the above point of vicw the feed-grain, amounting to about 155 , an acre, may be faid to conititute, according to the writer of the Survey of the County of Middlefex, the raw material. When the corn and ftraw, produced from this feed, are dreffed and fent to market, the greater part of it is then fit for confumption, and may be called a finifhed manufacture, The additional value above 15 s . is entirely the produce of labour, at leaft, in a conjunction with the affittance of nature; but as not one fhilling could be procured for the natural products of the world, without the application of labour, the whole may therefore be faid to be derived from labour; and amounts to about $9 / .5$ s. an acre, or 1233 l. per cent. on the coft of the raw material. Wheat is Still farther manufactured into bread; but, exclufive of
the operations of the miller and the baker, this is certainls not above the average for the produce of the arable land of this county ; and fome parts of Surrey, Kea*, and Effex, yield in the fame proportion. The raw material, on an average of the arable of the whole of South Britain, amounts to about 16 s - per acre, which is increafed in value by labour to 5\%. or $525 \%$ per cent. Hence the labour beltowed on fifteen millions three hundred thoufand acres, produce a return of $64,260,0001$. fterling.

And the cattle and implements may, it is fuppofed in a manufacturing point of view, be deemed the thock ; the amount of which, on the meadow-land in this county, is about 41 . an acre, and the produce 10l. The labour and profits of ftock, therefore, are $150 \%$ per cent. On a farm purcly arable in this county the bock would be 5l. and the produce $10 l$. or $100 \%$. per cent. There are not any grazingfarms in the county; if there were, their flock would be greater, and they would not yield fo large an increafe. The farming capital of South Britain is 5l. an acre, or 200 millions; anc its annual produce is about 130 , that is, 65 per cont.

He particularizes the annual produce of the foil in this way:
The arable lands, as before itated, - $164,260,000$
The hop-gardens make returns to the amount of $30 l$. an acre, for the produce of labour, or about
$1,000,000$
Nurfery grounds produce upwards of $65 \%$ per acre. Deduct the raw material, and the procuce of labour will not be lefo than $60 \%$. on 10,000 zeres, is

600,000
The fruit and kitchen-gardens are the mott valuable refources for labour, and make the greatelt return, probably to upwards of iool. per acre, on an average of Great Britain; but he only eftimates them at that fum on 50,000 acres, is

5,000,000
The grafs land and cider counties, cultivated in South Britain, make returns to the amount of $3 l$. on twenty millions of acres,
is

$$
£_{4}, 260,000
$$

$$
60,000,000
$$

The commons, eight millions, at is. $3 \%$ an acre

$$
500,000
$$

Total
$2131,360,000$

It is not prefumed to offer the foregoing ftatement, as one that cither is, or can be made out wih accuracy and precifion. But, under all the circundtances of the cafe, it may, it is believed, be fairly ftated, that the anntial agricultural produce of South Britain is not lefs than one hancred and thirty millions; which mult be allowed to furpafs all other manufactures that can be brought into competition wi:h.it, not only as to the grofs amount, but alfo as to its fuperior ufefulnefs.

And if it be further fuppofed, that there are two millions and a half of perfons employed in agriculture, their average earnings will be, for men, women, and children of all ages, $52 l$. which is a fum fo much exceeding their expences, that It is evident this employment mutt enrich lociety; and it is equally clear, that it contributes at once its furplas, wealth, and population, to make up the deficiencies of the ather departments both in men and moncy. This furely places the importance of rural labour in fuch a point of view, as fhould urge the cultivation of as much land of the kingdom as poffible.

Lamoer,

Labour, in a general fenfe, imports the exertion of human itrength in the performance of any kind of work.

The annual labour of every nation, fays 1)r. Smith in his "Inquiry into the Nature and Caufes of the Weath of Nations," (vol. i.), is the fund, which originally fupplies it with all the necelfaries and conveniences of life, which it annually confumes, and which confift always, either in the immediate produce of that labour, or in what is purchafed with that produce from other nations. As this produce, or its value in purchafe, bears a greater or a fmaller proportion to the number of thofe who are to confume it, the nation will be better or worfe fupplied with all the neceflaries and conveniences for which it has occation. This proportion, in every nation, is regulated by two circumftances, viz. the Akill, dexterity, and judgment with which its labour is gene. rally applied, and the proportion which the number of thofe who are employed in ufeflel labour, bears to that of thofe who are not fo emplojed. Whatever be the foil, climate, or extent of territory of any particular mation, the abundance or fcantinefs of its annual fupply mutt, in that particular fituation, depend upon thefe two circumftances; and chielly upon the former of them, which las ferved to improve the productive powers of labour. This improvement has very materially depended on the divifion of labour, as we may illiftrate and evince by a fingle example taken from a manufacture, that is, on the firft view of it, very trifling; viz. that of pin-making. A workman, not educated to this bufinefs, (which the divifion of labour has rendered a diftinct trade), nor acquainted with the ufe of the machinery employed in it, (to the invention of which the fame divilion of labour has probably given occafion), could fcarcely, with his utmolt indultry, make one pin in a day, and certainly could not make twenty. But as the bufinefs is now condueted, not only the whole work is a peculiar trade, but it is divided into a number of branches, confirting, for the molt part, of peculiar trades. One man draws out the wire, anctber firaightens it, a third cuts it, a fourth points it, a Efth grinds it at the top for receiving the head; and the making of the head requires two or three diftinct operations; the putting of it on is a peculiar bufinefs, and the whitening of the pirs is annther; the putting of them into the paper is a trade by itfelf. Thus the important bufineis of making a pin is divided into about 18 diftinet operations, which, in fome manufactories, are all performed by diltinet hands, though in others, the fame man will fometimes perform two or three of them. Dr. Smith mentions a fmall manufactory of this kind, where 10 men only were employed, and where fome of them confequently performed two or three diltinct operations. But though they were poor, and their machinery indifferent, they could, with exertion, make among them 22 pounds of pins in a day; each pound confinting of upwards of 4000 pins of a middling fize; thefe 10 perfons could therefore, among them, make upwards of 48,000 pins in a day; fo that each perfon might be confidered as making 4800 pins in a day. But if they had all wrought feparately and independently, and without having been previoully edueated to this peculiar bufinefs, they certainly could not each of them have made 20 , perhaps not one pin a day ; that is, certainly, not the two hundred and fortieth, perhaps not the four thoufand eight hundredth part of what they are at prefent capable of performing, in confequence of a proper divifion and combination of their different operations. This exemplification is applicable, in a certain degree, and with fome modifications, to other arts and manufactures; and it fhews that the divifion of labour, as far as it can be introduced, occafions, in every art, a proportionable increafe of the productive powers of labour. The feparation of dif-
ferent trades and employments from onc another, fecms to have taken place in cosifequence of this advantage. The great increafe in the quantity of work, which, in confequence of the divifion of labour, the fame number of people are capable of perforining, is owing to three different circumflances; forl?, to the increafe of dexterity in every particular workman; fecondly, to the faving of the time which is commonly loft 10 pating from one fpecies of work to another; and luflly, to the invention of a great number of machines which faciliate and abridge labour, and erable one man to do the work of many. This invention and introduction of nachinery feem th have been originally owing 10 the divifion of labour. Of machines confiructed for abridging and expediting labour, many have been devifed by common workmen, who have been employed in fome very fimple operation, and whofe attention has been wholly cirected to an ealy and ready method of performing it. Many improvements have alfo been made by the ingenuity of the makers of the machines, when the conftruction of them became the bufinefs of a particular trade; and fome by that of thofe who are called phlofophers and men of freculation, whofe obfervation has enabled them to combine together the powers of the moft diftant and diffimilaz ebjects. in fub-divition of employment in philufuphy, as well is in every other butinefs, has taken place among perfons of this defcription ; in confequence of which dexterity is improved, and time is faved. Each individual, appropriating to himfeif a particular branch, performs more work upon the whole, and contributes in a confiderable degrec to augment the quantity of fcience. It is the great multiplication of the productions of all the different arts, in confequence of the divifion of labour, which occafions, in a well-governed fociety, that univerfal opulencewhich extends itfelf to the loweft ranks of the people. Every workman has a great quantity of his own work to difpofe of beyond what he himielf has occafion for; and every other workman being exactly in the fame fituation, he is enabled to exchange a great quantity of his own goods for a great quantity, or, which comes to the fame thing, for the price of a grat quantity of theirs. He fupplies them abundantly with what they have occalion for, and they accommodate him amply with what he has occafion for; and a general plenty diffufes itfelf through all the different ranks of the fociety.

The divifion of labour, from which fo many advantages are derived, is not originally the effect of human wifdom, which forefees and intends that general opulence to which: it gives occafion. It is the neceflary, though very flow andgradual, confequence of a certain propenfity in humannature which has in view no fuch extenfive utility ; the propenfity to truck, barter, and exchange one thing for another. As it is the power of exchanging that gives occafion to the divilion of labour, fo the extent of this divifion mult always be limited by the extent of that power, or, in other words, by the extent of the market. When the market is very fmall, no perfon can have any encouragement to dedicate himfelf entirely to one employment, for want of the power to exchange all that furplus part of the produce of his labour, which is over and above his own confumption, for fuch parts of the produce of other men's. labour as he lias occafion for This leads us to obferve, that by means of water-carriage a more extenfive market is opened to every fort of indultry, than what land-carriage alone can afford it; fo it is upon the fea-coaft, and along the banks of navigable rivers, that induftry of every kind natisrally begins to fubdivide and improve itfelf; and it is frequently not till a long time after that thefe improvements extend themfelves to the inland parts of the country. If we

## LABOUR.

advert to fact, we fhall find, that the nations which appear to have been firt cultivated, were thofe that occupied the countries around the coaft of the Mediterranean fea. And of all thefe countries, Egypt feems to have been the firf, in which either agriculture or manufactures were cultivated and improved to any confiderable degree. Upper Egypt extends itfelf no where abeve a few miles from the Nile, and in Lower Egypt this great river breaks itfelf into many different canals, which, with the affiltance of a little art, feem to have afforded a communication by water-carriage, not only between all the great towns, but between all the confiderable villages, and even to many farm-houfes in the country; much in the fame manner as the Rhine and the Maefe do in Holland at prefent. The extent and facility of this inland navigation, was probably one of the principal caufes of the early improvement of Egypt. The fame obfervation is verified by extending our views to the provinces of Bengal in the Eaft Indies, and to fome of the eattern provinces of China, where the Ganges and other great rivers, with a multitude of canals, formed an inland navigation favourable to internal commerce, long before foreign commerce was much, if at all, regarded; the cafe is very different with refpect to the inland parts of Africa; and all that part of Afia, which lies at a confiderable diltance N . of the Euxine and Cafpian feas, the ancient Scythia, the modern Tartary and Siberia, which in all ages of the world feem to have been in the fame barbarous and uncivilized ftate in which we find them at prefent. See Canal, Commerce, and Navigation.

When the divifion of labour firft began to take place, the power of exchanging, upon which it chiefly depended, muft frequently have been very much clogged and embarraffed in its operations. In order to avoid part, at leaft, of the inconvenience refulting from this thate of fociety, every prudent man, in every period of fociety, after the firft divilion of labour, mult naturally have endeavoured to manage his affairs in fuch a mamer, as to have at all times by him, befides the peculiar produce of his own induftry, a certain quantity of fome one commodity or other, fuch as he imagined few people would be likely to refure in exchange for the produce of their induftry. Many different commodities, it is probable, were fucceffively both thought of and employed for this purpofe. In the rude ages of fociety, cattle are faid to have been the common inftrument of commerce. Thus we find, according to Homer, that the armour of Diomede cost only nine oxen; but that of Glaucus coft 100 oxen. Salt is faid to be the common medium of commerce andexchanges in Abyffinia; a fpecies of thells in fome parts of the coalt of India; dried cod at Newfoundland; tobacco in Virginia; fugar in fome of our Weft India colonies; hides or drefled leather in fome other countries; and Dr. Smith mentions a village in Scotland in which it was not uncommon for a workman to carry nails inftead of money to the baker's shop or the alehoufe. Metals, however, have been preferred for this purpofe to every other commodity ; and different metals have been appropriated by different nations to this ufe. See Cons and Moxey.

After the divifion of labour has been once thoroughly eflablineed, it is but a very fmall part of the neceflaries and conveniences of life with which a man's own labour can fupply him. The far greater part of thefe he mult derive from the labour of other people; and he mult be rich or poor according to the quantity of that labour which he can command, or which he can afford to purchafe. The value of any commodity, therefore, to the perfon who poffeffes it, and who means not to ufe or confume it himfelf, but to exchange it \{or other commodities, is equal to the quantity of
labour which it enables him to purchafe or command. La bour, therefore, is the real meafure of the exchangeable value of all commodities. This, however, is not the meafure by which their value is commonly eftimated. It is ofsen difficult to afcertain the proportion between two different quantities of labour. The time fpent in two different furts of work will not always alone determine this proportion. The different degrees of hardhip endured, and of ingenuity exercifed, muft likewife be taken into account. But it is not eafy to find any accurate meafure either of hardihip or ingenuity. Hence it happens, that every commodity is more frequently exchanged for, and thereby compared with, other commodities than with labour. When barter ceafes, and money has become the conmon inftrument of commerce, every particular commodity is more frequently exchanged for money than for any other commodity. Neverthelefs, labour alone, never varying in its own value, is the ultimate'and real itandard by which the value of all commodities can at all times and places be eltimated and compared. It is their ,eal price ; money is their nominal price only. But though equal quantities of labour are always of equal value to the labourer, yet to the perfon who employs them, they appear fometimes to be of greater and fometimes of fmaller value. He purchafes them fometimes with a greater and fometimes with a fmaller quantity of goods, and to him the price of labour feems to vary like that of all other things. It appears to him dear in the one cafe, and cheap in the other. In reality, however, it is the goods which are cheap in the ore cafe, and dear in the other. In this popular fenfe, therefore, labour, like commodities, may be faid to have a real and a nominal price. Its real price may be faid to confirt in the quantity of the neceffaries and converiences of life which are given for it; its nominal price, in the quantity of moneyThe labourer is rich or poor, is well or ill rewarded, in proportion to the real, not to the nominal price of his labour.

The real value of all the different component parts of price, fays Dr. Smith, is meafured by the quantity of labour, which they can, each of them, purchafe or command. Labour meafures the value, not only of that part of price, which refolves itfelf into labour, but of that which refolves itfelf into rent (of land), and of that which refolves itfelf into profit. In every fociety the price of every commodity refolves itfelf into fome one or other, or all, of thefe three parts; and in every improved fociety, all the three enter, more or lefs, into the price of the far greater part of contmodities. In the molt improved focieties, however, there are always a few commoditics of which the price refolves itfelf into two parts only, the wages of labour and the profits of flock; and a ftill fmaller number, in which it confilts altogether in the wages of labour.

The produce of labour conftitutes the natural recompence or wages of labour. In that original ftate of things, which precedes both the appropriation of land and the accumulation of fock, the whole produce of labour belongs to the labourer; as he has no landlord or malter to fhare with him. If this ftate had continued, the wages of labour would have augmented with all the improvements in its productive powers, to which the divifion of labour gives occafion. All things would gradually have become cheaper. They would have been produced by a fmaller quantity of labour; and as the commodities produced by equal quantities of labour would naturally in this ftate of things be exchanged for one another, they would have been purchafed likewile with the produce of a fmaller quantity. But this original flate of things, in which the labourer enjoyed the whole produce of his own labour, could not latt beyond the firit introduction of the appropriation of land and the accumulation of ftock.

## LABOUR.

As foon as land becomes private property, the landlord demands a fhare of almolt all the produce which the labourer can either raife, or collect from it. His rent makes the firtt deduction from the produce of the labour which is employed upon land. A fecond deduction is made by the profit accruing from the produce of the labour that has been fo employed. The produce of almoft all other labour, in all arts and manufactures, is liable to the like deduction of profit. What are the common wages of labour, depends every where upon the contract ufually made between the two partics, to whom belong the profits of flock, and the wages of labour; and the interefts of thefe parties are by no means the fame. The workmen defire to get as much, the mafters to give as little, as poffible. The former are difpofed to combine in order to raife, the latter in order to lower, the wages of labour. The mafters commonly fucceed; for being fewer in number, they can more eafily combine; and befides, the law authorizes, or at leaft does not prohibit, their combinations, while it prohibits thofe of the workmen. But though in difputes between mafters and workmen, the furmer mult generally have the advantage, there is, however, a certain rate, below which it feems impoffible to reduce, for any confiderable time, the ordinary wages even of the loweft fpecies of labour. The wages of a labourer mult at leaft be fufficient to maintain him; and indeed, on moft occafions, they ought to be fomewhat more; otherwife it would be impoffible for him to bring up a family, and the race of fuch workmen could not laft beyond the firt generation. There are certain circumftances, which fometimes give the labourers an advantage, and enable them to raife their wages confiderably above the rate already fecified; which is evidently the loweft that is confiftent with common humanity. When in every country the demand for thofe who live by wages; labourers, journeymen, fervants of every kind, is continually increafing; when every year furnifhes employment for a greater number than had been employed the year before, the workmen have no occafion to combine in order to raife the wages. The fcarcity of workmen occafions a competition among matters, who bid againft une another, in order to get workmen, and thus voluntarily break through the natural combination of mafters not to raife wages. This demand for thofe who live by wages, it is evident, cannot increafe but in proportion to the increafe of the furds, which are deftined for the payment of wages: thefe funds are of two kinds : firft, the revenue which is over and above what is neceffary for the maintenance; and fecondly, the flock which is over and above what is neceffary for the employment of their mafters. The demand for thofe who live by wages, therefore, neceffarily increafes with the increafe of the revenue and ftock of every country, and cannot poffibly increafe without it. The increafe of revenue and fock is the increafe of nàtional wealth. It is this continual increafe, and not the whole amount, of national wealth, which occafions a rife in the wages of labour. Accordingly, it is not in the richeft countries, but in the moft thriving, or in thoie which are growing rich the fafteft, that the wages of labour are the higheit. England is, without doubt, a much richer country than any part of North America ; yet the wages of labour are much higher in. North America than in any part of England. Although North America is not yet fo rich as England, it is more thriving, and advancing with greater xapidity to the further acquifition of riches. The molt decifive mark of the profperity of any country is the increafe of the number of its inhabitants. In Great Britain, and in moft other European countries, they are not fuppofed to double in lefs than 500 years. In North America, it has been found, that they double in 20 or 25 years. Labour is
: Vol. XX.
there fo well rewarded, that a numerous family of clitdren, inftead of being a burthen, is a fource of opulence and profperity to the parents. The labour of each child, before it can leave their houfe, is computed to be worth $100 /$. clear gain to them. The value of children is evidently the greateft of alf encouragenents to marriage. In North America the people generally marry very younc; ; and notwithtanding the great increafe occafioned by fuch carly marriuges, there is a continual complaint in that country of the icarcity of hands. The demand for labourers, the funds deltived for maintaining them, increafe, it feems, ftill falter than they can find litbourers to employ. Another circumitance deferves to be mentioned, viz. that the price of provifions is every where in North America much lower than in England, fo that a family can be maintained at a much cheaper rate. Upon the whole, if the money price of labour be higher there than it is here, its real price, the real conmand of the neceflarics and conveniences of life which it conveys to the labourer, mult be higher in a fill greater proportion. The liberal reward of labour, as it is the neceflary effect, fo it is the natural fymptom of increafing wealth. The fcanty maintenance of the labouring poor, on the other hand, is the natural fymptom, that things are at a fand, and their flarving condition that they are going falt backwards. The liberal reward of labour, as it is the effect of increafing wealth, is alfo the caufe of increafing population.

It deferves to be remarked, that it is in the progreffive ftate, while the fociety is advancing to the further acquilition rather than when it has aequired its full compliment of riches, that the condition of the labouring poor, of the great body of the people, feems to be the happieft and the molt comfortable. It is hard in the ftationary, and miferable in the declining ftate. The progreffive flate is in reality the chearful and the hearty ftate, to all the different orders of the fociety. The ftationary is dull, the declining melancholy. The liberal reward of labour not only encourages the propagation, but it increafes the induftry of the common people. Where wages are high, we fhall always find the workmen more diligent, active, and expeditious, than where they are low: in England, for example, than in Scotiand; in the neighbourhood of great towns than in remote country places. Some workmen, however, when they can earn in four days what will maintain them through the weck, will be idle the other three. But this is by no means the cafe with the greater part. Workmen, on the contrary, when they are liberally paid by the piece, are very apt to overwork themfelves, and to ruin their health and conftitution in a feiv years. Dr. Smith obferves, that if mafters would always Liften to the dictates of reafon and humanity, they have frequertly occafion rather to moderate than to animate the application of many of their workmen: and it will bo found, he fays, in every fort of trade, that the man who works.fo moderately, as to be able to work contantly, not only preferves his health the longef, but, in the courfe of the year, executes the greatell quantity of work.

Although the variations in the price of labour notonly donot always correfpond with thofe in the price of provifions, but are frequently oppofite, we mult not, upon this account, imagine that the price of provifions has no influence upon that of labour. The money price of labour is neceffarily regulated by two circumftances; the demand for labour, and the price of the neceffaries and conveniences of life. The former determines the quantity of the latter which mult be given to the labourer; and the monev price of labour is determined by what is requifiie for purchating this quantity. Though the money price of labour, therefore, is fometimes high, where the price of provifions is low, it would be fill R
higher,
higher, the denand continuing the fame, if the price of provifions were high. It is becaufe the demand for labour ino creafes in years of fudden and extraordinary plenty, and diminifhes in thofe of fudden and extraordinary feareity, that the money price of labour fometimes rifes in the one and finks in the other. 'L'he increafe in the wages of labour neceflarily increafes the price of many commodities, by increating that part of it which refolves itfelf into wages, and fo far tends to diminifh their confumption both at home and abroad. The fame caufe, however, which raifes the wages of labour, the increafe of fuck, tends to increafe its productive powers, and to make a fmaller quantity of labour produce a greater quantity of work. The owner of the itock, which employs a great number of labourers, neceffarily endeawours, for his own advantage, to make fuch a proper divifion and diftribution of employment, that they may be enabled to produce the greateft quantity of work poffible. For the fame reafon, he endeavours to fupply them with the beft machinery which he or they can think of. There are many commodities, which, in confequence of thefe improvements, are produced by fo much lefs labour than before, that the increafe of its price is more than compenfated by the diminution of its quantity.

Labour is diftinguifhed by Dr. Smith into productive and unproductive: the former is that which adds to the value of the fubject upon which it is beftowed; the latter is that which has no fuch effect. Thus, the labour of a manufacturer adds, generally, to the value of the materials upon which he works, that of his own maintenance, and of his mafter's profit. The labour of a menial fervant, on the contrary, adds to the value of nothing. 'Though the manufacturer has his wages advanced to him by his natter, he, in reality, cofts him no expence, the value of thefe wares being generally reftered, together with a profit, in the improved value of the fubject upon which his labour is bettowed. But the maintenance of a mowial fervant never is reflored. A man grows rich by employing a multitude of manufacturers ; he grows poor by maintaining a multitude of menial fervants. The lakour of fome of the molt refpectable orders in the fociety, is, like that of menial fervants, unproductive of any value, and does not fix or realize itfelf in any permanent fubject, or vendible commodity, which endures after the Jabour is paft, and for which an equal quantity of labour could afterwards be procured. The fovereign, for example, with all the officers, both of juftice and war, who ferve under him, the whole army and navy, are unproductive labourfrs. They are the fervants of the public, and are maintained by a part of the znnual produce of the induftry of other people. Their fervice, how honourable, how ufeful, how neceflary foever, produces nothing for which an equal quantity of fervice can afterwards be procured. The protection, fecurity, and defence of the commonwealth, the effect of their labour this year, will not purchafe its protection, fecurity, and defence for the year to come. Ja the fame clafs mult be ranked fome both of the gravell and mof important, and fone of the molt frivolons profeffions: churchmen, lawyers, phyficians, men of letters of all kinds, players, buffoons, mulicians, opera-fingers, opera-dancers, $\& \mathrm{c}$. like the declamation of the actor, the harangues of the orator, or the tune of the mufician, the work of all of them perifines in the very inftant of its production. Both productive and unprocuctive labourers, and thofe who do not labour at all, afe all equally maintained by the annual produce of the land and labour of the country. This produce has certain limits; and according as a fmaller or greater proportion of it is in any one year employed in maintaining unproductive hands, the more in the one cale and the lefs in the other will remain for
the productive, and the next year's produce will be greater or finaller accordingly ; the whole annual produce, if we except the fpontancons productions of the earth, being the effect of productive labour. This produce naturally divides itfelf into two parts: one of thefe parts, and frequently the largelt, is deftined for replacing a capital, or for renewing the provilions, materials, and finifhed work, which had been withdrawn from a capital ; the other for conltituting a revenue either to the owner of this capital, as the protit of his flock, or to fome other perfon, as the rent of his land. This is the cafe with refpect both to the produce of land and of a great manufactory. The part of the annual produce of the land and labour of any country, which replaces a capital, never is immediately employed to maintain any but productive hands; it pays the wages of productive labourers only. That which is immediately deftined for conilituting a revenve either as profit or as rent, may maintain indifferently either productive or unproductive hands. The rent of land and the profits of tlock are every where the principal fources from which umproductive hands derive their fubfiltence. And, therefore, the proportion betwcen the productive and unproductive hands ilepends very much upon the proportion between that part of the annual produce, which, as foon as it comes from the ground or from the hands of the productive labourer, is deftined for replacing a capital, and that which is deftined for conftituting a revenue, either as rent or as profit. The latter part is not only much greater in rich than in poor countrie, but bears a much greater proportion to that which is immediately dettined for conitituting a revenue, either as rent or as profit. The funds deltined for the maintenance of productive labour are not only much greater in the former than in the litter, but bear a much greater proportion to thofe which, though they may be employed to maintain either productive or unproductive hands, have generally a predilection for the latter. The proportion between thefe different funds neceffarily determines in every country the general character of the inhabitants as to indultry or idlenefs* The proportion between capital and revenue feems every where to regulate the proportion between indultry and idlenefs. Wherever capital predominates, indultry prevails: wherever revente, idlenefs. Every increafe or diminution of capital, therefore, naturally tends to increafe or diminilh the real quantity of induftry, the number of productive hands, and confequently the exchangeable value of the annual produce of the land and labour of the country, the real wealth and revenue of all its inhabitants. See on this fubject Smith's Caufes of the Wealth of Nations, paffim.

Ladoun, in Midaiffry. By the tern labour is, meant the aft of detruding a foetus or child from the uterus; and during the time this procefs is going on, the woman is faid to be in labour. The exertion or efforts ufed by the woman, or any other animal, in effecting the expultion of the fectus, are called labour pains, or throes, a Saxon word, meaning fuffering or enduring.

Labour pains return at intervals of longer or fhorter duration. In the commencement of labcur, the pains only recur once in an hour or two ; but as the labour advances, the return of the pains becomes more frequent; and at length they are alinoit continual, one pain being fcarcely finifhed when another begins: but in this there is a great variety, not only in different women, but in the fame woman in fubfequent labours.

The immediate or exciting caufe of labour is the exiftence of a feetus, with its placenta and membranes, in the uterus, now ripe, and fit for exclution.

Phytiologitts have in vain attempted to explain why the uterus

## LABOUR.

werus fhould bear the burthen of the orum until the contained foctus has arrived at jts maturity, and fhould then attempt its expulfion. The moft general and prevailing 'opinion has been, that the foctus having acquired fufficient fize and ftrength, and fiuding itfelf preffed upon, and ftraightened, it labours to free itfelf from its confinement, and that the pains are occafioned by its kicking againtt the lides and fundus of the uterus. But as pains equally ftrong are excited to expel a dead as a living foctus, or to force away the placenta after the birtio of the child, and as the eggs of oviparous animals are excluded by timilar efforts, it is plain the foctus is paffive in the bufinefs.

If the bulk of the foctus was in any way inftrumental in occafioning labour, then the period of geftation would vary according as the foctus happened to be larger or fmaller, which, we know, is not the cafe; except when it is dif\&urbed by accidental circumftances, as by falls, hurts, fever, or other difeafes. To every animal there is an allotted time for utero-geftation. This law in the economy of nature is fo uniformly attended to, that even when the foctus is contained in one of the Fallopian tubes; or in a fac, in the cavity of the abdomen, at the end of nine calendar months, the time appointed for women to carry their young, exertions for its exclution are excited, in the fame manner as they would have been if it had been contained in the uterus.

When the fruit is ripe, its connection with the parent tree is gradualiy loofened, and at length it falls to the ground. When the foctus has acquired that degree of maturity it is intended to attain to in the uterus, the fibres or velfels that connect the ovum, or bag in which the foctus is contained, become loofened, and are gradually diffolved or broken; and the ovum, now an extraneous body, would, like the fruit, fall or flide through the vagina, if it were not prevented by the ftraightnefs of the paflage through which it is To pafs. It is for the fame reafon, viz that they are become extraneous bodies, that abortions of two, three, four, or more months, are excluded foon after they ceafe to live.

Labours are divided or diftinguifhed by the terms natural, preternatural, or laborious.

Labours are called naiural, when the vertex of the head of the child prefents to the uterine orifice, the face inclining towards the facrum, the hind-head towards the pubes of the mother; the fize of the head of the child being aifo fo adapted to the pelvis of the mother, that the expulfion of it may be effected folely by the powers of nature, or by the pains, and within the fpace of a few hours.

Labours are called preternatural, when any other part of the child than the head prefents to the uterine oribice, as the feet, the breech, a fhoulder, or an arm. In all thefe cafes, more or lefs of manual affiftance will be required to complete the birth.

Labours are called laborious or difficult, in which the head of the child prefents, but either in confequence of its offering in a wrong pofition, or with an ear, or the face to the uterine orifice, or on account of its difproportionate fize, or from fome difeafe in the os uteri or vagina, or diftortion of the pelvis of the mother, it cannot be brought fafely into the world, without great difficulty, or without the affiftance of initruments.

Progrefs and Managenent of a natural Labour-Two or three weeks before the completion of the term of geftation, the abdomen of the pregnant woman is obferved to fubfide, and become lefs prominent; there is a fecretion of mucus from the glands of the vagina, and perhaps from the cervix uteri. This ferves to foften and relax the paffage, and to render it more eafily dilatable. The uterns finks gradually lower into the pelvis, and the os externum is fre-
quently, from this caufe, in a fmall degree thruf outward: In fome women, flight pains, recurring every three or four hours, are excited in the courfe of this procefs; and milk flows from the breafts. Thefe preliminary fymptoms occur, but perhaps in a lefs degree, in preternatural and laborious, as well as in natural labours.

The term of geltation being completed, the fundus uteri begins to contract, and to propel the foxtus downwards, by which the labia of the os internum, called alfo os tincx, are ftretched, made thin, and at length, forced open, at firtt to the fize only of a fixpence, or fo as fearcely to admit the end of the fore-finger of the affiltant, if he fhould happen to examine the woman at this time. This advance in the labour is ufually announced by the difcharge of a thicker mucus than what had been difcharged before, and often tinged with blood, effufed probably by the fmall veffels which had contributed to conneet the membranes to the cervix uteri. This difcharge of mucus tinged with blood is by the woman called a Joecu.

Though it may be proper, and is ufually expected, that the accoucheur or midwife fhould examine into the flate of the uterus, early in labour, by palfine the fore-finger of his right hand, anointed with lard, into the vagina, in order to difcover what part of the child prefents to the os uteri, and to repeat the examination every hour or two, to afcertain the progrefs of the labour; yet having found it is the head of the child that prefents, and that there is no unnatural obftacle to the birth, he muft be careful to do this in fo gentle a manner as to give no pain to the woman; and he is on no account to attempt to haften the dilatation of the os internum, or any part of the paffage, that being only fafely to be dose by the natural pains.

By the continuance of the uterine contractions, aided by that of the diaphragm and mufcles of the abdomen, the orifice at the womb becomes more and more thin and dilated, until it is fufficiently open to admit, during the pains, a portion of the membranes, filled with the liquor amnii, or Auid in which the foctus is fufpended. This bag, which is gradually cenlarged, contributes materially in opening the uterine orifice, until it becomes fufficiently extended to admit the vertex of the head of the child, when it ufuallyburts, and the contained fluid rufhes forth generally with violence. The women call this the breaking of the swaters. and they expect the birth of the chuld will foon follow; and if the bufinefs has been entirely left to the agency of the pains, this ufually happens in the fpace of one or two hours.
After the burfting of the membranes, there is ufually a fufpenfion of the pains for the lpace of ten or fifteen minutes, when they are again rencwed, and the head of the child is forced down, until it preffes againft the perinæum and the es externum, or outward orifice. In defcending to this pofition, the head of the child makes a half turn, to bring the forehead to the facrum, the hind-head to the pubes of the mother. The perinæum of the woman becomes now fo much diftended, that the diftance from the edge or frynum of the os externum to the anus amounts to three inches, or more. The pains now become more ftrong and frequent, diftending and enlarging the os externum, until it is fufficiently opened to allow a paffage for the head of the child, which is at length forced into the world, when it is ufual to fay the head of the child is born. The pains are now again fufpended for the fpace of ten or fifteen minutes, during which time the fundus uteri gradually contracts, until it comes again into contact with the breech of the fectus. Two, three, or more pains are required so expel the fhoulders; and as many more to bring the re-

## LABOUR.

mainder of the body of the child into the world. The child being born, the woman now enjoys a degree of happinefs, of which, if it be her first child, the had never been confcions before. But her trouble is not completely over; for at the end of fifteen, twent $y$, or a few more minutes, frefh pains arife, but not fo violent as thofe the had before experimend. By thefe the placenta is gradually loofened from the uterus, and thrust down into the vagina, and at length expelled from the body.

After the birth of the child, but particularly after that of the placenta, there is a conliderable difcharge of blood, particularly from the placenta, but, principally, from the uterus. This is called the lochia, and it continues flowing, in greater or lefs plenty, for five, fix, or more days; dimimlthing every day in quantity, and becoming thinner and paler, and is at length colourlefs. This is occafioned by the gradual contraction of the veffels of the uterus, which contnues until that vifcus is reduced to nearly the fize it was before the woman conceived.

With firt children, and, in a few inflances, with fubfequent births, this contraction of the uterus goes on almolt imperceptibly to the woman, moreordinarily pains are excited, fimilar to labour pans, and are called after-pzins. As they are not attended with dayger, and qenerally fubride, and entirely ceafe by the end of three or four days, it is not often found neceffary to atempt apoeain.; them by medicines; but when they are unufudly frequent and violent, preventing fleep, they may be quieted by opening the bowels with fome purging medicine, as caltor oil, an infufion " of fenna, with fome of the neutral falts, or by an emollient and opening clyfter, and at night giving a draught with ten, fifteen, or twenty drops of the tincture of opium.
The above is the ufual progrefs of a natural labour, but there is a great variety in the number, trength, and frequency of the pains required for the expulfion of the child in different women, as well as in the time taken in completing the labour, which in fome women is effected in a few minutes, and with very litt'e pain; more ordinarily, it takes from two to fix, eight, or ten hours. In fome cales, when the pains are tardy, the term may be extended to twenty-four hours. If delayed beyond that time, the labour will be denominated laborious or difficult, as fome affitance will be required to halten the barth, left the foft parts of the mother fhould be hurt, or the itrength of the child exhaufted, by its too long continuance in a ttraightened fituation.

During the progrefs of the labour, the woman is to be allowed to be fitting, walking, or lying down, as fhe feels herfelf moft difpofed. The friends about her, and perhaps the nurfe, generally advife her to hold in her breath, and to prefs down as ftrungly as the can with every pain, and to enable her to do this, they are inceffant in offering her caudle, or other heating drinks. But thefe things are not only unneceffary, but likely to do mifchief. The accoucheur or midwife will therefore interpofe his advice. They mult take care to keep the room $\mathrm{coo}^{\circ}$, and not permit more than one or two of the friends of the woman to be in the room toge'ther. They may affure the parturient woman, that the pains are of themfelves fufficient for the expulfion of the child, and that by endeavouring to increafe their force, fhe will only unneceffarily fatigue herfelf; and that by taking warm fpiced drinks, fhe will become hot and feverifh, the parts will become more irritable and tender to the touch, whence fhe will indeed fuffer more pain, but the birth of the child, initead of being accelerated, will be retarded, and rendered mone difficult.

To affuage her thisft, if that fhould be troublefome, toant
and water, baum-tea, or any fimilarbeverage, will be much more ufeful than wine or other heating drinks.

If the is coftive, and feels uneafinefs from that caufe, an emollient and gently opening clytter may be advantageoufly adminitered. When the pains become more ftrong and frequent, and from the complaints of the woman it is apparent that the head of the child is falt defcending, it willthen be proper that the woman be laid on the bed, either on one fide or at the foot of it, according as the nurfe has ar-. ranged it. The ufual and molt convenient pofture for the soman is, that of lying on her left fide, her head and Thoulders raifed, her knees drawn up to her belly, and with her feet fupported on the knees of an affiltant, or prefling againit the bed-poit. She is now to be covered with fuch a portion of the bed-clothes, as the feafon of the year, or the temperature of the air, may feem to render neceflary. The accoucheur will fit down behind her, and taking advantage of a pain, he will introduce his fore-finger into the os externum, which, if the labour is as far advanced as has been fuppofed, he will find on the full fretch, and the perinrum much diftended. This is the only part in which the affiftant need or ought to give any manual affittance in a natural labour. It will now be his duty to endeavour, with the : greateft care and diligence, to prevent a rupture of the frenum, and of the perinæum, which may happen if the head of the child fhould be alowed to pafs into the world with too much rapidity. This diftreffing accident, which, when the rupture is confiderable, extending to the anus, is hardly remediable by any art, rarcly happens but with a firft child, nor often perhaps with firlt children, but when means have been ufed, early in labour, to accelerate the birtho. With the view of preventing it, if, on examination, the os externum and the perinæum fhall be found to be ftrongly prefled upon, and diftended during the pains, and yiclding with difficulty, the accuucheur mult ferioully admonifh the woman to moderate her exertions, affuring her, at the fametime, that the child will fpeedily be born. During the pains he mult furround the part of the head of the child which protrudes, or is in the voorld, with the fingers and thumb of his right hand, the points of them relling on the edge of the os externum. In this poftion, the end of his thumb will touch the fronum, the part likely to give way frit. If he, finds that part fo much diltended as to be in danger of burtting, he will refilt the further defcent of the head during the pain. This operation will be affilted, by keeping his left hand, covered with a cloth, firmly preffed upon the diftended perinxum. When one-half of the head of the child has, by this cautious procedure, been conducted into the world, the accoucheur will find the occiput of the child rifing upwards, turning on the pubes of the woman, and drawing the forehead and face from under the perinæum. The head of the child being born, it is ufual with midwives to draw the fhoulders and the reft of the body foon after But experience has fhewn, that it is fafer and better to wait for the return of the pains, as during the fufpenfion of them, which lafts, as has been before mentioned, fifteen or twenty minutes, the fundus of the uterus contracts and defcends until it comes again in contact with the breech of the child. By this means the finufes and veffels of the uterus are gradue ally emptied, and diminifhed in fize, whence one of the caufes of inordinate hamorrhage is removed, at the fame time the placenta is loofened and prepared for its exit. The firk two or three pains occurring after the birth of the head of the child, are ufually expended in giving a favourable turn to the fhoulders, viz. in bringing one of them to the pubes, and one to the facrum of the mother; they are then gradually forced into the world, and foon after the rell of the body

## LABOUR.

the accoucheur ufing the fame precautions in fupporting the perinzum, as has been recommended during the paffage of the head.

The child ufually announces its birth, by crying more or lefs violen!ly according to its Itrength. This ferves to open the veffels, and to facilitate the circulation of the blood through the ungs. The child may be allowed to lic fome minutes under the clothes, before feparating it from the placenta, taking care that none of the clothes lie upon its face, which might impede its refpiration. In that interval the affiftant will lay his hand upon the abdomen of the mother, which, if there flould be another child, he will find nearly as much dittended as it was in the commencement of the labour. In that cafe, it will be necelfary, having previoufly difpofed of the firlt child, that he make a ligature on the end of the funis, which hangs nut of the vagina of the woman, but he is on no account to make any effort to bring away the placenta or membranes, which are ufually found to be adherent to thofe containing the twin. As foon as the pains re-commence, which they ufually do at the end of three or four hours, (though fometimes they do not return until fix, eight, ten, or more hours,) the accoucheur will pafs the fore-finger of the right band into the os uteri, to difcover the pofition of the feetus. If the head prefents, he will conduct the labour in the manner above defcribed, but as the parts have been previourly completely opened, there will be lefs difficulty to the woman, and lefs danger of any accident happening to the perinæum. If the face, or any other part than the head of the child ghould prefent, it will be neceffary that he immediately proceed to turn the chiid, and deliver it by the feet, in the manner to be defcribed under the article Labour, Preternatural. If there fhould not be a fecond child, the abdomen, particularly the upper part of it, will be found loofe and flaccid, and the accoucheur will perceive the fundus uteri contracted to the fize of the head of a child.

The more the uterus is contracted, and the lower it is funk down in the abdomen, with fo much the greater eafe and fafety the placenta will be expelled. The affiltant will now make a ligature upon the funis umbilicalis, or navelftring, about five inches from its infertion into the navel of the child, and having done this he will, with a fharp pair of fciflors, divide the navel-ltring, about an inch beyond the ligature, leaving the other end of the funis hanging out of the vagina. Having then examined the child to lee that it is perfect, and that no blood efcapes through the ligature or the funis, he will place it in a proper receiver (a flannel cap being firft put upon its head) and deliver it to the nurfe. By this time, or foon after, the woman will have a bearing pain, preffing down the placenta, or perhaps, at firf, only forcing away a clot of blood. During this and fubfequent pains, the alfiftant will aid their effect, by drawing down the funis. If, after waiting twenty or thirty minutes, the placenta fhould not come away, he will palis his fingers, or, if neceflary, lis hand, into the vagina, until he gets hold of the placenta, and by this means he will ufually eatily extract it. It fometimes happens, though rarely, if the labour has been properly conducted, that the cervix of the uterus contracts, and prevents the defcent of the placenta, and fometimes the plasenta continues adherent to one fide, or to the fundus of the uterus, long after the birth of the child. In either cafe, the accoucheur mult pafs one of his hands, gradually and flowly up into the uterus, until it reaches the placenta, when the lingers, and by degrees the whole hand, muit be infinuated between the placenta and the uterus, until it be completely feparated; ; it mult then be brought down to the vagina, whence it will be cafily extracted by the funis.

In this cafe the difcharge of blood will be fometimes fo great, as to endang the life of the woman. This accident rarely happens but when the birth haw been improperly and prepouterouffy accelerated, by givng affillance, as it is called, in the carly part of the labour; that is, by dilating the os internum and vagina during the pains, to make room for the head of the child to come down; by giving the woman hot and ttinulating drinks to increafe the pains, and by advifing her to bear down ftrongly during the pains. As the uterus may from exhauttion have becone torpid, and not difpofed to contract, fo as to leffen the caparity or lize of the blood. veffels, large flannels wrung out of cold water, to which about a fourth part of vincegar has been pdded, fhould be laid over the aldomen, and over the os externum of the woman. Thefe applications muft be ret. wed every five or fix minute, or as often as they becom" warm, and they will ufually have the effect of ex siting ti action of the fibres of the utcrus, on which the cur: entrely depends. In the mean while the woman is to L kej, if practicable, in a quiet and eafy polture, her head onlw moderately raifed, and covered with a fingle blanket, the cucr, or one of the windows of the room being opened, and every five or fix minutes fhe fhould take a fpoo ful or twa of a mixture, confifting of fix ounces of difilile 3 water, half an ounce of fpirit of nutmegs, as much fyrup of red poppies, fifteen drops of the tincture of opium, and as much of the vitriolic acid as will make it grateful to the falate. By thefe means the heat of the body will be diminifled, and the rapidity of the circulation checked. When the pulfe, which was fcarcely to be perceived while the difcharge was violent, begins to acquire ftrength, and on examination it appears that little or no blood now flows from the vagina, the cold and wet cloths may be removed, the proper clothes may be put upon the woman, and fhe may then be placed in the bed in fuch a pofition as may be moft agreeable to herfelf.

The procefs by which a child is produced, or brought into the world, is with great propriety called labour, as it is rarcly effected without confiderable exertion, which has the ufual effect, that of exhaufting the Itrength and firits of the woman. Thefe are to be recruited in the fame manner as if the wafte had been occafoned by any other kind of exercife; viz by reft, and by taking a moderate portion of plain and fimple food at fmall intervals. In the choice of their food, the women may generally be allowed to confult their own taltes, which will rarely, at fuch times, incline them to fpiced meats, or to drinks that are heating. It will be proper that they be kept in a recumbent pofture for the firlt four or five days, only leaving their beds fo long as may be fufficient to open and refreff them. By that time the veffels of the utcrus will be fo much contracted, as to remove all danger of hamorrhage, or of an inconvenient defcent of that vifus, which is fometimes the confequence of leaving the bed tuo early. It is proper alfo, on the fecond, or at the latell, on the third day after being delivered, to procure flools, either by fuch purging medicines as have been before defcribed, or by giving a clyfter. By this means the fever which is ufuaily excited by the fecretion of the milk will be moderated. This, which is called the milkfever, is of fhort duration, lafting only three or four days, and is not attended with danger. In the cure nothing is required but to keep the body open, and to fupply the patient with diluting driaks, taken warm, with the view of inducing a gentle perfpiration. The child fhould be put to the brealts a few hours after the completion of the labour, that it may get fome mouthfuls of the thin whey-like fluid which is at firt fecreted. This will ftimulate its bowels, and enable them to difcharge the meconium, or black

## I. A B O U R.

wifcid excrements with which they are always filled. It will alfo keep the brealts of the mother from being too tnuch diftended, the pain occafioned by which, if it is not the caufe, yet it certainly tends to increafe the milk-fever.
Bat there is another fever to which women are at this time fubjected, which is attended with confiderable danger, and which not unfrequently proves fatal. It is called, from an opinion that it is peculiar to this thate, the puerperal-fever. Its commencement is almoft always marked by a ftrong faiyering fit, which is followed by a quick pulfe, headeache, laffitude and dejection of the fpirits. It fometimes makes its attack during the labour, more frequently ou the next or fubfequent day. It is fometimes millaken for the milkfever, but belides that its attack is earlicr than that of the riik-fever, which never comes on until the third day after delivery, the fecretion of the milk is in this fever interrapted, and the breafts, inftead of being full and turgid, remaiy flacid. From after pains, with which it is fometimes confounded, it is to be diftinguifhed by the quicknefs of the pulfe, arifing very foon to 120 frokes in a mmute, by the head-ache, nauffea, and other concomitants of fever. Tendernefs of the abdomen, increafing to extreme forenefs and pain, foon come on, which are increafed by drawing in the breath, and are rendered almoft intolerable by coughing. As there is always a high degree of inflammation of the peritoneum prefent in this fever, and perhaps of fome of the eontained vifcera, we cannot be too early in taking away eight, ten, or twelve ounces of blood from the arm, according to the ttrength of the patient. If the abdomen appears diltended, attended with forenefs and pain, fix or cight 3ecches may he advantaggeounfy applied to that part, which may be afterwards fomented with flannels wrung out of a decoction of camomile and marrh-mallows moderately heated, and then covered with a poultice made with linfed-meal. A draught with infufion of fenna and fome neutral falt may be given to procure two or three ftools. The bowels may aftervards be kept open, and the pain relieved by giving a drachm of purging falt with two or three drops of the tincture of opium, in a fufficiency of water to diffolve the falt, every two or three hours. There are few cafes that will require or bear a repetition of the bleeding. If, however, the pulfe fhould appear to be ftrong, and the pain, with the difficulty in breatling, require it, that may be done on the fecond or third day, and a bliter may be applied over the part of the abdomen which is mold diftreffed. A blilter applied to the nape of the neck, fucceeds remarkably in relieving the pain of the head. There is rarely delirimm, at the leaft not to any confiderable degree, attending this feyer. The patient fhould be nourihled with light broths, panada, and fuch like mild food, and drink barleywater, gruel, baum-tea, toall and water, or, where preserred, table-beer. By perfiting in the ufe of thefe remedies, the fever is frequently fubdued by the end of four, five, or fix days, when recourfe may be had to a light decoction or infufion of Peruvian bark, Columbo, or fome other tonic taken twice in the day to recruit the ftrength. Too often, however, thefe and all other means that hiave been devifed prove infufficient, and the patient dies, fometimes as early as the third or fourth day; at others, not until the fixth, eighth, tenth, or twelfth day. Puerperal fever is by no means to be confidered as fouely the confeguence of tedious and difficult parturition ; it full as often makes its attack after natural, eafy, and expeditious labours, on which account it was thought proper to delineate the kitury and treatment of it here, rather than at the end of this differtation.
Puerperal fever occurring in lying-in-hofpitals, or where a
great number of fick or wounded perfons are confined, at fome times, that is, under certain difpofitions and temperatures of the atmofphere, becomes infectious, almoft every perfon delivered in the ward where the fever rages partaking of it in a greater or lefs degree. At fuch times, a larger proportion than ufual of thofe who are delivered in their own houfes are fubjected to it. When it has made its way into a lying-in ward, the wormen flould be removed, and feparated, where it can be fafely done, and no more perfons admitted until the ward las been well ventilated and purified. It is recommended, that the floors be fcoured, the walls and cielings fcraped and lime-wafhed; that the beds be taken down, and the bed-cluthes, and the whole room be expoled to the vapour of burning fulphur, or fumigated with the vapour of the narine or nitric acid. All this may with fafety and propriety be done, but experience dues not warrant us in laying that they have any effect in extinguining the fever, which, like the yellow fever, or the plague, does not, it is prchable, quit the places where it has made its appearance, until the tomperature, or other quality of the atmofphere, to which, perhaps, it owed its origin, is changed.

I: fometimes happens that women are troubled with hremorrhage, or difcharges of blood from the uterus, during pregnancy, recurring at intervals of two, three, four, or more weeks. Such difcharges happening early, that is, within the firt, fecond, or third month of geftation, ufually terminate in abortion, which fee. When the hæmorrhage makes its firft appearance in the fifth or fixth month, or later, if it is not very violent or frequent, the woman may go on to the end of her term. The immediate caufe of the difcharge is a partial feparation of the placenta from the uterus; and it may be occalioned by taking too much exercife, by reaching down any article placed at an inconvenient height, by frequenting affemblies or crowded rooms, by dancing, alfo by any ludden fright or alarm, or by falls, blows, or other accidents. To whatever caufe hemorrhage may owe its origin, it is only to be reftrained, and the ill effects of it to be prevented, by reft and retirement, and by avoiding all occafions of exertion; by keeping the air of the room of a moderate temperature, and uling a diet that is plain, fimple, and cafy of digettion. If coltive, the body fhould be kept open by the ufe of mild cathartics, or glyfters. When a contrary habit of body prevails, and the patient is ditturbed with purging and griping pains in the bowels, a dram of any purging falt diffolved in two or three fpoonfuls of water, with three or four drops of the tincture of opium, given every two or three hours, rarely fails of appeafing the tumult, and of reftraining the homorrhage. But though the difcharge may by thefe means be checked, it will return on the commencement of labour ; on which it will have fo much influence, that even when the prefentation of the child fhould be fuch as to bring it under the clafs of natural labour, yet it will be neceffary, in conducting it to its termination, to deviate confiderably from the rules that lave in thofe cafes been recommended.
On examining, it will be found that the os uteri, in the earlieft ftage of the labour, is more open, foft, and yielding, than in ordinary cafes; the pains are alfo gencrally kef bearing and efficient. It whll therefore be proper to affilt in dilating the opening, by gently moving the end of the fore-finger round its edge. If it is the head of the child that is coming down, which will be eafily perceived through the membranes, and the difcharge of blood is not conttant, or very confiderable, it will be belt to let it come in that polture ; continuing, at intervals, to affift in dilating the os uteri. When that orifice is completely dilated, fo as to ado

## LABOUR.

mit the head of the child, the membranes may be opened, by fcratching them with the nail of the fore-finger, that the waters may be difcharged. This will enable the uterus to contract, and prefs the placenta againit the head or body of the child, and fo itop the further effufion of blood. 'The completion of the labour may now be effected by the pains, as in common cafes. The placenta being in part detached, ufually comes down foon after the birth of the child. If, however, it fhould be delayed, and the difcharge of blood continue, it may be brought away in the manner before deferibed. But when the difcharge of blood is fo confiderable as to endanger the life of the woman, (and this will be the cafe when the placenta is placed near to, or, as it forretimes happens, part of it lies over the os uteri,) then it will be neceflary, even althou th the child is coming down in a natural polture, as foon as the os uteri is fufficiently dilated, to break the membranes, or to pierce through the placenta, and gradually and flowly to pars firft the fingers, and then the whole of the hand shirough the rupture into the bag, and to take hold of the feet of the child, and bring them down into the vagina. Tinse mult then be given that the uterus may contract, fo as to prels upon the head and fhoulders of the child, when the lahour mult be completed in the manner defcribed under the next article.

It fometimes happens that, on the burfting of the membranes, the funis umbilicalis or navel-ltring falls down into the vagina, before the head or other part of the child that prefents. In this cafe, it has been ufial to recommend that the prolapfed funis be folded in a piece of foft linen, and returned into the uterus: but experience has fhewn, that however carefully this be done, it contlantly returns in a few minutes. If the accoucheur fhould be prefent at the time of the rupture of the membranes, or foon after, and find a pulfation in the navel-flring,--a fure fign that the child is living, he will then, in whatever pofture the child may happen to prefent, treat it as a preternatural labour; that is, he will pafs his hand into the uterus, and turn the child, and bring it by its feet: for if the butinefs be left to nature, the preffure on the funis will put a flop to the circulation of the blood, and the child will die long before it would be expalled by the pains.

In fome irritable conftitutions, the women become convulfed in the courfe of the labour. This accident more frequently occurs with firlt than with fubfequent clildren. At whatever time convulfions make their attack, they never completely leave the woman until the labour is over, and fometimes not until the next or fubfequent day. In very mild cafes, the brain feems but little affected by the convulfions, which partake of the nature of hyiteric complaints. Thefe cafes are ealily curable, or give way fportaneoufly when the labour is completed. More commonly the convulfions are attended with coma, and other affections, indicating oppreffion on the brain. Thefe are of more difficult management, and often prove fatal even under the molt cautious and judicious treatment. Of whatever nature, or from whatever caufes puerperal convulfions may proceed, they affilt very much in forcing down the child.

At whatever period or flate of the labour the accoucheur may be called in, he will generally find it expedient to talk away fix, eight, ten, or twe've ounces of blood from the $\mathrm{a}=\mathrm{m}$; and in the fpace of two hours after, (unlefs the child is coming into the world,) this thould be followed by a clyter to empty the bowels. After the operation of the cly lter, from twenty to thirty drops of the tincture of opium may be advantageounly given, which will generally fucceed in making the fits lefs frequent and violent. The labour mult now be conducted in the fame manner it would have
been, if it had not been interrupted by the convulfions If the child prefents in a natural potture, and the polvis of the woman is of the natural form and dimenfions, it will be found that the eonvulfions have affilted much in dilating the os internum, and in accelerating the completion of the labour. If any other part than the head of the child prefents, as foon as the internal oifice is fufficient?y dulated, the accoucheur will pafs his hand into the uteruc, and turn the child, and brinz it by its feet. If, on the other hand; the birth of the child thould be retarded, rendered difficult, or impoffible, without the aid of inftruments, from diftortions of the bones of the pelvis, the accoucheur will ule the lever, forceps, or crutchet, whichever fhall be required, in the manner directed under the articie Linbour, difficult.

Labour, Preternatural. In all preternatual labours, the defcent of the uterus and the cilatation of its orifice prow ceed more flowly than in natural labours: hence it often happens that the part of the child prefenting cannot he diftinctly perceived, even though the woman has been feveral hours in pain. If, therefore, on examiting a woman in labour, during a pain, whofe pelvis is of a proper form and cimenfion, no part of the child can be perceived, the accoucheur may be aflured that it is fome other part than the head that is coming down. Nothing, however, will be neceffary to be done in this cafe, until the child is fo far thruft down by the pains, and the os uteri is fo much dilated, as to enable him to perceise the prefenting part through the membranes, or until, by the burfting of the membrares, and the difcharge of a part of the liçuor amnii or waters, a part of the child is forced into the pelvis. If the breech, or one or both of the lower extremities are cuming down, the operator will leave the expulfion of the child principally to the effects of the pains, only criving the affiftance directed under the articles Breech and Feet Preferitations. But if the fhoulder, arm, breaft, or any portion of the upper part of the trunk of the child fha! be found to have entered the os uteri, by the general cunfent of practitioners, the child muft be turned, and extracted by the feet. To effect this, the accoucheur will immediately, and tefore the whole of the waters are drained away, pafs his hand fowly and gradually into the uterus, until he comes to the fect of the child, which will often be found at or near the fundus, and grafping them in his hadd bring them down into the vagina; then pauling a little while, itill holding the feet in his hand, he will, by another effert, bring them through the os externum, or into the world.
This operation, if undertaken foon after the burfting of the membranes, will generally be pe-formed with great eafe and fafety, and with little pain to the woman: but if it be not begun antil the waters are entirely evacuated, and the uterus is contracted, and come into clofe contact with the body of the child, it will require a much greater degree of force to introduce a hand fo far into the uterus, as to be enabled to take hold of the feet of the child; and the whole of the delivery will be attended with much more pain, difficultr, and hazard.

From a due confideration of the ce circumilances, the following practical inference may be drawn, viz that whenever, on examining a woman in the commencement of $13-$ bour, no part of the child can be felt, or, if felt, not fo diftinctly as to enable the accoucheur to decide whether it is the head that is prcfenting, he fhould by no means leave the woman, or be far abfent from her, that he may be at hand to turn the child, if neceffary, foon after the burting of the membranes. But fuppofing this opportunity to have been neglected, or the accoucheur not to be fent for, until nearly the whole of the liquor amnii or waters are drained off, and

## LABOUR.

the uterus has contracted fo as to come into contact with, and trictly to embrace the body of the child, yet, even in thefe cales, if the pelvis of the woman is of the proper form and dimenfions, and the child is not difproportionably large, by proceeding flowly and cautionfly in the manner about to be deferibed, the refistance of the uterus may be overcome, and the delivery effected with perfect fafety to the mother and child.

Method of turning a Cbild in the Uterus, in preternatural Labours, and bringing it by the Fech.-. The woman being laid acrofs the bed, on her lefr fide, with her knees drawn up to her belly, a woman litung on the fide of the bed, to hold her feet, and keep her tteady, the accoucheur mult introduce, firlt one, then a fecond, third, and fourth finger of either of his hands, anointed with hog's lard, into the vagina, which he will gradually dilate, fo as to make room for his whole hand, with which he will fill further dilate the paffage. Then, paufing a little while, until the ftraining, on the part of the woman, which the intrutiuction of his hand will have occafioned, Shall have fublided, he mull again puif his hand gently upwards, until it has paffed the brim of the pelvis and entered the uterus; then, again pauling until the woman ceafes to ftrain down, he muft again pufh his hand upwards in the intervals between the pains or ftrainings of the woman, until he reaches one or both of the feet of the child, at which time the whole of his arm nearly, to the elbow, will be in the paffage.

When the refiltance of the uterus has been very great, it fometimes happens that the hand of the operator is fo cramped and benumbed, that he has no power to grafp and bring down the feet of the clild. In that cafe, he mult flowly and gradually withdraw his hand, and wait fome minutes until he has recruited his ftrength, and the woman is a little refrefhed, and then re-introduce the fame, or his other hand, with whichever he thinks (from the knowledge he has now acquired of the pofition of the child in the uterus) he thall be beft able to complete the delivery. This re-introduction of his hand he will be able to effect much more eafily than before, the uterus being fomewhat itretched and loofened by his former effort. He will now feduloully endeavour to get hold of, and bring down, both the feet of the child; but if that is abfolutely impracticable, he mult be contented with one of them, which he will bring down flowly, and by intervals, as he had introduced his hand. It will fometimes happen that the operator will not be able in this way to bring the foot into the world, the contraction of the uterus around the body of the child being fo confiderable, as to prevent its turning by any effort he can make in this way. He mult then withdraw his hand, and, after recruiting his ftrength, return it again into the vagina, with a noofe or fillet over it, until he has got hold of the foot of the child, and then, with the fingers of his other hand, puft up the noofe until it paffes the ankle of the child, by which means he will have a double purchafe; then drawing down with the end of the fillet that hangs out of the vagina with one hand, and with the other grafping and pulling down the foot, be will ufually, in a few minutes, fucceed in bringing the leg of the child through the external orifice.

The operator may now again pafs his hand up into the uterus to fearch for the other foot of the child, and bring it alfo down; or, not fucceeding in this attempt, he will wrap the leg that is in the world in a foft cloth, and draw it downsward ikeadly with both his hands, and with fufficient force to bring the breech of the child into the vagina. He will now paufe a few minutes, both to allow the woman to recover her ftrength and fpirits, and to give time for the uterus to contract, and come agrain in contact with the head and
trunk of the child then, renewing his efforts, he will cortinue drawing down the thigh, until the breech has freed the extermal orifice. He mult now examine the polture of the child, and if the fore-part of the shild lays to the pubes of the mother, he will turn it round to the facrum: then taking liold of the breech with both his hands, he will continue drawing downward fteadily, at the fame time moving it from fide to fide, until the whole of the body is born; he will then pafs a finger firlt along one, and then the other arm of the child, to the joints of the elbows, and draw them down, and if the child be now living, which may be known by a pulfation being felt in the navel-ltring, he will haften the birth, drawing down fteadily and ftrongly by the Thoulders: If he finds niuch refiftance, with a view of accelerating the birth of the headd, he mult pais the fore-finger of his left-hand along the brek part of the vagina to the mouth of the child, and draw down the under-jaw, at the fame time that he extracts by the Moulders with his righthand. The child being born, he will complete the delivery, in the manner directed under the article LABoUR, Natural.

Some writers and teachers of midwifery are very particular in prefcribing the pofture in which the woman fhould be placed as moft convenient for the operator in turning a child, which they think fhould vary according to the pofition of the child in the utcrus, as whether the face or foreparts of the child be turned to the back, belly, or one of the fides of the mother ; they alfo, from the fame circumftances, determine which hand will be moft proper for the acconcheur to ufe in performing the operation. But as the exact pofition of the child can rarely or never be known until the operator has actually introduced his hand into the uterus, there feems no neceffity for embarraffing him with regulations of this kind. The moft convenient pofture will generally be found to be that in which women are ufually placed in a natural labour, and, as has been now defcribed, viz. ly. ing on her left fide, with her knees drawn up towards her belly, her feet in the lap of an affiltant. In refpect to which hand the operator fhould ufe, he will be guided by circumflances, or by his habit or cuftom: moft perfons ufing one of their hands more dextroufly than the other. The moft important rule is, that the whole operation be performed flowly and gradually. Other writers have advifed that we by no means attempt to turn a child in the uterus, fo long as the woman continues to have pains, left the uterus fhould be ruptured. But as, at every pain, the vterus contracts, becomes thicker, embraces the body of the child clofer, as well as thrufts the prefenting part lower into the pelvis, it is evident that by waiting the difficulty of performing the operation will be increafed. It will be fufficient, in addition to what has been faid of the neceffity of proceeding nowly and leifurely, to warn the operator only to pufh his hand on in the intervals of the pains.

It was fuppofed, by the carly practitioners of midwifery, that when an arm of the child prefented, and became confiderably fiwelled, which it always is, when it has continued long in the vagina, that it fo filled up the paffage, as to add very much to the difficulty of paffing a hand into the uterus, and fometimes even rendered it impoffible to be done, until the arm was removed; and, accordingly, it was pretty much the practice in the beginaing of the laft century, firlt to attempt returning the arm into the uterus, but as that was rarely or never practicable, it was ufual in thefe cafes to make an incifion through the integuments, under the arm-pits of the child, with a pair of fcifors, or a fcalpel, and then twit off the limb; and in this mutilated fate the children were fometimes born alive. This practice has long fince been abolifhed; expericnce having fhewn, that the

## I. ABOUR .

obfacle oppofed by the tumid arm is rery inconfiderable, only affecting the firlt part of the operation, and by perfeyerance is calily overcome.

We have been lately told, by a practitioner of eminence, that when an arm or fhoulder prefents, and, by the continuance of the pains, has been thrult fo low into the pelvis, that it is abfolutely impracticable to turn the child (where the pelvis of the mother is too narrow to admit the hand of the operator, we prefume the writer means), that by paffing a blunt hook over the neck of the child, and drawing down ftrongly to fcparate the vertebre of the nock, and then twitting the hook round, the integuments of the neck will break, and the head be diffevered from the body, which may afterwards be drawn away with the crotchet. From the facility with which this operation is faid to be performed, it is to be feared, that perfuns of lefs fill and fagacity than the writer here alluded to, may be tempted to try the experiment on children fuppofed to be dead, but which are not fo, or when there is fufficient room in the pelvis to bring away the child without mutilating it, and thus fone lives be lof that might otherwife be preferved. This operation, therefore, fhould never be performed but in confultation.

It has in a few cafes happencd, when an arm or fhoulder prefents and enters firlt into the pelvis, and the woman has becn neglected, or the affiltant, not being called in time, was not able to turn the child, that by the continuance of the uterine contractions, or pains, the breech has been gradually forced down, the head and floulders receding and mounting upwards, and in this polture, viz. breech foremnft, the child has been expelled. This turning of the child in the uterus, by the fole agency of the pains, has been called by Dr. Denman the fpontaneous evilution of the foctus, and it has fometimes happened, we are told, that the child has, in this way, come into the world alive. It is well, as Dr. Denman jultly obferves, to know thefe facts, as in fome extreme cafes it may afford confolation both to the patient and the attendant; but the exittence of the uterus muit be very great indeed to induce a practitioner, who regards either his fame or his feelings, to trult to fuch an event, as in a great majority of cafes the child would be loft, and not uncommonly the woman would lofe her life alfo.

It fometimes alfo happens, in cafes where the arm, fhoulder, or breaft of the child prefents, and the expulfion of it has been left entirely to the pains, that at the end of many hours, or of two or three days continued labour, the child becomes foft and putrid, and inftead of making the evolution defcribed, is thruit down through the pelvis, and into the world doubled, the head lying on the breatt or back, and yet the woman has furvived.

This, however, is rather to be expected in premature births, that is, when the woman is only advanced five, fix, or feven months in pregnancy. At the fe periods, particularly at the two firlt, it will generally be right to let the foctus come into the world in whateser pofture it may prefent; as both the limbs of the foctus are then too tender to bear any confiderable degree of force or extemfion, and the capacity of the uterus is too ftraight to admit the introduction of the hand of the operator to turn the factus, and deliver it by the feet.

Labours of the third and laft clafs are thofe which are called difificult or laborious. Thefe vary much in degree, according as the caufes vary. When the difficulty is folely occafioned by a mal-prefentation of the head of the child, as when it offers by its face, or by one ear, the head will be frequently forced down in that pofture by the pains, and very little more affiltance will be neceffary than what is given

Vos. XX.
is naturad labours, from which it will only differ by its re. quiring a greater number of pains, and taking up a longer fpace of time for its completion. The fanne will hapien when the birth is retarded by a difpropotion hetween the head of the child and the pelvis through which it is 10 pafs ; that is, when a woman whofe pelvis is finall, but perfect in its form, produces a large child, or when the head of thee child is more than ufually offified. By the continued force of the pains, the bones of the heads of the generality of chis. dren, whioh do not ordinarily meet, or come in contact uith each other, will be preffed together until they ride, or lap one over the other, and fometimes until the bead aflumes a conical form, the vertex being the apex or poime of the cone, and in this fate it will come into the worts. The midwives are accultomed to call the heads of claldiren that have been fo preffed, and altered in their thape, montld-flot heads, or horfc-fhoe moulds, and are bufy, whien dreffing the children, in forcing the bones back into their placef.' B:: this is not neceflary, the heads never failtng, in time, to aftume their proper figure. Children who have been fubjected to fuch a degree of preffure as to occafion an alteration in the flape of the fkull, fhould they be born alive, will generally be found to be fo much weakened by the injury they have fuffered, as not to be prefersed without great care and dithculty.
It has here been fuppofed, that the expulfion of the liead of the child has been left, as in natural labours, to the power of the pains, which will generally be fufficient for the purpofe; but this will not happen, in fome cales, until, by the long detention of the head of the child in the paffare, the foft parts of the woman fhall be fo bruifed and injured, by the preffure they have fuffered, that fuppuration or mortification of the vagina fhall enfue, penetrating into the bladder, or rectum, and fometimes into both, making the vagina the common channel for the urine and the flools. To avoid thefe diffrefing accidents, which, when they occur, admit no remedy, or are only in a fmall degree alleviated by time, various contrivances have been invelited to bring away the head of the child, when it is enclavéc, or fixed in the pelvis, earlier than it would be forced away by the pains. Thole which have been preferred, and which are now almolt univerfally ufed, are the forceps, the invention of Dr . Hugh Chamberlen, and the lever of Roonhuyfen, (fee the articles Forceps and Lever,) the time and marner of ufing which will now be defrribed.

In all cafes requiring the affitance of inftruments to complete the delivery, the progrefs of the labour will be found, from its commencement, to be flower than in thofe labours which are denominated natural. The obfervation of this circumftance will induce the practitioner to be careful that the woman be kept cocl, and that no efforts be ufed to accelerate or itrengthen the pains; that fhe be encouraged fron time to time to void her urine ; that her bowels be kept open br clyfters, or by giving her a gently purging medicine, and that ten or trelve drops of the tincture of opium be given at night to procure fleep. By thefe means, (which misit be purfued the fecond day alfo if neceffary,) her Atrength will be preferved, and the will be enabled to meet the dificulties fhe will have to encounter, Before the end of the fecond day it will generally be found that the of uteris is completely dilated, that the bafis, or largeit part of the head of the chuld, has been fored into the brim of the pelvis, that the membranes have burit, and that the greater part of the waters has been difcharged. At this period, as if nature was tired with the conflict, the pains uffally remit, both in frequency and Arength; it now, therefore, becomes neceffary to watch over tbe fafety of the woman, and if, at the end of two or S
therep

## LABOUR.

three hours, the head continues fill unmoved, to proceed, (having previoufy informed the woman and her friends of your intention,) to the ufe of the proper neaus for expediting the delivery.

Nanncr of ufing the Forceps.-Having laid the woman on the bed, in the ulual pofition, the accoucheur will fit down behind her, and will introduce two or three fingers of his right hand into the vagina, and continue pufhing them gently upwards, until he feels an ear of the child, which will generilly be found under, or near, the os pubis; he will then take a blade of the furceps, previoully anointed with lard, and introduce it between his fingers, and the head of the child, continuing to pufh it upwards until it pals over the car, and fo on until the whole of the blade is in the vagina; he will then withdraw his fingers, and raife the handle of the forceps towards the pubes of the woman, while he introduces the fecond blade in the ame cautious manner, directly oppointe w the firit. He will then bring the handles together, and lock them, and that they mase not Ilip, he will conline the handles together with a handkerchief, or any appropriate ligature. It generally happens, that the force ufed in applying the forceps gives frefh ftrength to the pains. During each pain the accoucheur will nowly, and gradually, draw the handles of the forceps downwards, with his right lrand, moving ther, at the fame time, from fide to fide, keeping his left hand againft the perinæum of the woman, which he will, through the whole procefs, carefully guard, to prevent, if pofialle, its being ruptured, an accident more likely to occur in firft, than in fubfequent labours. Having in this cautious manner extracted the head of the child, the semainder of the delivery will be conducted as directed under the article Labour, Natural.
Many prafitioners in thefe cafes prefer the ufe of the levcr, which may be contidered as a blade of the forceps, and is to be introduced into the vagina between the fingers of the accoucheur and the head of the cliild, as before cirected, and pufhed on until it paffes over the ear of the child, that lies under or near the pubes of the mother. The accoucheur will then withdraw his fingers from the vagina, and grafping the handle of the lever with his right hand, he will, during every pain, raife it over the pubes, guarding the perinæum with his left hand, and continue this movement from time to time, until the head of the child is brought into the world. The plain and fimple form of this infrument, and the greater facility with which it is ufed, have given it a deferved preference over the forceps. For a fuller account of the manner of ufing the forceps and lever, and for an account of their comparative merit, the reader is referred to Dr. Denman's valuable'Introduction to the Practice of Midwifery, and for the hiltory of the invention of the inftruments, to Dr. Bland's Account of the Invention and Ufe of the Lever of Roonhuyfen, publifhed in the fecond volume of Medical Communications, in the year 1790. It is proper to obferve, that in all cafes in which it becomes neceffary to have recourfe to the ufe of infruments to finifh the delivery of the child, and, in fact, in all lingering labours, the operator fhould pay particular attention to the litate of the urinary bladder, and if the urine has been fupprefled, he mult draw it off with a calheter, before he begins to operate.

In the cafes that have been defrribed, where the labour has been retarded, and rendered difficult by the caufes above eaumerated, the methods recommended will generally be found to be competent to bringing it to a conclufion, withont occafoning much injury to the mother or to the child. But when the obftacle atifes from diftortion of the boaes of the pelvis of the mother, altering the Mape of the pelvis,
and dimininhing its capacity, means muft then be ured to leffien the volume or bulk of the head of the child, otherwife both the mother and child muft inevitably perifh. The perfons in whom this defect in the pelvis is found. are ufually fhort and delicate women, whofe growth had been checked in infancy by the rickets, or who had been confined, too rigidly in their youth, to a fedentary polture, in order to acquire a proficiency in mufic, drawing, or fome other accomplihment, and liad thence been prevented taking that portion of exercife in the open air, which is neceffary for the growth and ftrength, as well as for the health of the body.
When called upon to atterd a perfon labouring under this infirmity, the accoucheur will find, on examising, the lower vertebra of the loins, and the upper portion of the facrum, projecting forward, fo as to prevent the head of the child from entering the brim of the pelvis, and the offa ilia, which form the fides of that cavity, approaching too near to each other, thus itraighteming the capacity of the pelvis, and changing its form from an oval to a triangular figure. On his difcovering this derangement, it will be his duty to irform the friend to the woman of the manner in which he propofes to conduct the labour, and of the necefity he belic ves there will be of opening the head of the child, in order to preferve the life of the mother. To the parturient woman he will only fay, that the labour will be flow and tedious, that it will be neceffary that the avoid all heating drinks, and that fhe manaje her itrength and her fpirits in the belt manntr fhe is able. The bowels muft be kept fupple and open by clyfters, the urine malt be drawn off, if furprefled, with the catheter, and an opiate given at night, as in ordinary cafes of difficult labour. At the end of the fecond or third day, according as the pains have been more or lefs fevere, and frequent, the water being nearly all of it drained off, and the uterus contracted fo as to be in contact with the body of the clild, a fmall portion of the vertex, or prefenting part of the head, or perhaps only of the tumid fcalp, will be found to be thrult through the brim of the pelvis. As no farther affiltance can be expected from the pains, which now would only tend to exhaut the ftrength of the woman, and to excite fuch a degree of heat and fever, as might not afterwards be extinguifhed, it will be neceffary to proceed to opening the head of the child, and in that manner complete the delivery. The woman being laid on the bed in the manner befure defrribed, and the accoucheur placed behind her, he will introduce two or three hingers of his left hand into the vagina, and pafs them upwards until they touch the protruded part of the head of the child, and cindeavour to find the fontenelle, or the part where the parietal bones meet; he will then, with his right hand, flide the perforator up into the vagina, which will be guided by his fingers to the place, which it will readily enter, and having, by opening them in various directions, made an aperture into the lkull fufficiently large, he will withdraw the perforator, and allo the fingers of his left hand, both to give a refpi e to the woman, and to allow the pains to force a larger portion of the fkull, now yielding more eafily to the preliure, through the brin of the pelvis. At the end of two or three hours he will re-commence the operation, and will pals his left hand, or as much of it as he can, into the vagina, aud introduce one or two of his fingers into the aperture of the fkull of the child; this will ferve as a guide to the crotchet, which he will now ufe. Having further broken the texture of the brain with the crotchet, he will move it about within the cranium, until he finds it firmly fixed, when he will begin to draw downwards, and continue this action at intervals, until he finds he has brought the whole of the head of the child into the vagina. It is ufeful

## L A B

to keep the left hand, or two or three fingers of it, in the paffage, that if the crotchet thould fio, they may prevent any injury being done to the vagina. Having paufed ngain, for the fpace of an hour, to give the uterns opportunity of contracting, he will cafily bring the head of the chidd, now emptied of its contents, into the world, and the remainder of the labour wiil be conducted as in ordinary cafes.
In labours of this clafs, that is, in difficult labours, as the progrefs of them is always flow, giving opportunity to the uterus to contract, the expulfion of the phacenta is ufually performed fooncr, and more eafily, than in natural labours.
laboured Accompaximiny. See Accompaniment.

LABOURER, in Agriculure, a perfon who performs the manual or moft laborious part of the bulinefs of a farm. Lubourers are moftly fuch perfons as live in cottages, or fmall houfes in the vicinity of the farms, or in the houfes of the farmers themfelves.
The author of Modern Agriculture, after premiing that in all civilized ftates, the great body of the people live by labour; and that, of whatever nature it may be, the wages received mult be more than fufficient to maintain the labourer, as, were it otherwife, he could not bring up his family, and confequently this clafs of men would foon become extinct ; obferves, that in every county or diltriid, where the ufeful arts are-in a flourifhing ftate, and where thofe employed in carrying them on are moft fuccelsful -in accumulating riches, the rate of, wages, or price of labour, is highef. Luxury is a never-failing attendant on riche;, and the number of fervants always increafes with the means of maintaining them. Therefore an ircreafing demand for ferrants or labourers, whether for carrying on agriculture, the purpofes of trade, or for adminiffering to the artificial wants created by luxury, naturally tends to advance the price of labour. The very, great recent advance in the rate of wages in fome counties in Scotland, as Lanarl, Renfrew, Perth, Angus, Fife, \&cc. amounts, it is fuppofed, to the moft pofitive evidence, that commerce, manufactures, and improvements in agriculture have rapidly increafed. The ftill low price of labour in the counties of Caermarthen, Pembroke, Cardigan, \&cc. in Wales; and Nairn, Inverners, and the other northern counties of Scotland, notwithtanding the great emigrations of labourers to thofe parts of the ifland, where they are more certain of finding employment, is a fure fign that in thefe remote diftricts the arts have fcarcely ever been introduced. It flews alfo, that litile attention is beltowed by the proprietors to improve the fituation of the peafantry, either by inuring them to habits of induftry, or inflrutting them in the advantages to be derived from a proper divifion of labour. In thofe counties where the arts have been introduced, and where the rate of labour has continued for a number of years nearly the fame, it will be found that agriculture, commerce, and manufactures, although perhaps formerly in a profferous flate, are at prefent flationary, and that a national exertion is neceflary, in order to fet them again in motion.

And further, that the wages of farm-fervants, and of labourers, who are occafionally engaged in the operations of hußandry, vary nearly as much in the different diffricts of Great Britain, as they do in the feveral kingdoms of Europe. In the counties in England, where commerce and manufactures are carried on to the greateft extent, as Middlefex, Surrey, Kent, Lancafter, Chefter, the welt-riding of Yorkhire, \&c. the wages of farm-fervants and day labourers may, it is conceived, be flated as follows :

Where agriculture is the chief employment of the people. as in Hertford, Buckingtiam, Rutland, Northampton, Worcefter, Northumberland, \&cc.
A ploughman's wages may be fated from

| Average. |  |  |

It has been obferved, that the rate of wages has advauced very rapidly of late years, in many countics in Scotland. In that part of the kingdom fouth of the Grampian mountains, the rife in the price of labour has, he lays, been general, and is now nearly double what it was twenty years ago.

A ploughman's wares is from 7l. to 12 l. Average. A female fervant, from $3 l$. to $4 l$ l. 10s. $\quad 910$. A day labourer, in fummer, without board, from 1 s .2 d . to 1 s .6 d . -

| A carpenter, ditto, from ns. to |  |  |

From the above averages, the following table, which may be confidered as containing pretty nearly, he fays, the medium rate of agricultural labour in thefe kingdoms, at the prefent period, is formed:

General Averdire. £. s. d.
A ploughman
A female fervant
A day labourer, in fummer, without board
Ditto, in winter, ditto
A mafon, ditto
$A$ carpenter, ditto
In the above fatements, the difference in the rate of wares does not, it is fuppofed, appear fo confiderable (except in TVales, and the north of Scotland, compared with the better cultivated parts of Great Britain), as, had it been poffible to afcertain the price of labour in each particular county, would have been evident; local circumitances fiequently operating to augment or deprefs the rate of wages in particular diftricas, which is not difcernible when numbers are clafed together.

But the rates of wages, or prices of labour, have increafed in the propertion of, from a quarter to a half, fince the perind in which the above was written, which is only a very fow years. Theif are, he conceives, affected by fome or all of the tollowing caufes, viz, ift. The increafe of commerce and manufactures: 2 aly. The depreciation in the value of money, and its prefent nominal value, compared with the price of the ordinary articles of provifions: 3 dly. The ges:cral introduction of improvements, and of new modes of cultivation; whereby, although fewer hands are neceffary, thole ponfefling fuperior fkill become more in requeft: 4thly. The eafe or difficulty of finding conftant or regular employment : and, 5 thly. The mode in which a farm-fervant, or labourer, maintains his family.

With refpect to the firft, it is fuppofed, that the increafe of commerce and manufactures of the towns has contributed to the improvement of the country, as well by affording a ready market for the prodtuce of the foil, as by various other means, will not be denied; but that the rapid increafe of them within thefe few years has had a great effect in raifing the price of labour is equally evident. The great numbers of people crowded together in large cities and manufacturing towns, are not only againtt the increafe of propulation, but alfo againft longrevity. There are befides feveral forts of manufactures, which are well known to be deftructive of the human conititution; not to mention the many accidents to which thofe employed in the various branches of commerce and manufactures are expofed, tending to fhorten life, and from which thofe engaged in the oporations of hubandry are exempted. For thefe reafous, there is a conttant demand for pcople from the country, in order to keep up the population, and to carry on the commerce and manufactures of the towns. The great additional price commonly paid for commercial and manufacturing, beyond that for agricultural labour (except where the influence of the former affects the latter), and the habits of luxury, in which the labouring part of the community live in towns, compared with the generality of their neighbours of the fame clafs in the councry (particularly in Scotland), are throng inducements, it is contended, with many of the peafantry, either to remove to the towns, or fead their children thither: while others, in confequence of the too general practice of adding farm to farm, and demolifhing cottages, are forced to feek that alylum in towns which is refufed them in the country. The demand for labourers from the towns being complied with, the country is thereby drained of ufeful hands, and the price of agricultural labour advanced. This mult neceffarily happen, it is thought, in every kingdom during the period that its commerce and
manufactures are on the increafe ; and more efpecially in thofe nations where the legiflature turns its attention to fupport commerce and manufactures at the expence of agriculture.

The fecond, the depreciation in the value of money, is alfo another and fubftantial reafon for the apparent rife in the price of labour. The increafe of commerce and manufactures, which has been gradually taking place in this ifland ever fince the beginning of the reign of queen Elizabeth, and the immenfe additions which have been made almof every year to the national debt within the prefent century, feem to have rendered it neceffary to increafe, nominally, by means of bank-notes, promiflory-notes, bills, Sc. the quantity of money in circulation. That thefe fubftitutes for fpecie have had the effect to reduce the value of money is an obvious fact. If, therefore, the value of money has fallen, the labourer of the prefent day requires of courfe a greater quantity to carry to market than his predeceffors, to purchafe even fuch articles as are confumed in the particular diftrict where he refides (whether right or wrong), as indifpenfib'y neceffary for the maintenance of a peafant's family. Whether the Middlefex labourer goes to market to purchafe beef or mutton, or the Aberdeenfhire cottager oatmeal, it will, it is conceived, be found that nearly double the fum is required to purchafe the fame quantity now that it did thirty years ago.

After this, fome facts are ftated in order to thew that, however much the nominal price of labour has increafed, its real price, compared with that quantity of provifions it will purchafe, remains all over the ifland nearly the fame, except only where a variety of circumftances combine; fuch as contiguity to large towns, or extenfive manufactories and public works; and the want of due attention to the providing of work, from improved modes of hufbanday, not being introduced to raife or deprefs it beyond its ordinary level.

In regard to the third, it is oblerved, that befides forming canals and turnpike-roads, which may be confidered equally beneficial to the interelts of commerce and manufactures as to thole of agriculture, there have been many improvements introduced in hufbandry, which, while they have contributed to advance alike the profperity of the nation, the proprietors and farmers have aifo been the means of bringing about a confiderable alteration in the fituation of the inhabitants at large, as well as in the price of labour. The immenfe number of people necefary for carrying on the various operations of inclofing, draining, planting, erecting farmbuildings, digging marle, quarrying and burning lime-ftone, hoeing potatues, turnips, and other green crops, mult firit have had the effect of giving full employment to the people in thofe diftricts where fuch improvements were introduced, and gradually to advance the rate of wages, in confequence of the increafed demand for labouress. The general introduction of new modes of cultivation, whereby, alchough fewer people are neceflary, thofe pofieffing fuperiot fkill become more in requeft, is another reafon of the advance in the wages of the farm-fervants. This obfervation will be confidered as well founded by all thofe who recollect the period, when ploughing with a man and two horfes, without a driver, became common in Scotland. The number of horfes or oxen formerly worked in the plough varied in fome cafes, according to the nature of the foll ; but was more frequently regulated either by the cuftom of the diftcich , or the fancy of the farmer. When, in confequence of the fpirited exertions of fome individuals in feveral counties, the practice of ploughing with two horfes was pretty generally introduced, the farmers found themfelves thereby

## LABOURER.

relieved of a very great flare of the annual expence of cul. tivation; but as it was then confidered a very arduous undertaking to manage a two-horfe plough, every farmer felected the belt ploughman he could find; and thefe becoming thereby in requelt, it was no difficult matter for them to bargain for ard augmentation of wages, which the farmers of that period could very well afford, and which many now living will not hefitate to acknowledge they granted on principles of economy.

In refpect to the fourth, it is fuggefled, that the eafe or difficulty which labourers frequentl) have in tinding conltant and regular employment ; or, in other words, when labourers are only partially employed, the rate of wages mult be affected by that circumltance. It has already been obferved, that thofe who live by labour muft reccive fuch a compenfation as is more than fufficient for their fubfiltence. When a labourer has conltant employment, whatever be the rate of wages, as it mult be equal to the price of the ordinary articles of provifons in whatever part of the ifland be is lituated, lis incomings and outgoings will be nearly the fame. Hence it follows, that when, from the difficulty of finding employment, he can only procure work for three, four, or tise days in the week, he mult receive the fame fum for the fe three, four, or live days that in the other cales he would do for the labour of fix; otherwife his incomings mult be lefs than he is neceffarily called to expend. When that happens, labourers are often obliged to remove occafionally to another quarter, or betake themfelves to forre mechanicalemployment; and in either cafe, their fervices are loft to the farmi.g part of the community where they refided. The want of conftant employment, therefore, it is conceived, operates in two ways to raife the price of labour ; firlt, by the neceffity the labouser is under while he continues in that capacity of demanding as mech for the work of three, four, or five days, as is fully equal to his fubfitence for a week; and fecondly, many of them being obliged to betake themfelves to other means for providing for themfelves and fannlies, the number of labourers becomes greatly diminifhed, and the remainder of courfe more in requeft.

And on the laft point, it is fuppofed that the various modes in which farm-fervants and labourers maintain their families muit neceffarily have a very great influence on the expence of agricultural labour in different parts of the ifland. In a great part of England, butcher's-meat, dumplings or puddings, bread made of fine flour, with beer, ale, and very commonly tea, are reckoned indifpenfible articles of cottage houfc-keeping: while in Scotland, oatmeal, cooked in various ways, veg?tables, and now and then a little butcher's-meat, are the chief articles which conilitute the food of the people employed in hußandry, even in the beft cultivated parts of the kingdom. This effential difference in the mode of living mutt, it is conceived, be a great additional expence in the article of labour to the Englifh farmer beyond what thofe in Scotland are fubject to, and might induce fuch as are not acquainted with the various circumitances conneeted with the hufbandry of both kingdoms, to give a decided preference in favour of Scotland. It fhould, however, be remembered, that this kind of additional tax paid by the Englifh farmer more properly affects the landlord, and is one of the principal reafons why lands in England are rented lower than thofe of the fame quality in Scotland; it being an indifputable fact, and which, in Scotland, daily experience proves avell-founded, that a great proportion of what the farmers fave in the article of labour, or by the introduction of more improved and lefs expenfive cultivation, fooner or later finds its way into the landlord's pocket.

And a very refpectahle author, Dr. Smith, in his work on the Nature and Ca! $\int s$ of the Wealth of Nations, vol. $i$. has obferved, that "the difference in the mode of labourers' fubfiltence is not the cauie, but the effect, of the difference in there wages; although, by a llrange mifapprchenfion, I have frequently heard it reprefented as the caufc." It is farther eided, that " it is not becaule one man $k$ ceps a coäch. whilc his neifhbour walks a-foot, that the one is rich and the other poor; but becaufe the one is rich he keeps a coach, and becaufe the other is pour he wailis e-foot."

The author of Modern Agriculture thints it will be admitted, that at the period when a general alteration has taken place for the better in the eftablifled mode in which: labourers maintain their families (as in the fonth of Scotland, where the price of labour has nearly doubled within thefe twenty years), the expence at which a cottager's family is maintained has advanced in the fame proportion. 'They eat better food, wear more expenfive cluthes, and live in more comfortable dwellings,-all which, he fays, no do: bt, as Dr. Smith obferves, is the effect, not the caufe, of the secent increafe in the price of labour.

But that in Eugland, where the mode of maintaining a labourer's family has undergone litile alteration for ages, it is prefumed, that although the difierence in the modes of living was, at firft, the effect naturally to be expected from a rife in the price of labour, yet it is now one caufe why the rate of wages continues in that kingdom to advance. 'Thofe articles which with that clafs ware once deemed the luxuries, are now confidered only as the bare neceffaries of life, and the prices have advanced in nearly the fame proportion as their wages. For inltance, thofe who in that country require labourers, mult either pay them fuch an advance of wages as will enable them to fublit according to the general mode eltablifhed in the country, whatever the additional price of the ordinary articles of provifion may be, or compel them to make ufe of more fimple and lefs expenlive kinds of food, which were afed by that clafs of men a century or two ago. Asevery perfon who ftands in need of labourers, will adopt the firt of thefe alternatives, it follows of courfe that the difference which has long taken place in the mode of maintaining a labourer's family in England, compared to that of ancient times, is now one caufe for the advance in the rate of wages.

It is ftated, that it has now become a general complaint among proprietors, merchants, manufacturers, and farmers, that the price of labour is become too high. That, owing to one or all of the caufes before-mentioned, it has adranced in many diltricts to a degree unknown in any former period of the hiftory of thefe kingdums, is a fact well k'own. Thofe who regret that the price of labour is advanced, (provided it is kept within proper bounds, and does not arife from a national neglect of the fituation of the peafantry, ) ought to comfort themfelves with the refiection, that this never happens in any fate which is not increafing in wealth and profperity. It is owing to that caufe, and to no other, that the working-people in any nation are more liberal $y^{3}$ rewarded for their labour; and in place of regret it ought to give pleafure to every friend to his country, that the great body of the community are enabled, from the fruits of their honeit labours, to procure themfelves a greater ibare of the comforts of life. At the fame time, let it be obferved, that thofe who have occafion to cmploy labourers pay attention. to the advice of the author of the Scafons.
"Be mindful of the rough, laborions hind,
That finks you fofi in elegance and eafe."

They flould alfo confider, that there are bounds beyond which they ought not, in prudence, to pafs.

But the mode of maintaining farm-fervants in many places of England is both abfurd, and, it is conceived, expenfive in the extreme, and calls as loudly for reform as any error in the whole range of Britifh hufbandry. In Northamptor:flire, the breakfalt confifts of cold meat, with cheelé, bread, and beer; for dimer, roafted or boiled meat, with pudding ; and for fupper, the fame as at breakfalt; and befides ale, which is allowed on extraordinary occafions, they have fmall beer at command at all hours. And in the Rural Economy of the Midland Comnties, after noticing that the beer and ale are brewed unreafouably ftrong, and that the quantity allowed to a man is unneceffarily great, it is ftated, that, in hay and corn harvelt, the cuftomary allowance is a gallon (upwards of five bottles) of beer a man per day; and that, during winter, the quantity of fmall beer ufed is not much lefs chan in harve?. And it is farther noticed, that the increafed expence in the mode of maintaining farm-fervants, as now too generally practifed in England, is attributed to the following caules. So:ne few farmers in every county, either from a miltaken idea, that the better their fervants are fed the more work they will perform, or from pride, and from a defire to gain popularity among that clafs of people, lead the way, while their more fenfible neighbours, and even thofe whofe fituations in life but ill accord with fuch additional expence, are forced to follow the example, by which means extravagance in the maintenance of fervants has arrived at its prefent height, and feems to be daily gaining ground.

It is fuggetted, that the wrages paid for agricultural labour, either to lervants by the year, or to labourers by the day, throughout the better cultivated parts of Great Britain, although confiderably different, are, neverthelefs, much lefs fo than might have been expected, and appear by no means fufficient to counterbalance the advantages which are derived from fuperior climate, and more favourable fituations in regard to markets. The expenfive manner in which the farmfervants are maintained in the greateft part of England, when compared with that of the more improved parts of Scotlend, creates a much greater addition to the expence of cultivation in the former kingdom, than that ariling from the difference in the money-price of labour. In forming a juft eftimate of the difference which takes place in the expence of cultivation, in particu'ar diftricts, beyond that in others, it is neceffary, it is faid, to confider not only the fum of money paid as wages, and the expence of maintaining fervants, but alfo the quantity of work performed, and the number of men and horfes which, according to the practice of particular dittricts, are confidered as neceffary to eultivate the fame quantity of land. The following ttatement will thew at one view the difference of keeping a team by the year, and of ploughing an acre of land, in Gloucefterfhire, in England, where five horfes are commonly ufed; and in the county of Angus, in Scotland, where only two are confidered neceffary.

The County of Argus.

Gloucefterniire.

It is ftated, that if thefe men and horfes were employed in ploughing the whole year, and that they ploughed an acre a-day, they would each have plougher? 313 acres in the courfe of the year. The expence to the Gloucefterfhire farmer would be Ss. each acre, while the Angus farner would have the fame extent of labour performed at about 3s. 4d. per acre. There is allo as great a difference in the expence of thrafhing grain. Since the introduction of thrafhing-maclines in Scotland, the grain can be feparated from the Araw upwards of 50 per cent. cheaper, and to better purpofe, than is to be done in England by manual labour. This comparifon might be made to include other operations, which are more or lefs expentive to perform, in confequence of the peculiar cuftoms and practices of particular diftricts. But all that is propofed here is to give an idea of the proper mode of calculating the expence of agricultural labour, and an inflance or two of the faving which every farmer has in his power to make, by ufing well-conftructed implements of hufbandry, and performing the various operations with as few men and horfes as poffible.

It is added, that the fcarcity of farm-fervants and daylabourers has of late been confiderably felt in many parts of Great Britain, and feems to be gradually increafing. The principal caufes to which this evil is to be afcribed are, in the opinion of the above writer, the inclofure bills in England, the enlarging or engrofling farms in both kingdoms, and the general increafe of commerce and manufactures. But a more ferious and certain caufe of this evil is probably to be found in the conitant ftate of warfare in which this country has been engaged for almoft the whole of the lalt half century. The deficiency of labourers is an evil of fo ferious a nature, (from whatever caufe it has originated,) as ought to induce proprietors and farmers of all defcriptions to adopt fuch meafures as appear molt proper for infuring a future and more abundant fupply. That which feems the moit likely to effect this defirable object with the greateft certainty is the building of cottages on every farm, in numbers proportioned to the extent of hands neceffary for its cultivation. Experience has proved that cottages are the bef nurferies for ufeful farm-fervants and labourers; and while nothing would tend fo fpeedily or fo effectually to fupply this defect as affording the labouring clafs of the people the means of living comfortably in the country, it -would alfo be the means, in a great degree, of filencing the rifing clamour againft enlarging or engroffing farms. In this view it is fuggelted, that a tax on every proprietor and farmer in Great Britain, who had not as many cottages erectied and inhabited, in a limited time, as there were ploughmen required for the cultivation of the farm; or one cottage for every certain number of acres. Such a tax, if impofed for the exprefs purpofe of increafing the population:

## L A B

of the country, and thereby keeping the price of all kinds of labour moderate, could not fail in time, it is fuppofed, to have the wifhed-for effect.

However, it is obferved alfo, that the practice of juining two or three, fometimes half a dozen, fmall farms in one, and the confequent demolition of the cottages, has had the effect of bringing about a great alteration, in many counties, in the defeription of fervants employed in hufbandry: as, inflead of employing married men living in cottages contignows to the farm, and paying them partly in neceffaries of life, young men, brought up in towas or villages, are employed, and their wages paid wholly in money, 一from which many bad confequences proceca. From the advantages to be derived by employing married men, who have families refiding on fome detached part of the farm, as ploughmen, as well as from the acknowledged fearcity of labourers, may, it is fuppofed, be inferred the propriety and even neceffity of improving, by every proper means, the lituation of the peafantry. The labourer's fituation would be much improved, were his employers' to revert to the old practice of paying him a great part of his wages in the neceffary articles of provifions : he would then be prevented from the neceffity of having recourfe, for every article he requires, to thofe worfe than pawn-brokers, the keepers of little paltry chandler's fhops; a fet of people who, without remorfe, appropriate to themfelves, under the name of a reafonable profit, a great proportion of the hard-earned wages of the laborious peafant. And next to getting the great article of provifions on reafonable terms, the allowing every cottager the means of keeping a cow, and of planting a reafonable quantity of potatoes and other vegetables, would tend, more than any other circumltance, in the writer's opinion, to his happinefs and comfort ; as it would enable him to procure a couliderable fhare of the futtenance of his fanily, without the expenditure of money, or the rik of impofition. It would alfo, it is imagined, be a great fpring to the indultry of the labourer, to fet him all his labour by the great, or piecc. He would be induced to labour with more Itedfaftnefs and perfeverance, when he was fatisfied that it was in his power to apply the fruits of his extraordinary exertions to the benefit of his family. And, laftly, to encourage, by every proper means, the eitablifhment of friendly focieties among the labouring clafs of people, as a means of provifion againit accidents, ficknefs, and old age.

Farm labourers, Mr. Marfhall thinks, as being the molt valuable clafs of men that a populous country poffeffes, fhould have every comfort provided for thern that is compatible with their fituation, and conformable to the general interelt of the community :- that their wages ought to be every where, and at all times, fufficient for the maintenance of themfelves and families while in health, with a furplus to provide againtt the day of ficknels, without their being under the debafing neceflity of making application to their neighbours for relief. Perlons fo effentially ufeful to fociety fhould not merely fupport exiftence, but have the comforts of wholefome habitations, with fufficient fpaces of ground to furnifh them and their families with changes of proper vegetable food, without much expence. It is, after all, this clafs of men that conftitutes the great bafis or prop of a country.

Labourers confpiring together concerning their work or wages, fhall furfeit $10 \%$ for the firft offence, $20 \%$. for the fecond, \&c. and if not pais, to be fet on the pillory. (Stat. 2 \& 3 Edw. V.I. cap. 15.) Juftices of peace, and tewards of leets, \&c. have power to hear and determine comphaints relating to non-payment of labourers' wages. (4) Edw. IV. cap. 1. 2 ê.Geo. II. c. 19: 3 I Geo. II. c. 15.)

## LAB

And labourers taking work by the great, and leaving the fame unlinihed, uuleds for non-payment of wages, or wiven they are employed in the king's fervice, \&c., are to fulfer one month's imprifonment, and forfeit $5 \%$. The wages of labourers are to be yearly affeffed for every county, by the Sheriff and juftices of peace, in the Eafter feffions; and in corporations by the head oficers, under penaltics. ( 5 Eiliz. cap. 4.) And the fleriff is to caufe the faid rates and affeffments of wages to be proclaimed. (I Jac. I. cap. 6.) All perfons fit for labour thall be compelled to ferve by the day, in the time of hay or corn harvelt; and labourers in harvect time may go to other counties, having tellimonials. From the middle of March to the middle of September, labourers are to work from five o'clock in the murning till feven or eight at might, being allowed two hours for breakfaft and dinner, and half an hour for fleeping in the three hot months; and all the reit of the year from twilight to twilight, excepting an hour and a half for breakfait and dinner, on pain of forfeiting one penny for every hour's abfence. ( 5 Eliz. c. 4.) By flat. 6 Geo. III. c. 25. artiticers, labourers, and other perfons, abfenting themfelves from the fervice of their employers, before the expiration of the term contracted for, flall be punifhed by imprifonment, for not lefs than one month, nor more than three. If any labourer fhall make an affault upon his mafter, he fhall fuffer as a fervant making fuch a affault. ( 5 Eliz. c. 4i) See Manufacturers and Servaijts.

LABOUREUR, Jonn Le, in Biography, was born, in 1623 , at Montmorenci, near Paris. Ai the age of nineteen he difplayed a turn for hiltorical refearches by publifhing "An Account of the Tombs in the Church of the Celeftines at Paris, with brief Memoirs of the Perfons entombed ;" which was very well received. In 1644, he was at court, in the character of gentleman in waiting, when he was fent into Poland, with the marflallefs of Guebriant, on a miffion to Ladiflaus IV, to whom the duchefs of Nevers was contracted. After his return he publifhed a narrative of this embaffy. He next entered into the ecclefialtical profeffion, and was made almoner to the king, and prior of Juvigné, and in 1664 he was created commander of the order of St. Michael, and appointed almoner to the king. He wrote the "Hiftory of the Marihal de Guebriant:" and he was editor of a new impreffion of the "Memoirs of Michael ise Caltelnau," with feveral genealogical hiltories, in three vols.folio, 1731: this performance is reckoned to throw much light upon reveral parts of French hiftory:"Hittory of King Charles VI. tranflated from the Latin of a MS. in the Library of de Thou," two vols. folio; "A Treatife on the Origin of Cuats of Arms." He left many MSS. among which is "A Hiftory of the Peerage." Mureri.

LABOURSOME, among Seamen, implies a violent rolling or pitching motion of a fhip át fea, by which the mafts and even the hull are in great danger. By pitching fuddenly the malts are likely to be carried away, and by the heavy rolling motion the mafts frain upon the fhrouds, and, confequently, upon the fides, with an effort which increafes as the fine of their obliquity, and the continued agitation of the veffel gradually loofens her joints, and makes her extreme. ly leaky.

LABRADOR; in Geography, an extenfive country of North America, fo called by the Portuguefe, who firt difo covered its coaft, comprehended in New Britain. It is bounded on the N. by Hudfon's ftrait, on the S. by part. of Lower Canada and the river St. Lawrence, on the W.: by Hudfon's bay, on the N. E. by the ocean and Davis's ftraits, and cn the E. by the ftraits of Belline and the gulf
of St. Lawrence. 'The extent of this country has been but imperfectly afcertained : for our knowled re of the eaftern coa't and of its inhabitants, we are chiefly indebted to lieutenant Roger Curtis, from whof a papers extracts were made and communicated $t$ the Royal Socicty, in 1774 , by the honourable Daines Barrington (Phil. 'I'runf. vol. G4; part 2,) and to Mr . Cartwright, who relided, at difierent intervals, for fixteen years, in this defolate country, and whofe account of it was publinted at Nexark in 1793. But the knowledge thus obtained priocipally relates to the coait; for the ioland territory rewains ftill unexplored. 'Ihefe writers concur in reprefenting the face of the country, as far as they could difcover it, not only hilly, but mountainous; fome of the mountains being of a condiderable eleration. From the fea the fouth coalt feemed to be fertile and to be covered with a degree of verdure; but the foil, on examination, was poor, and the verdure was that of coarfe plants, which might ferve for deer and goats, but was not proper fir horfes, kine, or fleep. 'T'o the improvenent even of this part, the depredations of the bears and wolves furnifh a formidable impediment? and the cattle, on account of the feverity of the climate, mult be houfed for nine months in the year. The whole of the eaft coalt exhibits a very barien appearance: the mountạins rifing fuddenly out of the fea and being compofed of rocks, which are thinly covered with black peat earth, that produce itunted fpruces and a few other plants The adjacent fea, however, the rivers and lakes, which are numerous, abound with filh, fowl, and amphibious animals. Springs are rare, and the water is chiefly fup. plied by melted frow; neverthelefs, it is wholefome, and thofe fwelled throats which frequently occur in the Alpine regions of Europe and Afia, are unknown in this country. On the coaft are feveral fpacious and fafe harbours; and at a fmall ditance, and within its capacious bays, there are thoufands of iflands of different fizes, on which eider-ducks breed in large flocks, and which are focked with a multitude of fea-fowl. On fome of the larger iftes there are deer, foxes, and hares. All kinds of filh, belonging to the Arctic feas, abound on this coait; and the rivers are frequented by falınon and fea-trout, pike, barbel, river-trout, eels, and other kinds. At a fmall diltance from the coaft in the inland territory, the air is milder; the foil is more fertile, and trees, fome of which are of a large tize, are more numerous. The ground is covered with fpruces and firs, with an intermixture of larches, bireh, and afpens, particulagey near the fhores of the bays, rivers, brooks, and ponds, where alone they arrive at any degree of perfection. Other trees are mere flurubs, and they are the alder, ofier, do :berry, pears, currants, rafpberries, and a few others. The fruits coalit of vari us kinds of bervies, wiz. currants, rafpberries, partridge-berries, cranberries, applos, pears, whoralc berries, and a finall berry, the plant of which refembles the Itrawbery, each producing only a fingle fruit, of a bright pink coluur, granulated like a mulberry, and having a delicate flavour. The vegetables fit for food are wild ce'cry, feuryy grafs, the young leaves of the ofier and of the ground whortle-berry, Indian fallad, red docks, and an Alpine plan', of which the rein-deer are very fond. The foil, though of a light kind, is not dellitute of clay; no ores, execpt thofe of iron, have been difcovered; but thefe are plentifti. White fpar is common, and feveral famples of that cailed 1,abiador 〔par, have been picked up by the Efquimaux. The birds of the country are the whitefailed eagle, falcons, hawks, and owls of various kinds, the raven, white groufe, ptarmigan, fpruce game, whitting cublew, grey plower, sarious fpecies of fandpiper, and other
waders, reefe, ducks of various forts, thags, gulls, divers, fwaliows, martins, fome few fpecies of fmall birds, fnipes and doves, the two latt being very fearce. The bealts are white and black bears, rein-deer, wolves, wolverines, various fpecies of foxes, martens, lynxes, otters, mink, beavers, mufquafh, raccoons, hares, rabbits, and moles, and probably other kinds. The climate, though fevere, is falubrious; there is litlle appearance of fummer till about the middle of July, and in Seprember winter indicates its approach, fo that this latter feafon is long and the cold is fevere. In fummer the heat is fometimes unpleafant, and in that feafon the weather is very moderate, and remarkably ferene, without thofe fogs which are more prevalent in New: foundland, and thofe violent gales of wind, to which fome other parts of the globe are fubject. At this feafon, the mofquitoes and fand-flies, which are very numerous, are intulerably troublefome. The winters are faid to be lefs fevere than formerly. The greatelt heat obferved at Nain (N.lat, $57^{\circ}$ ) in the jear 1780, was $84^{\circ}$, ard this was ia July ; the greateft cold in 1779 was - 36 . On the fea-coalt it is much cooler than farther inland, more efpecially when the wind blows from the ocean, on account of the immenfe quantities of ice that are contiguous to the coalt; and which, together with the inands already mentioned, render the navigation dangerous. Thefe thoals of ice fet in from the north in fpring and fummer. It is not an unknown phenomenon in thefe northern and colder climates, that leveral beafts, and fome of the birds, change their colour with the feafons. It the winter, the prevalent colour is white; and againft the rigour of the cold, molt animals are furnifhed by the order of providence with a defence. The quadrupeds are clothed with a longer thicker hair, or fur; and the birds have a fofter down and feathers of a clofer contexture than thofe of milder countries.

On the coalt of this defolate country there were only a few factories, till the Moravian clergy formed finall fetrle. ments, particularly at Nain, about the year 1964. Upon barren rocks, covered with fnow for more than half the year, and where the winters are fo rigorons, and of firch long continaance, we cannot expect to find that the inhabitants are very numerous. The native inhabitants of this country are mountaneers and Efquinnux, between whom there fubfits an insincible averfion. The mountaineers inhabit the inte. rior parts of the country, towards the north, and with refpect to colour refemble our gypties, which is probably acquired by their being. expofed to the weather, and to the fmoke of their wigwams, 'They are of a robult conttitution, though their limbs are fmall, and their frame is well adapted to the rocky comntry, which they are continually travering. They have no hair except on the head; and for many years they have drefled their food, which they boil to a jelly,? whereas the other Indians eat every thing raw. They chiefly fubfit on rein-deer, which they are very dextrous in killing, They alfo kill foses, martens, and beavers. As they live a wandering kind of life, they never build honfes; but they conltruct a kind of tents, covered with deer-fkius and birch, and called wigwams; the $\mathbb{R k i n s}^{2}$ which they ufe for this purpole, as well as for clothes, are tainted in order to take off the hair, then wathed in a lather of brains and water, and afterwards well dried and well rubbed; but for winter ufe they have jackets of beaver, or deer-fkins, with the hair on. They traverfe the country by the affiltance of canoes in the fummer; and of rackets, or fnow-fhoes, in the winter. Their canoes are covered with the rind of birch; and though they are fo light as to be eafily carried, they are large enough to contain a whole family, and the ma:erials of their
traltic:

## L A B

traffic. By means of the numerous ponds which are found in this country, they thus convey themfelves to a great diftance in a thert time ; travelling by water or by land,'as circumilances requirc. They bear fatigue with incredible refolution and patience ; and will travel two days fucceffively, without taking any fort of nourifhment. They are efteened an indultrious tribe; and for many years they had been known to the French traders. Their chicf employment is to procure fur, and the neceffaries of life; they are very illiterate, but generally good-natured, and faid to be lefs ferocious than other Indians; and this foftnefs of manners they have probably acquired by their long intercourfe with Europeans. They come every year to trade with the Canada merchants, who have feal fifieries on the fouthern part of the coait, and they bear the character of jult dealers, fays Curtis, though Cartwright charges them with a pronenefs to theft. They are, without doubt, immoderately fond of fpirits, for which, blanketiag, fire-arms, and ammunition, they truck the greateft part of their furs. With regard to religion, they profefs themfelves Roman Catholics; but know no more of it than merely to repeat a prayer or two, count their beads, and fee a prieit whenever they go to Quebec. It is their cultom, fays Curtis, to deftroy the aged and decrepid, when they become ufelefs to the fociety, and burthenfome to themfelves. This practice they vindicate from their mode of life: alleging that thofe who are unable to procure neceflaries, fhould not live merely to confume them.

The $E$ fquimaux (fee that article) who inhabit the northern part of Labrador, are indifputably Greenlanders. They are of a deep-tawny, or rather copper-coloured complexion ; they are inferior in fize to the generality of Europeans, and there are but fesv of them who are of a good ftature. They are flat-vifaged, and have fhort nofes; their hair is black and very coarfe; their hands and feet are remarkably fmall. The women load their heads with large ftrings of beads, which they fatten to their hair above their ears; and they are fond of a hoop of bright brafs, which they wear as a coronet. Their drefs is entirely of fkins ; and confits of a fort of hooded clofe fhirt, breeches, flockings, and boots. The drefs of the different fexes is the fame, except that the women wear sery large boots, and their upper garment is ornamented with a tail. In the boots they occafionally place their children; but the youngelt is always carried at their back, in the hood of their jacket. They have no fort of bread, but live chiefly on the flefh of feal, deer, fiff, and birds. In the winter they live in houfes, or rather caverns, which are funk in the earth. In the fummer they occupy tents, made circular with poles, and covered with fkins. They have no fort of beverage among them except water, and are not fond of firituous liquors. They feem to have no fort of religion, nor to have any object of adoration among them. They have no kind of government; and no man is fuperior to another, but as he excels in ftrength or in cquage, and in having the greatef number of wives and children. They have no marriage ceremony ; a wife is confidered as property; and a hulband lends one of his wives to a friend. The women marry young. The men are extremely indolent, and the women are mere drudges, doing every thing except procuring food. They few with the finews of deer, and their needle-work is very neat. They have few difeafes, and are confequently without phyficians; but they imagine, that tying to their neck or writts the par--ticular part of fome fifh or animal, according to the complaint, will effect a cure. They have never been vifited with the fmall-pox. Thefe Indians cannot reckon numerically beyond fix; and their compound numbers reach no faro

Vol. XX.
ther than 21; every thing beyond this is a multitude. Their dread of the mountainecrs makes them live always upon the fea-fhores. Their canoes are extremely long in proportion to their breadth, being upwards of 20 feet by two, and contain only one perfon; they are covered with fkins, and extremely light, fo that they are cafily overfet, and yet there is not one among thefe people who can fwim. They navigate their fhallops without a compais, in the thickelf forgs, and are very good coafters. Their dogs, of which they have a great number, ferve as a guard, and as food: their fkins fupply them with clothing; and in winter they draw their fledges. They cannot bark, but make a molt hideous howl; they are large, and have a head like a fox, whereas the dogs of the mountainecrs are very fmall. The weapons of thefe Indians are the dart, and the bow and arrow, but they are not very expert in the ufe of either. Their number cannot be accurately afcertained; Mr. Curtis made fome at. tempt for this purpofe by counting the number belonging to each tribe, eftimated by the number of boats, and by that of the men, women, and children belonging to each boat ; eftimating them in this way, he reckons their number to be 1623. Mr. Cartwright fays, that thefe Efquimaux were the beft tempered people he ever met with, and the molt docile; nor, as he fays, is there a nation under the fun with which he would truft his perfon and property in preference to them; although till within thefe few years they were never known to have any intercourfe with Europeans, without committing theft or murder, and generally both.

The bufinefs carried on by the Englifh with Labrador is the fame with that on the ifland of Newfoundland. The exports are cod-fifh, falmon, oil, whalebone, and furs; but the latter are much better than any of the fame kind obtained upon that ifland, nor do ferv parts of the world produce better. N. lat. $50^{\circ} 30^{\prime}$ to $62^{\circ} 30^{\prime}$. W. long. $55^{\prime \prime} 30^{\prime}$ to $77^{\circ} 30^{\prime}$.

Labrador Lake. See St. Peter's Lake.
Labrador Spat, in Mineralogy. See Feldspar.
Labrador Stone. See Feldspar.
Labrador Tea, in Gardening, the common name of an evergreen plant of the more hardy kind. See Ledum.

LABRISULCIUM, a term in Surgery, derived from labrum, or labiurn, a lip, and fulcus, a deep fore, and fignifying fometimes a chap of the lip; but frequently the difeafe well known under the appellation of the cancrum or gangrena oris. See Gaygriena Oris.

LABRIT, in Geograpby, a town of France, in the department of the Landes, and chief place of a canton, in the dittrict of Mont-de-Marfan. The place contains 584, and the canton 44 II inhabitants, on a territory of $497 \frac{1}{2}$ kiliometres, in nine communes.

LABRUS, in Icbthyology, a genus of the thoràcic order. This tribe of fifhes is'extremely numerous, and comprehends many fpecies of peculiar beauty and variety both in form and colours; their general afpect is rather more diflinguifhed for elegance than fingularity, but the diverfity of thofe brilliant tints with which nature has embellifhed them is almolt endlefs. We are little acquainted with their manners of life; fuch as have occurred to our own obfervation appear to be thofe of the natural inhabitants of the marine clement ; fome delight to refide in the fhaliows and rocky bottoms of the fea contiguous to the boldell fhores, but the far greater portion of the fpecies are fo widely difperfed through the inamenfity of feas as to rarely occur to notice; and ferr, or indeed fcarcely any, are known in the regular finheries in any part of the globe. The Alefh of thofe cocalionally introducct for the table are of an agreeable and excellent favour, fuch as

## LABRUS.

as the "old wife," and fome others. The fmaller kinds are nted chiefly by the finhermen as bait.

The confufion prevalent among authors refpecting this family of fifhes is inconceivably great ; a circumitance the more remarkable in our ideas, fince the ohvious character of the genus does not appear ambiguous. The confution arifes from that want of precifion in the definition of the true character which is too perceptible in the writings of ichthyologiits in the carly part of the laft century, and which led them to admit indiferiminately with the Labri many kinds that ought not to have been included in the fame genus. Some of thefe crrors have been progreffively detected and amended by ceferring the fifhes improperly claffed as Labri to other genera. But for others apparently not lefs exceptionable, we muft place our trult in their defcriptions only, the ohjects defcribed being unattainable; and while this uncertainty continues, it will be concluded the whole of the prcfurned fpecies of Labrus can never be reduced to very fatisfactory order.

On a retrofpective view we need not perhaps refer beyond the 1oth edition of the Linnxan "Syttema Naturx;" in this we find the genus Labrus with the following eflential character. Teeth acute ; gill membrane with fix rays, and the covers fcaly; and the dorfal fin with a filiform fkin extending beyond the end of the pofterior rays. This is the Linnæan character in its lateft tate of inprovement, excepting only that it is added, with a laudable degree of caution, that the two genera Labrus and Sparus are fo clofely allied, as to render it difficult to diltinguifh them: "Labri et Spari genera ob affinitatem etiamnum difficilius diftinguuntur." Linnzus defcribes altogether about forty feccies, fome of which had been defcribed in his former works as of the Labrus, Sparus, and Sciæna genera, and for thefe, with the exception of a few new kinds in Muf. Ad. Fr. he ftood indebted to the labours of his friend Artedi, or to thofe of Gronovius, Ray, and Catefby, by whom fome were called Labri and others Spari.

Gmelin endeavoured to amend the effential character of Labrus by rendering it more comprehenfive, and for this reafon adds to the character before-mentioned that the lips are fimple; the pectoral fins pointed, and the lateral line ftraight. Stili this was found infuflicient, and is, in our ideas, confefledly inferior to the very exceilent and concife character by which Bloch dillinguifhes the genus, namely, the lips large, the upper one double and extenfile: the genus poffeffes other characters, but this is the moft material. Another attentive obferver of nature, Monf. Commerfon, has offered fome improvements in the inflitution of the genus Labrus, and has added to the genus many new feccies. One of the lateft and moft copious writers on this fubject however remains to be noticed, namely, count Lacepede, a naturaliit who undertook the taik of reforming the whole fyttem of claffification, and one to whom fcience is indebted in a great meafure for the number of new fpecies introduced of late years to the knowledge of the worid.
'To the Linnzan naturalit, the arrangement propofed by Iacepede will rather, we apprehend, appear an innovation, than improvement. In this refpect, confidering the very eoncife view the limits of our article will allow us to take of this fubject, we are not difpofed to exercife much critical remark, or we conceive it would not be impoffible to afcertain that it partakes of the character both of improvement and innovation. Our own opinion is, that the Limmean definition, though extremely ufeful, is inadequate, and that the character affigined by Bloch, though still more concife, is betser. We allow, moreover, the neceffity of reformation; srany of the Linnzan Labri belong to other genera, and
there are, befides, fpecies more recently referred to the genus Labrus which rather conititute new genera. Hence the neceflity of forming a larger number of gencra, by dividing the Labri, is admitted; but in allowing this, it itill remains a queltion, whether Lacepede has not fallen into a greater error than that he endeavours to reform; for inftead of permitting them to remain in a fingle genus, he conftitues no lefs than feven new genera of the Labri, and their immediate dependencies. In extenuation, it may be indeed obferved, in the language of one of his continental admirers, "this iutelligent writer found the genus (Labre) fo vitiated, that he was under the neceffity of forming fo many now gencra, This increafe of genera might feem to have diminifhed the number of fpecies in the Labres to a trifling amount, but, on the contrary, by the introduction of the new kinds very recently difo covered, they are again advanced to the number of one hundred and thirty fpecies."

The genera into which Lacepede divides the Labrus of Linnens, and other authors, are Labrus, Hiatula, Osphimenemes, Cherlinus, Lutjanus, Trichopodus, 'and Cheilodipterus.

Labres, according to this writer, is characterized by having the upper lip extenfile; neither incilive teeth nor grinders; gill-covers deftitute of fpines and denticulations ; dorfal lin one, extending nearly from the nape almolt to the tail, and compoled of rays terminating in a filament. This genus (which Lacepede feparates, chiefly according to the furcated or rounded form of the tail, into three fections) includes a great number of the Linnæan genus Scimna, as the fpecies capa, lepifma, unimaculata, gibba, cinerafcens, armata, and fufca, with many others; and, on the contrary, the number of Linuran Labri is lefs extenfive than might be imarined, it includes his fecies lunaris, venofus, and guttatus: but the genus conlitts principaliy of new lifthes.

Hiatula is a genus eftablifhed for one feecies (Labrus. hiatula) of Linurus, which, being deititute of any anal fin, cannot, fays Lacepede, remain with the reft. This he calls. Hiatule gardenienne.

Ospmbonemus is a genus inflitutea by Commerfor, from whom it was adopted by Lacepede. Its character conlifts in having five or fix rays in eacl thoracic fin, the firf of which is a fpine, and the fecond terminated by a long flament. This genus contains only the fpecie3 Gorany and another.
Cherlinus is a genus eftablifhed for the reception of the Linnxan Labrus fcarus, and a new fpecies obferved by Commerfon, the fpecies trilobé. The upper lip is extenfile ; gill-covers deffitute of fpines or teeth, and a fingle dorfal fin.

Lutusaves was originally eftablifhed by Bloch, from whom it was adopted by Lacepede ; this forms a mott extenfive genus, and comprehends feecies from feveral of the Linnean genera, as Perrat tligna, itriata, argentea, and nobilis ; Sparus virginicus, and Cbatodn araums, together with the Labri Itriatus, fcina, lapma, ramentofus, ocellatus, adriaticus, \&cc. Its character is, that one or more plates of the gill-covers have a fmall tooth; the back a fingle dorfal fing. and fometimes a beard to the jaws.

Tricnoponus includes part of the Linnæan Labri; the character confints in having a fingle ray longer than the body to each of the thoracic thas, and one dorfal fin.

Chenlodipterls. The upper lip in this genus is extenfile; it has neither incifive teeth, nor grinders ; the gillcovers are deftitute of fpines or tecth, and the back is furnifhed with two fins. This laft genus contains nine fpecies.

Having thus far ftated the moft material alterations that bave taken place in this extenlive geaus, it only remains to
enumerate the fpecies, the order of which, in confurmity with our original plan, will be reduced as nearly to the arrangement adopted in the Ginclinian fythem, as the introduction of the more recently difcovered hinds will permut.

## Species.

* Tail forked.

Scarts. Tranfverfe appendages at the fode of the tail. Eimn. Scarzs Autlorum, Arted. Cikiline fiare, Lacepede.

A native of the Mediterrancan, where it appars in thoals, and feeds chiefly on fuci, and other marine plants. The length is about twelve inches, the ficales large and thin, and the front teeth broad and blunt. 'Ihe fleth of this fpecies was eftecmed a delicacy amung the ancient Romans, and in their days of luxury, obtained, if we may crudit Oppian, the moft extravagant price. It feems to be molt abminant near the fhores of Greece.

Asimins. Body entirely reddifh. Art.
Inhabits fouthern Europe and Ammerica. Gmelin conceives, from the ferrated operculum, it may be a perca. Bloch conltitutes of it a dillinct granus, under the nare of Anthias.

Cnetensis. Teeth four, body greenif. Art.
Inhabits Candia, and the adjacent places.
Hepraves. Lower jaw longer; body with tranferfe black lines each fide. Ârt.

An European \{pecies found in the Mediterranean fea, and fometines in the rivers adjacent. The dorfal fin has ten fipinous rays, and twent $y$-one foft ones, and behind the former a black fpot.

Gmseus. Tail fub-bifid; body fomewhat greyifh. Gmel . Turdus pinnis brancbialibus carens, Catefby:

A native of America. Catefloy has figured this fpecics svithout pectoral fins, fays Gmelin, and ditrults his accuracy; from a reference to the preliminary obfervations, it will be however remarked, that Lacepede admits its corre:tnefs, and inftitutes a new genus of this feccies only.

Luxamis. Tail-fin truncated in the middle; dorfal and anal with a purple line; lips folded. Gmel. Labrus oblongus, \&ec. Gronov. Lie croiffant, Bonnaterre.

An inhabitant of the South American and Indian feas. The body is oblong-violet, weth bands of yellow difpoled tranfverfely; the dorfal and anal fin yello:r, except the violet line.

Gallus. Caudal fin truncated in the middle ; dolfal and anal with violet lines at the bafe; lower lip with a doubling each fide. Gmel. Scarus ral':us, Forlk.

Defcribed by Forfeal amung the fighes of A rahia: the body is dalky green, with violet lines all over the body, the belly with two blue ftripes, and an intermediate ore of grves; feales lax, ftriated, membranaceons at the edre, and marked with a tranfyerfe purple band; eyes remoie, with red pupil; teeth in one row; tail yellow in the middie, violet towards the lides, and edged with blue. The fleth of this kind is accounted poifonous.

Punpureus. Caudal fin truncated in the middle; dorfal and anal with a longitudinal purple repandate ftripe at the bafe. Gmel. Scarus purpureus, Forfk.

Inhabits the fhores of Ardbia; the length eighteen inches; body fomewhat lance-flhaped and truncated, colour duckygreen, with three purple ftripes each fide, beneath blue; fcales broad, rhombic, ftriated, and loofely imbricated; crown convex, naked and brown, wth a purple triangle each fide before the eyes; gill-covers naked, with a fquare purple fpot; lateral line ramofe. The fleth of this wifn is elteemed grood.

Patrracus. Caudal fintruncated in the middle ; edge of
the fins, abdominal frion, and mastes on the imat bien Gincl. Scarus plitacus, forlt.
The body of this fuecies is greenifh, with yellowith linues cyes fmall and remote; jaws of two bones, the hower one with one tooth each bide, the nuper three; gill-cower. with toofe foales; lateral line fomewhat ranofe, and dubll. the firlt near the back, the other in the midule; lims pumpto A native of Arabia. Perhaps of the fcarus gerus?
Pistarclus. Green, with three longitudinal red ftripes on each fitw; dorfal fin ycllow, with longitudinal red lard. L.: Ampubk, I acepede. Parrakect lubrus, Shaw.

Deferibed from a drawing by Plumicr. The fpecies u!hahits the American feas. Over each eje is a black treak; tail yellow, with four or fise curved bands of blee and red.

Nigern. Trail truncated in the middle: down the chitr ? dafky green longitudial fripe. Gmel. Scurus nis . Forlis.

An Alabian Species found near the fhores of the fea. Thas jaws are bilid, the blotehes on the bead and outer margna of the fins blue green : lips edged with reth, and then grees.-inh-brown; tecth in the upper jaw two, canine and white; fins villet-brown; pectoral oblcure, ferruginous and brownifh at the bate; tuil greenifh, the angles lanceolate.

Chisus. Hend with three blucifh rivilets each fide, under the eye a blue fquare fpot. Gmel.

Colour above brown, beneath white; lower jaw longer, between the eyes two furrows diverging belind ; anterior gill-covers ferrated at the back pari, pollerior tridentate ; pectoral, ventral, and anal fins yellow; dorial and caudal foozted with red. Inhabits Turkey, near Conftantinople.

Operculatus. Body with ten brown bands; gill-covers with a brown fpot. Linn. Amoen. Acad.

A native of Aria.
Paro. Body varied with green, blue, fanguineous red, and hoary. Gmel. Labrus pulicire varius, finnis pelloralibus rotundatis, Art. Labrius pıwo, Haffelquit. Peacook labrus.

Length twelve inches. Inhabits the Mifditerranean fen, near Syria.
Auritis. Gill-covers fin-haped. Gmel. Perca furviatilis gibbofa, ventre luteo, Catelby.

Nutive of the freh waters of North America; the iris is yellow; gill-cover with a long, obtufe, black membrane at the tip ; the tall bllubate.

Theropmenes. Ventell fins with one ray. Pallas, Sparis, Sec. Koclreuter.
Length four inches, the body casinated behind, firghty modulated with bros:a and pale, the midde of the thes and bale of the tail with a romd brown black ?pot, furrounded by a paler circle. An Indiantpecies of the marine kivd.

Fucurcs. Dorian and and lins falcated, the five firat ravs unarmed. (imel.

Inhabits America, the colour Givery, and length of the brean; the tecth are acute, and the ventral fins imall.

Refes. T'ail lanaze; body entirely tawny. Loef. Turdus flavurs, Catelby.

An American fpecies.
Zexlanicle. Tail lunate; body above green, beneath pale purple. Ind. Zool.

An edible fill. It inhabits Ceylon. The head is blue, the gill-covers green, with purple lines; pectoral fins witha purple fpot in the middle, and edged with blue; ventral bine; dorfal and anal blueih-purple edged with green; tail in tire middle yellow, each fide ftreaked with red, at the bafe blue.
Ayext. Body filvery : rays of the dorfal fintwo-fire, and neany unarates. Forls.

## LABRUS.

thluabits the fandy flores of Arabia. The length fix inches; body oblong; belly flraight, and fometimes marked with interrupted ftripes; the lips are equal, the upper protractile; teeth numerous and very fhort; lateral line nearer the back, and almoit parallel; tail bilobate, the lobes lanceolate, and the fins glancous.

Catenula. Lower jaw longer; back elevated; on each fide eight feries of very fmall equal fpots, and two tranfverfe bands upon the nape. I.e labre chapelet, Lacepede.

Obferved by Commerfon in the Indian feas. This and Several of the following new fpecies are probably fpecies of the Linnzan Sciena.

Lovahostris. Snout much advanced; gill-covers of two pieces. Le lalre lonz-muficiu, Lacepede.

Found wit' the preceding.
Melipterus. Fins black; head bare of feales. Labrus wh-lipterus, Bloch. Le libure ì nagoires molles, Buff.

A native of Japan.
Seminuber, Four teeth in the upper jaw larger, anterior half of the body red, the pulterior yeilow. Le labre demi-rouge.

Obferved by Commerfon in the Indian feas. The bafe of the poiterior part of the corfal fins ficaly.

Punctulatus. Upper lip large, thick, and pleated; three longitudinal rows of black dots on the dorfal fin, and one on the polterior part of the anal fin. Le labre tetracanthe, Lacepede.

Native country unknown.
Semidiscus. Pale, with numerous black tranferfe bands; tail terminated in a clear pale crefcent. Le labre demi-cifque, Lacepede.

The bands acrofs the body of this fifh are about nineteen in number, and the dorfal fin feltooned. A fpecies found in the Indian feas.

Doliatus, Grey, with about twenty-three tranfverfe brown bands; caudal fin crefcert-fhaped. Le labre cerclé, Lacepede.

A native of the Indian feas.
Hirsutus. Six larger teeth in the upper jaw; lateral line hirfute with fmall fpines; body with numerous longitudinal lines. Le labre bériffé, Lacepede.

Inhabits the Indian feas.
Furcatus. Lower jaw longer; teeth fmall; lobes of the caudal fin pointed and very long. Le labre fourchu, Lacepede.

Found in the fame feas as the former.
Sex-fasciatus. Opening of the mouth very fmall; lower jaw longer ; body with fix tranfverfe bands. Le labre ffix bandss, Lacepeje.

Obferved with the preceding by Commerfon.
Octo-vittatus. Teeth in the upper jaw much longer ; on each fide the body four fomewhat oblique rays. Le labre buit raiks, Lacepede.

Fuund in the Indian feas. The tail in this kind is crefcent fornicd.
Lazvis. Lower jaw longer ; teeth large, recurved, and equal; lateral line nearly Itraight; body with five large tranfuerfe if ots or bands. Le labre liffe, Lacepede.

A native of the Indian feas.
Gounnir. Each gill-coper compofed of three plates, and terminating in a large rounded projection; lateral line obfolete; between the thoracic tins a pointed procels. Le labre gouan, Lacepede.

Country unknown.
Macrorterus. A black foot oa the pofterior angle of
the gill-covers; nearly all the rays of the fins terminating in filaments. Le labre macroptere.

A fpecies met with in the Indian feas by Commerfon, in his voyage round the world.

Plumieri. Head rayed with blue; body filvery, with fpots of blue and golden-yellow, and curved tranfverfe band on the tail. Le labre plumiericn, Lacepede.

Found in the American feas.
Exneacasthus. Lateral line interrupted; body with fix tranfverfe bands, and two on the tail. Le labre cnníacanbe, Lacepede.

Each jaw is fursilhed with two or four large and very flrong teeth, and the fcales are confiderable in point of fize. Its native place is unknown.
lismina. Head with feven fmall blue rays each fide, and four larger of the fame colour each fide of the body; tail crefcent-haped. Le labre Lijmira, Lacepede.

Native of the Red fea.
Ins. Gill-covers compofed of four plates, and ending in an angular prejection; a large oval black fyot with white annulation at the potterior part of the dorfal fin.
'Inhabits the frefh waters of Carolina, where it is very common, and is etteented as an edible fill.

> ** With, tail entire.

Hiatula. Anal fin none; body with fix or feven black bands. Linn.

Communicated to Linnæus by Dr. Garden. The fpecies inhabits Carolina, and conflitutes the genus hiatula of Lacepede. Whether L. grifeus before mentioned be really of this genus, or is defective only in the reprefentation, appears uncertain. Should it actually be deftitute of the anal fin, as defcribed, it mult probably be placed in the fame genus (hiatula) as this fpecies, notwithiftanding the diference in the form of the tail.

The lip in the prefent fifh is retracti'e, and wrinkled within ; jaws befet with flarp teeth, thofe in the palate orbicular; gill-covers punctured at the edge; /pinous rays of the dorfal fin equal, on the potierior part hiack.

Marginalis. Subfufcous; edges of the ecoffal and pectoral fins tawny. Loeh. it.

Inhabits the ocean.
Ferrucinevs. Sides blueih, with a longitudinal, tawny, indented fripe each fide. Gmel.

An Indian fpecies.
Iulis. Body above fufcous and green; beneath white, wish a fulvous dentated fripe cach fide; two fore-teeth longelt. Donov. Brit. Fifhes. Labrus iulits; fapra fufus viridffue fulutus albus viita fulva utrinque s'mtata, dentibus duobus primoribus fupra longiorilus, Ibid. Labrus iulis, Linn. Lalrus iulis, Bloch?
"Difcovered on the coaft of Cornwall in the year 1802. As a native of the Mediterranean fea, this fifh is mentioned by various writers; but as a Britih fpecies it is perfectly new, not having been recorded as fuch either by Willuglby, Ray, Borlafe, Pennant, or any other writer on the zoology of this country."-"This fifh has arrefled the attention of many ichthyologilts among the aricients as well as moderns, the former of whom pronounced it the molt beautiful of European fifhes. It may be collected from the works of Elian, Ariftutle, Salvian, Aldrovardus, and others, that this finh is common at certain feafons in the Mediterraneañ, 不lian fpeaks of it, however, as a poifonous fifh, and of fuch a venomous nature that it would be unfafe to eat it, or even the fefl of any other fifh that had been touched by it. Galen mentions it, on the contrary, as wholefome food. The male of this fpecies is dittinguihed,
guifhed, according to fome writers, by having the back of a black colour, inttead of green, as in the female; but it appears in this and other refpects to be an extremely variable fpecies. Neither are its habits and manners correctly known. It is generally afferted that it fwims in fmall fhoals: Ariftotle feaks to this etfect; but this is contradicted by Salvian and others, who defcribe it as a more folitary filh, \&ce" Vide Brit. Fifhes.

The ufual length is about feven or eight inches.
Paroticus. Lateral line curved; fins rufous; gillcovers exrulean blue. Liun. Muf. Ad. Fr.

Native of India.
Suillus. Dorfal fin filamentous; above the tail a black fpot; dorfal fpines nine. Linn. Fn. Suec. Sparus berg Jbyltra, It. Wg.

Inhabits the fhores of Europe.
Striatus. Dorfal fin filamentous; body with white and brown lines. Ling.

Native of America.
Guaz.i. Fufcous; tail rounded, the rays extending beyond the membrane. Loetl.

Inhabits the ocean.
Oceldarts. Dorfal fin filamentous; an ocellate fpot at the bafe of the tail. Linn.

Country unknown.
Punctates. Dorfal fin filamentous; body with longitudinal lines fpotted with brown. Gmel. Sciena, \&c. Linn. Labrus, Gronov.

## Found in Surinam.

Melops. Dorfal fin filamentous, and with the anal varicgated ; behind the eyes a brown crefcent. Linn.

Inhabits the fouth of Europe.
Niloticus. Dorfal, anal, and caudal fins clouded. Linn. Labrus niloticus, Haffelq.

Inhabits Egypt.
Ossifragus. Lips doubled; dorfal fin with thirty rays. Linn.

An European fpecies.
Rupestris. Dorfal fin filamentons; tail with a brown Spot at the upper edge. Gmel. Sciana, \&̌c. Linn, Curadje, Ströem.

Found on the rocky fhores of Norway.
Onims. Dorfal fin hiamentous; belly fpotted with cinereous and brown. Limn.

Country unknown.
Viridis. Green, with a blue line each fide. Alt.
Inhabits the Mediterranean.
Lineitus. Fins greenifh, the dorfal one ramentous; body green, with numerous yellowifh longitudinal lines. Donov. Br. Fithes.
"A new and highly interefting fpecies, defcribed on the authority of an example found by captain Bray on the coalt of Cornwall. 'This fpecimen, which is in our poffeffon, is feven inches in lengeth; the prevalins culour greenifh, with the belly yellowifh," \&xc. Vide Br. Fithes.

Luscus. All the fins yellow; usper cye-lid black. Lins.

Country unknown.
Livers. 'Tail rounded; dorfal fin filamentous; body livid brown. Linn.

Exoletus. Dorfal fin filamentous; body lineated with blue; anal fin with five 〔pincs. Miill. Zool. Dan.

Inhabits the Atlantic and Norway feas, and alfo Green. land, though rarely.

Sinengis. Dorfal fin filamentous; boly livid; crown retufe. Gmel.

An AGatic fpecies.

Jaronices. Fine yellow. Hontuyr.
length fix inches, and imhabits Japan.
Boop's. Lower jaw longer; dorfal in two. Houttuyn. Found in Japan with the latter.
Tisca. Dorfal fin ramentaceous; body yellowifh, variegated with blue and red fpots; fins red, with fiffous margins, and dotted with white. Donov. Br. Fithes. Pinna dorfoli ramentaciz, corpore flizerfente cerulco variegato rubroque maculato, pinnis rubris fufco marginatis albo-guthatis, Ibid. Labrus tinca, Linn. Labrus vetula, Block. Tirchus vulgatifimus, Whll. Trielle, peulle de mer, gallet, Belon. Wrafle, or old avife, Kay.

Molt writers concur in admitting the labrus tinca as a fift almolt, if not exclutively, peculiar to this country. " Habitat in maris Britannici profundis feopulufis," Gays Gmelin; and this opinion is fanctroned by the conntenance of Lacepede and others. Hence it cannot be improfer to regard it chiefly as a Britith production; and as fuch, it will not be amifs to repeat fome obfervations that have been already delivered by us on this fubject, in the volumes of b-itifh lintes to which we have before adverted. "Th:is charming fpecies of wraffe cannot but be conlidered as one of the moit beautiful of the fihh tribe obferved to this tiase on the coatt of Britain," \&e.-" We have obtained this fpecics from Scarborough, and other ealtern coalts of England, more than once; we have received it alfo from Cornwall, from the Skerry illands, nerth of Anglefea, and from Scotland; but have been uniformly led to believe it a fpecies not very common on either of thefe coalts, except near Scarborough. The ufual length of this fpecies is about fifteen or eighteen inches, and its form rather bulky in proportion to the length, The prevailing colour is yellowilh, inclining to greenifh or olivaceous on the back, and white towards the belly; the markings variahle in form, and diff ring much in colour. The whole of the back and fides are fpoited with red, varying in different ipecimens from a deep or purplifh crimbin to a reddifh-orange, and even in fome varieties almolt to fulvous, a:d curiontly marked with irregular lines, dots, and fpecklings of crerulean blue, efpecially about the head; the fins are red, with a broad duflsy border inclining noore or lels to purple, and clegrantly marked with numerous roundifl dots of white. Bloch confiders the dukky border of the lins (which in the fpecimen he delineates is black) as a fufficient indication of the fpecies. In his fifh, the black border was dittinct only in the ventral, anal, and caudal fins; to which may be added, that the dorfal fin is commonly dufky or purplifh, as well as thofe before mentioned.
"Block defcribes this fifh under the title of labrus vetula, and as a native of the coaits of Britanny, Normandy, and the North fea; from the lalt of which he received it through the medium of his friend, M. Spengler. Gmelin, as before remarked, fpeaks of it as an inhabitant of the Britifh coafts, probably on the authority of Ray and Willughby. But the fpecies is not confimed to Europe: a fpecimen of it, taken among a varicty of other fihes by captain Cook in the South feas, is at this time in our collection.
" The haunts of this lifh are deep waters on the boldeftrocky fhores, where it fubfilts on crabs and teltaceous animals; for the maceration of which, the three tuberculated bony procefles of its throat are admirably conftructed, This fifh takes bait engerly, and is more commonly caught. with the hook and lise than in the net, or by any other mode of capture.
" It appears Mr. Pennant had not confidered the varieties. of this fifiattentively, or, we think, the ballan wraffe would not have been delcribed as a fpecies diftinct from the labrus, tinca.

## L A BR.US.

tirca. The ballan wraffe of that writer is certainly the fame as our fith, from, which it differs only in being of a paler colour, and $m$ having the body marked with yellowifh inHead of orange or red. Such pale coloured varieties occur pretty frequently, and are indeed more common than thofe of deeper or more lively colours. Dr. Turton fufpects the ballan wraffe to be a variety only of the labrus tinca of Linnaus, though he deferibes it as a fpecies with this diftinctive character: " Body ycllow, fpotted with orange; above the nofe a deep fulcus; farther gill-cover with a deep depreffion radiated from the centre." In thefe particulars Dr. Turton was mifled by the account given by Mr. Pennant, without reflecting that the fame characters apply precifely to labrus tinca. Mr. Pemant informs us, the ballan wraffe "was the form of the common wraffe, only between the dorfal fin and tail was a confderable filiking; above the nofe was a deep fulcus; on the fartheit cover of the gills was a deprefion radiated from the cenre." It is already fhewn that the fuots on this fifh vary confiderably; to which may be added, that the finking between the dorfal fin and tail is confpicuous in all the varieties of labrus tinca, and fo alfo is the fulcus above the nofe. With regard to the laft characteriftic, the radiated depreffion on the gill-covers, one, two, or more fuch deprefiions are apparent on thofe parts, when divelted of the large fcales that adhere to them; every fcale, of which there are feveral on the gill-covers, leaving fuch a radiated depreffion on the thin menibrana e us $k$ in, when taken off. Thofe particulars inclined us to believe Mr. Pemnant was in fome meafure deceived by the imperfect ftate of the Scarborough fpecimen he examincd; and our opinion has been lince confirmed by various circumitances. Mr. Travis, the fon of the medical gentleman who furaifhed Mr. Pennant with the fecimen he defcribes, informs us the ballan wraffe is the individual fifh conmonly known by the nane of old vuife among the lifhermen on the Searborough coalts, where it appears in froals during fummer, and that there is only one fort found in thofe parts. This kind we have examised, and have no hefitation in ftating it to be the ballan wrafle of Pemant, and the labrus tinca of every other ielho thyolngit." Vide Brit. Fittes, vol. iv.

In the details ahove mentured will be found fome further arguments on this fubject, which the linits of our article camot permit us to repeat. For the length of the prefent digreflion we mult indeed offer an apology, and this will doubtlefs be accepted on the following grounds. The Eallart wraffe of Mr. Pennant has been alnoot uniformly admitted as a fpecies by the belt writers; when the accomnt from which the preceding extracts were taken was publifhed, we were atware it was received as a fpecies by leveral yefpectable writers, and lince that period, we have obfe:ved it included as fuch by a modern continental weiter, Miefo. Bole, under the name of le labre ballan; be fpeaks of it on the authority of Euglifh authors, and as a native of this country only. To correct this error, it will be admitted, was defirable, and it was certainly no lefs incumbent in declining to defrribe the ballan wrafle, to explain our motives for fuch omiffion.

Vamegates. Red, with ahout four irregular parallel olive Aripes on the fides, and an equal number of blue ones, Donov. Br. Fifhes, Latrus zarirysatis, Gmel. Striped ruralfo.
A.very elegant and local Britihh filh. To Mr. Pennant we are indebted for an account of this fpecies; he was fo fortunate as to difcover it fome years ago; he found it on the coalt of Auglefea, off the Skerry inlands. The length of his fpecimen was ten inchee, but we procured both fexes at the fame place, and of a fize rathor larger, the formale
meafuring fourtecn inches in length, and the mate twelve. Brit. Fithes, vol. i.

Croms. Dorfal fin rearly united: fecond ray of the anal fin very large, thick, and compreffed. Limn. Brown, Sc. Coracinus Srafilienfis, Ray. Guatucupa, Marcg.

## Native of Carolina.

Lasenus. Oblong; all the rays of the dorfal fin fpinous, except the latt. Limu.

Inlabits South America and India.
Perdica. Tail even; back ftraight; crown fmooth: body with indenred yellowifh fripes each fide. Fork:

This and the two following fpecies inhabits the fea about Contlantinople.

Scras. Body greenifl, with white and ycllow waves: between the eyes an impreffed hollow, and before the hollow a groove. Forfk.

The middle teeth large; anterior gill-covers flightly ferrated behind, polterior unarmed; lateral line interrupted: pectoral fins yellowith and without fpots, the reft obfcure, Jcllow, fputted with blue.

Lapisa. Pectoral fins yellow; ventral blue, the relt villet fpotted wish blue. Furl.

Body oblong-nval, above brown, beneath whitifh, the fides greenihh-yellow, with three lines each lide, each compofed of a double row of red fpots.

Ramestoies. Greenifh-brown ; filament of the firf dor. fal fpincs twice as long as the ray. Fork.

Native of Arabia; the body lanccolate, fpotted with violet on the fins, crown, and under the eyes; or fometimes fine green; fcales large, rourded, entire, and difpofed in sine rows from the belly to the back.

Ocellates. Greenifh, with a fcarlet ccellate foot behind each eye. Fork.

Inhabits th: flores of Syria; the body fuboval, back yellowina-brown, and the head marked with blee irregular lines.

Luxelates. Greenifh-brown with darker bands, feales with each a ferruginous band; brealt fpeckled with red. Forf.
Length one foot; fceles broad and entire. This fpecies inhabits Arabia.
Thinacclates. Red: on each fide at the bafe of the dorfal hia two dark fpots, and a third between the dorfal fin and tail. Donov. Br. Fifhes. Lalrus trimatulutus, Gmel. Lubles carnerts, le Pann ronge, Bloch. Trimaculated zerraff.
"The length of this fpecies is about twelve inches; its form is graceful, and the colouse, when recent, of peenliar elegance and delicacy: A fine orange varying to red upon the back, and becoming palce and whiter towards the belly; is the chief and moft pervading colour. The dorfal fin and tail are tine orange, the former itrongly marked. with dark purplifh-black, and prettily edged with blue; and the reft of the fins paler. The three dark fosts at the potterior extremity of the back, which principaly conflitutes the fpecific diftinction of this kind of wrafle, are of a rich blackith purple. There are alfo four other fpots of a delicate rofe colour, fituated contigunus to thefe, and which do not apm pear to have been mentioned by any writer. Two of thefe fpots are difpofed in the fpace between the three darker ones before mentioned, and the third and foursh are placed one at each extremity of the outermolt ones, fo as to form together a feries of feven fpots, which are alternately of a pale rofe colour and a very deep purple. This fpecies is uncommonly rare. Our fpecimen was canght on the coait of Corawall in June 180 n." Vide Brit. Fithes. v. ia.

Olivacels.

Orimaeres Body olive-green; gill-covers blue at the tip; tail with a black fpot. Brunn.

Native of the Medilerranean; the length two inches; body oblong, comprefficd, bencath inclining to filvery.

Fusects. Budy brown, with blue lines and $f_{1}$ ots. Brunth

Length threc inches, compreffed oblong, beneath whitifl. $T$ he fpecies inhabits the Mediterrancan.

Uximacelates. Body lincated with olive; dorfal fin behind with a black foot. Mrum.
Inhabits the Mediterranean, and a fuppofed varicty of it, which is reticulated with dulky and greenith tivery, occurs in the Adriatic. The body is three inches long, oval, compreffed, and marked with abour ten paic blue longitudinal lines.

Vevosus. Green, with anaftomofing weins; gill-covers and dorfal tin with a black foot. Bloch.

Native of the Mediterranean; bedy oval, and comprefled : fides of the head with a few lougitudinal red lines; filaments and band on the dorfal fin red. Length three inches.

Griseus. Body grey, with darker fpots; tail with a black foot at the bafe. Brunn.

Length three inches, oval; cheeks lineated with blue; fins reddifh, with dufky yellow fpots. Found in the Mediterranean.
Guttatus. Body reddih, variegated with black; tail with a fpot on the middle of the bafe. Brunn.
Native of the Mediterranean.

- Adraticus. Body with four broad tranfverfe brown bands; dorfal fin on the anteriur part ten-fpined; on the pofterior part marked with ocellated black fpots. Brunn.
Length three inches; body pale; head with oblique tawny lines.

Leopardus. Two teeth in the front of each jaw larger ; body fpeckled with brown; from the eyes to the gill-covers a dark line, and on the tail a black band. Le labre leopart, Laccpede.
A fpecies found in the Indian feas, and called leopardus, from the colours and markings on the body, tail, the dorfal and anal fin, refembling thofe of the leopard. It was difcosered by Commerfon.

Bivittatus. Back red, fides yellow, with two longitu. dinal brown rays, the upper one of which extends from the eye, the lower from the pectoral fin. Le labre a deux lignes, Ėc. Bloch. Le labre birayé, Lacepede.
The country unknown.
Macrolepidotus. Yellow; fcales large; nine finines in the dorfal fin; beneath the eyes two rows of pores. $工$.e Jabre a gandes ècailles, Efc. Bloch.

Suppofed to be an inhabitant of the Indian feas.
Areo-radiatus. Lips very thick; body yellowifh, with two very long white rays, and a third above fhorter. Mem. Acad. Petr.

## Country unknown.

Marmozatus. Marbled with brown and whitifh. Le labre marbré, Lacepede.

A native of the Indian feas; difcovered by Commerfon. The teeth are equal and diftinct.

Bergylta. Scales large; the laft rays of the anal and dorfal in much larger than the others. Bloch, \&c. Le labre bergytte, Lacepede.

Found in deep feas in the north of Europe: Feeds on crabs and fhells, and grows to the length of ten or twelve inches.

Hortulanus. Body and tail decuflated with dark

Atripes, and a fpot in each divifion. La labre futeore, fan cepede.
Native of the Inclian feas.
Canones. Scakes large; lateral line firaighe; mar thes pecteral fins a large browa fout. I.c lubert calops, J, merpede.
Shlathits the fas of Europe, and is known at Dispoce under the nane of "brune." The eyes are largs and black ; the back dulky.

Ascasif. thove red, varied with green fones and ftreah, and the under parts ycliowifi, fpeckied with red. Le rone afomius.

Length feven inches; green ftripes on the dorfal ant anal fin about two or three in number; tail green, with the tip red.

Csinoptencs. Above varicl with red, green, and yellow; beneath green and brown; lins thluc. Cbeilontitere cyunutere, I acepede.

A beautiful fpecies, found in the American ficas.
Cingelem. Anteriur rats tivid, potterior brown, with an intermediate white girde, dorfal fin edged with whice. Lacepede, \&sc.

Native of the Indian feas:
Dasa. Four larger teeth in the upper jaw; in the lower two; centre of each fale marked with a brown credeent. Le labre diane, Lacepude

An Indian feccies.
Machodox. Scales large; mouth furnihed with four larger curved teeth. Le lalire nuctidonte, Lacepede.

Neustriw. lack varjed with brown, orange, and greeniflh, the lides marbled with brown, ora gige, and white. $L c$ labre Neufrien, Lacepede.

Found in the Seine, where the fifhermen diftinguih it by the title of "grande vieille," and "bandouliere marbre."
Creentatus. Silvery, with large irregular fpots of fanguineous. Le labre enfinglantí, Lacepede.

Obferved by Plumier in the American feas.
Knnuta. Body blackifh, with a yellow longitudinal ftripe cach fide, and beneath yellowih with rufous fin. Job. nius karutta, Bloch. Le lubre kurui, Lacepede.

An Indian feecies.
Cupreus. Somewhat filvery ; head, back, and fins, tinged with coppery. Jobnius aneus, Bloch.

Shape lanceolate. This £pecies inhabits the Indian feas; and is called Anei kattalei by the natives of Malabar.

Anvulatus. Body encircled by nine regular ftraght bands or rings. Le labre annelé, Lacepede.

One of the fpecies found by Commerfon in the Indian feas.

Brasiliexsis. Two teeth in the upper jaw longer and recurved; dorfal and anal fin with two or three longitudinal: lines. Bluch, \&cc.

Found on the coafts of Brazil, where it is taken with the hook and line; the fefh is excellent.

Tessellates- Back violet, fides filvery, and divided into compartments like a wainfcot.. Labrus tefellatus, Bloch. Le labre boifé, Buff.
This kind inhabits the North feas. Some French authors. call it "perroquet boife."
Cornubius. Body variegated with green ; near the tail a large fufcous fpot; anal fin yellow, obliquely banded with. fufcous. Donov. Erit. Fithes. Labrus corsulius, Gmel. Goldsmay, Ray.

This beautiful fpecies is about a palm's length, the back brownifh, bencath which the green prevails, and below this the fides and lower part are jellowith Clvery; anal fin golden yellow, whence. its name.

Combeb:

## LAB

## LAB

Comsrr. Back, fins, and tail red; belly yellow. $L$. corpore miniato, cauda rotundata, Gmel. Comber, Ray, \&ec. A fmall fpecies of an oblong form, recorded by Ray as an inhabitant of the fhores of Cornwall.

Coques. Purple and dull blue, beneath ycllow. Gmel, Iuhabits fame place as the former, according to Ray.
Mintus. Variegated with yellow and blue; anterior teeth larger. Arted.

Found on the fheres of Dalmatia.
Fulvus. Body fulvous, Gmel. Turdus cauda convena, Catefly

A native of America.
Varius. Varied with purple, green, blue, end black. Art.
Native of the Mediterranean.
Merlea. Blackilh blue. Art.
An European fpecies.
Cynaedus. Pale yellowr ; back purple; dorfal fin reaching from head to tail. Art.

Found in the Mediterranean.
LABURNUM, in Botany. See Cytisus and Aragyrts.

Laburaum, in Gardening, a common name applied to a beautiful, flowering, ornamental tree, for pleafure and other grounds. There are two forts of this tree in ufe generally, which, while young, have nuch the fame appearance in the wood and foliage, but are afterwards readily dittinguifhed by the fmallneis and finenefs of the flowers, and of that of the branches. The fine flowered and more branchy fort, is the molt proper for fituations where ornament is required, fuch as fhrubberies and pleafure grounds; but the more coarfe flroag growing kind, fucceeds belt in poor, gravelly, and rocky fituations.

LABY, in Geagraphy, a town of Sweden, in the province of Upland; 12 miles N. of Upfal.

LABYRINTH, AzE゚vontos, among the Ancients, was a large and intricate edifice cut out into various inles and meanders, running into each other, fo as to render it difficult to get out of it.

There is mention made of four celebrated labyrinth among the ancients, ranked by Pliny in the number of the wonders of the world ; wiz, the Cretan, Egyptian, Lemnian, and Italian.

That of Crete is the mofl famed ; it was built, as Diodorus Siculus conjectures, and Pliny pofitively afferts, by Dædalus, by command of king Minos, who kept the Minotaur fhut up in it, on the model of that of Egrpt, but on a lefs fcale : but both affirm, that in their time it no longer exifted, having been eilher defroyed by time, or purpofely demolifhed. It was hence that Thefeus is faid to have made his efcape by means of Ariadne's clue.

Diodorus Siculus and Pliny reprefent this labyrinth as having been a large edifice; while others have confidered it as merely a cavern hollowed in the rock, and full of winding paffages. If the labyrinth of Crete, fays the Abbé Barthelemi (Travels of Anacharfi3, vol. iv. p. 44I, \&c.), had been conitructed by Dxdalus under the order of Minos, whence is it that we find no mention of it, either by Homer, who more than once §peaks of that prince, and of Crete, or by Herodotus, who defcribes that of Egypt, after having faid that the monuments of the Egyptians are much fuperior to thofe of the Greeks; or by the more ancient geographers; or by any of the writers of the ages in which Greece flourifhed? This work was attributed to Dxdalus, whofe name, fays our author, is fufficient to difcredit a tradition. His name, like that of Hercules, had become the refource of ignorance, whenever it turned its eyes on the early ages. All
great labours, all works which required more ffrength than ingenuity, were attributed to Herculcs; and all thofe which had relation to the arts, and required a certain degree of intelligence in the execution, were afcribed to 1) $\begin{gathered}\text { dalus. Ac- }\end{gathered}$ cording to Diodorus and Pliny no traces of the labyristh of Crete exifted in their tine, and the date of its deltruction had been forgotten. Yet it is faid to have been vilited by the difciples of Apollonis: of Tyana, who was contemporary with thofe two authors. (Philoltrat. Vit. Apoll. 1. iv. c. 34.) The Cretans, therefore, believed that they polfeffed the laburinth. At Nauplia, near the ancient Argos, fays Strabo (1. viii.), are ttill to be feen valt caverns, in which are conflructed labyrinths that are believed to be the work of the Cyclopes; the meaning of which, as. Barthelemi underttands him, is, that the labours of men had opened in the rock paffages which croffed and returned upon themfelves as in quarries. Such, he fays, is the idea we ought to form of the labyrinth of Crete. He then fuggefts an enquiry, whether there were feveral labyrimths in that inland? Ancient authors fpeak only of one, which mot of them place at Cnoffus, and fome few at Gortyna. Belon and Tournefort defcribe a cavern fituated at the foot of mount Ida, on the fouth lide of the mountain, at a fmall diftance from Gortyna: which, according to the former, was a quarry, ard according to the latter, the ancient labyrinth. Belides this another is fuppofed to have been fituated at Cnoflus, and in proof of the fact it is alleged, that the coins of that city reprefent the plan of it. The place where the lahyrinth of Crete was fituated, according to Tournefort, was, as Barthelemi fuppofes, one league diftant from Gortyna; and, according to Strabo, it was diftant from Cnoffus fix or feven leagues; with refpect to which our author concludes, that the territory of the latter city extended to the vicinity of the former. In reply to the inquiry, what was the ufe of the caverns, denominated kabyrinth, Barthelemi imagines, that they were firft excayated in part by nature; that in fome places ftones were extracted from them for building cities, and that, in more ancient times, they ferved for an habitation or afylum to the inhabitarits of a diltrict expofed to frequent incurfions. According to Diodorus Siculus, the molt ancient Cretans dwelt in the caves of mount Ida. The people, when inquiries were made on the fpot, faid, that their labyrinth was originally a prifon. It might indeed have been applied to this ufe; but it is fcarcely credible that, for preventing the efcape of a few unhappy wretches, fuch immenfe labours would have been undertaken. See Crete.

The labyrinth of Egypt, according to Pliny, (N. H. v. ii. 1. 36.) was the oldeft of all; and was fubfilting in his time, after having flood, according to tradition, as he fays, 4000 years. He fays it was built by king Petefucus, or Tithoës; but Herodotus makes it the work of \{everal kings: it ftood on the fonthern bank of the lake Mceris, near the town of Crocodiles, or Arfinoe, and confifted of twelve large contiguous palaces, in which the twelve kings of Egypt affembied to trarfact affairs of ftate and religior, containing 3000 apartments, 1500 of which were under ground.

This frueture feems to have been defigned as a pantheon, or univerfal temple of all the Egyptian deities, which were feparately worlhipped in the provinces. It was alfo the place of the general affembly of the magiftracy of the whole nation ; for thofe of all the provinces or nomes mer here to fealt and facrifice, and to judge caufes of great confequence. For this reafon, every nome had a hall or palace appropriated to it; the whole edifice containing, according to Herodotus, twelve; Egypt being then divided into fo many kingdoms.

## L A B

## LAC

Pliny makes the number of thefe palaces 16, and Strabo makes them 27. All the halls were vaulted, and had an equal number of doors oppofite to one another, lix opening to the north, and fix to the fouth, all encompaffed by the fame wall. The exits, by various paffages and innumerable returns, afforded to Herodotus a thoufand uccafions of wonder. The roofs and walls within were incrutted with marble, and adorned with fculpturcd figures The halls were furrounded with pillars of white ftone finely polifhed; and at the angle, where the labyrinth ended, tood the pyramid, which Strabo afferts to be the fepulchre of the prince who built the labyriath. According to the defeription of Pliny and Strabo, this edifice Itood in the midit of an immenfe fquare, furrounded with buildings at a great diltance. The porch was of Parian marble, and all the other pillars of marble of Syene; within were the temples of their feveral deities, and galleries, to which was an afcent of 90 fteps, adorned wih many columns of porphyry, images of their gods, and fatues of their kings, of a coloffal fize: the whole edifice was conftructed of fone, the floors being laid with valt flags, and the roof appearing like a canopy of itone: the paflages met, and croffed each other with fuch intricacy, that it was impofiible for a ftranger to lind his way, either in or out, without a guide; and feveral of the apartments were fo contrived, that on opening of the doors, there was heard within a terrible noife of thunder. Although the Arabs, fince the days of Pliny, helped to ruin this Itructure, yet a confiderable part of it is fill ftanding. The people of the country call it the palace of Charon. See a plan and defcription of this labyrinth, in the prefent Itate of $i$ : , in Pucocke's Hit. of the Eatt, wol. j. p. 6i, \&c. See alfo Perry's View of the Levant, P. 3 Sr, \&c.

Strabo, Diodorus Siculus, Pliny, and Mela fpeak of this monument with the fame admiration as Herodotus; but not one of them fays that it was conftructed to bewilder thofe who attempted to pals through it; though it is manifelt, that, without a guide, they would have been in danger of lofing their way. The Abbé Barthelemi (ubi fupra) fuggerts, that this danger introduced a new term into the Greek language. The word labyrinth, takea in the literal fenfe, fignifies a circumfcribed fpace, interfected by a number of palfages, fome of which crofs each other in every direction, like thofe in quarries and mines, and others make larger or fmaller circuits round the place from which they depart, like the fpiral lines that are vifible on certain fhells. Hence it has been applied, in a figurative fenfe, to obfcure and captious queftions, to indirect and ambiguous anfwers, and to thofe difcuffions, which, after long digreffions, bring us back to the point from which we fet out.
Tht labyrinth of Lemnos was fupported by columns of wonderful beauty; there were fome remzins of it at the time when Pliny wrote. That of Italy was built by Porfenna, ling of Etruria, for his tomb.
Labyriath, in Gardening, a fort of maze or wildernefs plantation, abounding with hedges and walks, diltributed into many windings and intricate turnings, leading to one cofmmon centre, extremely difficult to be found out, deligned by way of amufement. This is commonly formed with liedges, in double rows, leading in various twiltings and turaings, or backward and forward, with intervening plantations and gravel-walks alternately between hedge and hedge. The great object is to have the walk contrived in fo many mazy intricate windings, as to caufe much labour and difficulty to fod out the centre, or out again in the way a perfon came in. But they are now rarely introduced into modern garden defigus; and farcely to be feen, except in fome old gardens.

Vor. XX.

The hedges for this ufe are ufually of hormbam, hut ma be of becch, elm, or any other turt of tree or hirab tiact can be kept in neat order by clipping. The walks firoutlo be five feet wide at leaft, laid with gravel, and neatly rolled ; and the trees and florubs to form the thicket of wond between the hedges of any of the hardy kinds of the decidimats tribe interfperfed with fome evergreens. In the middik, fpace foould be left open as the centre. The labyrinth whit is, we believe, fill in exiltence at Hampton Court, is alm wholly formed of the common elm trec, cut in fo as to keetp it down to the proper height.

But fraill labyrimhs are oecafionally formed with Lo: edgings, and borders for plants, and alleys for walking 1 m . in imitation of the large ones, and which have good effect in fmall garden-grounds.

Labymitit, in Geography, a clufter of fmall illands: in the Pacific ocean, difcovered in 1722 , by captain Roxyewein, 75 miles W. from the Peraicious iflands.-Alfo, a chain of hoals, rocks, and fmall iffands on the E. coaft of New Holland, extending from Cape Tribulation to Cope York.

LABYRINTHUS, in Anatomy, a name given, on ac. count of its apparently complicated itructure, to the internal organ of hearing ; to the part, indeed, which, from is receiving the auditory nerve, is the true feat of the fenfe. See Ear.

LAC, or Lacca, Gum, as it is commonly, though no: very properly, denominated, becaufe it is neither a gum nue a refin, is a kind of compound fubitance, preparea by the female of a minute infect, called by fome Cocces Lacca, and by others Cinermes Laca, which is found in feveral fpecies of trees in the Eaft Irdies, and particularly on the banyantree (Ficus indica and religiofa of Linurus), feveral fpecies of Mimofa, and the Biher on Rhamnus jujuba. Thete infects are nourifhed by the trees on which they are produced, and fix themfelves upon the fucculent extrimities of the young branches; and around thair edges they are environed with a fpiffid fub-pellacid liquid, which feems to glue them to the branch. It is the gradual accumulation of this liquid, which forms a complete cell for each infect, and is what is called Gum Lacca. When the cells are completely formed, the infect is in appearance an oval, fmooth, red bag, without life, about the lize of a fmall cochineal infect, emarginated at the obtufe end, full of a beautiful red liquid. When the eggs are hatched, the young infects, or grubs, firft feed upon the rel liquid above-mentioned, and when this is expended, they pierce a hole through the coat that invefts them, and move off one by one, leaving their exuvix behind, which are the white membranous fubltance found in the empty cells of the Stick lac. The accumulation of lac appears in the cconomy of this infect to be the fubitance that anfwers the double purpofe of a nidus and covering. to the egg or infect in the firft flage of its exiftence, and of food for the maggot in its more adranced ftate. The lac is formed into complete cells, finifhed with as much regularity and art as the honey-comb, but differently arranged. The flies are invited to depofit their eggs on the branches of the trees by befmearing them with fome of the freft lac fteened in water, which aitracts the fly, and gives a better and larger crop. For a particular defcription of thefe infects, and their cells, we refer to the papors of Mr. James Ferr, of Patna; Mr. Robert Saundere, firgeon, at Buglepour, in Dengal; and Dr. Roxburgh, of Samulcotta, in the Philofophical Tranfactions, vols. 1xxi. lxxix. and lxxxi. Lac is a faple article of commerce in Anam, a rountry bordering on, and much conne led with, Thibet, which furninhes the greatef quantity of that in ufe; and it is alfo found upon the uncul-

U
tivated
tivated mountains or buth fides of the Canges. The ondy trouble in procuring it is that of breaking down the tranches, and carrying them to market. The price in Dacea, in 1785, fays Me. Kerr, was about 825 . the hundred pounds weight. although it was brought from the diftant country of Aflam. The beil lac is of a decp red colour. If it is p.le, and piarced at top, it is depretiated in value, becaule the infects have left their cells, and confequently they can be of no ule as a dye or colour; though they may be probably better for varnihers. Of lac there are four kinds known in commerce: viz. I. Stick lac, which is the lac in its matural Itate, from which all the others are formed. This is ob:ained in pretty confiderable lumps, with much of the woody parts of the branches on which it is formed adhering to it. 2. Seed lac, which is the former broken into fmall pieces, garbled, and appearing in a granulated form. 3. Lump lac, which is fecd lac liquefied by fire, and formed into cakes. 4. Shell lac is the purified lac, or the cells liquslied, frained, and formed into their tranfparent laminx. Lac is brought into this Itate, or purified, by the following procets. It is broken into fmall pieces, and picked from the branches and titicis, and then put into a fort of canvas bag of about four feet loug, and about fix inches in circumference. Two of thefe bags are in conflant ufe, and each of them held by two men. The bag is placed over a fire, and frequently turned till the las is liquid enough to pafs through its pores, when it is taken off the fire, and fqueezed by two mern in different dire tions, dragging it along the convex part of a plantain tree (Mufa paradifaica of Linneus), prepared for the purp re: while this is doing, the other baje is hazting, to be treated in the fame manner. The mucilaginous and fmooth furface of the plantain-tree feems peculiarly well adapted for preventing the adhefion of the heated lac, and giving it the form, which enhances its value fo much. '1'he degree of preflureon the plantain-tree regulates the thicknefs of the Thell, and the quality of the bag determines its fincnefs and tranfparency, upon which its value depends.

The lac is applied to various purpofes by the natives in India. A great quantity of the foell lac is confuned in making ornamental rings, painted and gilded in a varicty of taltes, to decorate the arms of the ladies; and it is formed iuto beads, fpiral and linked chains for necklaces, and other femalc ornaments. It is alfo ufed for fealing-was. For this purpore, take a ftick, and heat one end of it upon a charcoal fire; put upon it a few leaves of the fhell lac foftened above the fire; keep alternately heating and adding more thell lac, until you obtain a mafs of three or four pounds of liquefied fhell lac upon the end of your flick. Knead this upon a wetted board, with three ounces of levigrated cinnabar, and form it into cylindrical pieces; and to give them a polifh, rub them while hot with a cotton cloth.

For japanning, take a lump of gell lac, prepared in the manner of fealing-wax, with whatever colour you pleafe, fix it upon the end of a thick, heat the polifhed wood over a charcoal fire, and rub it over with the half-melted lac, and polith by rubbing it even with a piece of folded plantain leaf held in the hand; heating the lacquer, and adding more lac as occafion requires. Their figures are formed by lac, charged with various colours in the fame manner. In ornamening their images and religious houfes, \&c. they make ufe of very thin beaten lead, which they cover with various varnifhes, made of lac charged with colours. The preparation of them is kept a fecret. The leaf of lead is laid upon a fmooth iron heated by fire below, while they fpread the varnifh upon it.

For grindtones, take of river fand three parts, of feed lac wahed one part, mix them oyer the fire in a pot, and
form the mafs into the flape of a grindtone, having' a fquare hole in the centre, fix it on an axis with liquefied lac, heat the ftone moderately, and by turning the axis it inay be eafily formed into an exact ofbicular fhape. Polifhing grindftones are madconly of fuch fand as will pafseafily through fine muflin, in the proportion of two parts of fand to one of lac. The fand is compofed of fmall angular cryftalline particles, tinged red with iron, two parts to one of black magnetic fand, The itone-cutters, inltead of fand, ufe the powder of a very hard granate, called Corunde. Thefe grinditones cut very faft: when they want to increafe their power, they throw fand upon them, or let them occafionally touch the edge of a vitrilied brick. The fame compofition is formed upon flicks ; for cutting fones, fhells, \&c. by the hand.

For painting, take one gallon of the red liquid from the firtt working for fhell lac, ftrain it through a cloth, and let it boil for a flort time, then add half an ounce of foffil alkali; boil an hour more, and add three ounces of powdered load (bark of a tree), boil a flort time, let it itand all night, and ftrain next day. Evaporate three quarts of milk, without cream, to two quarts, upon a flow fire, curdle it with fome milk, and let it Itand for a day or two, then mix it with the red liquid above-mentioned; flrain them through a cloth, add to the mixture $1 \geq$ oz. of alum, and the juice of eight or ten lemons; mix the whole, and throw it iuto a cloth-bag thrainer. The blood of the infect forms a coagelum with the cafeous part of the milk, and remains in the bag, while a limpid acid, water drains from it. The coagutum is dried in the thade, and is ufed as a red colour in painting and colouring.

For dyeing, take one gallon of the red liquid prepared as lefore without milk, to which add three ounces of alum. Boil three or four ounces of tamarinds in a gallo: of water, and Itrain the liquor. Mix equal parts of the red liquid and tanarind water over a brifk frre. In this mixture dip and wring the filk alternately, until it has received a proper quantity of the dye. To increafe the colour, increafe the proportion of the red liguid, and let the filk boil a few minutes in the mixture. To make the filk hold the colour, they boil a handful of the bark called load in water; ftrain the decoction, and add cold water to it ; dip the dried filk into this liquor feveral times, and then dry it. Cotton cloths are dyed in this manner; but the dye is not fo latting as in filk. The lac colour is preferved by the natives upon flakes of cotton dipped repeatedly into a ttrong folution of the lac infect in water, and $\mathrm{t}^{\text {hen }}$ dried. The Hindoos, as Mr. Charles Wilkıns informed Mr. Hatchett, diffolve fhell lac in water, by the mere addition of a little borax ; and the folution, being therı mixed with ivory-black, or lamp-black, is employed by them as an ink, which, when dry, is not eafily acted upon by damp or water. Mr . Hatchett found this fact to be exaßly as it was ftated by Mr. Wilkins.

Belides the lac above-mentioned, there is another furt which is white or yellowith, brought from Madagafcar, yery much refembling the pe-la of the Chinefe, which has been lately examined by Dr. Pearfon. See Laccic Acid.

Mr. Hatchett (Phil. Tranf. for 1So4, part ii.), has detailed a number of experiments for the analyfis of the three common fpecies of lac, with a view of afcertaining its conitituent parts and difcriminating properties.

Lac, though long known in Europe, has not much attracted the attcution of chemifts. The firf perfon who fubjected it to a regular examination was the younger Geoffroy, the refult of which is publifhed in the Mem. de 1'Acad. de Paris for 1714. He concluded that this fubftance is not, as fome have fuppoled, a gum or refin, which

Thas exuded from vegetables fimply punctured by infects. Gcoffroy and Lemery obtained from lac, by diltillation, fome acid liquor, and a butyraceous fubltance; and Gcoffroy obferves, that when ftick-lac was thus treated, fome ammonia was alfo obtained, but not when feed-lac was employed. Geoffroy confidered lac as a kind of wax, very dititinct from the nature of gum or refin. Since his time it has been little examined, and therefore chemilts have entertained various opinions concerning it. Chaptal, adopting Geoffroy's opinion, calls it a kind of wax ; but Gren and Eourcroy regard it as a true refin.

Mr. Hatchett found that when water is poured on flick lac, reduced to powder, it immediately began to be tinged with red, and by heat, a deep-coloured crimfon folution was formed. Repeated operations of this kind reduce llick-lac to a yellowifh-brown fubitance, and the water no longer receives any colour. The portion feparated from the lac has, on an average, amounted to 10 per cent.; but as it canuot be completely feparated, confiderable variations mult be expected in different famples.

Fine feed-lac does not afford more than $2 \frac{\pi}{2}$ or 3 per cent. of the colouring fubllance; and fhell-lac, when treated in the fame manner, i. e. merely with water, did not yield more thant $\frac{1}{2}$ per cent. Alcohol diffolves a confiderable portion of each of the different kinds of lac; and when heat is not emp'oyed, the diffolved part is refin, combined with fome of the colouring matter; but if the lac is digefted with heated alcohol, the folution is more or lefs turbid, and it is difficult to obtain it in a ftate of purity and tranfparency, either by repofe or filtration. The folution obtained by digelting flick-lac in alcohol, without heat, is of a dark brownifi-red colour; and the infoluble part fubfides, retaining the greater part of the colouring matter, moit eafily foluble in water. The proportion of refin thus diffolved. when flick-lac is treated with alcohol, amounted to $\mathrm{CH}_{7}$ or 6 S per cent. The feed-lac ufed by Mr. Hatchett was very pure, and yielded to alcohol about 88 per cent. of relin, containing little of the colouring matter. Shell-lac, in finall fragments, by fimple digellion with alcohol, afforded in the firt inflance nearly 8 r per cento ; but part of the refin required fubfequent operations to feparate it, fo that the total quantity of relin mighi be eltimated at 9 I per cent. Sulphuric ether does not feem to att fo powerfully upon the varieties of lac as alcohol; and, therefore, ether is not the beft mentruum for lac. Concentric fulphuric acid acts firft on the colouring matter of lac; and after a thort digellion in a fand-bath, the whole is converted into a reddifh-brown thick liquer, which foon becomes black; and the chief part of the lac is feparated in an infoluble ftate, refembling coal. During the folution of lac in futphuric acid, a confiderable quantity of fulphureous acid gas is evolved. When lac is digetted with nitric acid, nitrous gas is at firft produced; the lac fivells much, and is converted into a deep yellow opaque brittle fubitance, which, by a fufficiercy of nitric aciu, and a continuance of the digellion for about 48 hours, is diffolved.

This yellow nitric folution is converted by esaporation into a deep yellow fubfance, which burns like refin, but is foluble in boiling water. Muriatic acid diffolves the colouring matter and gluten of lac with a feeble astion, unlefe the refin has been previoully feparated. Acetous achd much refembles the rouriatic in its effects. Stick-lac, feed.lac, and fhell-lac are partially diffolved by acetic acid; and the diffolved part confifts of the colouring extract of relin, and of gluten; the wax being the only ingredient which is infoluble in this mentruum. A farurated iolution of toracic acid in water diffolyes the colouring extract ; but
the lac is litele, if at all, acted upon by this acid. Sub. borate of foda or burax has a powerful effect on lac, fo as to render it foluble in water; and it is concluded from the fo facts, that the exeefs of foda in borax is the active fubitance, which conelufion is corroborated by experiments made with the alkalis. In order to render lac, efpecially fhell lac, foluble in water, about one-fifth of borax is neceflary. The beft proportion of water to that of lac is 18 or 20 to 1 ; fo that 20 grains of borax, aid 407 . of water, are, upon an average, requilite to diffolve 100 grains of facll.lac. The general properties of the folution fhew, that it is a fuponaceous compound, which, being ufed as a varnith, or vehicle for coluurs, becomes (when dry) difficul:ly foluble in water. The lixivia of pure foda, and of carbonat of foda, completely diffulve the feveral kinds of lac ; and the folutions refemble thofe formed by means of borax, excepting that they are deeper coloured. Lixivium of pure or cauftic potafh Speedily diffolves the varietics of lac, and forms faponaceous folutions, fimilar to that with borax, exclufive of the colour, which more approaches to purple Lixivium of carburate of potafh extracts a great part of the colouring matter, but lefs completely diflolves the entive fubftance of lac than pure potah. Pure ammonia, and carbonate of ammonia, readily act upon the colouring matter of lac, but do not completely difolve the entire fubltance.

From a variety of other experiments, as well as thofe, the refults of which we have given, but which we cannot recite, it appears that the different kinds of lac confitt of four fubItances, namely, extract, refin, gluten, and wax. The extract, when dry, is of a deep red colour, approaching to purplifh-crimfon; emitting finoke when laid on a red-hot iron, with a fmell like that of burned animal matter, and Jeaving a bulky porous coal; partially foluble in water, hot or cold; more flowly in alcohol, and with a lels beautiful colour; infoluble in fulphuric ether; foluble in fulphuric, nitric, and acetic acid; partially in muriatic acid; not very readily in acetous acid; almolk perfectly fuluble in the lixivia of potalh, fodia, and ammonia, with a beantiful deep purple colour. When pure alumine is put into the aqueous folution, it does not immediately produce any effect, but with the addition of a few drops of muriatic acid, the colouring matter fpeedily combines with the alumine, and a bearitiful lake is formed. A fine crimfor precipitate is alfo pruduced by muriate of tin, when added to the aqueous folution: a fimilar coloured precipitate is alfo formed by the addition of folution of ifinglafs. Thefe properties of the colouring fubitance of lac, efpecially its partial folubility in water and in alcohol, and its infolubility ia ether, together with the precipitate formed by alumine and muriate of tin, indicate that this fubftance is vegetable estract, perhaps flightly animalized by the coccus.

The relin of lac is of a brownifh-yellow colour, emitting on a red-hot irou much fmoke, with a peculiar fiveet odour, and leaving a fpongy coal; completely foluble in alcohol, ether, acetic acid, nitric acid, and the lixivia of potafh and foda; precipitated by water from alcohol, ether, acetic acid, and partially from nitric acid; and poffeffing the other general characters of a true relin.

The gluten is obtainable in two ways; if the pieces of lac, after digeftion in alcohol, be digefted with dilute acetic, or muriatic acid, moft of the gluten is diffolved, and may be precipitated by alkalies, added in due proportion ; but is rediffolved by an excefs of them, and then is feparable by acid. It much refembles the gluten of wheat.

The wax of lac is found floating like oil on the furface of a folution of lac, after long and repeated digettion in buibing nitric acid, and may be collected when cold; or it may
be more cafily obtaieed in a pure flate, by diyefing the refidue left by alcohol in boiling nitric acid. The wax, thus obtained, when pure, is pale yellowilh-white, and (unlike bees' wax) is devoid of tenacity, and extremely brittle: ir melts at a much hower temperature than that of boiling water, and burns with a bright flame, and an odour refembling that of fermaceti. It is infoluble in water and co's aicohol; but the latter, when boiled, partially difolves it, and upon corling, depofits the greater part; foluble in heated fulphuric ether, but upon cooling, nearly the whole is depofited. Lisivium of potath, boiled with the wax, forms a milky folution; bat moot of the svas floats on the furface in the flate of white flocculi, and appears to be converted iuto a kind of foap of difficult. folubility; it is no longer inflanmable; and, with water, forms a turbid folution, from which, as well as from the folution in potafh, the wax may be precipitated by acids. Ammonia, when heated, diffolves a fmall pertion of the wax, and forms a folution funilar to the former; nitric and muria:ic acids do not act upon the wax. When the properties of this fubftance are compared with thofe of bees'-wax, a difference will be perceived; and on the contrary, the molt Itriking analogy is evident between the wax of lac and the myrtle wax which is obtained from the Myrica cerifera. The properties of myrtle wax, defcribed by Dr. Boftock in Nichollon's Journal for March, 1803 , coincide fo perfectly with thofe of the wax of lac, that Mr. Hatchett is led to confider them as almoft, if not altogether, the fame fubftance.

Ourouthor, from his analy fis of the three different fpecies of lac infers, that the fubitances that compofe them bear the following proportions: 100 parts of ftick-lac gave 68 of refin, 10 of colouring extract, 6 of wax, 5.5 of gluten, and 6.5 of extraneous fubltances: 100 parts of feed-lac gave 88.5 of refin, 2.5 of colouring extract, 4.5 of wax, and 2 of gluten: 100 parts of fhell-lac gave 90.9 of refin, 0.5 of colouring extract, four of wax, and 2.8 of gluten.

We have already fécified feveral ufes to which lac is applied in India, and it is no lefs important, in a variety of refpects in Europe. A folution of lac in water may be advantageoufly employed as a furt of varnifh, which is equal in durability, and other qualities, to thofe prepared with alcohol ; and, of courfe, much cheaper. It will be found, likewife, of great ufe as a vehicle for colours; for, when dry, it is not eafily affected by damp, or even by water. Mir. Hatchett fays, that with a folution of this kind he has mixed various colours, fuch as vermilion, fine lake, indigo, Prufian blue, fap-green, and gamboge ; and it is remarkable, that although the two luit are of a gummy nature, ard the others had been previoully mixed with gum (being cakes of the patent water-colour), yet, when dried upon paper, they could not be removed with a moiftened fponge, until the furface of the paper itfelf was rubbed off. In many arts and manufactures, therefore, the folutions of lac may be found of great utility; for, like mucilage, they may be diluted with water, and yet, when dry, are little, if at ali, affected by it.

The colour given by lac is lefs beautiful, but more dura. ble than that given by cochineal. To render the colouring matter of the lae diffufible in water, fo as to be applied to the ttuffs to be dyed, Mr. Hellot directs the following procefs:-Let fome powdered gum-lac be digetted for two hours in a decoction of comfrey-root, by which a fine crimfon colour is given to the water, and the gum is rendered pale or ftraw-coloured. To this tincture, poured off clear, let a folution of alum be added; and when the colouring matter has fubfided, let it be feparated from ste clear liquor, and dried. It will weigh about one-fifths
of the quantity of lac employed. This dried fecula is to be diffolved or diffufed in warm water, and fome folution of tin is to be added to it, by which it acquires a vivid fearles colvur. This liquor is to be added to a folution of tartar in boiling water; and thus the dye is prepared.

The method of obtaining the fine red lac ufed by painters from this fubitance, is by the following fimple procefs:Boil the Itick-lac in water, filtre the decoction, and evaporate the clear liquor to a drynefs over a gentle fire. The occafion of this eafy feparation is, that the beautiful red colour, here feparated, adheres only nightly to the outfides of the Aticks, broken off the trees along with the gum-lac, and readily communicates irfelf to boiling water. Some of this fticking matter alfo adhering to the gumitlelf, it is porper to boil' the whole togetber; for the gum does not at all prejudice the colour, nor diffolve in boiling water: fo that after this operation the gum is as fit for making fealing-wax as before, and for all other ufes which do not require its colour. See Lakke.

A tiacture of gum-lac may thus be prepared:--Take two ounces of gum-lac, reduce it to a fine powder, and make it into a. filff pafle with oil of tartar per deliquium ; fet this in an open glafs to dry by a gentle heat, then remove it to the open air, that it may relent and grow foft; then dry it again, and repeat this two or three times, at the end of which the hard body of this refin will be found refolved into a purple colour. This may yet again be dried, and when dried mult be reduced to powder, which powder will afford a fine ftrong tincture to feririt of wine, being boiled in it in a tall glafs in a fand-heat for two or three hours. And by this procefs flrong tinctures may be made from myrrh, amber, gum, juniper, \&c. which will yield no tincture of ftrength to fpirit of wine alone, if treated in the ufual way.
A firituous tincture of Atick-lac was formerly fometimes given as a mild reftringent and corroborant in female weakneffes, and in rheumatic and fcorbutic diforders. But the principal medicinal ufe of this concrete was as a topical corroborant and antifeptic, in laxities and fcorbutic bleedings, and exulcerations of the gums. Some employed for this purpofe a tincture of the lac in alum water; others a tincture made in vinous fpirits, impregnated with the pungent antifcorbutics. The college of Edinburgh directed an ounce of the powdered lac, with half an ounce of powdered myrrh, to be digelted in a fand-heat, for fix days, in a pint and a half of fpirit of fcurvy grafs.

The gum-lac has been lately ufed as an electric, inftead of glafs, for electrical machines. See Laceuer, Lake, and Varmisif.

Lac, or Lacca, Ammoniaci, in the Materia Medica. See Gum Ammoniac.

Lac, or Lacca, Artificial, or Laque, is alfo a name given, to a coloured fubftance, drawn from feveral flowers; as the yellow from the flower of the juniper, the red from the poppy, and the blue from the iris or violet.

The tinctures of thefe flowers are extracted by digefting them feveral times in aqua vitæ, or by boiling them over a fove fire in alixiviu:a of pot-afhes and alum.

An artificial lacea is allo made of Brazil wood, boiled in a lixivium of the branches of the vine, adding a little cochineal, turmeric, calcined alam, and arfenic, incorporated with the bones of the cuttle-finh pulverized, and made up into littie cakes, and dried.

If it be to be very red, they add the juice of lemon to it ; to make it brown, they add oil of tartar.

Dove-coloured, or columbine lacca, is made with Brazil. of Fernambuc, ileeped in ditilled vinegar for the fpace of a month,
month, and mixed with alum incorporated in cuttic-fifh bone. For other proceffes, fee Lake and Madder.
Lac, Acid of. See Laccic Acid.
Lac, or Gum Lat. Sec Crotos.
Lac Luna. Dr. Plote tives this foffil as a mark of good lime-ftone; but it has been obferved, that two quarrics in Ireland, where lac lunx was found, were of building ftone, but would not burn into lime. Phil. Tranf. $\mathrm{N}^{\text { }} 4 i 7$. 69.

There are many varieties of this mincral, differing in their texture and colour. It is found in many parts of Europe, and alfo in Afia and America. Many of the Englinh quar. ries in Oxfordhire, Gloncelterhire, Northamptonfhire, and Derbyhhire, afford cenfiderable quantities of it. It adheres to the toofs and walls of grottos and caverns, and is lodged in the fiffures of ttrata of llone, fometimes in form of a farinaceous powder, and fometimes concreted into maffics. Its furface is rough and duffy; it colours the lands, adheres to the tongue, melts readily in the mouth, without grittincfs, yields an infipid talte, and raifes an ebullition in water, which foon diffolves it into a fine white powder. See MiTireral Agaric:

Lac Sulpburis, in Chemifry, and the Matcria Medica, denotes fulphur feparated by acids from its alkaline folution, which in the procefs changes its lemon-yellow colour for a grey or yellowih-white like creain. As a medicine it is thought to be fomewhat milder. See Sulphur.
Lac Virginale. See Virgin's Milk.

LACCA. See LAC.
LACCADIVE Istands, in Geagraphy, a group of fmall iflands in the Indian fea; the neareft being about 15 miles from the coalt of Malabar. They are fuppofed to be the iflands called by Ptolemy "Infule numero 19," though in reality they are 32. All of them are fmall, rocky on their fides, covered with trees, and feparated by deep channels. They are vifited by Englifh thips in their paffage from India to the Perfian gulf, or Red fea. Their principal traffic conGitts of the produce of the cocoa palm, fuch as the oil, cables, and cordage, and alfo of fifh, which, being dried, is fent to the continent of India, whence rice is obtained in return. They alfo trade to Mafcat, in large boats, and for their commodities they bring back dates and coffee.' Ambergris is often found floating near thefe iflands.. N. lat. 10 to $12^{\circ}$ $40^{\prime}$. E. long. $71^{\circ} 15^{\prime}$ to $73^{\circ} 30^{\prime}$.

LACCIA, in Icbtbyology, a name given by Paulus Jovius to the fhad, or, as we foretimes call it, the mother of the pilchards. See Clupea Alofa.

LACCIC AcID, in Chemiffry, is a fubflance that was firt introduced to the notice of chemilts by $\mathrm{Dr}_{\mathrm{r}}$. Pearfon. It is obsaioed from a peculiar compound called swhite lat, which Dr.

A naderfom of Madras difcovered to be the product of fome infects of the coccus tribe. Small quantities of it were fer: to Europe about the year 1789; and, at the requeft of fir Jofeph Banks, an examination of it was undertaken by Dr. Penrfon, and the refult of his inquiries appeared in the Philofophical Tranfactions for $1794^{\circ}$. The lac, in its natural thate, is of a grey colour; and occurs in pieces of from three to fifteen grains in weight. Many of its propertics prefent confiderable refemblance to thofe of bees' wax; and Dr. Pearfon is of opinion, that thefe fubltances are very nearly allied to each other, differing only in the proportions of their conftituents. A curious circumftance, connected with this point, is, that the infect which fecretes the lae alfo produces honey; but the phenomena attending the appearance of the later product have not been examined with. the attention which they merit. To procure the laccic acid, it is merely neceflary to expofe the lac, as afforded by the coccus, to a hicat jult fufficient to liquefy it. A reddifh watery fluid will feparate, having the fmell of newly baked hot bread; and it is this fubitance which conlfitutes the acid under inquiry. "The following are fome of its properties. At the temperature of $60^{\circ}$, it has a fpecilic gravity of 1.025 . Paper ftained with litmus and turnfol is reddened by it. It poffeffes a faline tafte, and is fumewhat bitter ; but is not in the fmalleft degree four. By expofure to the air it becomes muddy, and depolits a fmall quantity of fediment. Dr. Pearfon ditilled 250 grains of it, and afterwards evaporated the produet until it grew turbid. On flarding fone hours, acicular cryftals were produced, having a bitterifh tafte, which amounted to about $\mathbb{Z}_{\frac{3}{5}} \mathrm{~d}$ th of the weight of the fluid employed. The acid diffolves carbonat of foda with cffervefcence; : and by evaporation yields cryfals which are deliquefcent. It produces a purpliih tint on being mixed with lime-water, but no fediment appears. Tincture of galls caufes a green precipitate ; and with acetat of lead a reddilk powder is depofited. This forms nearly the whole of the information that has been coiveyed to us with refpect to it ; and as yet, therefore, nothing either very Atriking, or very important, has been communicated by the difcovery. It is to be lamented that Dr. Pearfon had fo fmall a quantity of matter to operate upon in his experiments, as it becomes difficult, from the want of a more complete examination, to afcertain whether the fubftance is entirely new to us; or whether it is only the modified appearance of fome compound with which we had been before acquainted.

LACCOS, Aaxxos, among the Greeks, a ditch or trench ufed inftead of an altar, when facrifices were to be offered to the fubterranean or infernal gods. - See Altar.

LACE, in the Manufaiures, is formed of thread, cotton, or filk, woven into a net, the mefhes of which are varied in their figure, according to the defign of the pattern, as octagons, hexagons, sic. \&c. The lace is alfo ornamented by a thread, much thicker than the thread forming the net, which is woven in among the mefthes, in the figure of flowers, and other fantaftic curves; upon the beauty and elegance of which, the value of the lace depends. This thick thread is called the gimp.
Lace is made upon a pillow or cufhion, upon which a piece of ftiff parchment is Atretched, having a number of holes pricked through it, to form a pattern of the intended lace. Through thefe holes, pins are fluck into the pillow; and the threads, wound upon fmall bobbins, are woven around the pins, and twifted round each other in various ways, to form the required pattern. This procefs is extremely tedious, particularly for the wide laces, with complicated patterns; and though it is extremely expenfive to

## x $\wedge \mathrm{C}$

## LAC

the confumer, the people (chiefly in Bedford and Buekinghamfhire) who manufacture it can ouly obtain fufficient to fupport a wretched exiltence, by the mott inceffant exertion. Of late years, the manufacturers of Nottingham have directed their ingenuity to imitate this fpecies of lace by machinery, in which they lave fucceeded molt perfectly: but Itill it is only an imitation, the knot or loop of the mefles being effentially different. In the pillow lace, the net or meflies may be defcribed, by fuppofing a number of ropes, each formed of two or more threads tailled round each other: thefe are extended parallel; but at every two or three firial turns of thefe ropes, the ftrands or threads compoling one rope are twitted around with thofe of its neighbour, and then returu,to be twitted with its own: and this reciprocally of the whole number forms a netting; the figure of the meihes depending upon the number of turns which are made, before the twilt is changed from one rope to the next. To form a lace of this defcription, it is effential that the ends of each thread be detached, and capable of being twifted over the adiacent threads. This is eafily done by the hand upon the pillow, by twifting the bobbins round each other ; but has many difficultics which prevent its performance by machinery.

The Nottingham lace is only a modification of the flitech or loop of which llockings are made; all the mefles being formed by a continuance of one thread, which is, by the machine, formed into loops a whole courfe (that is, length of the intended piece of lace) at once, by preffung it down alternately over and under between a number of parallel needles; a fecond courfe is then made of fimilar loops on the fame needles, and the loops of the firt are drawn through thofe of the fecond, in fuch a manner as to form mefhes by retaining the firlt loops; the fecond are then retained by a third courfe, and this by a fourth, and fo on. The machine is very nearly like a common tocking-frame, but provided with an additional apparatus, which can be readily applied. It confifts of a frame, containing a number of needles, which we will call points: thefe are introduced between the fixed needles of the Itocking-frame, and a certain number (one half, for inftance) of the loops in the thread are taken off the fixed needies upon thefe points, which are moved endways, the face of two, three, or more fixed needles, and put down upon them again. Another fet of loops is now taken alpon the points, and moved in the oppofite direction; by this means, crofling the loops over each other, and forming mefhes, the figure of which will depend upon the number of needles it is thus carried over. But as this admits of no great variety of patterns, another machine has been invented, which is much more extended in its applications. Like the former, it has the parts of the ftock-ing-frame, bout differently made. The thread is, in this, rolled upon a cylinder, in the fame manner as a weaver's beam; as many threads being wound round it as there are needies in the frame. Thefe threads pafs through cyes in the ends of fmall points, called guides, which are oppofite the needles; and thefe guides are fixed on two bars, each of which has half the guides faltened in it, that is, one guide is fatt in one bar, and the next in the other, and fo on alterrately of the whole. Each of the guides prefents a thread to its needle, and are all at once moved by the hand to twilt the threads two or three times round the needles which are oppofite them: the loop is now made in a manner fimilar to the other frame. The next time, the alternate guides are fhifted endways, fo as to apply themfelves to other needles than thole they ware oppolite before. This croffes the thread, fo as to make a net: but the quantity which is thifted endways is altered every time, by means of the ma-
chinery, fo as to move a certain number of needles; which number is altered every time, to produce the pattern. Ali the parts of this machine, execpt the guides, are moved by means of treadles, inltead of ufing the hands, as in the common flocking firame. The net produced by thefe frames is woven in bands of the width of the intended lace, leaving a wider mefh thain the others, through which the divifion is to be made to Feparate the lace into narrow ftrips. Before cutting up in this manner, the lace is fpread in a frame, and a common needle with a thick thread is worked in the mefhes, to imitate the gimp, according to the 'pattern for which the lace is intended.
The lace trade of Nottingham has been carried to a very great extent, but is at prefent in a itate of flagnation, being chiefly dependent on foreign trade, as it has never been in fuch great repute with the Britifh ladies.

Lace is alto made of gold and filver tbread (which fee), much in the fame manner as the bone or blond lace above defcribed. The importation of gold and filver lace is prohibited. Great quantitics of the finelt blond laces have been imported from Flanders. By 3 Geo. III. c. 21. and 5 Geo. III. c. 48. if any perfon fhall import any ribbauds, laces, or girdles, not made in Great Britain, whether the fame fhall be wrought of filk alone, or mixed with other materials, the fame fhall be forfeited, and may be feized by any officer of the cuttoms, in whatever importers', venders', or retailers' hands they may be found; and the importer, and every perfon affilting therein, and the venders and retailers in whofe cuftody they fhall be found, or who fhall fell or expofe the faine to fale, or coaceal with intent to prevent the forfeiture, fhall forfeit refpectively 200\% with colls half to the king, and half to the officer who Ihall inform and profecute.

Lace is alfo ufed for a kind of chord made of filk or cotton, chiefly ufed in lacing women's ftays.

## Lace Bark. See Dapine.

LACED※MON, in Ancient Geography, a celebrated town of Greece, in the Peloponnefus, in a country which was originally called Laconia, and afterwards changed into Lacedæmon, or Sparta. See Sparta. See alio Laconia.

LACED ÆMONIANS, the inhabitants of Laconia, are faid to have derived their name from Lacedæmon, herr and fucceffor of Eurotas, whofe daughter he married. Their ancient name was Icleocrates, which has been found in fome ancient infcriptions. The commencement of their liftory is little known. But their firit king, according to the chronology molt gencrally received, was Lelex, furnamed Autochtos, becaufe he was fuppofed to have been one of the Aborigines; and from him his fubjects bore the ancient name of Leleges. He began his reign in the year 1516 B.C., was fucceeded by his eldeft fon Myles, and Myles was fucceeded by his fon Eurotas, who, having no male iffue, appointed for his fuccefior Lacedæmon, the fuppofed fon of Jupiter by Taygeta, to whom he gave his daughter Sparta in marriage. Lacedæmon was the firft king of the Lacedxmonian line, which confifted of twelve fovereigns, the laft of whom was Tifamenes, who terminated this line in $110+$ 3.C., upon the return of the Heraclidx into the Pcloponnefus. In inoz B.C., upon the divifion of the Peloponnefus by the Heraclidx, the kingdom of Lacedæmon or Sparta commences under Procles and Euryfthenes, the two fons of Aritodemus, the chief of the Heraclidx. Euryfthenes was fucceeded by his fon Agis, from whom the defcendants of that line had the appellation of A gidx, or A'giadx: and the firlt princes of the former line were denominated Proslidx, till Eurytion, or Eurypon, the third
of this line, exchanged it for Eurytionitx, or Eurypontidx. In the line of Agis fucceeded Wechettratus 1058 13.C., lanbotas 1023 B.C., Doryfus 9 Sif, B C., A gefilaus 957 R.C., and Archelans 9 r. B.C. The fucceffors of Procles were Ivas ro60 B.C., Eurypon rozs 13.C, Irrytanis 1021 B.C., Eunomus 996 B.C., and P'olydectes 907 B.C. Lycurgus, the fon of Eunomus, fucceeded Polydectes, but he only retained the kingdom till his filter was delivered of a fon, to whom he immediately refigned it; hut his fituation being rendered uncafy, he fet out for Crete about eight monthis efter the birth of his nephew. During this voluntary exile of ten years, he meditated that new form of a commonwealth into which he afterwards modelled the goverument ; and for this purpofe he returned to Lacedæmon in the year $\mathrm{SS}_{4} \mathrm{~B} . \mathrm{C}$.

The government of Lacedxmon was, as we have feen, originally monarclical; ard though the kings had fome fubordinate magiltrates, chofen by themfelves, of whofe counfel they occafionally availed themfelves, yet the will of the fovereign was the fupreme law. Thus the fovereign power palfed through a fucceffion of twelve princes, from Lacedamon, the fon-in-law of Eurotas, and founder of this monarchy. Under Eury llhenes and Procles the govermment took a new form, and inftead of having one fovereign, it became fubject to two. Thefe two brothers governed jointly, and with equal power and authority, each bearing the title of king of Lacedxmon, and being acknowledged and obeyed as fuch. In this bipartite condition the government continued under a fucceflion of thirty princes of the line of Euryllihenes, and twenty-feven of that of Procles, and it terminated in bothabout the fame time. Difcords, however, were unavoidable, and foon commenced. Two parties were formed, and they became turbulent and unmanageable. By the divifions that were thus occafioned, the regal dignity funk into fuch contempt, that the government was upon the briak of falling into anarchy and confugion, when Lycurgus, as we have faid, undertook the management of it, during fome part of his nephew Charilaus's minority. During the period of his voluntary abfence, when he had travelled through Crete, Alia, and Egypt, the government had become fo corrupt, that not only his friends, but even thofe who had been his molt zealous enemies, were glad to repeat their embaffies, entreating him to return and fave his country from ruin. Thefe were the inevitable confequences of that fatal divifion of the regal authority betseen two competitors, which Lycurgus took a quite different method of remedying than by confining it again to either of the lines. The plan he adopted was that of reducing their authority, by conitituting a fenate, endowed with the fupreme power in all civil matters, and leaving to the kings, befides the title and honour, only the management of military and religious affairs. In order to qualify him for the important undertaking in which he now engaged, he had paid particular attention to the laws of Minos at Crete, and in Afra he had obferved the effects which are produced by different governments and menners, and he had alfo availed himfelf of the opportunities which Egypt had afforded him of gaining wifdom. With a view of giving greater effect and ftability to his new con!titution, he had, like other legiflators, taken care to fecure the approbation of heaven. With this view, he confulted the oracle at Delphi, and had received for anfwer: "the gods accept thy worfhip, and under their aufpices, thou fhalt frame the mott excellent of political conflitutions." Nor did Lycurgus ever afterwards neglect to maintain a correfponderce with the Pythia, who fucceffively impreffed on his laws the feal of divine authority. He alif, before he commenced his operations, fubmitted his plan
to the examination of his friends and the moft diflinguifhed citizens; and from thefe he felećted thirty, who were to attend him completely armed in the general atrembly, and w defend him from thote perfonal affaules which he had reafori to apprehenel in the promulgation of his laws. At length the new conltitution was approved by all orders of the flate. Yet, notwithtanding its excellence, it was not alfured of duration. Lycurgus, therefore, when the people were alfembled, thus addreffed them: "It itill remains for me to lay before you the mof important article of my legifation; but I wih firit to confult the oracle of Delphi. Promife me that, until my return, you will make no alteration in the laws already eitablifhed." They promifed him. "Swear it," faid he. The kings, fenators, and citizens, called the gods to be witnefics to their words. This folemn engagement could not but be irrevocable, for it was his refolution never more to return to his country. Accordingly he immediately repaired to Delphi, and enquired whether the new laws were fufficiont to enfure the happinefs of the Spartans. The Pythia, having. anfwered, that Sparta would be the molt flourifing of cities fo lorg as fhe fhould continue to obferve them, Lycurgus fent that oracle to Lacedæmon, and condemned himfelf to voluntary banifhmert. He died far from the country of whofe happinefs the had been the caufe. See Licultgus.

In fettling the gorernment of Lacedxmon, Lycurgus was too wife to abandon the adminititration of public affairs to the caprices of the multitude, or to leave it entirely to the will of the two prinecs on the throne. He Jought, as we have a!ready faid, a mean, by which he might reltrain and temperpower by wifdom; and he thought that he had found it in Crete, where a fapreme courcil moderated the authority of the fovereign. Such an eftabiifment he introduced at Sparta, under the appellation of a fenate. Twenty-eight aged men, of confummate experience, were appointed to thare with the two kings the plenitude of power. In this auguit fenate the great interelts of the thate were to be difcufled ; here the two kings prefided, and every queftion was to be decided by the plurality of voices ; and the determinations of this council were afterwards laid before the gencral affembly of the flate, which had the power of approving or rejecting, but not of altering them. For abour 130 jears the fenate maiatained a juft equilibrium between the kings and the people ; but the places of the fenators', as well as ti.e authority of the kings being held for life, it was to be feared that,-in time, thefe might too clofely unite, and no longer find any oppofition to their will. It was therefore deemed advifable, with the fanction of the Delphian oracle, to transfer a part of their functions to five magiftrates, called. Ephori, or infpectors appointed to defend the people in cafe of oppreffion. This new intermediate budy was inflituted, with the confent of the ftate, by the king Theopompus; or, if it had been originaily eftablifhed by Lycurgus hinifelf, it was revived, with fome additional powers and prerogatives, by Theopompus. (See Ephori.) The conilitution of Lycurgus contained a happy mixture of monarchy, ariftocracy, and democracy. Theopompus added to thefe an oligarcliy which afterwards became tyrannical. Although Lycurgus limited the authority of the kings, he left them honours and prerogatives which they enjoged as the heads of religion, the adminiftration, and the army. Befides certain prielthoods, which were exercifed by themfelves, they regulated the public worthip, and appeared at the head of the religious ceremonies. One of their prerogatives invelted them with the right of maintaining a fecret correfpondence with the prielts of Delphi, the authors of thofe oracles which often decided the fate of an empire; and this may be confidered as one of

## LACEDRMONIANS.

the mof important privileges in the pofeffion of royalty. As head of the !tate, the king, upon a!cending the throne, might annul the debts which a citizen had contracted either with his predeceflor, or with the republic; and he poffeffed certain portions of inheritances, affigned him by the people, which he might diftribute during life in favour of his relations. The two kings prefided in the fenate, and propofed the fubjects for deliberation. Each gave his fuffrage in perfon or by proxy ; and this tingle fuffrage was equivalent to two. When the two kings agrced i:3 propoling any project of manifet utility to the public, no perfon was permitted to oppofe it. All caufes relative to the maintenance of the lighways, the formalities of adoption, or the choice of the kinfman who fhould be obliged to mariy an orphan heirefs, were fubmitted to the decition of the kings. The kings were not allowed to be abfent during peace, nor both at once in time of war, unlefs there were two armies in the field. They had by right the command of the army, with fech appendages of fplendour and authority that might enfure them refpect and obedience. The ttate provided for the maintenance of the general and his houfehold, with the neceffary attendants. Accordinedy, he had full leifure to direct the operations of the campaign, to fign truces with the enemy, and to give andience and anfwers to the embafiadors of foreign powers. In time of peace the kings were confidered merely as the firlt citizens of a free city; appearing in public without a retinue, and without offentation. As firit citizens they occupied the firlt place, and every perfon rofe in their prefence: and in all repatts, public and private, they were allowed a double portion, which they fhared with their friends. When the kings died, they were honoured with various tokens of refpect.

The fenate, confilting of the two kings, and twenty-eight aged perfons, were the fupreme council, in which were difcuffed, in the firlt inflance, all quettions relative to declaring war, concluding peace, entering isto alliances, and other high and important aftairs of thate. The dignity of a me:nber of this council was never granted but to the cirizen who, from his earlieit yoush, had been diftinguifhed for confummate prudence and eminent virtues; nor could he arrive at it before the age of tixty years, and he retained it till his death. The clection took place in the forum, where the people were aitembled with the kings, fenators, and the different claffes of magithrates; and it was attended with various folemnities and acclamations. When it was decided, it was honoured with a kind of triumphal proceffion, and with ceremonies performed in the temples. Of the functions pertaining to the fenator, Some refpected the ftate, and others related to particular cafes, which were referred to the judgrment of the members. - On this tribunal depended not only the lives, but the honours of the citizens. When a king was accufed of having violated the laws, or betrayed the interefts of the flate, the tribunal which acquitted or condemned him was compofed of the twenty-eight fenators, the five ephori, and the king of the other family. However, he might appeal from them to the general affembly of the people.

The ephori were elected by the poople from among the citizens of every rank; they, were five in number, and changed every year, to prevent their abufing their authority. (See Eruoni.) We thall here add, that the kings in their own name, and the eph:ori in the name of the people, engaged, by a folemn oath; the former to govern according to the laws, and the latter to defend the royal authority fo -long as it fhall not viokate the laws.

As the Spartans had interefts peculiar to themfelves, they had alfo others in common to them with the deputies of the different cities of Laconia. Hence there were two kinds of
affemblies, at which were always prefent the kings, the fenate, and the different clallis of the magitrates. Witen the fucceffion to the throne was to be regulated, when magittrates were to be chofen or depofed, when fentence was to be pronounced on public crimes, or the great objects of religion or legiflature were to be decided upon, the aifenbly was only compored of Spartans, and was called the "leffer affembly:" The ordinary affembly of this kind was held cvery month; the extraordinary whenever circumftances required. Every one had a right to give his opinion, provided that he had pafed his zoth year, for before that age he was not allowed to Ipcak in public; and it was required alfo that his manners foould be irreproachable. The general affembly was convoked whenever the queltion related to making war or peace, or contracting alliances. The deputies of the cities of Laconia were then admitted into it, as were alfo frecquently thofe of the allied itates, and of the nations who came to implore the fuccour of Lacedæmon. On occafions of this kind, the kings and fenators frequently fooke, and their authority hiad great weight; but that of the ephori was greater. When the question had been fufficiently debated, one of the ephori alked the opinton of the affer.bly; upon which a multitude of voices exclaimed for the affirnaative or negative. In order to determine the majority, the fame magiltrate afcertained it by numbering the two parties, which he caufed to feparate.

As a gereral prelininary to the laws of Lycurgus, we fhall here observe, that this legifator ordained, that the magiltrates fould not be appointed by lot, but elected by fuffrages. He deprived riphics of the influence and refpect annexed to them, and divefted even love of jealoufy. And though he granted fome difinctions, the government, having imbibed his fipirit, never prodieally lavihed them, and virtuous men dared not folicit them. Honour was the moft valuable reward, and reproach the moft crucl punifhment. Death was fometimes inflicted, but a fentence of this kind followed a vary careful and rigorous examination, for nothing was regarded fo precious as the life of a citizen. Execution was performed in the prifon, and during the night, that the firmnefs of the criminal might not move the commiferation of the people, and his life was taken away by the cord, that the fufferings of the guilty might not be multiplies.

Of all the inflitutions of Lycurgus, the divifion of lands was that which required, on his part, the greateft degree of firmnefs and refolution, becaufe it was likely to be much oppofed, and to occafion various and violent contelts. He thought it, however, neceflary for ellablifling peace and good order in the commonwealth. With a view of banifhing from the community infolence, envy, fraud, luxury, and at the fame time, extreme poventy and exceffive wealth, he perfuaded the citizens to furrender all their lands to the flate, and to allow a new divifion of them, that they might live together in a perfect equality, and that virtue and merit Glould eltablifh the only claim to pre-eminence and honours. This fcheme was no fooner propofed than executed. The diltrict of Sparta was divided into 900 portions of land, and the rell of Laconia into 30,000. Each portion'affigned to a head of a family mult have produced, befides a certain quantity of wine and oil, $y 0$ meafures of barley for himfelf, anid I2 for his wife. This is Plutarch's account. Others fay, that he only beftowed on the Spartans 6000 portions, to - which king Polydous is faid afterwards to have added $3000^{\circ}$. And others again fay, that the Spartans received one half of thefe 9000 portinns from Lycurgus, and the other half from Polydorus. After Lycurgus had made this ditribution, he thought it advifeable to abfent himfelf, that the palions of the people might have leifure to fubfide and cool.

## LACED TMONIANS.

On his return, he found the fields of Laconia covered with clufters of hieaves, all of the fame fize, and placed at diftances nearly equal. Accordingly he feemed to behold a large domain, the productions of which had been divided among bretbren; while the Lacedrmonians belicved they faw i: him a father, who had manifetted no more fondneff for one than for the reft of his children. After having divided their immoveables, he undertook likewife to make the fame equal divifion of all their moveable goods and chattels, that he might uterly banifh from among them every kind of inequality. But apprehending invincible oppofition to this meafure, he endeavoured to accomplifh his object by fapping the foundations of avarice. With this view he cried down all gold and filver money, and ordained that no other fhould be current belides that of iron; which he made fo heavy, and fixed at fo low a rate, that a cart and two oxen were neceffary to carry home a fum of ro minas (equal to about $20 \%$. fterling), and a whole chamber to keep it in. He next banifhed all ufelefs and fuperfluous arts from Sparta. But without doing this, mot of them muft have funk of themfelves, and difappeared with the gold and filver money ; becaure the tradefmen and artificers would have found no vent for their commodities; and this iron money had no currency among the other Grecian ftates, which fo far from efteeming it, made it the fubject of their banter and ridicule. The importation of all foreign money was prohibited, that corruption might not enter under the name of commerce. Barter or exchange of one commodity for another, was preferved by law in Sparta, long after it had been difcontinued in every other flate. Intereft was alfo forbidden in the Spartan commonwealth. According to the laws of Lycurgus, the head of a family could neither buy nor fell a portion of land; he could neither give it during his life, nor bequeath it by will to whom he pleafed. He was not even permitted to divide 'it. The eldeft of his children was entitled to the inheritance, in the fame manner as in the royal family, the eldeft fon fucceeded by right to the crown. In order to provide for the other children, he eftablifhed other regulations. The land, as well as the perfons of the Spartans, were free from all impofitions. The flate had no treafure. On certain occafions the citizens contributed according to their abilities, and on others they had recourfe to means which evince their exceffive poverty. The deputies of Samos once came to Lacedrmon to folicit the loan of a fum of money. The affembly of the people, having no other refource, ordered a general falt to be obferved by the free citizens, naves, and domeftic animals, and gave the fum thus faved to the Samians.
Another regulation of Lycurgus, was that of public meals. That he might entirely fupprefs the magnificence and extravagance of public tables, he ordained that ail the citizens fhould eat together of the fame common vietuals, which the law prefcribed, and exprefsly forbade all private eating at their own houfes. By this fettlement of public and common meals, and by this frugality and fimplicity in eating, he depreciated the value of riches, and made them of no ufe as means of procuring the luxuries of life. This regulation, however, was very offenfive to the opulent. At thefe meals, each table accommodated about 15 perfons; and every perfon furnihed every month a bufhel of flour, eight meafures of wine, five pounds of cheefe, $2 \frac{\pi}{2}$ pounds of figs, and a fmall fum of money for preparing and cooking the vietuals. Every perfon, without difrrimination, was obliged to attend at the common meal.' At thefe public tables the children obtained inftruction and improvement ; they were likewife trained and accuiftemed to great fecrecy; for as foon as a young man came into the room, the eldeft perfon of the company ufed to fay to him, pointing to the door, "Nothing
fpoken here, muft ever go out there." The moft exquifie of all their eatables was that which they called their "black broth;" and the old men preferred it to every thing elfe upon the table. Dionyfius the tyrant, however, thought otherwife, and complained of it as infipid; upon which he was told that the feafoning was wanting. When the tyrant enquired, what feafoning? he was told, running, fweating, fatigue, hunger, and thirft. Thefe, he was told, are the ingredients with which we feafon all our food. As they were moderate in their eating, they were no lefs abltemious in their drinking; the Lacedxmonians only drank to quench thirtt; drunkennefs was reckoned infamous among them, and feverely punifhed; and that young men might conceive the greater abhorrence of this fpecies of debauchery, the flaves were compelled to drink to excefs, that the beaflinefs of the vice might appear. When they retired from the public meal, they were not allowed any torches or lighte, becaufe it was expected, that men who were perfectly fober, fhould be able to find their way in the dark; befides, this practice gave them a facility of marching without light, a quality very ufeful to them in time of war.

As to drefs, there was no diftinction between the rich and poor. Their garments were made for ufe and not for fhow: and they were taught betimes to diftinguifh themfelves by their virtue, rather than by their robes. Boys were always ufed to go without fhoes, nor were they permitted to cut or trim their hair. Baths and anointing were not much in ufe among the Lacedæmonians; the river Eurotas fupplied the former, and exercife the latter. Young women wore their velts, or jerkins, only to their knees, or, as fome fay, not fo low; a cuftom which has been cenfured both by Greeks and Romans as indecent. Gold, precious flones, and coflly ornaments were permitted only to common women; which permiffion was the ftrongeft prohibition to women of virtue, or fuch as valued their reputation. Virgins went abroad, without veits, with which, on the contrary, married women were always covered. In certain public exercifes, to which girls were admitted, they, as well as the young men, were obliged to perform naked.
Lycurgus had very few written laws, becaufe he did no: wifh to fet bounds to virtues, and left the people, imagining they had done all which their duty required, fhould defift and not do all which they are able to perform. But he did not conceal them; they were tranfmitted from mouth to mouth, cited on all occafions, and known to all the citizens, the witneffes and judges of each individual. They were taught and enforced by practice and example. Young perfons were not allowed to cenfure them, nor in fubmit them to examination, fince they had been received as the commands of hearen, and fince the authority of the laws was founded only on the profound veneration they infpired. Nor was it allowed to praife the laws and ufages of other nations; becaufe, unlefs the people were perfuaded that they lived under the beft legination, they would foon be led to defire a new one. Indeed, obedience was, among the Spartans, the firt of virtues.
Lycurgus confidered the education of youth, in every ftage of it, from the earlieft infancy to maturity, as the molt important objet of a legilator's care. His grand principle was, that children belonged more to the flate than to their parents; and therefore he ordered the ftate to be entrufted with the general care of their education, that they might be formed on conflant and uniform principles, by which they might be infpired with the love of their country, and of virtue. As foon as a boy was born, the elders of each tribe vifited him; and if they found him well made, ftrong and vigorous, they ordered him to be brought up at the public charge; but if, on the contrary, they found X him

## LACED EMONIANS.

him deformed, tender, and weakly, he was caft into a gulf near mount 'l'aygetus. This law, it has been faid, feems to have been calculated, in one refpect, to render women very careful, when they were pregnant, of eating, drinking, or uling exercife to excefs; and it alfo feemed to make them excellent nurfes, for which employment they were celebrated throughout Greece. At his carlieft age the child was accultomed to the moft hardy treatment in his food, drefs, rett and general mode of life. He was to be ufed to folitude and darknefs, and to be brought up a ftranger to imprefions of terror, ulelefs rettraints, and unjuft reproaches. At the age of feven years his education according to the laws commenced, and he was trained up under the difcipline appointed by the ftate. Education, indeed, in the whole courfe of it, was, properly fpeaking, an apprenticefhip of obedience. While they were at table, the malter infructed the boys by akking them queftions, to which they were to give a quick and concife, or laconic anfwer. Lycurgus, it is faid, was for having the money bulky and heavy, and of little value, but their language very pithy and flort, comprifing much fenfe in few words. 'To literature they paid little attention; for all the fciences were banifhed from the country. The principal objects of their Itudy were obedience, the patient enduring of hardfhip and fatigue, and victory in battle. The fuperintendant of their education, was one of the moft honourable men of the citr, and of the firlt rank and erudition, or one of the ephori, who appointed over every clafs of boys, into which they were initiated, malters of the molt approved wildom and probity. Strict obedience, and great refpect to their ctders and fuperiors, were matters feduloufly inculcated in the Spartan fyltem of education. To the old men the youth rofe up, whenever they came into any public place; when they met them in the ftreets they gave way; and they were filent, whenever their elders fpoke. All the old men were dcemed to have the authority of parents and warranted in the exercife of it ; and thus Lycurgus provided, that as youth are every where too apt to offend, they might be no where without a monitor. The laws went ftill farther: for if an old man was prefent when any youth committed a fault, and did not reprove him, he was punihed equally with the delinquent. Amongft the youths there was one of their own body, or, at molt, two years older than the relt, who was denominated "iren;" he had authority to queftion all their actions, to watch their behaviour, and to punifl them if they did amifs; and their punifhments were not flight, but fevere. Silence was highly commended at Sparta, where modefty, not only in words and actions, but in looks and geltures, was held to be a moft becoming virtue in young people. An inconfiderate perfon, who would not liften to inftruction, and who feemed to difregard what the world might think or fay of him, was treated by the Lacedæmonians as a difgrace to human nature.

Occupations among the Spartans that were neceffary for the benefit of the community, fuch as agriculture and the like, were left to their flaves, the Helotes; but arts, fubfervient to luxury, were wholly interdicted. Thus orators or rhetoricians, augurs, bankers, and dealers in money were excluded. The Spartans admitted no theatrical diverfions among them; but other kinds of poetry were allowed, provided the magittrates had the perufal of pieces, before they were introduced to the public. Mufic was much encouraged, provided that it was fuch as had been in favour with their anceftors; and they would not permit their flaves to learn either the air or the words of their molt admired pieces.

Among the effects of ancient mufic, in foftening the manners, promoting civilization, and humanizing men, naturally favage and barbarous, the monf fingular and Atriking
is related by Polybius, the hittorian, a grave, exact, and refpectable writer, who, in fpeaking of feveral aets of cruelty and injuafice exercifed by the 巴tolians, againft their neighbours the Cynotheans, has the following remarkable paffage, which we fhall give at full length, from Mr. Hampton's excellent tranflation.
"With regard to the inhabitants of Cynætha, whofe misfortunes we have juft now mentioned, it is certain, that no people ever were. elteemed fo juftly to deferve that cruel treatment to which they were expofed. And fince the Arcadians, in general, have been always celebrated for their virtue throughout all Greece; and have obtained the higheft fame, as well by their humane and hofpitable difpofition, as from their piety alfo towards the gods, and their veneration of all things facred; it may perhaps be ufeful to enquire from whence it could arife, that the people of this fingle city, though confeffed to be Arcadians, fhould, on the contrayy, be noted for the favage roughnefs of their lives and manners, and diftinguifhed by their wickednefs and cruelty above ail the Greeks. In my judgment then, this difference has happened from no other caufe, than that the Cymatheans were the firft and only people among the Arcadians, who threw away that inftitution, which their ance[tors had eftablifhed with the greateft wifdom, and with a nice regard to the natural genius, and peculiar difpofition of the people of the country; I mean, the difcipline and exercife of mulic: of that genuine and perfect mufic, which is ufeful indeed in every ftate, but abfolutely neceffary to the people of Arcadia. For we ought by no means to adopt the fentiment that is thrown out by Ephorus in the preface to his hiftory, and which indeed is very unworthy of that writer, that mulic was invented to deceive and delude mankind. Nor can it be fuppofed, that the Lacedæmonians, and the ancient Cretans, were not influenced by fome good reafon, when, in the place of trumpets, they introduced the found of futes, and harmony of verfe, to animate their foldiers in the time of battle: or that the firf Arcar dians acted without ftrong neceffity, who, though their lives and manners, in all other points, were rigid and aultere, incoporated this art into the very effence of their government; and obliged not their children only, but the young men likewife, till they had gained the age of thirty ycars, to perfift in the conttant ftudy and practice of it. For all men know, that Arcadia is almott the only country, in which the children, even from their moft tender age, are tanght to fing in meafure their fongs and hymns, that are compofed in honour of their gods and heroes : and that afterwards, when they have learned the mufic of Timotheus and Philoxenus, they affemble once in every year in the public theatres, at the feaft of Bacchus ; and there dance, with emulation, to the found of flutes, and celebrate, according to their proper age, the children thofe that are called the puerile, and the young men, the manly games. And even in their private fealts and meetings, they are never known to employ any hired bands of mufic for their entertainment ; but each man is obliged himfelf to fing in turn. For though they may, without fhame or cenfure, difown all knowledge of every other fcience, they dare not on the one hand diffemble or deny, that they are fkilled in mufic, fince the laws require, that every one fhould be inftructed in it ; nor can they, on the other hand, refufe to give fome proofs of their fkill when afked, becaufe fuch refufal would be eftcemed difhonourable. They are alfo taught to perform in order all the military fteps and motions, to the found of inftruments: and this is likewife practifed every year in the theatres, at the public charge, and in fight of all the citizens.
"Now to me it is clearly evident, that the aucients by no means introduced thefe cuftoms, to be the inftruments of

## LACEDKMONIANS.

luxury and idle pleafure: but becaufe they had confidered with attention, both the painful and laborious courfe of life, to which the Arcadians were accuftomed; and the natural aufterity alfo of their manners, derived to them from that cold and heavy air, which covered the greateft part of all their province. For men will be always found to be in fome degree affimilated to the climate in which they live: nor can it be afcribed to any other caufe, that in the feveral nations of the world, diftinct and feparated from each other, we behold fo wide a difference, in complexion, features, manners, cultoms. The Arcadians, therefore, in order to fmooth and foften that difpofition, which was by nature fo rough and ftubborn, befides the cuftoms above defcribed, appointed frequent feftivals and facrifices, which both fexes were réquired to celebrate together; the men with women, and the boys with virgins ; and, in general, eftablifhed every inftitution, that could ferve to render their rugged minds more gentle and compliant, and tame the fiercenefs of their manniers. But the people of Cynatha, having flighted all thefe arts, though both their air and fituation, the moft inclement and unfavourable of any in Arcadia, made fome fuch remedy more requifite to them than to the reft, were afterwards engaged continually in inteftine tumults and contentions; till they became at laft fo fierce and favage, that, among all the cities of Greece, there was none in which fo many and fo great enormities were ever known to be committed. To how deplorable a ftate this conduct had at laft reduced them, and how much their manners were detefted by the Arcadians, may be fully underitood from that which happened to them, when they fent an embaffy to Lacedxmon, after the time of a dreadful flaughter which had been made among them. For in every city of Arcadia, through which their deputies were obliged to pafs, they were commanded by the public crier inftantly to be gone. The Mantineans alfo expreffed even fill more flrongly their abhorrence of them: for as foon as they were departed, they made a folemn purification of the place; and carried their victims in proceffion round the city, and through all their territory.
"This then may be fufficient to exempt the general cuftoms of Arcadia from all cenfure; and at the fame time to remind the people of that province, that mufic was at firlt eftablifhed in their government, not for the fake of vain pleafure and amufement, but for fuch folid purpofes, as flould engage them never to defert the practice of it. The Cynretheans alfo may perhaps draw fome advantage from thefe reflections; and, if the deity fhould hereafter blefs them with better fentiments, may turn their minds towards fuch difcipline, as may foften and improve their manners, and efpecially to mufic; by which means alone, they can ever hope to be divefted of that brutal fiercenefs, for which they have been fo long diftinguifhed."
Though Polybius in this paffage feems to attribute the happy change that was brought about in the manners of the Arcadians tomufic alone, it does not appear to merit all the honour, as a confiderable part was doubtlefs due to the poctry that accompanied it ; which being grave, majeftic, and full of piety and refpect for the gods and heroes, whofe glorious actions and benẹfits were celebrated in it, muft have had great influence upon the minds of young perfons, in whofe education thofe two arts had fo confiderable a fhare.

Thucydides, as quoted by Aulus Gellius (lib. i. cap. i i.) fyys, when the Lacedæmonians went to battle, a Tibicen played foft and foothing mulic to temper their courage, left by an ardent temerity they fhould have rufhed on with too great impetuofity; for, in general, they had more need of having their courage repreffed than excited.

However, in an engagement with the Meffenians, they
were very near being difcomfited, when the celebrated 'I'yrtæus, who performed the part of a Tibicen that day, finding the troops give way, immediately quitted the Lydian mode, and played in the Phrygian, which fo reanimated their courage, repreffed by the preceding mode, that they obtained a complete victory.

The Lacedæmonians, though a military people, of auftere manners, appear at all times, notwithftanding their inhofpitable law againtt the admiffion of ftrangers, to have invited eminent muficians into their country, and to have encouraged mufic; not only in order to regulate the fteps, and animate the courage of their troops, but to grace their feftivals, and fill their hours of leifure in private life.

Athenxus tells us (lib. xiv.), that they had a flute painted on their enfigns and ftandards.

There was one kind of theft to which the boys were ac cuftomed, and which was even authorifed by the law, and by the confent of the citizens; and this was their itealing herbs or roots from the gardens and public baths; but if they were caught in the fact, they were punifhed for want of dexterity. The defign of the Spartan legiflator in allowing this practice, was to infpire the Spartan youth, who were all defigned for war, with a view to felf-defence, and not to extent of dominion, with boldnefs, fubtlety, and addrefs; to enure them betimes to the life of a foldier, to teach them to live upon a little, and to be able to fhift for themfelves. The patience and conftancy of the Spartan youth were fignally exemplified in Diana's feltival, called "Orthia," which fee. The molf ufual occupation of the Lacedæmonians was hunting, and other bodily exercifes, to which they devoted in private and public much of their time and attention.

Hunting was made a part of the education of the Lacedxmonians, becaufe it had a tendency to prevent corpulence, which incurred public contempt, if not banifhment, and to ftrengthen their limbs, and to render thofe who practifed it fupple and fleet. They had a kind of public dances, in which they much delighted, common alike to virgins and young men. Indeed, in all their fports, girls were allowed to divert themfelres with the other youths; infomuch that, at darting, throwing the quoit, pitching the bar, and the like robuf diverfions, the women were as destrous as the men. For the manifelt peculiarity of this cuftom, Lycurgus affigned no other reafon, than that he fought to render women, as well as men, ftrong and healthy, that their children might refemble them. The laborious life ceafed with the age of $30:$ and they then employed themfelves wholly either in affairs of flate, or of war.

As to the laws relating to religion, they prefcribed that the ftatues of all the gods and goddeffes worfhipped by the Spartans, fhould be reprefented armed, even Venus herfelf; that the people might regard a nilitary life the moft noble and honourable, and not attribute, as other nations did, floth and luxury to the gods. Their facrifices confifted of things of fmall value; that indigence might never hinder them from worthipping the gods. They were forbidden to make long or rafh prayers to the heavenly powers, and were enjoined to afk no more, than that they might live honeflly, and difcharge their duty. Graves were allowed in their city, and they buried clofe to the temples, that all people might be familiar with death, and not conceive of it as a thing dreadful in itfelf, or that dead budies defiled the living. Magnificent fepulchres were forbidden, nor was the plaineft or moft modeft infcription permitted, except for fuch as were flain in the wars, or for women who had devoted themfelves to a religious life. Tears, fighs, and outcries were not permitted in pubiic, becaufe they difhonoured Spartans, who ought to bear all things with equanimity.
Mournings were reltricted to feren days.
Celibacy in men was regarded as infamous, and punifhed

## LACEDEMONIANS.

by various tokens of contempt. If a man did not marry when at full age, he was liable to an action; as thofe alfo were who married above or below themfelves. Such as had three children had certain immunities, and thofe who had four were free from all taxes. Virgins were married with out portions; hulbands were allowed to beat their wives; and there were fonte other laws which we flall not here recite. The men of Sparta are generally faid to havebeen dittinguifhed for their virtue; but the Spartan women have been as generally decried for their boldnefs, and contempt of decency.
No Spartan was admitted to any concern in their judicial proceedings under 30 years of age; and it was held indecent, and in ill repute, for a man to bufy himfelf at the tribunals, when he had no affairs there of his own. By thefe regulations, Lycurgus thought to prevent litigioufnefs, and that multiplicity of fuits which are always fatal in a ltate. Perfons of abandoned characterloft all right of voting or fpeaking publicly on public affairs; for it was a perfuation among the Spartans, that a man of a bafe character in private life could not ferve his country from motives of triue patriotifm.

At Sparta, it has been faid, every thing tended to infpire the love of virtue, and the hatred of vice; the actions of the citizens, their converfations and mutual intercourfe which frequently occurred, thier public monuments, and their inferiptions. Accordingly Lycurgus would not allow all forts of perfons to travel, left they fhould bring home foreign manners, and return infected with the licentious cultoms of other countries, and thus become averfe from the life and maxims of Lacedrmon. On the other hand, he would fuffer no ftranger to remain in the city, who did not come thither to fome ufeful or profitable end, or out of mere curiofity, left they fhould diffeminate the vices of their own countries. A foldier was the only reputable profeffion in Sparta; a mechanic or hufbandman was looked upon with contempt. War, indeed, was the trade and bufinefs of the Lacedrmonians, and the firf law of war with them was never to fly, or turn their backs upon their enemies, however fuperior in number ; never to quit their poit; never to deliver up their arms; in a word, either to conquer, or to die upon the fpot. Hence it is, that a mother recommended to her fon, who was going to make a campaign, that he fhould return either with or upon his fhield; and that another, hearing that her fon was killed in fighting for his country, anfwered very coldly, "I brought hims into the world for no other end." A Spartan lady, having heard that her fon had fied from a battle, wrote him this fhort letter, "Fame fpeaks ill of you; cfface it, or be no more." In all expeditions, they were careful in the performance of religious rites; and after their evening meal, the foldiers fang together hymns to their gods. When they were about to engage, the king facrificed to the Mufes, that, by their affiltance, they might be enabled to perform deeds worthy of being recorded to lateft times. Then the army advanced in order to the found of flutes, which played the hymn of Caftor. The king himfelf fung the Pæan, which was the fignal to charge. When their enemies began to fly they purfued no longer than till victory was afcertained; becaufe they would feem to fight rather for the honour of conquering than of putting their enemies to death. After 40 years' fervice, a man was, by law, no longer required to go into the field, and confequently if the military age was .jo, the Spartans were not held invalids till they were 70. It was one of the wifent maxims in the political fyltem of Lycurgus, that he forbade the Spartans to fight often againft the fame enemy. They were forbidden to meddle with maritime affairs, though in procefs of time they were forbidden to tranfgrefs this inftitution.

It has been faid that Lycurgus was the author of that
political expedient for leffening the number of flaves, or Helotes, in Sparta, called "Cryptia," i. e. the ambufcade, when the flaves were thought too numerous. Such as had the care of educating the Spartan youth, felected the ftoutell of them, and having armed them with daggers, fent them out to deftroy their unhappy flaves, either by furprifing them in the night, or falling upon them in the day, when they were at their work and defencelefs. Plato condemns this law; and Plutarch denies that it was made by Lycurgus, whereas Ariftotle exprefsly lays it to his charge; but when or however it was made, it was undoubtedly a cruel unneceffary expedient, in all refpects unworthy of a virtuous people. The abbe Barthelemi (Trav. Anach. vol. iv. p. +8 I.) has, in our opinion, fatisfactorily vindicated Lycurgus from the charge of having inltituted fuch a practice. Plato himfelf recommends, that in a well governed ftate, the youth, as foon as they are of fufficient age, fhould, during two years, range the country with arms in their hands, braving the rigours of fummer and wintèr, leading a hardy life, and fubjected to a ftrict difcipline. As the Cryptia was only practifed among the Spartans, Plato has here defcribed the nature of it. In this and another fimilar paffage the object of the Cryptia is defribed, but not a word is faid of the chace of the Helots; of which no mention occurs in any of the uow remaining works of Ariftotle, nor in thofe of Thucydides, Xenophon, Ifocrates, and other writers of the fame age, though they often fpeak of the revolts and defertions of the Helots, and occafionally cenfure the laws of Lycurgus, and the cuftoms of the Lacedrmonians. The Abbé concludes, that till about the time when Plato wrote his treatife on laws, the Cryptia was not employed to fhed the blood of the Helots. Afterwards, $i . e$. a fhort time after the death of Plato, the laws loft their force, and the Spartan youth killed thofe Helots who made too much refiftance, and perhaps gave occafion to the decree of the ephori, which imported that the Helots might be murdered with impunity. The abufe increafing from day to day, the Cryptia was at length confounded with the chace of the Helots. According to Ariftotle the Cryptia was inflituted by Lycurgus. Plato explains its object and believes it to be extremely ufeful. When the manners of Sparta became corrupted, the youth of Lacedxmon, we are told, abufed this exercife to perpetrate horrid cruelties, which cannot be juftified, but which have been tranfmitted to us with exaggeration, and unjuflly charged upon the inflitution of Lycurgus.

The inflitutions of Lycurgus have been much extolled both by ancients and moderns, but they are unqueftionably liable to many objections. The legiflator himfelf, when he framed them, mult have been in a great degree devoid of that comprehenfion and fenfibility of mind, which takes an enlarged view of the frame and condition of men, and which duly attends to the feelings of human nature; particularly thofe of parents and children. The underitanding was left in a great degree uncultivated; decency was profcribed, barbarity rendered familiar ; and all thofe tender fenfations that humanize fociety were fmothered, as it were, in the birth. The conftitution was a moft unnatural effeet of fpeculation, founded upon the mifery of the individuals that compofed the community: for if the Spartans were free with refpect to other nations, they were flaves to their own leginature. In a word, fay the authors of the Univerfal Hiftory, it was a difcipline calculated, not for a free people who had a right to cultivate the powers of reafon, and tafte the nobleft enjoyments of life, but for the defperate militia of a defpotic tyrant, who wants to extinguifh every fentiment of humanity, and produce a contempt of life by frripping it of all its comforts.

## LACED TMONIANS.

Such an inflitution as that of Lycurgus, with all its defects and failings, is a jutt object of admiration : but it rould have been lefs wonderful, if it had fubfitted only during the life of the legiflator; however, we know that it fubfifted many ages after his deceafe in a greater or lefs degree of vigour and influence. Xenophon, in the encomium he has left us of Agefilaus, and Cicero, in one of his orations (Pro Flacc., obferves, Lacedæmon was the only city in the world that preferved her difcipline and laws for fo confiderable a term of ycars unaltered and iaviolate. "Soli," (fays Cicero, fpeaking of the Lacedxmonians), "toto orbe terrarum feptingentos jam annos amplius unis moribus ad nunquam mutatis legibus vivunt." In Cicero's time, however, the difcipline of Sparta, as well as her power, was very much relaxed and diminifhed. But all hittorians agree that it was maintained in a very confiderable degree of vigour till the reign of Agis, under whom Lyfander, though himfelf incapable of being blinded or corrupted with gold, filled his country with luxury and the love of riches, by bringing into it immenfe fums of gold and filver, which were the fruits of his victories, and thereby fubvertizg the laws of Lycurgus. But the introduction of gold and filver, fays Rollin, was not the firlt wound given by the Lacedxmonians to the inflitution of the legiflator. It was the confequence of a violation of another law ftill more futndamental: ambition was the vice that preceded and made way for avarice. The defire of conquefts drew on that of riches, without which they could not have propofed to extend their dominions. The main defign of Lycurgus, in the eftablifhment of his laws, and efpecially of that which prohibited
the ufe of gold and filver, was, as Polybius and Plutarch have judicioufly obferved, to curb and reftrain the ambition of his citizens, to difable them from making conquefts, and in a manner to force them to confine themfelves within the narrow bounds of their own country, without carrying their vicws and pretenfions any farther. Indeed the government which he cittablifhed was fufficient to defend the fronticrs of Sparta, but was not calculated for raifing her to a dominion over other cities. That it was not his defign to make the Spartans conquerors is evident from his having exprefsly forbidden them, though they lived in a country furrounded with the fea, to meddle in maritime affairs; to have any fleets, or even to fight upon the fea. Although he made them a nation of foldiers and warriors, it was only that, under the fhadow of their arms, they might live in liberty, moderation, juftice, union, and peace, by being content with their own territories, without ufurping thofe of others, and by being perfuaded, that no city or ftate, any more than a fin. gle perion, can ever hope for folid and lafting happinefs, but from virtue only, On this fubject, fee Anc. Un. Hift. vol. vo Rollin's Anc. Hitt. vol. ii. Travels of Anacharfis, vol. iv.
The ftability, as well as the glory, of the Lacedxmonian government, was derived from the wife inflitutions of that celebrated lawgiver, of whofe government we have given an account. After the death of Lycurgus, the Lacedæmonian hiftory becomes perplexed, being fupplied from fcanty and fcattered materials.
The following table fhews the fucceffion of their kings, in both lines, with the duration of their reigns, from Lycurgus until the Achæan league.

Table of the Lacedxmonian Kings.

## LACED $\mathbb{A M O N I A N S . ~}$

It would far exceed our limits to detail minutely the hif. tory of the Lacedxmonians during the feries of reigns which we have above enumerated. We mult content ourfelves with marking fome of its principal events, and particularly thofe in which their ambition led them to violate the conftitution eftablifhed by Lycurgus. We fhall find that inftead of employing their arms and exercifing their valour for maintaining their own independence, they were actuated by an ambition for making conquefts and extending their territories, by methods directly contrary to the rules of conduct which Lycurgus had preferibed. Charilaus, his nephew and pupil, began with an unfuccefsful war with the Argives, and with the Tageate, a people of Arcadia; and he then turned his arns againft the Achæans, who lad taken from the Lacedxmonians feveral frontier towns, which he and his colleague Teleclus recovered. But a more important event in the Lacedxmonian hifory was the Meffemian war, the foundation of which was laid during the reign, or, foon after, the death of Teleclus ; but it was actually commenced by Alcamenes, king of Sparta, who made a fudden irruption into the Meffenian territory. In the profecution of this war, the Lacedemonians and their two kings took a folemn oath not to return till they had thoroughly reduced Meffeniz, by which oath they entered into an obligation to tranfgrefs two of the exprefs laws of Lycurgus; one of which forbade them to make conquefts, and the other which prohibited them from prolonging their war againit the fame people. Polydorus and Theopompus continued the war which had been begun by Alcamenes and Nicander; and conftrained the Meffenians to fortify a city which was fituated on the top of the mountain Ithome, that they might retire into it for fafety and felf-defence, when they were driven from their other cities and villages, that were more expofed. The Lacedrmonians, regardlefs of that claufe in the laws of Lyycurgus, which cautioned them againt befieging fortified places, laid fiege to Ithome; and altogether deftitute of experience in this branch of military tactics, they were under a neceffity of continuing the fiege for fourteen years before they reduced the place. It was during this expedition that Theopompus is faid to have created the ephori, thus altering the original conftitution of the Spartan government. The attention of the Spartans was diverted from the Meffenian war by a difpute with the Argives, concerning the city of Thyrea, and its diltrict, which, lying on the borders of Argolis and Laconia, occafioned great contentions between thofe ftates.
The Argives were defeated with great flaughter; but when Polydorus was urged to purfue his victory, and to attack Argos itfelf, he declined it with this noble declaration, worthy of the inflitution of Lycurgus, "that the Spartans fent him to affert their rights, but not to rob others." The Spartans, after having provided for the adminiftration of affairs at home, by the appointment of the ephori, renewed the Meflenian war, and marched with a great army towards Ithome, but they were defeated with great lois, and conftrained to betake themfelves to flight. At length, after an obffinate reliftance on the part of the Meffenians, they were obliged to furrender Ithome to the Spartans, and they themilves were treated with great rigour. The Spartans, during the Meffenian war, having been ten years abfent from the city, on account of their oath, which obliged them not :o return till they had entirely fubdued that country, were :eminded by a mefiage from the women, that, whill they were fo careful to fubdue their enemies, they neglected the city. In confequence of this meffage, they decreed that the joung men among them who came out of Sparta under age, ond on this account were not obliged by the onth, fhould
return, and affociating themfelves promifcuoufly with the unnarried women, preferve the city from falling into decay. This project being executed, thofe who were burn of fuch young women were called "Parthenix," that is, fons of virgins. When the Lacedæmonians returned, after having reduced Meflenia, they neglected thefe young men, who, finding themfelves involved in difficulties, for want of parents and an inheritance, intrigued with the Helotes, and formed a plot againft the ftatc. The plot, however, was difcovered, and they were fent off to Italy, where they fettled near Tarentum. In the reign of Anaxander and Anaxidanug, 685 years B. C., the fecond Melfenian war begun, and continued $1+$ years. It terminated with the capture of Ira or Era, after a fiege of in years, and by the conquelt of Meffenia, the inhabitants were made flaves, and the whole country was divided by the Spartans among their own citizens, the diftrict of Methone excepted, which they gave to the Argives. Nothing of any great importance occurred in the hiftory of the Lacedæmonians until the Perfian war. When Miltiades, the Athenian, fought the famous battle of Marathon, and defeated the Perfians, in the 490th year B.C., the Spartans had promifed an army, but fent none ; fome time after the battle their troops arrived, contemplated the fpot where it had been fought, and after having highly comnended the Athenians, returned home again to Sparta. When this battle at Marathon excited the Perfians to attempt again the conqueft of Greece, the Spartans, with a refolution worthy of the difciples of Lycurgus, deternined to oppofe them. The ftates of Greece, apprized of the hoftile intentions of Xerxes, unanimoufly joined in a general affembly to defend its liberty againft the Perfians; but in the event, of all the confederates, the Spartans and Athenians were the only fates that feemed prepared to execute their purpofe. A refolution was formed to defend the ftraits of Thermopylx; and when 6000 foot were appointed for that fervice, the command of them was given to Leonidas, who had fucceeded Cleomenes in the kingdom of Lacedxmon. Of the 6000 foot, 300 only were Spartans. Leonidas himfelf confidered it as a defperate undertaking, but was determined either to fucceed, or to die in the attempt. The iffue of this conflict was the death of Leonidas with all his Spartans; but the victory on the part of the Perfians coft them 20,000 men. The Grecian fleet, which lay at Artemifium, was entrufted to the command of Eurybrides, a Spartan, poffeffed of great perfonal courage, but timorous as a commander, and unexperienced in maritime affairs. When Mardonius attempted the conquert of Greece, Paufanias, the fon of Cleombrotus, who affumed the character of tutor or protector to Pliftarchus, the fon of Leonidas, had the command in chief of the whole Grecian army, which amounted to 100,000 men. The Perfians were undoubtedly double this number. But both armies were afterwards greatly diminifhed by defertion. At length the Lacedæmonians and Tegetæans were forced to engage Mardonius's army without affiftance. The Perfians, it is acknowledged, behaved well on this occafion; but being neither fo well armed, nor fo well difciplized as the Greeks, their valour was of no ufe but to expofe them to flaughter. The Perfians were defeated and Mardonius killed. The Perfian camp was forced; the Lacedrmonians opened a paffage; and then a mercilefs flaughter enfued. Of 300,000 men, whom Mardonius brought into the field, fcarcely 3000 efcaped. The number of Greeks that fell is uncertain ; Plutarch reckons them at 1360 , but Diodorus Siculus affirms pofitively, that they were very few lefs than 10,000 . On the fame day in which the battle of Platra was fought, (479 B.C.) Leotychides, king of Sparta, with Xanthip-

## LACED EMONIANS.

pus, the Athenian, gained a glorious vietory at Mycale, where the laft remains of the Perfian fleet, and of the Perfian armies, which had been drawn together for the deftruction of Greece, were utterly defeated, and Paufanias was afterwards fent to take the command of the fleet, with frict orders to free the Grecian cities from the Perfian garrifons. But he foon after intrigued with Artabazus, and engaged in a fcandalous treaty with the Perfians; affecting, by the affiftance of the great king, to make himfelf fovereign of Greece. The allies took umbrage at his conduct, and privately fent to accufe him at Sparta. He was induced, however, by delufion to return to Sparta; where he was feized by the ephori, but for want of fufficient evidence, or dreading his influence, they releafed him. He neverthelefs purfued his negotiations with Artabazus, till his intrigues were difcovered. Upon his retiring to the temple of Minerva Chalcidica, in order to take fanctuary there, the Spartans blocked up the gate, and thus preventing his efcape, reduced him to the neceffity of flarving in the temple. At the end of the 77 th olympiad ( 465 B.C.) a molt dreadful earthquake happened at Sparta. Diodorus fays, that 20,000 perfons loft their lives; and Plutarch affirms, that only five houfes in the city efcaped ruin. In this year, 465 B.C., the third Meffenian war commenced, by the infligation of the Ifelotes, and lafted ten years. The next war which the Lacedxmonians undertook, was that ftyled the "Sacred," by fome the "Phocian" war; begun in the $44^{\text {Sth year }}$ B.C. The defign of it was to put the temple of Delphi into the hands of the inhabitants of the country, whereas it bad before belonged to the Phocians; this defign the Spartans effected; and they were recompenfed by a decree on the part of the Delphians, that they fhould have a right of firft confulting the oracle; which decree was engraved on the forehead of a brazen wolf, confecrated in the temple. The Athenians foon after, having reftored the temple to the Phocians, obtained the fame privilege, and the decree which granted it was engraven on the right fide of the wolf. The Lacedæmonians having induced the Bœotians to revolt from the Athenians, and Eubœa at the fame time fhaking off the yoke, availed themfelves of this opportunity for giving a mortal blow to Athens; for which purpofe Pliftoanax was ordered to invade their territories, at the head of a great army. He was perfuaded, however, by his guardian Cleondrides, who accepted a bribe from Pericles, to return home, without effecting any thing, for which corruption the Spartans punihed Cleondrides with death, and fentenced their king to exile. Soon after a peace was made between the Spartans and Athenians. This peace was of no long duration; for in the year 43I B.C. the Peloponnefian war began. Archidamus, the king of Lacedæmon, wifhed to avoid this war, and fent a meflienger to Athens, with a commiffion to this purpofe; but he was fent back unheard. After feveral incurfions into Attica, Archidamus died. He is faid to have been one of the beft kings that ever reigned in Sparta. Being afked, "who were governors of Sparta ?" he replied, "the laws, and the magiftrates according to thefe laws." During the reign of his fon and fucceffor Agis, who invaded Attica, the Athenians took feveral towns; but at length they were routed with great flaughter by the Spartans under the command of Brafidas, one of the molt celcbrated men of Sparta. In the year 42 I B.C. a peace was concluded, after the war had raged for ten years. But in order to preyent too intimate an union between Sparta and Athens, feveral of the Peloponnefian ftates leagued themelves with Argos, which was a very powerful republic, and hoftile at this time to the Lacedromonians. After fome flights and affronts, the Spartans, much irritated, refolved on a war
againf them and their allies; and entered the territory of Argos with a large army. The Argives, being ill prepared for a confict, declined it, and obtained from A gis a truce of four months ; which gave great offence to his allies, and for which he was feverely mulcted and opprobrioufly treated on his return to Sparta. The Athenians, having obtained a fupply of troops, renounced the treaty made with Agis, and the two armies engaged at Mantinea. The Spartans under $\Lambda$ gis, though inferior in number to the Argives and their allies, and very obltinately refifted, gained a complete victory. This happened in the year $4 \times 8$ 13.C. In the year 4I B.C. Agis entered the territories of Elis, in order to revenge the difhonour that had been done fome years before to the republic, by forbidding them to be prefent at the Olympic games. After repeated irruptions into the country, the Eleans treated with the Spartans, and a peace enfued. At this time the Peloponnefian war was renewed. The Athenians having fent a great army into Sicily, the Lacedæmonians fent Gylippus to affilt the Syracufans; among whom he gained great reputation at firlt, though it was afterwards ruined by his avarice. About this time Alcibiades repaired to Sparta, having been expelled his country by a prevailing faction. By adopting the Spartan mode of living, he became a great favourite, and was treated with particular refpect by Agis, who received him into his houle; but in return for the hofpitality he experienced, he bafely debauched the wife of Agis, and was obliged to quit Laconia, and to feek among the barbarians a place of fafety. Whilit king Agis managed the war in Attica, the conduct of maritime affairs was committed to Lyfander, who proved the great hero of Sparta, and brought to a termination the Peloponnefian war. Lyfander was fuppofed to be of the royal family, and of the Herculean race; he paffed his younger years under all the reftrictions of the inftitutes of Lycurgus, and was thus rendered bold, hardy, patient, and refolute; his genius was extenfive, and in his difpofition and manners, he was affable, modeft, vigilant, and indefatigable; but with thefe great qualities he cherifhed the moft dangerous ambition, in order to gratify which he flooped to every fpecies of flattery and diflimulation; fo that to accomplifh his ends, he made no fcruple to violate the moft folemn oaths. When he entered on his command, he found the Athenians greatly fuperior at fea; but in a few years he deprived them of all power ; but, above all things, he fought to advance his own credit and authority. Lyfander foon perceived, that without the Barbarian gold, Sparta could not carry on the war ; and he therefore infinuated himfelf into the favour of Cyrus, who was then at Sardis, and obtained from him 10,000 pieces of filver, which he applied to the purpofe of fupporting his foldiers, and refitting his fleet. Whilt he lay at Ephefus, repairing his fhips and keeping his foldiers and mariners to their exercife, he projected a fcheme for making himfelf, in a manner, fovereign of Greece. After feveral previous manceuvres and changes of pofition, he attacked the Athenians, whofe fleet was under the command of Conon, both by fea and by land, and completely defeated and routed them; fo that, in a fingle hour, he put an end to the Peloponnefian war, and to the maritime power of Athens. After this victory ( 40 , B.C.), and the power acquired by it, Lyfander acted rather as an univerfal monarch than a general from Sparta. He immediately vifited all the neighbouring cities, and changed their government, placing in each of them a Spartan magittrate, and with him ten of his friends from Ephefus, where he crected a kind of political univerfity. Thefe men conducted themfelves with haughtinefs and feverity, and the Lacedæmonian government was thus rendered ungrateful; fo that the people were uni-

## LACEDTMONIANS.

verfally difpofed to fhake ir off as foon as they could. Lyfander collected the wealth which his viEtorics had put into his power, and deftined it to be fent to Sparta, whither he had before fent a meffenger with the news of his victory over the Athenians, together with an affurance that he would foon be before Athens with a flect of 200 fail; upon which, Agis and Paufanias, the two kings of $\mathrm{S}_{\text {parta, }}$ were fent, with a very large land army, into Attica. Lyfander entered Athens in triumph, on the anniverfary of the great victory at Salamis, April ${ }_{2} 4$, in the year 404 B.C., which completely finifhed the Peloponnefian war. (See Athens.) Lyfander, having accomplifhed this object, fent the immenfe treafures which he had collected to Sparta, under the care of Gylippus, whofe avarice and fraudulent difpofition led him to open the bags which contained them, and to take out what he thought proper. Upon his arrival at Lacedxmon, their contents were examined, and compared with a ticket which Lyfander had put into each fealed bag. The deficiency was foon difcovered; Gylippus was impeached by his fervant, and his crime being proved, he was exiled under the feandalous imputation of being a detected cheat. This influx of wealth occafioned great difputes at Sparta: thofe who were beft acquainted with the nature of their conftitution regarded the receipt of it as an open violation of the laws of Lycurgus, and they exprefled their apprehenfion, that in procefs of time they, would have reafon to repent this accef. fion of opulence. It was at laft determined, as a compromife of the fubfifting difputes, that the ftate might make ufe of the gold and filver, but that private perfons fhould poffefs neither, on pain of capital punifhments. Lyfander, while he remained in Greece, amply evinced his imperious difpofition; fetting up his own flatue, and thofe of his commanders, who were his favourites, and dedicating two ftars in honour of the deities Cattor and Pollux, two flars which his fycophants pretended had been feen in the rigging of his Ship, at the battle of Egos. The range of his ambition in Afie was ftill lefs reftrained. At length the ephori and fenate of Sparta difpatched a foytala (which fee) to recall kim. After fome tokens of difpleafure, the Spartans became reconciled to him, and in procefs of time extolled him for a man of integrity and true public fpirit, to the mortification of their king Paufanias, who had endeavoured to humble his pride and reftrain his infuence. Before Agefilaus was well fettled on the throne ( 397 B.C.), the king of Perfia declared war againt the Spartans: the king was, not without reafon, jealous of the power of Lyfander ; and a mifunderftanding between them taking place, Lyfander refolved to overturn the government of his country. But new difturbances occurring in Greece, he perfuaded the ephori and fenate once more to entruft him with an army. An army was foon raifed, to the command of which he was appointed; and another army was put under the command of king Paufanias. Lyfander, haftening by quick marches to Haliartus, and unfupported by Paufanias, who was more dilatory in his progrefs, was attacked by the Thebans and Haliartans, and killed on the (pot, and the Spartans were defeated. A treaty was concluded with Paufanias, on condition of his retiring out of Bœotia. But on his return to Sparta, fuch a fpirit of refentment appeared againft him, that he was afraid to undergo his trial, and therefore retired to Tegæa, where he led a private life. The memory of Lyfander was held in great veneration, not only for the fervices which he had rendered his country, but on account of his dying poor, notwithltanding the opportunities he had of enriching himfelf.

Agefilaus, having fubjected the greateft part of the coaft, determined to march into Perlia, and revenge the cruelties
perpetrated by Xerxes, when he invaded Greece; but being recalled, he returned without hefitation ; preferring his duty townrds the conftitution of his country to the profpect of fubduing the whole Perfian empire. During the reign and military exploits of Agefilaus (B.C. 393), Conon, the Athenian, threatened the Spartans with the lofs of their fovercignty by fea; upon which it was refolved at Sparta to fend Antalcidas into Perfia, to appeafe the great king, and to detach him from the interefts of their rivals. The negociations of Antalcidas prevailed, fo that a peace was co cluded ( 387 B.C.), called the peace of Antalcidas, by which the fovereignty of Greece was, in a manner, guaranteed to Sparta, but upon-very difhonourable terms, the Greek cities in Afia being entirely abandoned to the Perfians, notwithtanding all the promifes which had been made to them, and although Agefilaus himfelf had fought in their quarrel. The Lacedæmonians became haughty and infolent, and refolved to punifh all who had injured them. They began with the Mantineans, who had becn their confederates, and had done them great fervices. They next extended their arbitrary power to the Phliafians, and then to the Olynthians, who were reduced to fuch diftrefs, that they made a treaty with the Spartans, by which they engaged to have the fame friends and enemies with them, and to follow them as affociates in their wars, whitherfoever they fhould lead them. Sparta exercifed a government that was arbitrary and cruel over all whom the had brought noft unjufty under her dominion; for, by the peace of Antalcidas, the had engaged that all the cities fhould be left free. The Perfian king perfifted in his defign to bring about a fettled tranquillity, which, in the beginning of the 102d olympiad, ( 372 B.C.) feemed to be nearly effected; the Athenians heartily concurring with the Lacedæmonians, and giving no countenance to the Thebans, who refufed to hear of peace, becaufe the Spartans infifted they fhould fet the cities of Bocotia at liberty. In this oppofition they were encouraged by Epaminondas, who demanded that, before the Lacedxmonians gave laws to others, they fhould fhew a proper regard to thbfe maxims of equity themfelves, by giving up. Meffenia to its ancient proprietors, and fetting Laconia free. This obitinacy violently incenfed Sparta, and offended Athens. Cleombrotus, with an army of 12,000 men, penetrated into Bootia, and advanced towards Leuctra. A truce, however, was concluded by the mediation of Jafon, a powerful prince of Theffaly. But as Cleombrotus was retiring, he met Archidamus, the fon of Agefilaus, with a reinforcement from Sparta; and thefe princes, notwithftarding the truce, marched back to Leuctra, fin order to fall on the Bcootians, where they found Epaminondas ready to receive them. The Spartans, in the battle of Leuctra, (fought July Sth, 37 I B.C.) were defeated with great flaughter; and thus they loft the empire of Greece, which they had held near 500 years. Epaminondas afterwards entered Laconia, and appeared before Sparta; but Agefilaus compelled him to retire, though not without defolating the country in his retreat. Epaminondas, when he quitted the territories of Sparta, rebuilt the city of Meffene, and recalled the ancient inhabitants of Meffenia from the feveral countries where they had taken refuge, and reftored them to the poffeffion of their ancient patrimony, after they had loft it 300 years. Having accomplihed this object, he offered the Lacedæmonians peace, on condition that they furrendered all pretenfions to Meffenia, and left Laconia free; terms which they rejected with difdain. At length the Perfian king difpofed almoft all Greece to think of peace; and this was effected, after the Laconian or Bootic war had lafted about five years. In the fecond year

## LACEDEMONIANS.

of the roth olympiad ( $363 \mathrm{~B} . \mathrm{C}$ ) new commotions arofe in Peloponnefus. Epaminondas made an unfuccefsful attempt to furprife Sparta, and afterwards Mantinea; mortified by thefe difappoinements, he determined to attack $\Lambda$ gefilaus, who was at the head of the Lacedemonians and Areadans, with the rett of their allies ; but in his charge againnt the Lacedrmonians, he expofed his perfon too much, and fell under a cloud of darts, and was at lengrth killed by a Spartan javelin. Pyrrhus of Macedon, interferiag in a difpute about the fuceeffion to the throne of Sparta, made feveral attempts againtt the city, but was.as often repulfed; and before he quitted Greece he was kilied in a battle with Areus the Spartan king. Cleonidas II., who fucceeded Arets II. in the year 257 B . C had long lived in the court of Scleucus, and acquired a tatle for pomp and grandeur. At Sparta le had an opportunity of indulsing this talle, for the maxims of L.ycurgus had funk not only into difufe, but into contcmpt. One of the ephori, who had gained influence, and who had conceived a prejudice agaiat his own fon, procured a law, by which all mea were left at liberty to difpofe of their lands by gift or fale, or by tettament at the time of their deceale. In confequance of this law, which fubverted the original conltitution, mort of the lands were, by degrees, transferred from the ancient Spartan families; and thus the credit and glory of the Spartan fate declined. Agis, the colleague of Leonidas, and a perfect counterpart to him in difpolizion and character, attempted to counterach his conduct, and to reltore the conffitution of Sparta. Cleombrotus, who fucceeded Ieconidas, after he lad been fet alide, concurred with Agis in all his deligns; but when Agis was obliged to go with a body of Spartan troops to the affillance of the Achreans, his colleague abufed his power to fuch a degree, that Leonidas was reftored; upon which Agis, when he returned, fled to the temple of Minerva, and could not be drawn out of his fanctuary by any methods which Leonidas could practife. He was at length treacheroufly feized, tried, and condemned by the ephori, and at last put to death. On the death of Leonidas, Clermenes afcended the Spartan throne; and refolved to fupprefs the ephori, and to reltore the ancient conflitution of Sparta. In the courfe of his reign he invaded Achex, and took feveral citics. Being informed that Aretus and the Achrans were preparing to give him difturbance, he marched a body of troops into their territories, and gained many advantages over them. At length the Achrans, difheartened by their ill Cuccefs, offered to fubmit to any terms which Cleomenes propofed. He acted like a generous vietor, declaring that he merely fought to be acknowledged general of the Greeks, and that he was ready to deliver up the prifoners without ranfom, and to reitore the cities he had taken. But being feized with a diforder, which insuced for a time a difability for fervice, Arctus fuffered jealoufy, ciny, and felf-conceit to triunph orer his virtue and love for his country ; and he, who in his youth lad expelled the Macedonians out of Pelopontefus, merely frum the love of freedom, now privately recalled them, fearing that Cleomenes, the molt worthy of the Spartan kinge, thould be raifed to that dignity which he fo highly njerited. When Cliomenes recovered from his diforder, he advanced towards. Argos, where the Achreans held their affembly; but when he drew near, Aretus fent to inform him, that he mult either enter the city alone, or be content to treat without the place. Cleomenes, in confequence of this treatment, invaded Achrea, and took feveral cities. He foow after furprifed Argos, and advanced himfelf to greater power than any of his predeceffors had poffeffed; and his city to greater pre-eminence than the had ever held in Greece. At a fubfequent period, wiz, in the Vol. XX.
year 222 B. C. he gave battle to Antignous at Sallafia, where, from the fuperiority of the Macedonian troops, and the ereachery of Damoteles, the Laccdxmonians were defeated with a great flatyhter of their mercenary tronps, and an almolt total defltruction of their own. A feer this difaftrous defeat, Cleomenes fled to Egypt, where he put an end to his life. With him terminated the Herculcan race of Spartan kings, if we except the fort reign of $A$ gefipelis. After the fatal battle of Sallafia, Sparta $f$ fll into the hands of king Antigonus, who treated the inhabitants with great kindnefs, and they for a time behaved very quietly. Lycurgus, the Spartan king, invaded Meffenia, and defeated the Meffenians. After he had obliged Philip of Macedon to retire from Lacenia, the ephori, pretending to have received information that he wauted to make himfilf abfolute, attenipted so furpric and nurder him; but he withdrew into Neolia, and when the iniquiey of the eplori was difcovered by the people, he was recalled. Machanidas, the fuccefor of Lycurgus, cjected the ephori, averfe from having any either equal to, or greater than, himfelf in Sparta. A broad, he made all Peio. ponsefus trem:ble, and would probably have fubdued it, if Phulopxomen, the chief of the Acheans, had not oppofed his deligns. This leader engaged all the cities in that league to furrifl troops for reducing the power of Machanidas; an engagement took place between the contending parties at Mantinea, in which the Sparta:ss were defeated, and Machanidas was killed. Nabis, a cruel tyrant, fucceeded Machanidas ; and upon lis death, by the hand of violence, the chicf of the Etolians broke into his palace at Sparta, and rifled alt his treafures. The foldiers followed his example, fo that the Lacedrmonians, who had fuffered fo much from the wanton and favase tyranny of Nabis, looked upon his murder as their misfortune ; and a multitude of them affembled, and put many of the 厄etolians to death without mercy. In the middt of their confufion, Philopocmen arrived, and having conviaced the Lacedremonians of the madnefs of their act, enyaged them, fince they had fo happily recosered their freedom, to unite themfelres to the Achrans, B. C. 19 io $^{\circ}$ (Sec Acuresis.) In the year 188 B. C. upon a quarrel between the Lacedxmonians and Achreans, Philopcomen deftroyed the wal's of Lacedremon, abrogated the laws of Lycurgus, and compelled the Spartans to adopt thofe of the Achreans. Upon their preferring a complaint to the fenate of Rome, Callicrates ordered the walls of their city to be re-built; and according to the opinion of Meurfius, which is the molt probable, the liws of Lycurgus were not reftored till after the Romans had vanquilhed Perfeus, and Achaia was joined to their empire. Lacedxmon was placed under the protection of the Romans. During the civil wars of the Roman empire, the Lacedemonians attached themfelves to the party of Cæfar and Auguitus, to whom they confecrated temples. Nero, in his expedition into Greece, durlt not enter Sparta, by reafon of the feverity of its laws. Pliny the elder fpeaks of Lacedzmon as a free city under Vefpafian. A pol ionus Tyaneus, if we may credit Philotratus, found the laws of Lycurgus in full vigour in the time of Domitian; but it is probable, that this emperor diminilhed the liberty of the Lacedxmonians, for Pliny the younger, writing under the reign of Trajan, fays, that there only remained the fhadow of liberty. From that time no vellige remains of the intlitutions of Ly'curgus; at leaft Meurfius could not difcoverany. When Chriltianity became the religion of the empire, the relidue, if any, of thefe inflitutions mult have been abolifhed. Meurlius cites a paffage from Theodoret, which proves that they were entirely abolified by the Romans before his time, that is, before the 5 th century.
Although, in the preceding article we have ufed the appellations
pillations Iacedemonians and Spartans as fymmymon: yet whe they are ditinguifhel, the Spartans denote the citizens of Sparta, and the Lacedemonizns are the imbhitants of the province. The number of the former ancently amounted to 10,000 . In the time of Xerses their number was 8000 ; but by their continued wars they were fo much reduced, that very few ancient families were fond at Sparta. The new families were defcended from the Helots, or llaves, who, being lirtt rewarded with their liberty, afterwards acquired the citle of citizens. Thefe were not called Spartans, but were differently denominated according to the various privileges they had obtained, and their feveral names hore fome reference to their former condition. The lacedicmonians, properly fo called, formed a confederation, the object of which was to unite their forces in war, and to maintain their rights in time of peace. When the interefts of the whole itate were to be difcuffed, they fent their deputies to the general affembly, which was always held at Sparta. There were fettled the contributions which each city fhould pay, and the number of troops it floould furnifh. The inhabitants of the cities of Laconia did not receive the fame education with thofe of the capital. Their manners were more rude, and their courage lef's brilliant ; and hence Sparta obtained an afcendancy over the other cities. Anc. Univ. Hitt. vol. v. Rollin's Anc. Hift. vol. ii. 'Trav. of Anacharlis, vol. iv.

LACEDEMONIUM Marmor, in the Notural Ifflory of the Ancinats, the name of a \{pecies of marble very hard, and of a beautiful green colour; it is a very clofe, even, and compat marble; of a fine floug and bright green, and when polithed, is the brighteft of ail the green marbles, and is remarkable for this, that the colour is not reguilarly and equally difufed through the whole mafs, but leav-s in it many foots and lines very bright and pale, and fome much deeper than the general colour, though there is no colour but green in the whole, only in different fhades and degrees, fome parts approaching to black, and others to whitenels.

It was originally found only in Egypt, and there not in entire flrata, but in large pieces wahed off from the illata, and fometimes le.t on the furface, fometimes buried in the earth, and was greatly valued. It has been fince found in Italy and Germany, and in England. About five miles from the Hot-Wells at Briltol there is a ftratum of it, whence it might be had in confiderable quartitics. Its beauty would foon recommend it, if it were once known; and though hard to cut, it would make amends for that by the high polifh it would take.
LACERATED Wounds. Sce Wounns.
LACERNA, a thick coarfe fort of military garment worn by the ancients.

The lacerna was a kind of cloak of woollen, only ufed by the men; who wore it over the toga, and, when that was not on, over the tunica. It was at firit very hort, but growing popular in the Roman army, it was foon lengthened.

The lacerna was fcarcely known in Rome till the time of the civil wars, and the triumvirate; then indeed it came into fafhion; for the foldiers being then frequently in the city, or at the city gates, the fight became familiar to the citizens, and they fell into the ufe of it; infomuch that it became the common drefs of the knights and fenators, till the time of Valentinian and Theodofus, whea the fenators were prohibited the wearing of it in the city.

The lacerna appears to have been much the fame with the chlamys and birrus.

Martial mentions lacerne of ten thoufand fefterces price.
LACERTA, LrzAnd, in Affronomy, a conflellation of the porthern hemifohere, including, according to Hevelius,
en itars, and in the Britifin Catalogue fistem. Sce Coso stellation.
Lacerta, in Zoology. See Ifzamb.
L.ACER'I'I, a divifion of the reptiles, comprehended under the grenus of 1 acerta.

LACERTUS, and Lacertales, in Anatomy, names fometimes applied to the bundles of fibres, of which the mufcular organs ate compofed.

Lacemtes, in Zoology. See Manis.
Lacertes, in Ichtlyography, the lizard-fik, a name given by fome writers to a tifh of the cuculus kind, much refernbling the common mackarel in flape and in tafte, and more ufually called trachurus.

Lacertes is alfo ufed for a fifh of the gar-fifh kind, or acus Oppiani, but larger than the common fpecies, and called by the Italiaa fiflermen arughia imperia!', or the imperial garfith, and by the fiffermen of England, particularly in Cornwall, the girrock, in diftinction from the cor son kind which they call jkipper. It is thicker in proportion to its length than the conmon gar-lifh, and has a fhorter and fharper fnout, and inftead of teeth, has only its jaws ferrated like a file. It is a fearce lifh, but is more firm in its flefl thau the common gar-fifh. Sice Esox.
LACERUM, in Anatomy, an epithet applied, fronr their irregular ligures, to two foramina of the $\mathbb{k}$ ull ; one in the orbit, the other in the batis cranii. See Cranicas.

Lacercy Foliun, among Boianifls. Sce Leaf.
LACHAS, in Gengraphy, a toiwn of South America, in the audience of Quito ; 60 miles N. of Quito.

LACHELiA, a town of Sweden, in Ealt Buthnia; 13 miles S.S.E. of Wafa.
LACHELLO, a town of France, in the department of the Selia ; nine miles W.S.W. of Vercelli.

LACHEN, a town of Switzerland, in the canton of Schweitz, on the S. fide of the lake of Zurich. Near it are fome mineral fprings, and alfo crytals and petrifactions; eight miles IV. of Utznach.

LACHENALIA, in Botany, fo named by profeffor Jacquin, jun. in honour of Werner de Lachenal, profeffor of botany and anatomy at Bafil, a diltinguihed pupil of Haller and friend of Limxus, eminent for his knowledge of European plants, and ftill more eltimable for his candour and hibcrality. Scveral of his differtations occur in the Ala Helvetica, which throw great light upon the botany of switzerland, and were intenced as preparatory to a Flora of that csuntry, difpofed according to the Linnæan fyttem; hut this work has never yet appeared. Whether its author be ttill living, we have not lately heard. He was born in 1736.-Jacq. fil. in Act. Nov. Helvet. v. 1. $3^{\text {S. t. 2. f. } 3 .}$ Murr, in Lim. Syt. Veg. cd. 14 - $31+$. Gen. Ch. Cal. none. Cor, of fix oblong unequal petals, approximated into the form of a tube, united at their baje; the three outer ones fhortelt, and often callous at the tip. Stam. Filaments fix, erect, awl-fhaped, axtached to the bate of the petals, various in length; anthers erect, oblong. Pi/f. Germen fuperior, nearly ovate; ityle awl-thaped, as long as the ftamens; fligma fimple, obtufe. Peric. Capfule nearly ovate, with three wings, and three cells. Seeds feveral, globofe, attached to the central column.

Eft. Ch. Corolla inferior, regular, of fix petals; the three inner ones longeft. Stamens erect. Capfule fomewhat ovate, with three wings. Seeds globofe.

Obs. Juffieu and Lamarck, following the younger ${ }^{\circ}$ Linnreus in his Supplemenium, confound this genus with the

Phornium of Forler, or New Zealand flax, the former retaining this name, while the latter adopts that given by facquin as ahove ; but thefe genera are no lefs dittinct in bahit than in their effential characters. See Puonmus.
The fuecies of Lactendia are beautiful bulbous plants, with the hathit of a Hyacinth, having all radical oblong leaves, a fimple racemofe fower-ttalk, and variounty-colvarred, more or lefs fpreading or drooping flowers. Wildenow ha3 ${ }_{2}+$ fpecies; the 2 d edition of Horr. Kicwo. enumerates 17 as cultivate- in that nohle collection; but we would prefume to remove two fpecies from both thefe liits. $I_{c}$ f.rotima, which is $H_{\text {Sacinthus f frouinus of } \mathrm{L} \text {.inneus, } 2 \text { native of Spain, figured }}$ in Curt. Mag. t. 859 and t. $145 \%$, is referred by Mr. Ker, in the lalt-mentioned work, to Sillu, a meafure to which we cannot but readily arcede ; and $L$.. vir:dis nay as well, in our opinion, continue, in Hyatinthus, where Linnxus has placed it; at lealt it cánot weil be made to agree with $L$.a. cbraalia; fre Stucq. Ic. Rar. t. Goi. The remaining fpecies are all natives of the Cape of Good Hopz, and, as far as we know, of no other part of the world. Such as we have in gardens are cultivated in the green-houfe, being treated like other Cape bulbs, and flowering chieft in the carly fpring, a few of them in autumn. Good examples of this genus are,
L. orchioides. Orchis-like Lachemalis. Jacq. Ic. Rar. t. 390. Curt. Mag. t. 854. 1269.-Flowers bell-haped, fefille. Inner petals obtufe, expanding. Style the leegth of the flamens. Leaves oblong-lanceolate, with a crenate cartilaginous edge.-This is the o'dett intabitiant of the Englinh gardens among the whole genus, having heen cuttivated by Miller in $2 \boldsymbol{7} \boldsymbol{5}$. It appears to be a very variable fpecies, at leall if more that ouse be not confoundel mider this nam. The leaves are more or lefs fpeckled, ike the \#talk. Fiosers numerous, varying with yple yellow or purple miugling into flades of brown.
L. contaminata. Mised-coloured Lachenalia. Curt. May. t. I401. (L. hyacinthoides ; Jacq. Ic. Rar. t. 3's. Willi. ni: 4 . L. orchioides; Jacq. Hort. Vind. v. 2. 83 , t. 17 -8.1Flowers bell-fhaped, fomewhat cylindrical, on fhort thalks, erect. Inner petals lancediate, obtufe, crect. Leaves linear-awl-fhaped, channelled, lax, longer than the ttaik. This has long been at Kew, having been fent from the Cape, by Mr. Maffon, in 17\%t. The lomg taper-pointed leares, deeply-fpoted fall, and fpe:kled focerers, in which whitc, brownifla purple, and tints of green, contend for the fupesiority, but the two former fenera ly prevail, characterife this fpecies. - Neariy akin to it is L.. angylifolia, Jacq. Ic. Rar. t. 38 I. Curt. Mag. t. 735 . Redout. Liliac. to 162; chiefly dilltinguilhed, accordiur to Mr. Ker, by the broader proportion and fpreading poilure of the inuer pecta's. The leazws alfo are narrower. Gut the whole habit and collours of the plant are very fimilar.
L. oriboppcala. Straight-petalled Lachenalia. Jacq. Coll. v. 3. 240. Ic. Rar. t. $3^{83}$.-Flowers eylindrical, fighthty fun-nee-flaped, on fhert italks, erect. Petals all lanceolate, ttraight. Bracteas cup-faped. Leaves linear-awl-haped, clamnelled, lax, longer than the ftalko - Of this we hare feen no fpecimen, but Jacquin's figure proves it abundantly diftinet trom the contaminuta, with which, as Mr. Ker obferves, it has been confounded by Willdenow and in the Horrus Kezerffis. The petals are white, with a green fpot at the back, near the point of each. The abovecharacter expreffes their form and polition.
L. puffuluta. Bliftered Lachenalia. Jacq. Coill v. 3. 244 v. 4. 220. t. 2. f. 5 . Ic. Rar. t. ${ }^{386}$. Curt. Mag. t. 817.-Flowers bell-fhaped, fomewhat criindrical, on wery thort Halks. Inener petals dilated and obtufe. Stalk triangular,
reclining. Lesares two, danceolate, binered.-The laven are rentarkable for thicir blittered upper firface. The forsors are pallich and unornamental ; their inuer petahi, at Girth creamn-coluired and fpreadiug, become twilted together and yellowil' in decar.

 Flowera be bi-hapeci, tlatked. Inner petals obtuf, revoluts. Stamens pronnisent. Stalk angular above. Leaves two. lancell.te, blithered.-(Ore of the more handifome kind, confpicuons for its copious flocerers, which are warieyated with blue and purple, and finell like havethorn. Theif colours and expanded form give them a refemblance to forse fpecies of Scilla. The kazes are fliort and broadih, occafiomally deltitute of bliiters.
L. iancesfoulin. Spotted copperss-leaved L.echenaliaJaç. Ic. Rar, to +22 . Curt. Mag. to G 43 . Redoutt. Lidiac. t. 59.- Flowers foneewhat bell-fiaped, 'preading, on italks thrice their owa length. Petals linear, Whant, nearly equal. Leaves numerwas, orate, pointcd-Chiefly remarkable for its numerous, troad, taper-puinted leaves, fpreadings in the form of a thar, of a chaucous hue, enor: or lefs fepckled with a darker green. The fouerss arnumerous, pendulous, variegated with du!l purple and green.
E. triccler. Broad-leaved three-coloured I.achenalia, Mifuray in Li. n. Syyt. Ved. ed. ri4- 314 . Redout, Liliac. t. 2. Curt. Mar.t. 82. (L. Iuteola; Jacq. Ic. Rar. to 395Pharnium aloides; Limn. Suppl. 205.)
A. Luteola; Curt. Mag. t. 1020. (L. Alava; Andr. Re. pof. to +56 .)
$\gamma$. quadricoior ; (L. quadricu'or ; Curt. Mag. t. $5^{\hat{6} 8}$ and 1097. Jact. Ic. Rar. t. 3y, Andr. Repof. to. r\&8. L. triculor; Jacq. Ic. Rar. t. 6r. L. pendula $\hat{\beta}$; Wild.

Flowers cylindrical, pendulous, flalked. Inner petais twice the length of the outer, dilated, fightly fipreading, fomewhat emaryinate. Bracteas taper-pointed. Leaures two, lanceolate. - This is ope of the moft common and generally cultrivated fpccies. We are fo well fatisficd of the truth of Mr. Ker's remark, that the quadriciolor of the above authors, referred by fune to the perululat, is molt akin to tricolor, that we cannot conlider it otherwife than as a varicty, certaindy not more fecifically dittinct than the luteold. We concecire therefore that either thecit three phants mult conflitute one fpccies, or they ought all to be confidered ac alike dittinct. Cnltivation by feed mult in time decide this quaction. Thie leates in all of them are in pairs, and recurved; thofe of the firlt are broad and fpoteed; the others longer and narrower, generally without fpots. spite in all fomeyhat comofe, many of the uppermoft flowers being abortive, and their pointed bracteas crowded into a tuff. The outer petals of all are tipped with green; thofe of the firit and third varieties more or lefs tinged with red, thofe of the fecond plain yellow. The inner petals of the firft are variegated with yrien and pale yellow; thofe of the fecond are of a plain full yellow, being moreover rather broader and more expanded; thofe of the third are lemon-coloured, clegantly tipped with deep crimfon or purple.
L. rubida. Dotted-fowered Lachenalia. Jacq. ic. Rar. t. $399^{\text {s. }}$ Curt. Mag. t. $90 \mathrm{~S}_{3}$.
B. tigrina ; Jaç. Ic. Rar. t. 399 .
$\gamma$. punctata a ibid. t. 39\%.
Flowers cylindrical, drooping, on fhort flalks. Inner petals one-fourth longer than the outer, fpatuluate, fomewliat umequal, obtufe. Bracteas fearcely pointed. Lecaves two, ellipetic-oblong.-This is faid to be rather rate in our collec.
tions. The leanes and flal: are fpeckled with purple, and the foozeres dotted with red, in all the three varecties, which have no pretentions to be reckoned fuecies. They differ only in luxuriance, tigrina being the ftrongett plant, pandata the weakett and moft flender.
L. pendula. Fonrecoloured Pendulnus Lachenalia.Sit. Hot. Kew. ed r. v. 1.46 r . Jacg. Coll. v. 3. 239 . 1:0 Rar. t. 400 . Curt. Mage t. 590 . Aludro Repolit. $\mathrm{q}^{1}$. Redont, Liliac. t. 52.
Flowers cylindrical, pendulous, on very flart Atalks. 1 inner petals nearly onc-fourth longer than the outer, wedgethaped, obtufe. Bracteas fearcely pointed. Leaves two, nvaro olanceolate. -One of the molt commonly cultivated and mo't beautiful fpecies, flowering in the green-houfo or frame in February. The lenves are brvad. Fioowers numerons, dionping and forewhat curved, of a finc red at their hafe, their fegments tipped with various degrees of purple and green, the middle part yell:w. The main falk is fout and Atraight, fieckled; the partiat oncs sery flurt.-Willdenow makes the quadricolor a varicty of ahis, in which he is inadvertently copicd by the editors of the fecond edition of Hurt. $\mathrm{h}^{\prime} \mathrm{rcse}$; an error corrected by Mr. Ker in Curt. Mag. 8. 26. p. 1020. See allo v. 16. P. 585 , of the fantice work.
Lacienalia, in Gardening, comprifes phants of the bul. bous-ronted kinds, of which the fpecies moitly cuitivated are the fpoted-leaved haclemalia, L. orchioides, the pale-fowered laclienalia, L. pallida, the three-colotrred lachicnalia, L. tricolor.

The third fort varies with yellow, faffron-coloured, bloodred purple at the tip, and greenilh-yellow corollas ; alfo in the proportion between the inner and outer petals; and in the breadth of the leaves.

MTethod of Culture.-All the fe plants may be increafed by offsets from the bulbs, and by feeds, when they are produced in perfection.
The offsets flould be planted out in pots of light freth earth, when the bulbs are in a ftate of inactivity of growth, placing them in a warm border to be covered with handglafes, or, what is better, in a dry flove or green-houfe.
Thefe plants bear forcing tolerably, and their flowering is much promoted by being preferyed in the warmth of the flove.
They all afford variety ameng collections of potted bul-bous-rooted fowering plants.
LACHES, from the French lafcher, i. e. laxare, or laffbe, ignayus, in our Lazus, fignifies hacknels or negligence; as it appears in Littleton, where laches of entry is a neglect in the heir to enter, and probably it may be an old Engyifh word: for when we fay there is laches of entry, it is the Fenee is if it were faid, there is lack of entry; and in this lignification it is infed. (Litt. i36.) No laches fhail be adjudged in the heir within the age; and regularly laches thail not bar either infants or femes covert for not entry or claim to aveid difeents: but laches fhall be accounted in them, for non performance of a condition a miexed to the fiate of the land. (Co. Litt. 146.) The lav alfo determines, that in the king there can be no negligence, or laches; and therefore no delay will bar his right. Co. Litt. 90 .

## Iachesis, in Zoology. See Coluber. <br> LACHEZE, in Geography. See La Cuaise.

LACHISH, in Scriftere Geograpby, a town of Paleftine, in tle trise of Dan, S.IV. of that of Judah, on the frontiers of this tribe, to which Senacherib laid fiege, when he feat his haughty meflage to Hezekiah It was a fmall towno,
or village, about 7 miles $S$. from Elentheropolis, in the tinne of Eufebius and Jerom. Jofh. x. 23. xv. 39. 2 Kings, xviii. 17. xix. 8. ? Chron. xxxii. 9.
1.ACHNEA, in Botany, from $\lambda \% \chi^{v n}$, foft hair or down, alluding to the fine hairy clothing of the corolla. The name feems to have been given by the e'der Van Royen.-Lim. Gen. 19t Schreb. 261. Willd. Sp. Pl. v. 2. $434^{\circ}$ Mart. Mill. Dict. v 3 Ait. Hort. Kew, ed. 2. v. $2.415^{\circ}$ Juif. 77. Lamarck. Illuftr. t. 292. Clafs and order, O.grmdria Monogynia. Nat. Ord. Veprecula, Lim.' Thymeluca, Juff.

Gen. Ch. Cal. Perianth inferior, of one leaf, coloured, permanent ; tube long and flender; limb in four deep unrqual fegments, the upperinof of which is much the finalleft and erect, the other three reflexed, the middle one largett. Cor. none. S/ain. Filaments eight, briltly-fhaped, crect, infcrted in:o the upper part of the tube, and nearly as long as the limb; a little unequal; anthers fimple, roundifh. Pif. Germen fuperior, ovate; ftyle thread-fhaped, longer than the tube, attached laterally to the germen; Ittigma capitate. hifpid. Peric. none, except the permanent bafe of the calyx. Sced folitary, coated, ovate, with an oblique point.

Eff. Ch. Calyx tubular, coloured, with a fo!r-cleft unequal limb. Stamens inferted into the mouth of the tube, prominent. Seed one, coated.

Obf. This genus differs from Pafferina in having an irregular flower osly. We follow Limmus in his Gen. P\%. as to the denomination of the parts of the flower, though in his $S_{y, j}$. Veg. he fubfequently termed corolla what he had before called calyx; but the analogy of Daphne compared with Gnidia, (fee thofe articles), confirms his original phrafeology.
I. L. erioccplacha. Woolly-headed Lachnea, Linn. Sp. Pl. 514. Andr. Repor, t. 104. Curt. Mag. t. 1295. (Pafferina eriocephala and cephalophora; Thunb. Prod. 75.) -Leaves uppolite, imbricated in four rows, pointlefs, keeled underneath. Flowers woolly; fegments acute.Native of the Cape of Good Hope, like all the o:lier fpecies. This is faid in the Forifus Scerenfis to have bepn introduced into. Eugland in 1793, by Meffrs. Lee and Kennedy. It is a green-houfe ihrub, flowering al fummer long. The fhort flender fmooth leaves, flanding in four rows, refemble thofe of fome kinds of heath. The flow ress are large and white, in terminal folitary heads, fubtended by bracteas broader than the leaves, of an elliptical figure, and tinged with red. The talk and bafe of each fower, as well as the outfide of its limb, are all very woolly. Nothing is recorded refpecting the feent of thefe flowers, nor have we had an opportunity of examining them fufficiently to. afcertain this point ; but we fhould expect them, from analogy, to be fragrant at fome time of the day or night. An authentic fpecimen fhews this to be Paffrina cephalophora of Thunberg, and we prefunse it muft be his eriosepbala.
2. L. purpurea. Purple-flowered Lachnæa. Andr. Repof. t. 293. Leaves oppolite, imbricated, in four rows, oftufe, keeled underneath. Segments of the calys finoo:h. This elegant fpeci-s, dillinguithed by its larger fize, and rofe-coloured or light purple forwers, whofe outhide is fmooth. and naked, except a thort puticfeence on the tube, was gathered at the Caple by Mr. Jancs Niven, an indefatigable collector fent out by Gca. Hibbert, efq. M. P. It flowers. in June and July, and is theftered in the green-houfe in winter, where it is liable to pevifh from damps. The tube of each flower is white, with a woolly tuft at its bafe, like the former. The brateas are broad and almoll round.
3. L. glaucge Glaucons-leaved Lachmean Salifb. Parad,

## L $\boldsymbol{A} C$

f. 109. (L. buxifolia; Lamarck. Dict. V. 3. 37.3. Andr. Rrepof. 1. $5^{24}$. Gnidia filamentofa; Lim. Suppl. 22.4.) Leaves feattered, elliptical, glaucous. Segments of the calyx downy on both tides. - This beautiful Species was communicated to Linnxus by his friend Bock. Mr Niven fent it to Mr. Hihbert about the year 8800 . Its broad elliptical glaucous leaves at once diatinguith it. The flowers are white, fragrant, exceflively copious in each round terminal head, their $\mathrm{Ne}_{5}$ mints downy on both fides, pointed, and not very unequal. Minute glands altervate with the ftamens, are found in the orilice of the tube, as in Gnidia, but finaller.

Some excellent remarks are given by Mr. Salifbury, in his Paradifus, in favour of the latter opinion of Linneus concerning the calyx of this genus, which he therefore terms co:olia, but the point feems to us ltill doubiful, at leatt, and we therefure adhere to what we have always maintained.
4. L. conglamerata. Crowded Iachara. Linn. Sp. Pl. 514. (Paflerina glomerata; Thenb. Prodr. 75.) Leaves oppolite, imbricated in four rows, abrupt. Fiowers oppolite, crowded about the ends of the branches. Bracteas elliptical, three ribbed.-Gathered by Sparmann and Thunberg at the Cape, bat as y yt unknown to our cultivators. It is a frall branching $/ f r r u b$, very clofely refembling Paffrina fliformis, but the leaves are horter, and much more remarkably abrupt or retule, nor are they at all incurved. The upper ones infenfibly become brakas, being dilated, elliptical, concave, with three, fometimes five, itrong projecting ribs; their inner fide is cluthed with denfe prominent wool. Thefe bracteas continue, in three or four oppolite pairs, to the end of each little branch, every one of them being accompanied by an axillary, fulitary, fmall flower, whofe tube, longer than the bractea, is woolly, its limb nearly or quite f:nooth and naked. The colour of the flowers is apparently purplifh; their fegmen's are fufficiently tuequal to make the phat a Lachnea, though they and every other part are fo very like Polferina filifornis, in whofe fegments likewife we thinic we perceive an inequality, that we are certain thefe two plants oiight to be placed in one genus. They differ, however, fecifically in their brateces, which in P. fliformis are ovate, pointed, itrongly keeled, with numerous finaller lateral ribs. We recomnenend this lalt to the notice of betanifts who publifh figures of plants. Of L. conglomerata we can lind no reprefentation in books. The fynonyms quoted by Limnxus and copied by Willdenow, belong to a very diffimilar thob, from which neverthelefs the fpecific character feems to be taken, and which appears to be the following.
5. Le phylici:des. Phylica-leaved Lnchnea. Lamarck.
 capitis bunx 〔pci; Breyn. Cent. 18. t. 7?)-" Leaves linear-awlhaped, fmooth, loofely imbricated. Heads fmall, cluftered, white and downy." Lamarck deferibes this as "very clofely refembling a Pbylica, in which genu: he had placed it, tiil an examination of the fowers let him right. Thefe he found quadritid and oetandrous, with fo llight an inequality in the limb, that he doubts whether that character be futficient to keed the plant dillinet from Paffrinu. It is a branching: Jrub, the branches Atraight, Inender, leafy, fmooth, except the youngelt fhoots. Leazes numerous, feffile, linear-awlhaped, nearly triangular, quite fmooth, Atraigh:, loufely imbricated, Lomewhat refenbling Diofima rubra. The fozvers are collected, from fixe to eight tugether, into cottony white heads, the lize of a pea, terminating the numerous, very fhort, croíded little branches, which furn a.fort of coryinb at the end of the principal ones.

## L $\Lambda \mathrm{C}$

The caly $y$ is white, downy; its tube a line and half long, its limh in four oval, concave, unequal fegments, nearly as long as the tube.". 'The amthor received it dried from M. Thoum, as a native of the Cape. He oljects to the ryo nonym of Breymius, which we have, with great doubts, transferred hither from the preceding fpecies. 'T'o this plate, in his own copy, Limaxts has writen the name of Pbylica imberbis, a plant adopted in his Mantifa, p. $2 c 9$. from Bergius, without having feen a fpecimen hmfelf; and he there copics this very fynonym of Breynius, without recollecting that he had cited it already as Lachnra conglo. merata. Lamarck thinks it belongs to Pbylica Jlipstlaris. The plant of Bergius is ceriainly, by his defuription, a Pbylica, and if that of Breymius be the fame, it mult be erafed from Lacbnea. We have one more error to correct concerning $L$. consflomerala, which is, that Thunberg thinks it the fame with Paffrina ericoides, though nothing can be more diltinct than the latter in the Linneun herbarinm, with the ovate tube and fmall regular limb of its fower, fo exactly refembling fome Species of Erica. This Pafferina is, therefore, it feems, erroneoufly omittal in Thmberg's Prodromus. - The author lalt named, regardlefs of the irregularity of the flower, unites Lacbnaas altugether with $P^{\prime}$ afferina, a meafure we are very unwilling to adept. It is an opinion of the ingenious Cerrea de Serra, that, in every naturd order, there are cine or more gencra, differing from the relt in the regularity or irregularity of the fiower. Lachnea then is the only genus of the Thymelac, or Mezereon tribe with an unequal or irregular flower. S.
LACHNIS, in Natural Hiflory, the name which fome have given to a gen:us of foffils, attributed to the clafs of the fbraric; the characters of which are, that they are fibrofe bodies, not elatic, and compofed of fhort and abrupt fibres, ur filaments.

The word is derived from the Greek $\lambda x \chi^{u r}$, a hair or fhort capillament or fibre.

The bodies of this genus have been divided into thafe which are compofed of larger and broader, and thofe which are compofed of fmaller and narrower filaments. Hill's Fofils. See Fibrarif.
LACHNOSPERMUM, in Botany; a genus fo called by profeffor Willdenow, from $\lambda x \chi^{\prime \prime}$, custl, and smegue, feed ; indeed that author ditinguifhes this plant from Staebelina, on account of the woollinefs which inve!ts its feed. - Willd. Sp. Pi. v. 3. 175 S7. (Staehelinæe fpecies; Thunb. Prod. I43.) Cliafs and order, Sjezenefia Polyramia-Rqualis.. Nat. Ord. Compofila Difcoider, Liun. Cinaroceplale, Juff.

EfI. Ch. Receptacle hairy. Seeds invefted with hairs. Calyx cylindrical, inbricated.

1. L. ericifflium. Willd. (Stachelina fárciculata; Thunb, Prod. 143.)-A native of: the Cape of Good Hope- -The branthes of this $\not\langle b r a b$ are divaricated, rigid, and downy. Lazeres very fmaili, about half a line in lengrth, fafciculated, rulind, obtufe, inveited with downo. Flozuers folitary, at the tops of the little branches, on thurt footlalks, fimetines in pairs, the fize of Sketecima frutionfio. Caly.e. cylindrical, downy ; fcales ovate, acute, with a naked, elongated, fpreading point. Seeds. withour a proper crown, cutolded with hairs. Rezeptacle hairy, the hairs as loug as the florets.

LACHOW, in Geggraply, n town of Puland, in Volhynia; 28 miles N.W. of Conttantinow.

Lacimemar Duïs, Fundat and Sac, Difeafe of. Sec Epirioma, and Fistula Jachrymafis.
Lachimal Fï/ula. Sce Fistla Lachrymalis.
Lacumsul Gland, Difafe ofo 'The lachrymal gland, fodged in the folfula of the anterior and external part of the root of the orbit, and enveloped in the fat which furrounds the globe of the eye, is not frequently met with in a llate of difeafe. Doubtlefs, it is often involved in the general inflammation, whichaffects all the contents of the orbit in cafes of ophthalmy; but inftances of this individual gland fuffering inllammation by itfelf, mult be regarded as extremely uncommon.

The lachrymal gland, however, is fubject to feirrhous induration, which is more frequently notieed in diffections, than practicc. We allude to cafes, in which the gland is the only part thus difeafed; for it is well known by all experienced furgeons, that when the eye-ball is affected with carcinoma, the lachrymal gland is very liable to participate in the dittemper, and for the fake of fecurity, ought generally to be extirpated together with the eye.

A remarkable cafe is related by M. Guérin, where he extippted a fcirrhous lacluymal gland, which was fo much e:larged, that it covered the whole of the eye-ball. The latter part, indeed, was entirely concealed, and might have been fuppofed to be confounded with the fwelling, had not circumitances exitted, which teuded to fhew, that the organ in queltion was found and fituated under the tumour. M. Guérin fuccefsfully detached the fivelling from the cye and eye-lids without injuring the rectus externus mufcle.

If this can be received as really and unqueflionably an example of a fcirrhous lachrymal gland being found difeafed quite alone, and extirpated by itfelf, it is a cafe which, perhaps, has not its fellow in the records of furgery. Pof: tibly, the fwelling might be nothing more than an encylted tumour.

LACHRYMATORIES, in Antiquity, fmall glafs or earthen phials, with a long neck, found in the fepulchres of the ancients. Mayy antiquaries have fuppofed that thefe velfels ferved to collect the tears of the weeping friends that furvived, or of perfons hired for that purpofe. This belief was grounded on the appearance of the opening of thofe phials, which is generally furnifhed with a round concave part well adapted for embracing the convexity of the eyebell. On fume lachrymatorics are cven found impreffions of an eyc, and fometimes of a pair of eyes. But here, as in many other cales, the cye appears to be merely emblematical. It may alfo be faid that the opinion of tears being preferved in thofe veffels is nufupported by any ancient cuftom we are acquainted with, or by any well interpreted paflige in anclent authors. This opinion was firt broached by Chitlet; it foon fpread over Europe, and was, in fpite of its improbability, adopted and fupported by Kirchmann, Kipping, and many other antiquaries. At lalt it was combated by Schoepfin and Paciaudi; fo that at prefent it appears to be agreed on all fides that the lachrymatories did never contain any thing but balins dettined to moilten the funeral pile or the afhes of the dead, or elfe the blood of martyrs. 'There is in the Capitol a bas relief which is much in favour of this idea: on this marble, which reprefents the funcral rites at the death of Meleager, a woman approaches the pile, holding in one han a large bellied veffel, and in the other a long flender phial with elongated neck and bottom, and in crery refpect fimilar to feveral earthen lachrymatories preferved in collections. This wonlan is in the act of pouring out of the large into the fmall veffel what may be fuppofed to be balms or odoriferous oil for the purpofe of perfuming the funeral pile of Meleager. If we may
believe Dumolinet, there have fmall fpoons been fuund in lachrymatories, which may have ferved for diltributing into feveral fmall phiais the contents of a veffel of greater dimenfions. Millin Dict.

LACHSA, denominated alfo Hulsjar, and fometimes Babbrein, in Geograply, a province in Arsbia, bounded towards the E. by the P'erlian gulf, towards the S. by Oman, towards the W. by the province of Nedsjed, and towards the N. by the territories of the wandering Araths in the vicinity of Baftora. This province affords no great variety of productions. Its afles and camels are elteemed to be of an excellent breed; and of the latter fome thoufands are annually fold into Syria. In the interior parts the inhsbitants fublitt very much upon dates. Upon the coails pearl-fifhing is purfued with advantage; and there is a confiderable trade in foreign commodities. The inhabitants of Lachfa are very much divided with regard to religion. Thofe who live in the towns are Shiites; but the peafants are, like the Bedouins, Sunnites. Here are alfo fome Jews, and many Sabzans, or Chriftians of St. John.

Lachfa was once a province of the empire; but the Arabs have long fince thaken off the Ottoman yoke. Many Turks, defcended from the anctent Pachas, itill remain ia the province, and poflefs conliderable eltates, but have no fhare in the government. At prefent the fovereignty of this province belongs to the fchiesh of the Arabian tribe of Beni Khaled, which is one of the molt powerful tribes in Arabia. The greater part of Lachfa is inhabited by Bedouins, and other petty tribes; but they all acknowledge the dominion of the fchiech of Leái Khaled. The cities in the interior parts of this province are little known. Niebulr. -Alfo, a town of Arabia, capital of this province, where the fchiech relides, fituated on the river Aftan, near the Perlian gulf. N. lat. $265^{6} 6^{\prime}$. E. long. $4^{8} \quad 34^{\prime}$.

LACHWA, a town of Lithuania, in the palatinate of Brzefe; ;o miles E. of PinR.
LACING, in Ship Building, the name of one of the pieces compofing the knee of the head, which is continued up to the top of the hair-bracket, and to which the figure and the ends of the head-rails are fecured.
LaCiniATED Leaf, in Botuny. See Leaf.
LACINIUM Prosontomus, $1: 1$ Anciens Geography, Capo delle Colone, a promuntory of Italy, at the ealtern part of Brutium, and bounding on the fouth the gulf of Tarentum. This cape was much cele brated on account of a temple of the Lucinian Juns, which was an object of great veneration, and which received many rich offerings from various parts. Authors report that here might be feen a large column of maffive gold. The Romans report, that Hannibal, when he was forced to quit Italy by an order of the fenate of Carthage, affembled in this place all his Italian allies, and maffacred all who would not accompany him into Africa.

LACIPPO, or Lactipus, a town of. Spein, in Beetica.
LACIS, in Botany, fo named by Schreber, and derived from $\lambda_{a x s} \%_{2}$, to tear, or lacerate, becaufe the herbage of this genus exhibits a fringularly jagged or lacerated appearance. Schreb. 366. Willd. Sp. P1. v. 2. 1225. Mart. Mill. DiEt. .v. 3. (Mourera; Aubl. Guian, v. 1. $5^{82}$. Juff. 411. Lamarck Illuftr. t. 480.)-Clais and order, Tolyandria Dizynia. Nat. Ord. uncertain.

Gen. Ch. Cal. Perianth none. Cor, none. Siam. Filaments numerous, about 40 , capillary, winged on each tide at the lower part, inferted into the receptacle which is furrounded by 12 fpines; anthers oblong, cloveri at the bafe, acute, incumbent. Pil. Germen fuperior, oblong, angularly ftriated ; Ityles two, incurved; Itigmas obtufe. Peric. Cap-
fulk orate, with eight furrows, of one cell and two values. Sceds numerous, very fimall, affixed to an ovate, unconnected receptacle.

EIf. Ch. Calyx none. Corolla none. Capfule of one cell, two valves and many feeds.

1. L. fuveiatilis. Willd. (Mourera fluviatilis; Aubl. Guian. t. 233.) A native of rivers in Giiana, flowering and bearring truit in November. Its Caribxan name is Mou-rerou--Reot creeping. Stems herbaceous, fimple, rough. Lebves alternate, divided into numerous, repeatedly jagged, lobes, dark green, curled and veined at the margin, rough, with minute points. Flowers in fikes, terminal, each one, before expantion, inve!ted with three fmall deciduous leaves. Filaments violet-colonted; anthers yellow.

We know not how Willdenow came to defcribe the leaves as fmooth, for in Aublet's own fpecimens we find them extremely rough with minute points.

LACIS'LEMA, fo denominated by Dr. Swartz, from $\lambda e x b_{5}$, a cleft, or fiffure, and sripx, a flamen, alluding to the divifion in the filament. Swartz. Prodr. I. II. Ind. Occ. v. 2. 10ワI. Schreb. 783. Willd. Sp. Pl. v. 1. 27. Mart. Mill. Dict. v. 3.-Clafs and order, Moradelphia Diandria. Nat. Ord. Anuntacca, Lime Juff.

Gen. Ch. Cal. a common Catkin, cylindrical, imbricated on all fides; fcales fingle-flowered, ovate, concave, with two fmaller, linear, lateral, internal fcales under the corolla. Cor. of one petal, in four dcep, nearly equal, lanceolate, acute, afcending fegments, fhorter than the internal fcales, without any tibe. Nectary of one orbicular, concave, entire, central leaf, lefs than the petal. Stam. Filament folitary, from the centre of the nectary near the germen, erect, cloven in the upper part and incurved over the pititl; anthers folitary on each branch of the filament, minute, roundifh. $P_{j}^{\prime}$ f. Germen fuperior, globofe ; thyles two, very fhort, recurred; ftigmas fimple. Peris. Berry flalked, obovate, of one cell. Seed folitary, oblong.
r. L. myricides. Swartz. Prodr. 12. Fl. Ind. Oce. v. 2. 1003. Ic. Plant. 5. t. 1. (Piper aggregatum; Berg. in Act. Helvet. v. 7. 131. t. 8.)-Received by Bergius from Surinam. Swartz found it in bufhy parts of mountains, on the weflert fide of Jamaica, but fparingly, flowering in fpring, and ripening fruit in fummer. This is a $/ \mathrm{brub}$, or fmall trec, with a fmooth bark. The principal branches are round, lax, and fmooth, with a few alternate zig-zag fubdivifions. Leaves alternate, ftalked, two or three inches long, clliptical, pointed, entire, very fmooth, brownifigreen, with one rib and feveral tranfverfe veins. Stipulas none. Catkins axillary, feveral together, feffile, loufely fpreading, a little curved, about half an inch long, whitifh, many-flowered, hairy at the bafe. The foowers are extremely minute; the corolla white. Berry black and foft, the fize of a red currant, with a fwettifh intipid tafle. There is fome difficulty in defcribing the parts of the flower, efpeciaily the inner fcals, which Swartz incautioufly named bradtas, though fituated within each proper feale of the catkin. Nematofpermum of Richard in the Actes de la Societć d'Hith. Nat. de Paris, v. . r . ro5, is jullly indicated as nearly allied in defrription to this plant, except that it is faid to have three fligmas (or rather fyles), and a capfule with three feeds, fufpended from its valves by threads. We prefume therefore they cannot be the fame genus. See Nematospermenas.
LACK, in Groorrapby; a townfhip of A merica, in Miflin county, Pennylvania, containing 1071 inhabitants.

Lack of Rupees. See Rupee.
LACKAH, in Geography, a fmall river of Ireland, in the county of Donegal, which flows into Sheephaven.

LACKANWADDY, a town of Hindookian, in the circar of Aurungahad ; 45 miles E. of Jaffierabad.

LACKAR, an ifland in the Eaft Indian fea, about 30 miles long and fix broad. S. lat. 8 18'. E. long. $12 \mathrm{~s}^{\circ}$ 14'。
I,ACKARAGO, a town of Africa, in the kingdum of Kafton.

LACKARI, a town of Perfia, in the province of Irak; 129 miles W.N.W. of Ifpahan.

L.ACKI, a town of Hindoottan, in Bengal; 5 to miles N of Dacca.

LACKIPOLE, a town of Bengal; 16 miles N.E. of Calcutta.
L.ACKRICOTTA, a town of Hindooltan, in the circar of Cicacole; 24 miles S.W. of Vizianagram. -Alfo, a town of Hindooltan, in Coimbetore; 13 miles S.W. of Coimbetore.

LaCKRITAPILLA, a town of Hindooftan, in the circar of Cuddapa; 20 miles S.W. of Cuddapa.

## LACMUS. See Litmus.

LACOBENA, in Ancient Geography, a town of Afia, fituated between the mountains N . of Comagene, on a fmall river, which ran into the Euplurates, S.E. of this town.
LACOBRIGA, a town of Spain, upon the Piforaca, S. of Juliobriga and N.E. of Pallantia, belonging to the Vaccei.

LACOCK's BAy, in Geograpby, a bay on the N.E. coaft of Barbadoes; one mile N.W. of Cuckold's Point.

LACONCAVAN, a town of Upper Siam, on the Mecon; So miles S. of Porcelon.
LACONDY IsLes, two fmall iflands among the Laccadives, about three miles apart. N. lat. 10 $33^{\prime}$ '. E. long. $71^{\circ} 40^{\prime}$.

LACONIA, in Ancient Geography, a country afterwards called Sparta and Lacedremon, was fituated on the S.E. point of Peloponnefus, and bounded on the N. by A rgos and Arcadia, on the W. by Meffenia, on the E. by the bay of Argos, and by the Mediterranean on the S. On the W. were the mountains named Taygetus, from fome of the fummits of which, which are faid to have rifen above the cloudf, the eye might furvey the whole of Peloponnefus. The fides of thefe mountains were every where covered with woods, which were the afylum of a great number of goats, bears, wild boars, and ftags. The extent of Laconia from E. to W. where it reached fartheft was $\mathbf{I}^{\circ} 45^{\prime}$, but it became narrower towards the north, and its extent from N. to S. was about 50 miles. As the fouth part of this kingdom was encompaffed by the fea, and the eatt and north-eall part by the Argolic bay, it had a great number of promontories, the chief of which were thofe of Melea and Tanara, now capo Malio and capo Matapan. Thefe two being fituated on the Mediterranean form the large Laconian gulf, which lies between them, and is now called the Golto di Colochina, into which the famed river Eurotas, better known by the name of Balilipotamo, or Royal river, difcharged its waters with an eafy and gentle courle. The fea-coalts of Laconia were furnifhed with a confiderable number of fea-ports, towns, and commodious harbours, of which the largeft and molt convenient were thofe of Trinaflus and Acria, fituated one on each fide the mouth of the Eurotas, and Gythium, at a fmall diftance from Trinaflus ; which laft is faid to have been built by Apollo and Hercules; but the moft noted was Epidaurus, now Malvefia, feated on the gulf of Argos, now Golfo di Napoli, a well-built town, famous for its excellent

## L A C

wine called Malvefy, or Malmefy, which was produced from grapes that grew round it." There werc about 12 more fea-port towns along the Laconian coalts; and they were rendered particulatly famous on account of a fiell fifin caught in the neighbourhood, which yielded a purple dye, inferior to none but that which was brought from the Red fea. Inland towns likewife abounded in this kingdum, the molt confisderable of which was the netropolis Sparta, which fec. Other cities of note were Amyclx, Helve, Thulana, and Lenctrum. The mountains of Laconid were numerous. Its mult conliderable rivers, belides the Eurotas, were the Smenns, the 'Thiafus, and the Scyras. The foil was very rich, efpecially in the low and flat grounds, and being well watered, it was excellent for palture; but the number of its mountains and hills prevented its being fo well tilled, as it might otherwife have been. It was much better fituated for trade and navigation, by having the fea round above half the kingdom, and fo many good havens about it. How well the i:habitants inproved thefe advantages, how powerful they became, what flects they maintained, and brave experienced admirals they bred, may be feen in their hiltory. We fhall here only obferve, that the Lacedmomians were a courageous people, hardy, and inared to war both by fea and land, averfe from floth and luxury, jealous of their honour and liberty, as well as the power of their neighbours; nor were they wanting in any military difcipline, in order to fecure the one, and curb the other. By thefe means they became fo powerful, and made fo confiderable a figure in Greece, that the kings of Egypt and Phocnicia did not difdain to pay a kind of homage to them, and own their fuperiority by folemn embafies. See Lacedimonians.

Laconia, in Geograpby, a tract of land, extending from the river Merrimack to Sagadahock, and from the ocean to the lakes and rivers of Canada, fo called in the grant of lands, in 1022, from the council of Plymouth to Caut. Mafon, and fir Ferdinand Gorges. See Iroqzois.

LaCONIC Stile. See Stile.
laconica Scittala. See Softala.
LACONISM, Aaxvys $\mu 0$; a fhutt, pithy, fententious fpeech, in the manner of the Lacedremonians, who were remarkable for the clofenefs and concifenefs of their way of delivering themfelves.

LACOVIA, in Geozrapby, a town of Jamaica; 55 miles W. of Kington.

L HCQUER, or LAcKer, is a varnifh applied upon tin, brafs, and other metals, to preferve them from tarnihhing, and to improve their colour. The bafis of lacquers is a folution of the refinous fubltance called feed-lac, or rather thell-lac, in fpirit of wine. This fpirit ought to be very much dephleginated in order to diffolve much of the lac. For this purpofe, fome authors direct dry pot-afh to be thrown into the fpirit. This alkali attracts the water, with which it forms a laquid that fubfides ditinctly from the fpirit at the bottom of the reffel. From this liquid the fpirit may be feparated by decantation. By this method the fpirit is much dephlegmated: but at the fame time it becomes impregnated with part of the alkali, which depraves its colour, and communicates a property to the lacquer of imbibing moilture from the air. Thele inconveniences may be prevented by diltilling the fpirit ; or, if the artilt has not an op. porturity of performing that procefs, he may cleanfe the pirit in a great meafure from the alkali, by adding to it fome calcined alum, the acid of which uniting with the alkali remaining in the fpirit, forms with it a vitriolated tartar, which, not being foluble in fpirit of wine, falls to the bottom together with the earth of the decompofed alum. To a pint of the dephleganated and purified fpirit, about three ounces
of powdered fhell-lac are to be added; and the misture to be digefted during fome days with a moderate lieat. The liquor ought then to be poured off, fltained, and cloared by fettling: This elear liquor is now fit to receive the required colour, from certain refinous colouring fubitances, the principal of which are gamboge and anotio; the former of which gives a yeilow, and the latter an orange colvur. In order to give a golden coour, two parts of gamboge are added to one of anotto; but thefe colouring fubitarcess may be feparately. diffo'ved in the tincture of tik, and the colour required may. be adjulted by mixing the two felutions in different proportions. When filver-leaf, or tin, are to be lacquered, a larger quantity of the colouring matcrials is requifite than when the lacquer is intended to be laid on brafs.

There are fundry other materials, from a due mixture of which a like colour may be produced, as turn:eric, faffron, dragon's blood, \&c. See Gold Colourd Vabnisu, and Japanner's Gilming.
Initead of fhell-lac, ufed in the compofition of varnifhes for lacquering, refin or turpentine is fubfituted for the coarfer ufes. The following compolition for brafs-work, defigned to refemble gilding, has been much recommended: take of turmeric ground, as it may be had at the dry-falters, one ounce, and of faffron and Sparifh anotto each two drams: put them into a bottle with a pint of highly rectified firit of wine, and place the bottle in a moderate heat, occafionally fhaking it, for feveral days; then ftrain off the yellow tincture thus obtained, through a coarfe linen cloth, and putting it back into the bottle, add three ounces of good feed-lac grofsly powdered ; place the bottle again in a moderate heat and thake it, till the feed-lac be diffolved. The-lacquer ftrained as before will be fit for ufe, and muft be kept in a bottle carefully ftopped. By increafing or diminifhing the proportion of anotto, the lacquer will be rendered warmer and redder, or cooler and searer a true yellow. A cheaper compofition little inferior to the former, may be formed of one ounce of turmeric root ground, half a dram of the beit dragon's blood, and a pint of fpirit of wine, managed as the former.

The varnith for tin may be made of one ounce of turmericroot, two drams of dragon's bloud, and one pint of fpirit of wine, prepared in the fame manner with the other. The dragon's blond may be increafed or diminithed, as the red or yellow is to be the molt prevalent; and for a coarfer lacquer the quantity of fhell-Lac may be leffened, and the deficiency fupplied by the fame proportion of re!!n. The lacquer for lucks, nails, \&c. where little or no colour is defired, may be either fhell-lac varnifh alone, or with a little dragon's bleod; or a compound vamifl of equal parts of fhell-lac and refin,' with or without the dragon's blood. The manner of laying on the lacquer is as follows: the pieces to be lacquered mult firt be made thoroughly clean; and if they be new fourded, aquafortis mult be wfed for this purpofe. When they are afterwards heated by a fnall charcoal fire, the lacquer is laid on with a proper brufh, like other varnifhes, and the pieces reflored to the beat. After the lacquce is thoroughly dry and firm, the fame operation mult be renewed for four or five times, or till the work appears of the required colo:r and brightnefs.

The lacquering of leather, improperly called gilding, is performed by means of leaf-filver, coloured by a ycllow: varnifh. (See Japanner's Gilding.) For this purpofe. calf or goat-fkins are procured in a dry fate, after the common dreffing and tanring. They are foftened by being immerfed and itirred about for fome hours in a tub of water; and afterwads beaten againft a flat tone and fmoothed, by fpreading them on the flone and rubbing
them over with an iron inftrument : the fikins, thus prepared, are joined together in pieces of the dimentions required; and then fized on the grain of the leather with a kind of foft glue, or fitiff fize, that anfwers to the groldfize ufed in other kinds of gilding or filvering, prepared from parchment or glover's cuttings. The worknan next proceeds to cover the whole furface - of the fized flin, before it be quite dry, with leaf filver, and with a fox's tail, made into the form of a ball at the end, fettles the leaves, by prefling and Ariking them; and clofes this operation with gently rubbing the whole furface with the tail. When the flins are filvered, they are hung to dry firft on cords, and the drying is completed by putting them over a board joined together, with the filvered fide next the boards, where they mult be kept ftretched out by means of fome nails. They are then burnifhed with a fiint burnifher, which operation is performed by fpreading the ikin even on a fmonth flone, and fliding the burniher backwards and forwards over every part of the $\mathbb{K} \mathrm{kin}$, with a confiderable degree of preffure. In fome manufactures the burnifhing is performed, by paffing the filvered fkins betwixt two cylindrical rollers of tteel, with polifhed faces. The flins are now prepared for receiving the yellow lacquer or varnifh, which gives the appearance of gilding. Different artifts have different recipes for compounding this lacquer. The following is faid to be equal to any hitherto ufed: take of fine white refin, $4 \frac{1}{\frac{1}{2}}$ pounds; the fame quantity of common refin; of gum fandarac, $2 \frac{1}{2}$ pounds; and of aloes, two pounds: bruife and mix them; and put them into an earthen pot over a good fire of charcoal, or over any other fire which has no flame: when all the ingredients are perfectly melted and mixed, add gradually to them feven pints of linfeed oil, and ftir the whole well together with a fpatula : let the whole boil, flirring all the time, to prevent a kind of fediment, that will furm, from fticking to the bottom of the veffel. When the varnifh is almoft fufficiently boiled, which will generally require feven or eight hours, add gradually half an ounce of litharge, or half an ource of red lead; and when this is diffolved, pafs the varnilh through a linen cloth, or flannel bag. A pint of oil, and a correfponding proportion of fine refin and aloes, have produced a very good varnih in an hour and a half. This lacquer or varnifh is laid on the filvered leather in the open air; and is beft done in fummer, when it is hot and dry. For this purpofe, the 1kins are flretched and faltened with nails to the boards, on which the drying was finifhed, with the filvered fide outwards. And when thefe boards are properly difpofed on treffels, the workman generally fpreads Tome white of eggs over each flin; and when this is dry, the varnifh, which is nearly of the confiftence of a thick fyrup, is repeatedly fpread with the four fingers of one hand, moved fo that each finger paints a kind of $S$ with the varnifh, from one end of the fkin to the other: and it is then diffufed evenly over every part with the flat of the hand: after this it is to be immediately beaten by ttrokes of the palms of the hands, and principally where the varnifh is obrerved to lie thickeft. When this coat of varnifh is fufficiently dry, which nay be known by the fingers making no impreffion upon it, another coat is laid on in the fame manner. When this coat is dry, the varnifhing for producing the appearance of gilding is completed; and if it has been well performed, the leather will have a sery fine gold colour, with a confiderable degree of polifh or brightnefs. When there is an intention to have one part of the leather filver, and the other gold, a pattern is formed on the furface, by printing, calking or tlamping, a defign on Vol. XX.
the fitrface after thy filvering. The fkin is then to be varnifhed, as if the whole were intended to be gold ; but after the laft coat, inftead of drying the varnifh, it is to be immediately taken off that part, which is intended to be filver, according to the defign printed or calked upon it, by a knife; with which the workman fcrapes off all that he can without injuring the filver, and afterwards by a linen cloth, with which all that remains is to be wiped or rubbed off. The ikins thus filvered and varnifhed, are made the ground of various defigns for cmboffed work and painting. The emboffed work or relief is raifed by means of printing with a rolling prefs, fuch as is ufed for copper-plates; but the defign is here to be engraved on wood. The painting may be of any kind; but oil is principally ufed, as being durable and more eafily performed. Doffie's Handmaid to the Arts, vol. i. p. 454, \&c.

LACRIMOSO, Ital. a mufical term, feldom ufed now, which implies a plaintive movement, in a fyle as if weefing.

Lacryma Cervina, in Natural Hifory, a little round and hard bone, faid to grow in the great corner of a Itag's eye after a certain age. Some alfo preferve under this name a thickened excretion from the inner angle of that creature's eye, in colour and confiltence refembling myrrh, or ear-wax, long hardened in the ear. This is of a Alrong and very difagreeable fmeil, like the fweat of the fame animal, and is affirmed to be fudorific and alexipharmic.
LACRYM FE CHRISTI, the name of a fort of wine produced by grapes on the lower part of Mount Vefuvius; fo called from the drops of juice oozing frcm the grapes, when fully ripe.
LACRYMAL. See Lachrymal.
LACRYMALIS, in Anatomy, an epithet applied to feveral parts about the eye. The lacrymal gland is the organ fecreting the fluid which compofes the tears: the puneta lacrymalia are the orifices of two fmall ducts, by which this fluid is abforbed from the furface of the eye; and the lacrymal fac or bag is the cavity in which the tears fo abforbed are received. See Eye.
The os lacrymale is a name applied to the bore in which the lacrymal bag is lodged; it is called allo os unguis. See Cranium.
The lacrymal nerve is a branch of the ophthalmic or firft branch of the fifth pair. See Nerve.
LACSUR, in Geography, a town of Perfia, in the province of Korafan ; 50 miles N.E. of Herat.

LaCTANTIUS, generally called Lucius Cėiuus, or Cacilius Fimminus, in Biograply, the moft eloquent of the Latin fathers, flourihed towards the clofe of the third and the beginning of the fourth century. Some have conjectured that he was born at Firmum, now Fermo, in Italy, and hence called Firmianus; but as he was a difciple of Arnobius, who taught rhetoric at Sicca in Africa, this was probably the country of his nativity. This latter opinion is confirmed by his itinerary from Africa to Nicomedia, which contained, as we may reafonably imagine, an account of his own journey, when he was fent for by Dioclefian. Whilt he was young, he wrote his "Sympofium," or Banquet, and thus acquired a degree of reputation, which occafioned his being fent for to teach rhetoric at Nicomedia, when Dioclefian propofed to render this city a rival to Rome. Some have fuppofed that Lactantius was in his youth a heathen, and converted to the Chritim faith; but it is molt probable, from the argurnents alleged by Dr. Lardner, that he was educated in Chriftian principles, and that he was a

## LACTANTIUS.

Chritian when he taught thetoric at Nicomedia, at the commencement of Dioclefian's perfecution, though it does not appear how he efcaped the danger to which his Chriltian profeffion mult have expofed him, at a time when the church of the Chriftians in that city was deftroyed. Nicomedia was at this time chiefly inhabited by Greeks, who had no great tafte for Roman eloquence; and the religious profeffion of Lactantius, notwithfanding his learning and talents, rendered him. unpopular, fo that the number of his fcholars was fmall, and he was under the neceflity of writing, in order to procure a fcanty fubfiftence. As he was much addicted to reading, and books in MS. were colly, his library mult have exhaufted his pecuniary fupplies. Thefe circumftances will account for the poverty of his condition; without fuppofing with Dupin and Cillemont that it was voluntary. His dituation, however, was improved, when he was invited by the emperor Conftantine into Gaul, and appointed preceptor to his fon Crifpus; but when Crifpus was put to death by his father, he loft the benefit of this office; nor does it appear that Conflantine made any permanent provifion for him, which might reafonably have been expceted. It is generally allowed, that, during the greateft part of his life, Lactaztius was in indigent and even deflitute circumftances, often wanting neceffaries. Of other particulars of Lactantius's life, which was prolonged to a very advanced period, no records remain ; nor has the time of his death been afcertained. It does not appear that he ever pleaded as an advocate at the bar. From his works, which are allowed to be authentic, we may collect his fentiments with regard to fome of the diftinguifhing tenets of theology. Lactantius often fpeaks of the nature and defign of the Chriltian revelation, as fuited to promote the general good of all, of every age, fex, and condition; fo that all may attain to juft fentiments of God, and be directed and affifted in the way of holinefs, and obtain everlafting happinefs. And he afferts it to be in the power of the meaneft and pooreft of men to attain to righteoufnefs. He fometimes glories in the great and happy effects of the Chritian doctrine upon the minds and lives of men; and he recommends this divine religion, as the medicine of the foul, effectual for healing all its difeafes. He afferts the freedom of man's will, or his power to do goed or evil. He openly afferts the innocence of Chriftian people, all whofe religion, he fays, confifts in good works, or a care to live unblameably and inoffentively. And the criminals, who fell under the fentence of the magiffrate for robbery and other offences, he obferves, were not Chriftians, but of the fame religion with their enemies. He expreffes himfelf as if in his time Chriltians performed miracles in difpoffeffing demons. Lactantius was of opinion, that another life, or a future flate of happinefs for good men, may be proved by reafon. He did not deny the cternity of hell torments. With regard to repentance he often afferts its great value, and maintains, that whenever finners repent, they are pardoned. He alfo thinks, that the divine difpleafure againft men ceafes immediately upon their repentance and amendment. True virtue alone, as he alleges, recommends man to the divine acceptance; and God defires nothing of man but fincere virtue, or true holinefs. As to the ends and views of Chritt's coming, and particularly of his death, he afferts, that Chrift came to be a teacher and a pattern of virtue; and that he died and rofe again, to affift men in overcoming death, and give them alfo hopes of rifing again, and obtaining the reward of immortality. Chrift, he fays, lived in a mean condition, and undervent the ignominious death of the crofs, that he might be a complete example of virtue, and of pa-
tience under fufferings; and that he might more efpecially lead and encourage luch as are poor and mean in this world. In a word, he fays, Chrilt came, and was made like unto man, lived, and died, and rofe again, that he might clearly teach the precepts of virtue, and afford the beft motives to the practice of it, and effectually help frail man to conquer the defires of the flefh, and the fears of prefent evil, and to overcome all the temptations of this life, and thus obtain a happy immortality.

Lactantius has itrenuounly afferted the right of private judgment for every man in things of religion, and he exhorts all men to the refolute and diligent exercife of it. He alfo argues excellently againft perfecution; efteening it the greateft abfurdity that can be conceived, for any to impofe on others a worlhip contrary to their confcience, or to deny men the liberty to choofe their own religion ; and exprefsly affirming, that it is not zeal for religion, but a love of power. For religion, he fays, is the freet thing in the worid; nor can it be promoted by force and violence. Compulfion may make men hypocrites, but it cannot make them religious. He alfo maintains, that it is no juft reafon why men thould be perfecuted, becaufe they defert or oppofe ancient and eftaLlifhed religions. For there can be ro profcription againtt truth; and every man has an unalienable right to fearch after truth, and to profefs it, when he has acquired the knowledge of it ;-with much more, admirably exprefled, to the fame purpofe. Of the numerous errors, real or imaginary, charged upon Lactantius, we shall enumerate the following: the firlt and principal is that of Manichairm, from which he is vindicated by Lardner. It is well known, that he denied the exiftence of Antipodes. He adopted the common notion of the age in which he lived concerning the fall of many of the angels; and he expected a terreftrial reign of Chriit for 1000 years before the general judgment, and he thought it to be very rear, within a period of 200 years. (See Millexsium.) Lactantius denied the perfonality of the holy ghott; nor did he confider Chrilt's death as a propitiatory facrifice for fin, or a fatisfaction made to divine juftice for the fins of the human race. Thefe opinions, in which he differs from many others, and fome of which are undoubtedly erroneous, have occafioned feveral reflections upon his judgment and character. Dr. Heumann, in particular, acknowledges that he was pious, learned, and eloquent ; though chargeable with feveral faults and defeets; he was no critic, nor philofopher, and but a poor divine. Bull fays, that he had rery little knowledge of the Chrillian doctrine; and Warburtonafferts, that be knew but litele of Chriltianity.

As a writer, Lactantius has been bighly commended. Dupin fays, that he is jullly efteemed the Chriltian Cicero for his Atyle, whillt he greatly furpaffed him in his thoughts. Some authors have not only found a friking refemblance between the ftyle of Cicero and that of Lactantius, but have even preferred the latter to the former. Dr. Lardner fays of him, "that the time in which he lived fecures him a kind of veneration. He faw the quies and peaceful fate of the church before Dioclefian's perficution; he was alfo witnefs of that dreadful fcene, and afterwards faw the flourihhing condition of Chrittians under Conftantine. His eminent abilities recommended him to the efteem of two great emperors, of different religions. His uncommon honelty and fimplicity, and earnelt zeal for the Chriltian religion, ard all truth in general, appear in his works, where alfo his learning is very confpicuous." He had, as it feems, a certain vehemence and impetuofity of natural temper not uncommon in Africans, which on Come occafions hindered

## I. $A C$

his confidering and weighing what might be faid on both fides of a quellion. At the fame time, poffibly we are indebted to that fire, which fupported him in the fatigues of acquiring knowledge, and then communicating it to others. Upon the whole, he was "an honour and ornament to the Clirittian profeffion in his day;" for "he employed his fine parts and extenfive learning in the fervice of religion, without worldly views of any kind." "A part," it will be allowed, " of this writer's reputation is owing to the charms and beautics of his fyle; but the matter of his works is alfo a juft recommendation."

The principal work of Lactantius is intitled "Inftitutionum, libri vii." which was occafioned by the writings of two heathens of note, who publifhed their pieces againt the Chrifians at the beginning of the perfecution under Dioclefian, apd was alfo intended as a general anfwer and full confutation of all others, who already had oppofed, or hereafter might oppofe, the Chriftian doctrine. The learned are not agreed about the time when this noble work was written, Dr. Lardner, after having examined different opinions on this fubject, concludes, that Lactantius formed the defign of this work in the year 303, that he compofed the greatelt part of it under the perfecution of Dioclelian, and that, probably, it was not publifhed till that perfecution terminatcd. We have alfo an "Epitome" of the Inftitutions, infrribed by Lactantius to his brother Pentadius, which is fuppofed to have been written not later than the year 311 , 312 , or 313 . This work was imperfect, until a copy of it was tound in the library of the king of Sardinia at Turin, by Dr. Chriitopher Matthew Pfaff, and publifhed by him intire, or nearly fo, at Paris in 1712 , to the great joy of the learued world. This abridgment is an ufeful book, and contains fome things not to be found in the Inflitutions themfelves. His book "De Ira Dei," i.e. of the wrath or anger of God, which is ftill extant, is particularly commended by Jerom, as a learned and elegant performance, and a complete treatife on the fubject. In this work he endeavours to prove that God is capable of anger, as well as of mercy and compaffion. In his treatife "De opificio Dei," i. e. of the workmanfhip of God, he eftablifhes the doctrine of God's providence, by demonitrating the excellence of man, his principal work, giving an elegant defcription of the parts of the human body, and the properties and facultics of the foul. Of the genuinenefs of another work, ufually afcribed to Lactantius, and intitled "De Mortibus Perfecutorum," i. e. of the deaths of perfecutors, different opinions have been entertained. Dr. Lardner has referred to the writers who have efpoufed both fides of the queftion; and as for himfelf, he feems to incline to the opinion of thofe who do not allow it to have been written by Lactantius. He allows, however, that it is a very valuable work, containing a flort account of the fufferings of Chriftians under feveral of the Roman emperors, from the death and refurrection of Ctrift to Dioclefian ; and then a particular hiltory of the perfecution excited by that emperor, with the caufes and fprings of it; as well as the miferable deaths of its chief inftruments. In this work occur alfo feveral remarkable facts, that are recorded no where elfe. This is a work which none of the ancients, after the time of Jerom, have noticed; it was firit publifhed by Stephen Baluze in the fecond volume of his Mifcellanea, in the year 1679. It is needlefs to fay any thing of the poems de Phoenice, de Pafche, de Paffione Domini, which fome have afcribed to Lactantius, and which are joined to his works in moft editions. They are not mentioned by Jerom, and are now generally fuppofed not to belong to this author. The "Itinerary" and "Granmati-
cus," mentioned by Jerom, are irrecoverably lof. A work, nuder the title of the "Sympofium," or Banquet, long fuppofed to have been loft, was not long ago publifhed by 1 Dr . Heumann, who afferts its genuinenels. It is a collection of 100 triftich cpigrams, with a prologuc. All our author's books of Epiltles are entirely lolt. The editions of Lactantius are very numerons. Fabricius has given a full and copious catalogue of them. The firlt edition was publifhed at Rome, in 1468 , fol. by Conrad Lewenheim; and the laft, which is the moft correct, was edited at Paris in 1748 , in two vols. 4to, by the Abbé Lenglet.
lactantius has, in his various works, references to the goipels, the Acts of the Apoltes, and fome of the épilttes, and to the book of the Revclation, which he exprefsly quotes as facred feripture, and written by John. It appears alfo, that he had a collection of fcriptures, confifting of the Old and New Teftament; which he efteemed facred and dsvine, and of the highelt authority. His quotations of S:bylline books, and other writings, afcribed to heathen vatcs or diviners, fuch as Hydafpes, and Hermes Trifmegittus, were intended to ferve the caufe of Chriftianity; but he did not reckon them a part of thofe books which were of austhority with Chriftians. Nor does it appear, that he placed the preaching of Peter and Paul in the rank of facred fcripture, though he has once quoted it. Fabr. Bibl. Eccl. fub Hieron. cap. Ixxx. Cave's H. L. vol. fub frc. Arian. Dupin. Lardner's Works. vol. iv.
LACTARY, in Rural Economy, a term frequently applied to a milk-houfe, or place where milk is kept.

Lactary Column. See Column.
LACTATION, the act of giving fuck.
The word is alfo applied to the time during which the mother doth that office to her young.

LACTEA VAsA, or Ladeals, in Anatony, are thofe abforbing veffels which take up the chyle, or the nutritive matter furnifhed by the food, from the furface of the intef--tines. As this fluid is of a white colour, the veffels, when filled with it, appear quite white, and hence their name. They may be feen in valt abundance in an animal killed a few hours after a meal. See Absorbents.

Lactea Via, the milky way. See Galayi.
Lacteal Fevers, a term ufed by ATedical Writers, to exprefs what the women call milk fevers, that is, fuch fevers as attend the difficult ingrefs of milk to the breaft of lyingin women. See Labour.

Lacteals of Birds. See Anatomy of Birds.
LaCTEUS Lapis, in Natural Hiffory, a name given by fome authors to the galactites.

LaCTLFERI Ductus, in Anatomy, the tubes of the mammary gland, in which the milk is fecreted. See Breast.

LACTIFEROUS, an epithet applied to fuch plants as abound with a milk-like juice, fuch as the tithymal, fowthittle, and many others.

LACTOMETER, in Rural Economy, the name of an inflrument for the purpofe of afcertaining the different qualities of milk. It was invented by Mr. Dicas, mathematical inflrument maker, in Liverpool; and the following defcription of it is given in the Survey of the County of Lancaller. This lactometer is contrived fo as to afcertain the richnefs of milk from its fpecific gravity, compared with water, by its degree of warmth taken by a ftandard thermometer, on comparing its fpecific quality with its warmth, on a fcale conftructed for this particular purpofe, and by which, if the principle be right, may be difcovered not only the qualities 28

## L A C

of the milk of different cows, paftures, food, as turnips, potatoes, grains, Sce. but alfo probably, which may be the beft milk or beft paltures for butter, and which for cheefe. This in?rument, however, is but in its infancy. At his own houfe, the writer has made a number of varied experiments upon different milks from different farms.

It is flated to be conltructed with ten divifions upon the Aern, fimilar to the patent brewing hydrometer, and with eight weights, which are to be applied only one at a time upon the top, to obtain the weight of milk; an ivory flidingrule accompanies the inftrument, upon the middle or fliding part of which is laid down the lactometer weight of the milk, going from o to 80; and oppolite thereto are placed the various itrengths of the milk, from water to $160 ; 100$ having previoully been fixed upon, from a number of experiments, as the ftandard of gond new-milk, and each of the other numbers bearing a proportionate refierence thereto. At one end of the fiding-rule the degrees of heat, from 40 to soo, are placed with a itar oppofite, as an index to tix the flide to the temperature of the milk; the whole being graduated to fhew the exact frength of the milk, as it would appear in the temperature of 55 degrees of beat, although tried in any inferior or fuperior temperature between $40^{\text {. }}$ and $100^{\circ}$ : thus the great inconvenience which would attend bringing the milk at all times to one temperature is avoided, and a fimple mechanical method of allowing for the contraction and expanfion fubtituted. And as fkimmed milk, being divelted of the particles of butter which exilted before flkimming, appears to have a lefs degree of affinity with that than the new milk has, ane fide of the ivory fliding-rule is adapted to fkimmed, and the other to new. This fimple contrivance is reprefented in the annexed plate.

General Rulle.-Firit, find the temperature of the milk with the thermometer, and fix the nliding-rule fo that the Atar fhall be facing the degree of heat the mercury rifes or falls to; then put in the lactometer, and try which of the weights, applied to the top, will fink it to fome one divifion upon the ftem; add the number of the weight upon the top and that of the divifion together, and oppolite the fame, formed upon the fide, will be fhewn the itrength of the milk.
Examples of $N e=u$ milk.-If in the temperature of $72^{\circ}$, the lactometer with the weight 40 finks to 9 upon the flem, fix the fide fo that the ltar hall be facing $72^{\circ}$; then oppofite 49 will be found 100 , the ftrength of the milk. Again, 'if in $60^{\circ}$, the lactometer with 50 on the top finks to 6 upon the ftem, the flide being fixed for new-milk, fo that the far Shall be at 60 of heat, then facing 56 will be found ryo, the ftrength of this milk in proportion towards the other, provided it is equally replete with cream. To difcover which, it becomes requifite thefe two famples fhould tland a certain time, that the cream may rife, which being taken off, they are to be tried with the lactometer again; and as the cream is evidently the lighter part, the milk will appear by the lactometer denfer or better in quality than before. Suppofe the milk in the firt example to be 57 by the lactometer in 60 degrees of heat, then the ftrength by the fkimmed milk fide of the rule will be 112 . And admit the fecond example of rew-milk to be 58 in $6 \psi^{\circ}$ when fkimmed, the ftrength sould be 116 .
As a comparifon fay,

## No. 2. New-milk - 110 <br> When fkimmed <br> 116 <br> Difference

From which it appears, that No. 1. has produced a larger quantity of cream than No. 2 , and confequently may be deemed the better milk. Sume inflances have occurred where the flrength of new-milk has only been about 80 , and when flimnied near 100 . Thus it may, without the leait imprupriety, be called a milk much better adapted for making butter than cheefe; the ferum or whey in general being near the fame denlity.

The inllances in which the lactometer may be ufeful, are, according to the fame writer, in difcovering what breeds of cattle are molt advantageous; what food in the, winter fealon, whether carrots, turnips, potatoes, sce are beft; what the effects of different paftures may be; how far particular farms are belt adapted to making butter and cheefe; how far the inconvenience of large cheefes in fome dairies being too rich to ftand may be prevented, by difcovering when this redundancy of richnefs exitts in the milk; and in fixing a ftandard for the fale of this ufeful article of life.
A flandard for fkimmed milk may readily be fixed, by faying what Itrength the common faleable fkimmed milk fhall be by the lactometer, or what its Specific gravity fhell be in relation to that of water in the temperate degree of heat, and that an eafy comparifon may be made between the fpecific gravity of any milk, and its lactometer ftrength; this inftrument is fo conftructed, that one of feecific gravity fhall exactly correfpond with three of Arength; that is, the ftrength of 90 by the lactometer is a milk whofe fpecific gravity is ro30, to common pump water 1000. From a number of experiments and obfervations, it is obferved, that the common faleable fimmed milk in Liverpool is from $5^{2}$ to 64 of ftrength, and that of new-nilk from 70 to 80 ; but it would be difficult to fix any flandard for the latter, unlefs fome mode could be devifed to difcover whether it was mixed with old milk or not. The only method would be, after fixing the ftrength of it, to try, by letting it fland, to difeover if it produced that quantity of cream, which as new-milk it might reafonably be expected to do.

This ingenious contrivance is made ufe of in the Liverpool workhoufe, with great fuccefs in afcertaining the goodnefs of the milk which is there employed.
LACTUCA, in Botany, fo called by the Latins, from luc, milk, becaufe of its milky juice; the Lettuce.-Linn. Gen. 400. Schreb. 528 . Willd. Sp. Pl. v. 3. 1523. Mart. Mill. Dict. v. 3. Ait. Hort. Kew. v. 3. 117 . Sm. Fl. Brit. 819. Juff. 169. Tourn. t. 267. Lamarck. Illuftr. t. 649. Gxertn. t. 158.-Clafs and order, Syngenefia Polysamia-equalis. Nat. Ord. Compofise Semiffofculoje, Linn. Cichoracee, Juff.

Gen. Ch. Common Calyz imbricated, nearly cylindrical, of numerous pointed fcales, with membranous edges. Cor. compound, imbricated, uniform; the llorets hermaphrodite, numerous, equal, each of one petal, ligulate, abrupt, with four or five teeth. Stam. Filaments five, capillary, very fhort; anthers united into a cylindrical tube. Pif. Germen nearly ovate ; ftyle thread-fhaped, as long as the ftamens; ftigmas two, reflexed. Peric. none, except the permanent clofed calyz, become rather ovate at the bafe. Sceds folitary, obovate, pointed, itriated, compreffed; down capillary, fupported by a long ftalk tapering at its bafe. Recepto naked.

EII. Ch. Receptacle naked. Calyx imbricated, cylindri-

## LACTUCA.

cal, with pointed, membranous-bordered fcales. Sceds compreffed, ftriated. Down fimple, ftalked.

This genus is moft naturally allied to Sonchus, the Sowthiftle, in habit and qualities, as well as fructification, the talked feed-down, and much more flender and cylindrical calyx, contituting its chicf marks of diltinction. The rith edition of Sylf. Vig. enumerates ten frecies; Willdenow has 21. 'Three of them' are natives of Britain, occurring chiefly in warm dry fpots, where the foil is calcareous. Thefe are L.. virofa, Engl. Bot. t. 1957. Woodv. Med. Bot. Suppl. t. 250 , celebrated for its opium-like fcent and foporiferous quality: L. Scariola, Engl. Bot. t. 268, a more flender and lefs active plant, diftinguifhed by the vertical polture of its leaves, of much more rare occurrence, being fearcely found wild except in the inc of Ely: and Lo. feligna, Engl. Bot. t. 707 . Jacq. Auftr. t. 250, the moft llender of all, which ever fince the time of Ray has been ftationary about Pancras, and near the Small-pos Hofpital. There are atl biennial plants, three or four feet high, more or lefs ghaucous, with fimall fulphur-coloured Howers, which expand only in bright funny morrings. The Rev, Mr. R. B. Francis found the laft-mentioned at South-end, Eflex, but it is among the moft uncoramon of Englifh plants.
Of the foreign fpecies, L. fativa, Linn. Sp. Pl. in is. Ger. em. 3c6, is well known as the Garden Lettuce, rendered luxuriant, mild, and wholefome by culture; for though we know it not in an actually wild ftate, fome idea of its nature may be difcovered by allowing it to fow itfelf fpontaneoufly for two or three generations, the produce of which will be found much more bitter and acrid, as well as far lefs luxuriant, than the cultivated plants. Of this fpecies the L. crijpa, Willd. !., 2. Ger. em. 306. Dod. Pempt. 644, appears to be a variety, as it has always been thought, till Roth diftinguinhed it. Such is the caife with $L$. palmata of Willdenow, who quotes for this the L. crifpa non capilata, Lob'. Ic. 242, which is the very identical wooden cut he had juit before cited from Dodonzus for the preceding.
L. quercina, Linn. Sp. Pl. in18, has always been a very obfcure plant, fcarcely known but in the Limnean herbarium. The fynonym of Ray is, at belt, doubtful, and the figure given hy fir John Hill, in his cumbrous Vegetable Syftem, is altogether a deception, drawn from defcription or imagination. What the German writers intend under this name, we have no infermation. The following is a tranflation of Linnæus's account of the L. quercina, from his Swedifh Travels to Oeland and Guthland.-"Laftuca with leaves finuated in a pinnate form, finely toothed, acute, without prickles at the back, and a finooth ftem. Fl. Suec. ed. 1. $n . \sigma_{4} 6$. Found on the fouth fide of the leffer infe of Carlfoen, towards the eaft. I never had an opportunity of feeing this plant before; and Ray is the only author whofe defcription is fufficiently clear to prove, beyond a doubt, that the Laciuca foliis quernis, of his Hitt. Plant. v. y. 210 , is a fimilar plart. . The root of our's is flethy and obtufe. Stem a cubit high, erect, round, fmooth, fimple. Cluft: of flowers terminal, clofe, narrow and long. Leaves like Sonchus oleraceus, but having fharper teeth, as if bitten or jagged. Caly.x nearly cylzidrical, fcaly, fnooth, with fcattered ruity fpots; the fcales erect, furnifhed at the back with an additional fpreading fcale."
L. canadenfis, Linn. Sp. Pl. Iry, is rightly removed to Sonchus by Willdenow, under the name of pallidus. The fame author, on the contrary, removes the Linnean Sonchus suberofus to LaEluca, calling it fonchifolia, and he appears to be right in this inftance alfo, the feed-down being fupported by a confiderable falk.
L. perennis, Linn. Sp. Pl. 1120. (Chondrilia cxerulea: Ger. cm. 286.), is one of the more handiome fpecies of this genus, on account of its elegantly pinnatifid leaves, and large blue flozects. It grows in the warmer parts of Germany, Switzerland, and Fraice, and is pe cmial.

- A typographical error in our account of Hierecium, co. lumn 3, hine 6 from the bottom, demands correction. The comma after remarks, and the word thefe, both require to be expunged.

Lactuca, in Gardening, comprehends a plant of the herbaceous annual kind, of which the fpecies ufually cultivated in the garden, is the common garden lettuce, L. fativa, which has feveral varieties: the principal of which are ;of the cahbage-lettuce kind, the hardy green, white honey, great admirable white, brown Dutch, fmall carly, white ball, green bail; -and of the cofs-lettuce kind, the green cofs, white cois, Egyptian cofs, fpotted cofs, black cofs, brown Cilicia, green Cilicia, red Capuchin, green Capuchin, large imperial, the Roman, the prince; but the three or four firlt of the different forts are the moft valuable, and it is of much confequence to have the bell kinds employed in cultivation.

Metbod of Cu'ture- -This fpecies, and all the varieties, are raifed by fowing the feed annually, at different times, as in February and the three following months, for the fummer fupply of plants; and in Auguit and the following month, for the autumn, winter, and very early foring fupplies. And all thefe different fowings fhould be performed upon beds of fine light dry earth, in an open fituation, and expofed to the fun. Some of the late fowings may be made under hand-glaffes, or in frames or boxes, in order to have the young plants protected from the froits. Each of the varieties or forts fhould be fown feparately, and diftioct from the others, and be flightly raked into the fuil.

It is fometimes the practice to fow them among other low growing crops, fuch as radifhes, fpinach, onions, \&c. to fave ground ; but this flould always be avoided as much as polfible, as a very fmall portion of land is fufficient for railing large fupplies of plants.
For the very early fpring ufe, as open lettuces, the early white cahbage forts are the moft proper; but for the main crops, to remain for full growth, the principal forts of the cofs and cabbage kind mult be employed.

When the plants appear, they murt be kept perfeetly free from weeds, and properly thinmed out. As they attain a proper growth, as three or four inches in height, fome of the different forts mult be planted out into beds in the open ground, drawing them up carefully, and planting them immediately. This work fhould be performed by a line and fmall dibble, in rows, a foot or more diftant, with the fame fpace from plant to plant. The quincunx mode is mofly adopted, which affords the moft room, and at the fame time has the neateft appearance. As foon as the planting is finifhed, the whole fhould be well watered; and when the weather is dry, repeated once or twice.
By thus planting out the feveral forts at different times, at the diftance of three weeks or a month, from the early fpring till the latter end of the autumn, due fucceffions of good lettuces may be provided. In the fummer plantings out, when the weather proves very dry, it is fometimes the practice to plant them in fmall drills, in order to preferve the moifture more effectually.

After the beds of the different principal fowings have been confiderably thinned by the feveral tranfiplantations that bave been made from them, the plants that remain may be fet out

## I. A CTUCA.

to proper ditances by the hoe, and left to take their full growth.

As foon as the plants of the main fpring and fummer crops have attained a pretty full growth, efpecially thofe of the cofs kinds, it is neceffary to tie the leaves of them up with bafs pretty clofe, when the plants are quite dry, in order to blanch the inner parts, and render them perfectly crifp, fweet, and tender.

Mode of Culture in the IVinter and very early Spring Crops. - For this purpofe, fome feed of the hardy green and white cabbage forts, and the brown Dutch, and white and green cofs kinds fhould be fown about the middle of Auguft, and beginning of Scptember, in open lituations, when the plants will come up in a week or ten days, and about the end of September ; and in October, a parcel of the belt plants of each fowing flould be planted out in a warm dry fituation, five or fix inches afunder; and at the latter period fome in fhallow frames, to be covered with glaffes on cold nights, and in lad weather; or under hand-glafles, or in a bed arched over with hoops or rods, to be covered with mats in winter frofts. Under either of the above flelters the plants fhould have the free air in the day time in mild dry weather, covering them in cold nights with proper covers, efpecially after this month; alfo, in all very cold, and in very wet weather, day or night, particularly thofe in the frames and under glaffes; and thofe in hand-glaffes may have the glaffes almolt conftantly over them in winter, tilting up one fide in mild weather, only fetting them entirely off in fine mild or dry days; but in fharp frolty weather keeping thofe under every kind of fhelter quite clofe; allowing alfo additional covering of mats or litter, when the froft is very intenfe. Thofe in the borders may be defended by fome light litter; but the covering fhould never be fuffered to remain longer on any of the crops than the bad weather continues, the free air being admitted every mild day.

In this method lettuces may be had the greateft part of the winter and early in the fpring, particularly the cabbage forts: thofe planted out firlt will be fit for ufe in November and December, and the fecond plantings come in towards Chriftmas, and being fheltered by the glafes, continue coming in for ufe till fucceeded by the other latter autumn fowings; being careful that, as any are gathered out of the frames or glafles, others be removed from the borders to fill up the vacancies, whereby the glaffes may be conftantly fupplied during the winter feafon.

It is fometimes the practice where lettuces are intended to be planted in frames late in autumn, for winter ufe, to have a moderate hot-bed made for their reception, in order that they may be well forwarded in the beginning of winter; and if the heat is continued moderately by aid of livings, allowing plenty of air in mild weather, the plants may be very fine by Chrilmas, or a little after.

Mode of Culture in the Winter flanding Spring Crops.-In order to have good lettuces for fipring ufe, fome feed fhould be fown toward the middle and latter end of Auguh, for the plants to ftand the winter, fome where fown, others arauplanted into warm borders, to ftand without any other fhelter than that of the walls or other fences; and another fowing floould be performed about the middle of September, to provide plants for pricking out under frames, to have the Thelter of the glaffes all winter, as a referve in cafe thofe in the borders are deflroyed; where both ftand, one may fuc. ceed the other as crops. In the firlt cafe a quantity of the belt plants, when two or three inches high, fhould be planted out towards the latter end of OAtober, into a fouth border, unds a wall, $\& \in e$, and in fome other warm dry fituation,
in rows fix inches afunder, and four inches in the rows; or fome clofe under a fouth wall, or other fence, in a foot wide fpace all the way along, pricking them therein four or fix inches diftant ; as they will have a better chance of flanding the winter than thofe fituated more diftant from the fhelter of the wall. In each method the plants are to remain to take their chance all winter: out of the whole many of them will probably efcape the frolt; but in very fevere weather they may be protected by a light covering of dry long litter, which fhould be removed again in due time when the froft breaks. In March or A pril, if they remain too thick, fome fhould be thimed out and planted in another place, in rows twelve or fifteen inches afunder; the crops thus wintered in the open ground, come in for ufe in April and May, to fucceed thofe fown in autumn, and fheltered occationally all winter, and will remain good till the fpringfown plants are ready for ufe.

But in the latter cafe, or thofe fown in September, to be wintered in frames, they fhould be planted about the latter end of October, or the beginning of the following month, in rows, from the back to the front of the frame, three inches dillant, clofing the earth well about each plant, finifhing with a moderate watering all over the plants, and putting on the glaftes to promote their more fpeedy rooting afrefh, puhing the lights, however, two or three inches down, to give vent to the moilt vapour arifing from the mould. But when the plants have taken frefh root, and are fet to growing, the full air hould be admitted every mild dry day, by taking the glafles entirely off, which mult be continued throughout the winter feafon, in all dry mild weather, but putting them on every night in cold or very wet weather ; alfo in the day-time when great rains prevail; and in frofty we-ther keeping the glaffes always on, except in the middle of funny days, and when the froit is but finght; ufing alfo other coverings of mats or long litrer over the glaffes, and around the fides of the frame, when the frofts are very' fevere; during the winter keeping all decayed leaves clean picked off; and as the fpring and warm weather advance; letting them have the benefit of warm fhowers. In this way they may be effectually preferved, if thofe in the open ground thould be deltroyed by the froll or excefinve muifture. About March fome of them fhould be tranfphanted into a warm lituation in the open ground, in rows, a foot afunder, watering them moderately till frefh rooted; leaving a crop remaining in the frames or winter-bed, a foot apart, to tland to cabbage; which will arrive to perfection a confiderable time before the tranfplanted ones, and thofe that have been fully expofed all winter, are ready. Where frames cannot be fpared, a quantity of the plants may be pricked out under hand or bell-glaffes in autumr, to iland the winter, either by themfelves for a full crop, or foms under the hand or bell-glaffes that are placed over early cauliflowers, as practifed by the London gardeners, planting them round juft within the glaffes, and managing them as directed for thofe in the frames; or for want either of a fufficiency of frames or hand-glaffes, a quantity may be planted out in October, in four,feet wide beds, in a warm fituation, arched over with hoops or rods, to cover with mats and litter in bad weather, In this way they have a better chance of furviving the winter than thofe fully expofed; and in fpring tranfplanting a quantity, by way of thinning, into other beds, as directed already.

Manner of faving Seed. - With this intention fume of the belt cabbaged early plants of all the forts Should be chofen, as thofe of the latter crops rarely run foon enough to ripen fecds perfectly before they are attacked by the autumnal

## LA C'

ryins and cold, which greatly retard the ripening of the feer. And it is of much importance to have the different varietics intended for feed at fome diftance from each other, as, when too near together, the farina of the different forts may mix and fecundate one another, and thereby derenerate plants be produced, initead of fuch as are perfect in their nature.
The feed ufually ripens in Augult and September, but that of different plants racely equally together; fo that, as it arrives to perfection, the refpective ftems, \&.c. of ripe feed fhould be pulled up or cut off in dry days, and fpread upon a cloth, or tied in finall bunches acrofs lines in a dry airy place for a week or two, for the feeds to harden and become dry; then beaten or rubbed out, and cleaned from the down and other rubbifh, and expofed upon cloths a few days to dry for keeping ; being afterwards put up in bags for ufe, and hung in a dry room or other place.
In general thefe plants may be conlidered as amnuals and biennials; as thofe fown in fpring and fummer attain perfection, run up to feed, and perifin the fame year ; while the autumn fowings fland all winter until the fpring following, when they attain perfection, hoot up to feed, and perifh root and branch. All the forts are fufficiently hardy to grow in any good dry common foil, in a free fituation open to the fun and air.

In regard to the ufe of thefe plants it is principally in fallads, when arrived at full growth and cabbaged, that the inner leaves become blanched, crifp, and fiseet; and fometimes, alfo, the young open plants of the cabbage-lettuce forts are ufed in winter and fpring, till the other general crops arrive at perfection. Young open lettuces are alfo often ufed as fmall fallad herbs, fowing them thick in rows, like crelfes, \&c. and gathering them in the fame manner; but this mode is more particularly practifed in winter and early fprin. 5 . They, however, in general, do not eat any way fo crilp, fweet, and palatable, as when fully cabbaged. The fully cabbaged-lettuces are alfo excellent for thewing and for foups, as well as many other culinary ufes.

Lactuon Marina, fea-lettuce, in Botany, a name ufed by fome authors for the lichen marimus, commonly called oifergreen.

Lactuca Virofa, in the Materia Mcdice, a fpecies of laetuca, which grows about ditches, banks, borders of fields, and old walls, flowering in July and Augult. The plant has a frong ungrateful fmell, refembling that of opium, and a bitterilh acrid tafte. It abounds with a milk juice, in which its fenfible qualities feem to refide, and which feenis to have been noticed by Diofcorides, who reprefents its odour and talte as agreeing with that of the white poppy: and Haller fays, that its effects are powerfully narcotic. Dr. Collin, at Vienna, firft brought this plant into medical repute, and it has been lately inferted by the College of Phylicians at Edinburgh in the catalogue of the Materia Medica. $D_{\text {i. . Collin mentions more than twenty-four cafes of }}$ dropfy that have been treated with fuccefs by employing an extract prepared from the expreffed juice of this plant, which is ftated to be, not only powerfully diuretic, but to promote all the fecretions, and to remove vifceral obitructions. In the more fimple cafes, proceeding from debility, dofes of the extract, from eighteen to thirty grains a day, proved fuffic ent to accompliih a cure; liut as the difeafe was inveterate, and accomparied with vifceral obftructions, the quantity of extract was increafed to three drams; nor did larger dofes produce any bad effect befides exciting a naufea. The patients, it is faid, continued fo ftrong under the ufe of this remedy, that it was feldom neceflary, to em-
ploy any tonic medicines. In Germany, few phyficians have, fince the year 1771, when Dr. Collin made his experirgents with the lactuca, adopted the ufe of this plant: and lience Dr. Woodville (Med. Bet.) takes occalion to obferve, that the recommendation of 1 )r. Collin will be fcarcely thought fufficicnt 20 eftablina its ufe in England.

LACTUMEN, from lac, milk, in Surgery, a name fometimes given to tinea capitis, or the fcald bead, on account of the white fcabs which are formed in this difcafc.
L. ACTUMINA, from lac, milk, little ukers, or count fcabs in the fkin, chiefly occurring in children at the breaft.
LACUNA, A. .drew, in Biograply an eminent Spanifh phyfician, was born at Segovia, in Oll Caftile, in the year 1499. He ftudied philofophy at Salamanca, and afterwards went to Paris, partly for the purpofe of improving his knowldgge of the Greek language, and partly for the itudy of medicine. He took a degree in that capital, but probably only that of matter of arts. In 1536 . he returned. to Spain, and followed the courfes eftablifhed in the colleges of Alcala, Henarez, and Toledo, in the latter of which he received the honours of the doetorate. After this he inmediately repaired to the Low Countries, in confequence of a command from the emperor Charles $V$. and he paffed the greater part of his life at the ceurt of that monarch. In is $\mathrm{O}^{0}$, he went to the imperial city of Met\%, and refided there five or fix years, rendering great fervices to the citi-zens during the prevalence of an epidemic peftilence : and by his influence, thus acquired, he contributed to ftrengthen their adherence to the church of Rome and to the emperor. He vifited Italy, Germany, and France again, where he received many honours from the learned corporations, and at Rome was created count palatine, and knight of the order of St. Peter. He died in his native country in the beginning
of the year 1560 . of the year 1560.

He proved himfelf a learned critic by the corrections and commentaries on the works of Diofcorides, and on many parts of thofe of Hippocrates, Ariftotle, Galen, \&c. His own works are numerous, confinting of a treatife on anatomy ; an account of the epidemic at Metz; a life of Galen, an epitome of his works, and notes on the labours of his tranllators, \&c. He likewife publifhed a treatife on gout, on excrefcences in the neck of the bladder, and on diet. and an epitle to Cornaro; and he tranflated the works of Diofcorides into Spanifh. Eloy. Dict. Hitt. de Med.
LACUNE, in Anatomy, fmall cavities in fome of the mucous membranes, in which a fecretion of mucus is carried on: as in the urethra of the male and female. See a defcription of them in thofe organs under Gexeration.

LACUNARS, in Arclitectire, are the pannels or coffers formed on the ceilings of apartments, and fometimes on the foffits of the corona of the Ionic, Corinthian, and Compofite orders.

In the temple of Minerva at Athens, the lacunars are placed immediately above the frieze within the portico, and formed with a fingle recefs, having an ovolo at the top, which moulding terminates the vertical plane fides, and the horizontal heads of the lacunars. The lacusars are not fquare, but longer in the longitudinal than in the tranfverfe direction of the building.
In the temple of Thefeus at Athens, the lacumars are formed above the frieze, in two rows, between large beams which reach from the rear to the front of the pronaos: their figures are of a fquare horizontal fection, and bave only a fingle recefs upwards, with an ovolo aboze the recefs. The fide of the \{quare of each coffer is about one-fifth part of the diameter of the column, and their reefs upwards half the fide

## L A C

of their โquare. The diftance between the beams is equal to the breadith of the antx at the bottom, or nearly equal to the diameter of the columns. The beams are not regulated by the columns, but placed at equidittant intervals, to reccive the two rows of lacunars or coffers. Within the temple or cella, the beams reach tranfverfely from fide to fide; but without, and under the foffit of the pronaos, they extend longitudinally from the front to the sear of the pronaos, and the lacunars in the fame direction.
Temple of Minerva at Atbens, Plates IV., VII.-The lacunars are placed above a fricze highly decorated with hiftorical figures.

In this they are formed in one recefs, with a moulding ovolo at the top of the recefs, or the faxthet extremity of the fides. The lacunars are not fquare, but longer from front to rear of the portico, than in the tranfverfe direction of the building. Chap. ii. Plate XVIII.

In the foffit of the temple of Pandrofus at Athens, the lacunars are formed immediately above the architrave, each into three receffes, with an ovolo at the bottom of each, nearly as broad as the perpendicular furface. The whole depth of the recefs is nearly half the fide of the \{quare of the lower part of the faid recefs. Each part diminifhes gredually in breadth in a floping ttraight line, till the fide of the fquare of the upper part is fo contracted as to be only half that of the lower. Each fucceeding third part diminimes regularly in altitude, fo that accounting the bottom the firft, the altitude of the fecond, or the one next above, is fomething lefs, and the third about the fame quantity lefs than the fecond. Each orolo is fomething lefs in height than the vertical furface below it, and has the fame ratio to its refpective furface.
The cella of the temple of Velta at Rome is furrounded with a circular colonnade. The ceiling of the portico has a double row of lacunars, being two in the breadth of the portico. The lacunars approach as nearly to a fquare as is confiftent with their diminution, formed by radiations towards the centre of the building, and are conftructed in two receffes. The greatelt breadth of the outfide lacuinar is about nine thirteenths of the diameter of the columns. The whole depth of the recefs upwards is about one-feventh of a diameter. The radiating fides of the lacunars or coffers are in vertical planes, and the other two fides of each are vertical cylindric concentric furfaces. The greatelt breadth of the upper recefs is about two-thisds of the lower. The hollow of this recefz is occupied by a rofe of a circular form. The recefs or cradle vaults of the temple of leace at Rome are arched and erriched with cctagonal lacunars, each formed in three receffes, which diminifh in their margins as they recede upwards Between the octagonal lacunars are others of a rquare form in a diagonal pofition. The ceiling of the middle of the chapel of the faid temple is comparted with hexagonal and rhomboidal lacunars.

The lacunars of the arcl- of Titus at Rome are each fquare, the fide of which being about three quarters of the diameter of the column.

The entablatures of the Ionic, Corinthian, and Compofite orders, are generally enriched with lacunars between the modillions

LACYDES, in Biography, a Greek philofopher, and native of Cyrene, was a difciple of Arcefilaus, whom he fucceeded in the academic chair. He was brought up in very humble circumitances, but acquired great reputation by intenfe application to his tludies, and a graceful elocution. He was lighly efteemed by king Attalus, who gave him a garden where he might devote himfelf to ftudy, and to the Eilltruction of others: this was afterwards known by the

## 1. A D

name of the Lacydean garden. Attalus wihed Lacydes to come and refide at his court, to which he refpectfully replied. that the portraits of kings fhould be viewed at a diftance. He taught his difciples never to be hafty in their judgments, and never to fpeak pofitive'y. Having taught philofophy twenty-fix years, he refigned the employment to his fcholara Tclecles and Evander, in the fecond year of the 14 ft Olympiad. In old age he difgraced himfelf by giving a favourite goofe a moft magnificent funeral, and he fell a victim to exceffive drinking. Bayle. Enfield.

LAD, in Geograply', a town of Moldavia, on the Reut ! 36 miles E.N.E of Stephanowze.

LADA, in Botany, a name given by fome authors to the plant which produces the common black-pepper.

LADAK, or Lavta, in Geography, a province of Thibet, bounding on Caflmire towards the welt, towards the ealt on Ngari, and towards the north on the Urbeks. See Thibet.
LADANUM, in Botany. Sẹ Cistus.
Ladanum, or Labdanum, in Pbarmacy, a gummous or a relinous matter, oozing out of the leaves of a fhrub called ciflus creticus, or ladanifera, which is very common in the hot countries of the Levant, particula-ly in Candia, and of which there are various kinds. The flarub is alfo plentiful in Spain, though no ladanum is brought from thence.

Diofcorides fays, they gather the ladanum by means of goats, which, broufing on the leaves of this fhrub, return to the ftable with their beards loaded with a fat fubitance, which the peafants rake off with a kind of combs made for that purpofe. This matter they thus collect into lumps, and, as it is mixed with the goats' hair, and other impurities, call it ladanum in the beard, or natural ladanum. Others are faid to draw cords over the leaves, and other parts of the flarub; and, fcraping off what had ftuck to the cords, they make up the ladanum into little balls.

Tournefort affures us, that the common way of gathering. the ladanum at this time is, by bruhing it off the leaves with a fort of whip, compofed of many lafhes, or flraps: after it is fcraped off the ftraps, they make it into cakes of different fizes.

Pietro delle Valle tells us, he was informed by the Indians, that ladanum is formed like dew, and falls from heaven like manna; that it is gathered on the leaves of a plant a palm and a half high; that, after gathering, they boil it, by which means it becomes foft, like was.

Bellonius fays that this juice is collected by lightly bruthing the fhrub, in the fummer heats, with a kind of rake, called in Candia "Erga-tiri," having feveral ftraps or thougs of leather fixed to it inltead of teeth; the unctuous juice adheres to the thongs, and is afterwards fcraped off with knives, and formed into regular mafles for exportation.

There are two forts of ladanum in the fhops: the beft, which is very rave, is in dark-coloured maffes, of the confittence of a foft platter, which becomes ftill fofter on being handled. The other is in long rolls, coiled up and much harder than the preceding, and not fo dark. The firft las commonly a fmall, and the laft a very large admixture of fine fand, blown upon the juice from the fandy foil where it is found.

Ladanum has been fometines exhibited as a pectoral and aftringent in catarrhal affections, dyfenteries, and fereral other difeafes, but it is at prefent wholly employed in exterral applications and perfurnes. The foft kind, wivich has an agreeable fixell, and a lightly puugent bitterifh tafte, makes an ufeful ingredient in the cephalic and flomachic plafters of

## I. A D

The frops. Rectified Spirit of wine diffolves nearly the whole of the pure ladanum into a goldecoldured liquor. Water aequires by infufion much of its fmell and talle: and, by diltillation in water an effential oil arifes, leaving a brittle alnooft inlipid refin and a pale-coloured liquor, which, infpifsited, fields a weakly bitterifh extract. Heat foon deftruys the feceitic flasour of this juice. Lewis.

Ladanus, Lizuid, more properly called clear or purifeed lacanum, is a preparation of the natural ladanum, by meling and purifying it from the hairs, \&c.

This hardened is fometimes fold for a fort of black am3) argrs.

LAider to Heaven, in Bolayy. See Lily of the J"alle.j.

Ladders, Scaling, in the Military Art, are ufed in efcalade. They are of various forts; fome are of ropes and fome of wood; fome are made of feveral joints, fo as to be capable of being put together, and to form ladders of different length, according to the fervice required. There is a fort ufed in England, much of the fame make as the common ladders, except that the fteps turn about wooden pests, fo that the poles may be brought near each other, or to thut like a parallel ruler. Thefe are very convenient for carriage.

Ladders, in a Slip?, derive their names from the feveral hiacchways or other parts where they are fituated. Beffies thefe, there are fome of a particular conitruction, as the accommodation-ladder, and the quarter-ladder. The ac-comaodation-ladder is a fort of light faircafe, occafonally Fixed on the gangryay of the admiral, or commaider in chief of a fleet. It is furnifhed with rails and entering ropes, covered with red baize, and the lower end of it is kept at a proper dittance from the flip's fide by iron-bars or braces, to render the paffage more convenient to thofe who enter or leave the Chip. Quarter-ladders, are two ladders of rope, depending from the right and left fide of the thip's ftern, whereby to defcend into the boats which are moored altern, in order to bring them up along-fide of the frip, or to wfe shem for any other occafion.

Ladoer H'ajs, the openirgs in the decks where the ladders are placed.

LADEINOEPOLf, in Geggrafby, a town of Ruffia; in the government of Olonetz; 56 miles S . of P'etrozarodik. N. lat. $61^{\circ} 56^{\prime}$. E. long. $33^{\circ} 50^{\prime \prime}$.

LADEN, in Sea Language, denotes the fate of a finp when the is charged with a weight or quantity of any fort of merchandize or other materials, equal to her tonnage or burthen. If the cargo with which fhe is laden be extremely heary, her burthen then is denominated by the weight of the goods; if it be light fhe carries as much as fhe can ftow, fo Iis to be fit for the purpofes of navigation. A ton in meafive is gencrally ellimated at 2000 lb . in weight, and therefore a veifiel of 200 tons ought to carry a weight of $400,000 \mathrm{lb}$. when the matter of volich the cargo is compofed is fpecifically heavier than the water in which fhe floats.

Ladey, in Bulk, denotes the flate of being freighted with a cargn, which is not in cafks, boxes, bales, or cafes: but lies loofe in the hold, being defended from the moifture or wet of the hold, by a number of mats and a quantity of dumage. Such are ufually the cargoes of corn, falt, or fuch materials.

LADENBURG, in Geograpby, a town of Weftphalia, i:1 the bifhopric of Ofnabruck; nine miles S.S.E. of Ofnabruck.-Alfo, a town of the duchy of Baden; fix miles E. of Manheim. N. Jat. $49^{\circ} 27^{\circ}$. E. long. $8^{\prime} 40^{\prime}$.

LADETSCH, a town of Bohemia, in the circle of Czallau ; ${ }^{2} 2$ miles S.S.W. of Czafau.

LADJA, in Ifimboo ATwholow, a beirg prodirent be. Brahma, fimilanty with Lalha: a being which Eratera, en the creative power of the desty, produced from lis "in when peopling the world. Lalina is a perfonifocation of petite or paffion, and the word in Sanferit ha, as in rany wite banguages, a babial meaning, indicating the fource of th being thens produced. On hat occation Kama, a purtorit co. tion of love or defire (fee Fasa) , fprung trem his hears : the form of a beautenus female, and Brahma, focking on L... with amorous emutions, was informed by the Munis, (!... Mcxi.) that fle was his own daugherer: he fhrunk back, and Ladja, a perfunification of Chame, a binfinis virgin, we. producce. Brahma, deeming his body defiled by is cmotin: toward Koma, purified it by partial.y metamorphoting it inn ten females, who were refpectively elpoufed by the Atons:

LADIFIEH, in Genereshy, a town of Afatic Tome. in Caramania, anciently Latadica; 20 niles W. of Ccörio

Lamisgo Sce Bill of Ladios:
I, ADISL, AUS I, in Biegrotly, Fing of Funmary, of Beda I. born in 10\&1, was a martial prisce, and joina his brotber Geyfa in a sar againit Solunon, whom he wis the chief caule of defeating, at the tloolly battle which eroprived him of his crown, and placed it upon the head of Geyfa. Upon the death of the latter in 1008 , Ladinans was chofen to fucceed him. He immediately attacked and defeated the rebellious Wallachians, and annexed to his dominions Dalmatia and Croatia, through the gift of his filter, who was widow of the laft king of Dalmatia. He rečuce: the Bohemians 'who had revolted, expelled the Ifuns, and conquered part of Bulgaria and Rulia. He defeated allo the 'Tartars, and having made his dominions fecure on all fides, he ftudied to render them flourifhing and happy by the arts of feace: he encouraged commerce, and fublifhed an improved code of laivs. He built feveral new churches, and made conliderable preparations for joining in the firit crufade, when in an expecition into Bohemsa he was attacked with a difeafe, which put an end to his life in the year IO95, after a glorious reign of feventeen years. He was diftinguilhed for piety as well as valour, and was canonized in II 9 S by pope Celettine III. Univer. Hint.
Lamislaus III., king of Hungary. The fecond prince of this name reigned but a fery months, and did nothing worthy of record. The third Ladiflaus, the fubjeet of this article, furnamed Chun, came to the throne in 127z, after the death of his father, Stephen IV. He obtained the name of Chun from the barbarity of his difpofition. Soon after his acceffion to the throne, he, in conjunction with the cmperor Rodolph, defeated the Buhemian king Othogar, who was flim in battle. After this fuccefo, he gave himfelf up to all manner of voluptuoufnets; divorcing his own wife, that he might indulge his paffion with women of the Tartar nation of Cumans. His general condut was fo bafe, aud his opprefion of the Chriitians fo erormons, that the pope, at the delire of the principal people of Hungary, excommunicated him: upon whicli he feigned a fincere repentance, and built an hofpital for itrangers. His total neglect of the government, and the difaffection of his fabioses, invited the incurlions of the Tartars, by whom Hiniexiz was fo dreadfully defolated, that, for want of beats, men, and even thofe of the higher ranks, were obliged to drave the plough. Hence the Hungarian proverb, "The ploughs of Ladillaus." After a fecond invation, which Ladilans took no meafures to repel, he was Itabbed, while fleeping in his tent, by fome of the Cumanian women in whom be confided, but whom be had offended. Uniser. Hift.

Ladislals IV., king of Hungary, alío king of Poland, under the titte of Uladifans Vo, was fon of Jarello, of Aa Uladiflays
I. A D

Uladinaus IV., whom he fuececeded on tho Polinh throne in 4.35, being then only in the uinth Jear of his age. He was clected king of Hungary in $14 f^{\circ}$. As the famous crown of St. Stepheri was in poffeffion of the late queen, he was crownel with a diadem taken from the chefl containing the relics of that fainted nonarch. He declared war againt the Turks, and cmployed as his gencral John Huniades, who was very fucceffful in the canfe. Ladiflaus made peace, which gave much diffatisfaction to the pope, and other Cturittian princes; fo that he was induced to break it. A battle foon after enfued, in which he loft his life at Varna, in the year 14.4. His death occafioned the complete ruin of his army. Univer. Hitt.

Ladislaus V., king of Hungary, was born in 1440 , and freceeded to the crown in 144t, when the was only in the fifth year of his age. He was, at this time, at the court of the emperor Frederic III. ; and it was not till 1452 that he was reltored to his country. It was agreed that, during his minority, Hungary fhould be governed by John Corvin, fon of Humindes; Bohemia by George Podiebrad; and Auftria by Ulric count of Ciley, the kiug's uncle, who was appointed guardian of his perfon. The count endearoured to fupplant John Corvin, but in rain; and he obtained great honour by the defeat of the Turks before Belgrade. At the death of John, the government was transferred to his fon Ladiflaus, to the great mortification of the count of Ciley, who endeavoured to procure his affaffination; but he was limfelf killed at Belgrade by the friends of that family. In 1457, Ladillaus went to Prague, in order to celebrate his muptials with Magdalen of France, daughter to Charles VII.; but in the midf of the feltivities, he was taken fuddenty ill, and died, not without fufpicion of poifon. Mud. Univer. Hift.

Ladislaus VI., king of Hungary, fon of Cafimir IV. of Poland, was chofen king of Bohemia in 1470, and was foon involved in a war with Matthias king of Hungary, which was terminated by a peace in I 475 . At the death of Mathias in 1490, Ladiflaus was clected to fucceed him. He had, however, to make his way to the throne againit the holtile oppofition of his competitors, one of whom was his own brother. At length he was quietly feated; but being of an indolent and pacific difpofition, he wes ill fitted to contend with the diforders which haraffed his kingdom: and from his great bulk and inactivity, he acquired from his fubjects the appeliation of an ov. The 'Turks laving threatened Hungary, he was, during his whole reign, coufiantly at war with the Turks, and other neighbouring powers. Ladifans, though not warlike, was attentive to the dutiss of his high ftation, and employed much time in collecting all the Hungarian lavs, and the decrees of the monarchis, into one body, which has ever fince formed the bafe of the conititution and jerifprudence of the country. He died in 1516. Univer. Hith.

Ladislaves, kings of Poland. See Uladislade.
Ladislacs, or Lancelot, king of Naples, called the Piberal and vietorious, fucceeded his father, Charles Duras, in 1386. He was before count of Provence and king of Hungary. He obtaince the latter crown in 1403 , during the imprifonnent of Sigifmund, who compelled him to return to Italy: On the death of his father, he was oppofed by Lewis II. duke of Anjou, which occafioned fome bloody wars. The pope at firtt efpoufed the caufe of Lewis, but afterwards took the part of Ladifaus, who, however, marched againit Rome, and having taken it, turned his arms on the Florentines, whom he compelled to fue for peace in 1413 . He died in 1414, aged 3 S , being poiloned. as it was reported, by his miltrefs, who had been bribed to
perpetrate the bloody deed by the Florentines. Univer. Hitt. Tablettes Chronolugiques, par Du Frefnoy.

LADDIZIN, in Geagraply, a town of Poland, in the palatinate of Braclaw; if miles S. of Braclaw.
L.ADLE of a Gun, the inftrument whercwith the powder is put into the piece.

It is made of a plate of copper bowed in form of a half. cylinder, rounded at one end, the other being fixed upon a long taff: this fillid with powder, the gunner carries, with his left hand under the end of it, to keep the powder from falling out, till he cinters it in the muzzle of the piece; when he las carried the powder home to the charged cylinder, he turns the ladle, that the powder may fall out, and withdraws it.

Ladles are fitted to the bore of each gun, and hold powder fuficient for the charge.

Smali ladles, with flort handles of wood, are alfo ufed in filling the fuzes of fhells, or any other compofition for filling the cafes of rockets, \&c.

Ladie-Boards, thofe boards difpofed on the circumference of the vater-wheels of over-fiot mills; forming hollows, or receptacles, not unlike ladles, to receive the water that falls upon the wheel. See ${ }^{\text {Water. Wheel. }}$
I. A DOCO, Los Codos ie, in Gcography, mountains, which commence in Portugal, and are continued into Spain, feparating Galicia from the Atturias.

LADODA, a town of Hindooftan, in the fubah of Agimere; 20 miles S.E. of Roopnagur.

LADOGA, Nov, a town of Ruflia, on the fouth coaft of the lake Ladoga; 56 miles E. of Peterßurg N. lat. $60^{\circ} 2^{\prime}$. E. long. $21^{\circ} 44^{\prime}$.

Ladoga, or Ladoz/koi, Lake, lies in the government of Vyborg, between the gulf of Finland and the lake of Onega ; its fouth-welt extremity lying about 30 miles ealt from Peterburg. In ancient times it is faid to have been called Nebo. Being in length 175, and in breadth 105 verfts, it is reckoned one of the largeit lakes in Europe. It produces a great number of feais. On account of the perilous florms to which it is liable, and the feveral fand-banks that are ever fhifting their pofition, Peter the Great, in 1718, caufed the famous Ladoga canal to be dug along its chore, from the Volkhof into the Neva. It was begun by order of Peter, and finifhed under the reign of the emprefs Anne. This canal is 104 verfts long, 10 fajenes broad, $1 \frac{1}{2}$ fajene
 nected with the Baltic; by the Svir, with the Orega; and by the Volkhof, with the Ilmen. Into the canal flow the rivers Lipke, Nafa, Sheldika, Lava, and Kabona; into the lake the rivers Patha, Sias, Oiat, \&c.; whereas the Neva alone runs out of it. Both fhores of the lake belong to Ruffia, which have every wherc a flat coaft and a fandy wach. On this fhore it has alfo a few low fifhery iflands, and a fandy bottom. That part of the northern fide which lies in the government of Olonetz has marble on its ccaft, whence fome of thefe beautiful kinds of Finnifh marble are brought to St. Peterfburg. As the bed of this lake, for a great extent, is in the loweit part of the country, it receives, befides the above-mentioned rivers, the waters that come from the Alum hills; all of which have no other outlet than the Neva, Tooke's Ruff. Emp. vol. i.
LADONIS, in the Materia Medica of the Ancients, a name given by fume to the laurus or bay-tree. We find the werd in a compofition prefcribed in Galen, from the works of fome of the empirics of his time; but it never was uled by the more regular authors.

LADOS, in Geography, a fmall iland in the Eaft Indian foa, N. lat. $6^{\circ}$ 11'. E. long. $99^{\prime} 4^{\prime}$.

## L $\wedge \mathrm{D}$

I.ADRE, in the Manege, denotes dull. See Horse.

Ladrones, Marian, or Mary-Anne, Lflands, in Geography, a group of illands in the North Pacitic ocean, forming a chain of 200 leagues, and occupying a fpace of about 450 miles in extent. Magellan, who dilcovered this archipelago in 152 t , impofed on them the name of Ladrones, (Thieves or Robbers,) becaufe the natives. like thofe of many other illands, who had no idca of the exclufive right of property, manifelled a difpofition to pilfer, and a confiderable degree of addrefs in the execution of their deligns. Thefe iflands were alfo called "Iflas de las Velas," from the great number of failing craft which came from thicfe illands to meet Thips, when they prefented themfelves there for the purpofe of anchoriny. Towards the middle of the 17 th century, in the reign of Philip IV. of Spain, thefe iflands were called the "Marians," in honour of Mary-Anne, the queen of Philip. In 1564 or 1565 , Andreas Miguel Lopes Legafpi took poffeffion of them in the name of the crown of Spain; but he neglected them as unworthy of his artention, and purfued his voyage to the Plilippines. The iflands of Ladrones were forgotten till the zeal of a celebrated Jefuit, Santerores, interefted the derotion of queen Mary-Aine of Auftria, regent during the minority of her fon Charles II., and excited her to caufe the gofpel to be carried into thefe iflands, which Magellan had found means to annex to the poffertions of Spain, by difcovering a new route, that eluded the ridiculous line of demarcation eltablilhed by the fee of Rome, in the plenitude of its power. In 1658, the Spaniards prefented themfelves at the Mary-Anne iflands, with the crofs in one hand and the fword in the other; and with thefe two weapons, which lent one another mutual aid, their pretendel right to the poffeffion of thefe iflands could not fail to be acknowledged. They had no difficulty in making themfelves mafters of Guahan or Guaham (now called Guam), the principal of thefe iflands, and the molt fouthern of the Archipelago; and by degrees they fubdued all the others.' Pigafetta, who accompanied Magellan, defcribes the people of thefe illands as naked, their hair and beards long, tall, and well-proportioned, with an olive complexion. They coloured their teeth black, like the inhabitants of the Pelew iflands; and in their manners and cuftoms they refembled one another. Till the arrival of the Spaniards, the inhabitants of thefe iflands confidered themfelves as the only men in the world, being affured that the firtt man was made of a piece of rock taken from Funa, a little ifland near Guam; but, according to others, he was made of earth in the latter ifiand. When they were vifited by the Spaniards and Dutch, they inferred that thefe ttrangers were brethren, who had loit the primitive Guamefe language. In colour, fpeech, manners, and government, they much refemble the Tagals, or people of the Philippines, before the Spanifh conqueft. They were then very populous; Guam, which is 40 leagues in circuit, having 30,000 inhabitants. The women employed themfelves in dyeing their teeth black, and their hair white. The nobles were treated with great refpect, and thought it criminal to connect themfelves in marriage with a common girl; neverthelefs, the people were not eullaved, or even fubjects, though they treated their nobles with great reverence.
Their houfes were divided into four apartments, feparated by palm-leaves. In their abfolute independence each man avenged his own quarrel; but though wars were frequent, they were not fanguinary ; the lofs of a man or two deciding the battle. Their magicians invoke the anitis, or the dead, whofe tkulls were preferved in the houfe; and they manifeft 3 an anxiety left the anitis, or ghoft, fhould diturb their fifhing, or nocturnal repofe. Although Guam is the largeft of
thefe inands, Thinian has attracted the greater degree of at tention in confequence of the romantic defeription griven of it in Arfon's voyage. (Sce Gunar and Tinian.) The number of thefe iflands has been differently thated from 9 to 16 ; but it does not appear that above three or four are inhabited. Their failing veffels, called frons, evince confiderable akill in naval architecture. For an account of them, fee the article Boat. La Peroufe leads us to conclude that thefe iflands are volcanic; but their natural hif. tory is little known. They cultivate various feeds and fruit, and particularly the bread-fruit. For their productions of this kind, fee Tiniax. In fir Geurge Staunton's account of the embafly to China, we have fome infurmation of a recent and authentic kind with refpect to thefe iflands. The grand Ladrone he reprefents as a high-peahed ifland; and he mentions another near it, whofe fummit is fome what lower and more level. The latitude of the grand Ladrone appeared to be $21^{\circ} 52^{\prime} \mathrm{N}$., and the longitude $113^{\circ}$ ${ }^{3} 6^{\prime}$ E. of Greenwich. The latitude of another illand, called Cbooktchoo was $21^{3} 55^{\prime}$ N., and its longitude $113^{\circ} 44^{\prime} \mathrm{E}$. The obfervations from which thefe latitudes and longitudes are deduced were carefully made, and therefore they niay be deemed correct; though they differ from thofe ftated by other geographers. The margins, or rocks, of the Ladrone inlands next the fea are of a black, or dark brown colour, owing to the action of the falt-water; and the fpray and dafhing of the waves have corroded their furface, fo as to give them a honey-comb appearance. Some fprings are found on thefe inlands; and the water is neither brackiff nor chalybeate, nor in any refpect mineral in its tafte. The foil upon the furface appears to be of the fame nature with the component parts of the rocks below, and, indeed, is merely the upper layer of the rock, decompofed and pulverized by the joint action of the furr and rain in a fucceffon of ages. The rock confifts of a mixture of clay, calx of iron in a fmall proportion, and a great deal of filiceous earth and mica. The fea all round is of a dirty-yellowilh muddy colour, and of no great depth. The bottom is mud and clay.

The Ladrones, and clufters of iflands between them and the fouthern extremity of China, are fo near to each other, and to the main land, and are alfo fo broken, as well as fo irregular in their form and polition, as to appear like fragments, disjointed from the continent, and from each other, at remote periods, by the fucceffive violence of mighty torreats, or in fome fudden convullions of nature. Thefe fragments have now a very barren and unpromifing afpect. In particular fpots, however, there are fome fcattered patches of pleafing verdure; but, in general, little better thani naked rocks appear; and fcarcely ever a tree or fhrub is vilible among them. Thefe inlands ferve chiefly as retreats for pirates, and for the temporary abode of finhermen. To the north of the Ladrones are many fmall iflands, extending to
Todos los Santos, N. lat. Todos los Santos, N. lat. $30^{\circ}$; thofe further to the N . belonging to Japan. This group may either be arranged, fays Pinkerton, among the Ladrones, or might, perhaps, admit of a dittinct appellation. For a more ample account of the Ladrones, we refer to the Supplement of De Brofles, vol. ii. p. 492, and to the article Tinian.

Ladnones, three fmall iflands in the Pacific ocean, on the coalt of Vcragua; 8 miles S.E. of Cape Boruca. N. lat. $8{ }^{\circ} 20^{\prime}$. W. long. $83^{\circ} 16^{\prime}$.

LADROON, a river of Africa, which runs into the Indian fea, S. lat. $22^{\circ} 36^{\prime}$.

LADVOCAT, John Baptist, in Biograpby, a man of letters in France, was born in 1\%09. He was, at the ufual age, admitted a member of the fociety of Jofuits, and for Aa 3
fome

## I. A E

Some time occupied the cure of Domremi, the birth-place of the celbrated Joan of Arc ; but in 1740 he was appointed roval profeffor at the Sorbonve, and in two years after hic was elected librarian. The good duke of Orleans having foumled a Hebrev profeflorfhip in the Sorboune, Ladvocat was appointed, in 175 t, to fill that office, which he kept till his death, in the year 1765 . His works are "A Geographical Dictionary ;" "sn Hiltorical Ditionary ;" "A Hebrew Granmar," and feveral theological tracts. the is reprefented as remarkably mild, humane, and undifgruifed in his manners.
Ladvocit, Lewis Fr.iscis, a philofophical writer, and dean of the chanber of aicounts at Paris, where he died in 1735, in the ninety-firlt year of his age. As an author, his principal work is entitled "Entretiens fur un nouvean Syfteme de Morale et de Phyfique," which ahounds in folidid reflections, and well digetted reafonings. Some objections being made to the principles contained in thefe converfations, 1, advocat, in 1728 , replied by publining " $A$ new Syftem of Philofophy foumded on the indifputable Nature of Things, emmpared with the Opinions of the ancient Plilofophers relating to the frit Principles of Nature, \&c.:" to which is added a treatife on the nature of the foul, and the cxitence of Cod. Ladvozat was an able nagiftrate, and a good mina. Moreri.
LADY, in Geografby, a town of Rufla, in the governmient of Simulenko, and before the late difinemberment of Poland, a Ruffian frontier town.
LanY's J/and, an ifland in the Athantic, near the coaft of S. Carolina, in America, between Port Royal iffand and st. Helenn. N. lat. $43^{\circ} 30^{\prime}$, W. long. $80^{\circ} 3 z^{\prime}$.
Lady's Beld-Strazu, or CbeffoRennet, in Butany and the Materia Mradica. See Galiusi.

## Ladx's Bozuer. See Ceenatis.

Ladr-Bird, in Zoology. See Hemispiterra, and Sca. naveus. Coccinclle permatata. \%

Lady-Ebapel, a namie invented by modern architects and virtuofi to fignify the chapel which is generally found in our aucient cathedrals behind the fkreen of the high altar. It is fo denominated from its being generally dedicated to the blefied Vrggin Mary, called Our Lady.

Lady's Comb, in Botany. See Shepherd's Needlc.
Lady's'Cuf/bion. See Saxifiage.
Lady-Day, in Lazy, the 25 th of March, being the Annunciation of the Holy Virgin.

Lady's Finger, in Botany. See Anthyllis.

Lady's Seal. Sce Tambs.
Lady's Slipper. See Cyphipedium.
Lady's Smock, the common name of a perennial weed offen met with in pafture grounds. The flalk is upright, found, and fmooth, the leaves are winged, with the lobes of the tower oncs roundif, and thofe on the talk oblong. The flowers are large, handfome, and white, or purplifh, confifing of four obturfe veined petals. The feeds are contained in erect compreffed pods, about an inch in length, divided into two cells, which, when ripe, burft with a touch, and throw out their feed to a coniderable diltance. It has fometimes the vulgar names of cuckow-Hower, Canterburybells, \&c.

Ladx's Tracers. See Twyblade.
Lady of the Thifitio. See Tustre.
Ladx, Prefentution of our. See Puesevtation.
LADYKIRK, in Geograpby, a town of the ifland of Runaldifa. N. lat. $58^{\circ} .5^{\circ} 8^{\prime}$. W. long. $2^{\circ} 49^{\prime}$.
LegliUs, Cares, in Biography, a noble Roman, the particular frieide of the firl Scipio Africannas, accompanied
that commander to Spain, and was infrumental in thic capto ture of New Carthage. When Spain was reduced under the Roman power, Leilius was fent by Scipio to treat witie Syphax, and after this he wals employed to ravage the coalk of Africa. In conjunction with Maffinifita, he defeated Syphax, and brought him prifoner to Rome. He commanded the Italian horfe at the battle of Zama, and had a confiderable flare in the fuccefs of the day. He was mads conful in the year soo B. C.

Lemius, CAus, fiunnamed Sapiens, fuppofed to have been: the fon of the preceding, was equally dittinguifted with the former by his friendiflip with the fecond Scipio $A$ fricanus, fo that Ciccero reprefents him in his treatile "De A micitia," as. explaining the real nature of friendniup with its attendant pleafures. In this work, which is known to every well educated youth, Lexius appears as the clicf fpeakcr. He was ant eminent orator, and a fucceffful cultivator of polite literature. He was fignalized by his prowefs in the war with Spain, but is chiefly celebrated by the civil honours to which hic attained. His oratory is defcribed as of the mild and elegant kind. He was a member of the college of augurs, and pronounced one of the moft famous orations in that capacity. He was conful in the year B. C. 140. Whenhis friend Scipio quitted all concern in public affairs, Lexlius accompanied him to his couutry retreat, preferring the pleafures of retirement and friendthip to the honours of the world. He is fuppofed to lave had a thare in the compofition, or, at leatt, in the correction, of Terence's comedics. His modelty, humanity, and the manner in which he patronized literature and learned men, are as illuflrious as the greatnefs of his mind, and the integrity which he difplayed as a flatefman. Univer. Hitt.

LENA, among the Ancients, a thick, fhaggy, upper garment. See Chlizena.
LAER, Peter VAN, in Biograpby, a landfape, cattle, and converfation painter, known in Italy by the name of Bamboccio, from the nature of the fubjects he frequently painted during a long refidence at Rome, fuch as vintagerevels, drolleries, quarrels, mummeries, \&c. which are termed by the Italians Bambocciate. He was a native of Laeren, near Narden, was born in 16i 3 , and being endowed with excellent faculties of perception and imitation, he practifed the art he adopted with very great fuccefis. His hand and his imagination were equally rapid; and fo readily would the former exceute the dicates of the latter, that he rarely found it neceflary to make previous thadies for his pietures; but fketching flighlyy the fubject on his canvas, he finified the work witheut more delay. He had the great, advantage of poffeffing an excelleat memory, and if he confidered any object with an intention to infert it in a picture, it became fo imprinted in his mind, that he cou'd reprefent it with great truth without its being placed again before bis eyes.
His pitures are of a fmall fize, but very pleafingly executed, with an exceilent tone of colour.
In the hatter part of his life he was feverely tormented with an afthma, of which (not being endued with patience enough to bear its miferies tranquily), he contrived to rid himflif by drowning, in the Goth year of his age.
LAERTA, in Nstural Hilfory, a name given by authors to a fpecies of velpa or wafp, whofe fing is faid to be fatal = but this is an crroncons opinion. This wafp is larger and longer bodied than the cummion kiud, but fmaller than the hornet. It feens of a very irritable difpofition, attacking animals of any kind that come in its way.

LAET, Join de, in Bigarapby, diretior of the Fan India company, was born at Aniwerp, where he died in
s649. He was a. great proficient in the languages, and compofed or edited leveral works relating to geography and civil hifory, as "Novus Orbis;" "Hilloria Naturalis Brafilix;" "De regis Hifpanix Regnis ct Opibus;". "Refpublica Belgarum ;" "Gallia;" "'Turcici imperii Status. ;" "Perlixe imperii Status." Thefe works ate ftill in confiderab'e repute, as well on account of the hittorical and geographical information which they contain, as on account of the great beauty of the E'zevir types. They are known generally under the name of the Reipulsicx. Laet gave a new edition of the works of Vitruvius, enriched with notes of varions critics. Laet's account of Amcrica, which is found in his "Novus Ohbis," involved the author in a controveriy with Grotios relpecting the origin of the inhabitants. It has been much ufed by more modern geographers.

LAETIA, in Bolany, named by I oeflinp, in memory of John de Laet of Antwerp, whee publifhed a Latin hiftory of America in folio, in $16_{3} 3$, , dedicated to king Charles I. of England. Haller fpeaks with refpect of his botanical remarks, as throwing light upom tbe plants of Marcgrave, and tending to reconcile liss delcrptions with thofe of Clulums and the Spanifh botanits.-Lima. Gen. 267 . Schrej. $355^{\circ}$ Willd. Sp. Ml. v. 2. 11t, 3. Mart. Mill. Dict. v. 3. JuIf. 293. (Guidonia; Browne Jam. 249. Linn. in Loell. It. 190. Thamina; Browne Jam. 245.) -Clafs and order, Polyandras Morogynito Nat. Ord. Tiliacer, Jult.

Gen. Cl . Cal Perianth inferior, of tive oblong, coneave, refexed, coloured, withering leaves. Coro either wantug, or of five petals. Stam。 Filaments numerous, capillary, rather faorter than the calyx ; anthers roundifh. Pijf. Germen fuperior, oblong; ftyle thread-fhaped, lunger than the flamens; figna capitate, depreffed. Peric. Capfule roundifle with three or four angles and as many furrows, flethy, of one cell and three or four valves finally recurved. Seids nus merous, angular, each clothed with a pulpy tunic.

Eff. Ch. Corolla of five petals, or wanting. Calyx inferior, of five leaves. Capfule flefhy, of one cell, and three or four valves. Sceds rumerous, with a pulpy tunic.

Obl. We have endeavoured to profit by the obfervations of Suartz, compared with thofe of Browne and Loefling, in order to give a jult idea of the fruit, of which we regret having never examined any fpecimen. Neither is any fufficient reprefentation of it extant.

1. L. apezthta. Lima. Sp. Pl. 733. Jacq. Amer. 167. t. ics. Swartz. Obf. 219. LoeA. It. igo n. 65.-Petals none. Stalks axillary, three-flowered. Leaves clliptic-oblong, obtufe, minutcly ferrated, fmooth and fhining. Gathered by Jacquin in woods at Carthagena, South America, flowering in $A$ pril and May, bearing fruit in Augult. A tree 20 feet high, throwing out fpreading branches from the very bottom of its trunk. Leaves about the ends of the fhort alternate tapering lateral ihoots, ftalked, above an inch in length, elliptic-oblong, or cbovate, obtufe, fmooth and Thining, very minutely ferrated. Ficuers white, compared by Jacquin to thofe of Hawthorn, both in appearance and fcent, llauding molly three together, on fulitary axillary ftalks, not half fo long as the leaves. . Fruit, according :o Jacquin, ovate with three blunt angles, the fize of an olive, generally fourd more or lefs eaten by birds or infects, but he feems to fpeak of it as fmonth; Loefing defcribes it as yellow and downy, neariy globofe, with four obfcure angles and as many furrows. We are unable to determine whether thefe writers both fpeak of the fame fpecies, though fuch is the general opinion. Loeßing found his near Comana.Lamarck fufpects the L. apetala to belong to the Ludia of Commerfono See Ludla.

## 1. AI

2. L. Guidonia. Swart\% l'rodr. 83. (Guidonia; Browne Jam. ${ }^{2+9}$. t. 29. f. 4 ?)-" Petals none, Stalks terminal, lingle-fiowered. Leaves ublong, pointed, ferrated and downy." -Native of Jamaica. Swurrz. Browne calls his plant Rod-wood, and fays it "grows to a conliderable lize, being elteened a fine timber, and much ufed in all forts of buildings. The lines between the valves of the fruit are of a beautiful red, as well as the placentas". We know not why Swartz quotes him with a mark of doubt, nor have we ever feen any fpecimen of this fpecies from cither of thefe botanitls.
3. L. Thamnia. Swartz. Prodr. 83. Fl. Ind. Occ. v. 2.950 . (Thamria; Browne Jam. 245.) - Petals nonce Stalks axillary, forked, many-flowered. Leares cllptic-oblong, fomewhat crenate, frooth and fining -Native of Jamaica. Browre gathered it on the red hills above the Angels, but fays it is not common. His own fpecimen is befura uc. This is a firab, dis: feet high, with roundilh, fmooth, (lightly zigzag lirunctes, whofe young ends are comprefied and coloured. Leazes alternate, on round fmooth thalks half an inch long, elliptic-oblong, with a blunt point, fmooth ard fhining, filightly ctenate, two or three inches in lenoth, marked with chucid dots readily feen when the leat is held againtt the light. Flswer-falks from the young fhoots, axillary, much hurter tlan the leaves, forked and as it were jointed, minutely downy, as are the caly x -leaves. The focuers are not numerous, larger than the common Myrtle, the two outer leaves of the calyx purplifh, inner white, all refexed. Sianns downy. Andoers yellow, Fruit with four, rareiy five, angles, and as many valves, which are revolute whin ripe. Seeds numerous, with a purplifh tunic. Swartz found this plant on the fouth coalt of Jamaica, in bufhy chalky fots, flowering in the fprint. We have borrowed moft of his defcription, comparing it with Browne's fpecimen.
4. L. comileta. Limn. Sp. Pl. 733. Jacq. Amer. 15.7. t. 183. f. 60 . Lamarck. Dict. v. 3. 374.-Petals fiveStalks many-flowered, axillary, Leaves ovate-oblong, fineiv ferrated, rugofe, fmooth. - This was gathered in wouds at Carthagena by Jacquin, from whore book alone we have ar. y knowledge of it. The flem is fhrubby, branched, nine feet high. Leaves about tirree inches long, of a broad ovate fomewhat oblique figure, rugofe, veinj, finely but fharply ferrated, fmooth, flaiked. Commen fioner-flaiks downyFruit yellowih red, often flightly trangular, ripening in Augult and September. The tlowering feafon is June. The petals are as long as the calyx, but nothing is faid of their colour, Jacquin having feen then in a faded ita:e only.

Not one of this genus is known in the gardens of Europe, nor have any dried fpecimens, except the above-mentioned, fallen in our way.

LAEUANGER, in Geograply, a town of Norway, in the diocefe of Drontheim; 46 miles E.N.E. of Drontheim.

LÆVIUS, in Biography, a Latin poet, who probably flourilhed about the time of Cicero. He wrote a poem entitled "Erotopagnia," or "Love games," which is quoted by Aulus Gellius, and Apuleius. He compofed alfo a poem entitled "The Centaurs," which is quoted by Feltus under the title of Petrarum.

## LA FERE, in Gegraply. See La Fere.

Lafitau, Josebin Erincis, in Biography, bom at Bourdeaux, entered the fociety of Jefuits, and became a miffionary among the uncultirated. nations of Nurth America. On his return home he wrote a work entitled "Les Morurs des Sauvages Americains compares aux Mœurs des premiers tems," in two volumes to.: "A Hiftory of the difcoveries of the Portuguefe in the New Werld," in two

## L A G

vols. flo, which maintains a high reputation. He died about the year 1740 .

Laritau, Peter Francis, brother of the above, was a native of Bourdeaux, and became diflinguifhed as a preacher among the Jefuits. Being fent to Rome on various negociations he became a great favourite with pope Clement IX. who promoted him to the bifhopric of Silteron in Provence. He died in the year 1764, at the age of feventy-nine. He was author of the "Hiltory of the Conilitution Unigenitus," two vols. 1 mmo.; "Hittory of Clement IX.," in two volumes, and "Sermons," in four volumes, belides feveral de. votional and practical treatifes.

## LA FORCE, in Gcography. See La Fonce.

LAFORDSWICK, (Saxon, blaforl, i. e. dominus, and Fsuic, proditio, infidelitas crsa dominum, the betraying of a lord or matter. This word is found in king Canute's laws. c. 6I. and in the laws of king Henry I.

LA FRESNAYE, in Grostaphy. Sce La Fressame.
LAFVENSARI, a fnall ifand in the gulf of Fiulaid. N. lat. $59^{\prime} 57^{\prime}$. E. long. $45^{\circ} 3^{2} \mathbf{2}^{\prime}$.

LAGA, in Antiguity, denotes les or hazo: whence are deduced Saxon-lage, Danc-lage, \&c.

Laga, in Geography, a river of Sweden, which runs into the North fea; four miles W. of Laho!m.

LAGAMAN, a town of Candahar; 60 miles N.E. of Cabul.

LAGAN, or Lagos, in our Ancient Sca Lazus, fhip. wrecked goods, left by the fea, lying on the fand, either afhore, or out at fea.

The word feems formed from the Saxon legan, or lugan, jusere, to lie. Though others deduce it from the Latin ligare, is bind; and fuppofe it to denote goods tied together with a buoy, or the like, to hinder their finking to the bottom, that they may be found again.

Lagan is ufually joined with jotfon and forfon; which fee.
Lagan, in Geography, a river of Ireland, which rifes in the Sliebh droob mountains, in the centre of the county of Down, and making a fweep to the weft by Dromore, becomes the boundary between the counties of Down and Antrim, from the neighbourhood of Moira until it flows a little below Belfaft into that large eftuary called Belfaft Lough. There are many villages, befides the confiderable towns of Lifonrne and Belfaft, on this river, and its banks are adorned with numerous bleach greens. Great exertions have been ufed to improve the navigation of this river, and a canal joins it to Lough Neagh.

LAGANUM, in Natural Hifory, the name of a genus of the echini marini, of the general clafs of the placentæ. The characters of the lagana are, that they have their mouth in the centre of the bafe, and their aperture for the anus in its third region; that their fuperficies is whole, and their edges waved. Of this genus there are five known fpecies.

LAGA RES, in Geograpby, a town of Portugal, in the province of Beira; it miles S.S.W. of Vifeu.

LAGAU, a town of Brandenburg, in the New Mark; 25 miles S.E. of Cuttrin. E. lat. $52^{\circ} 28^{\prime \prime}$. E. long. $15^{\circ}$ $26^{\circ}$.

LAGEMAN, (Lagammannus) bomo babens legen, or bomo legalis fen legitimus: fuch as we call now good men of the jury. The word is frequently ufed in Domefday, and the laws of Edward the Confeflor, cap. 38 .

LAGEN, Lagen. 1 , in ancient time, was a meafure of wine, containing fix fextarii : whence probably is derived our $\not A_{a}-$ gon. The lieutenant of the Tower has the privilege to take unam lagenam vini ante malum et retro, of all wine hhips that come up the Thames; and fir Peter Leicefter, in his Antiquities of Chefhire, interprets lagena vini, a bottle of wine.

Lagen Bay, in Geography, a bay on the W. coat of the ifland of Ila, S. of Lagen point.

LAGENS, a town of the illand of Flores, one of the Azores, containing near 1400 inhabitants.
LAGENULA, in Potany, from lagkna, a bottle, becaufe the form of the fruit is like that of a little bottle or flagon. Loureir. Cochinch. 88.--Clafs and order, Tetrandria Monogy yiizo Nat. Ord. Cucurbitacea, Linr. Juff?

Gen. Cly. Cial. Perianth inferior, of four ovate-oblong, reflexd, permanent leaves. Cor. letals none. Neetary flefhy, with four erect, fome what approximated, lobes. Stam. Filaments four, awl thaped, equal to the calyx ; anthers ovate, incumbent. Pijft. Germen conctaled by the nectary; ftyle thick, fhorter than the flamens; Higma fimple. Peric. Berry frail, bottle-flaped, with a narrow neek, of two cells, add centaining two feeds. Seeds folitary, convex on one lide, angular on the other.

Eff. Ch. Calyx of four leaves, inferior. Petals none. Nectary four-lobed. Berry of two cells. Secds folitary.
I. L. petata. Calleí by tlie Cochinchinefe Cấy rát nhb lá. A moderate-fized Jbrub, found out the hills of Cochinchina. The feem climbs by means of tendrils, and is branched; deflitute of prickles. Leaves pedate, of five ovate, crenate, downy leaflets. Flowers whitith green, in terminal, fpreading, fubdivided clufters..
Such is Loureiro's defcription, which in moft refpects indicates a plant of the Gourd or Bryony tribe, except the germen being fuperior. It fhould feem therefore to range with a few more genera, mentioned by Juffieu, at the'end of his Cucurbitacee, which differ from the character of that order in the fituation of their germen.

LAGERSTRGMIA, fo called by Linneus, in commemoration of his friend Magnus Lagerttrem, a director of the Swedin Eaft India Ccmpany, member of the Royal Societies of Upfal and Stockholm, who communicated to him many natural productions, and fome other curiofities, defribed in the fourth volume of the Amanitatios Academica, under the title of Chinenfia Lagerfiramiana. Amonglt thefe was an exquifitely carved horn of a Rhinoceros, now in the hands of the writer of this article, which reprefents a leaf of the Cyamus $N_{\text {elumb }}$, accompanied by the fower and fruit in a fmaller fize, with other memorable plants, and feveral half-formed lizards, crawling as it were out of their native mud, and feizing on the grape, the Litchi, the Marigo, and the Mangoilan, celebrated oriental fruits. This feems to exprefs the fuppofed beginning of animal life, with its dependance on the vegetable kingdom, and throws light on the mythological hiftory of the $C_{\text {yamus, }}$ to which article, written by our lamented friend the late Rev. Mr. Wood, in our roth volume, we refer the reader. -Linn. Gen. 269. Schreb. 361. 833. Willd. Sp. Pl. v. 2. 1178 . Mart. Mill. Dict. v. 3. Ait. Hort. Kew. v. 2. 230. Juff. 33 I. Lamarck Dict. v. 3. 375. Illuftr. t. 473 . (Munchautia;' Linn: Mant. 153. Schreb. 515. 833. Mart. Mill. Dict. v. 3. Juff. 331. Murr. Gott. Præfot. I. Gen. Ch. Cal. Perianth inferior, of one leaf, bell. Shaped, angular, permanent, with fix deep, Tharpifh, triangular teeth. Cor. Petals fix, roundih or obovate, wavy ; their claws thread-fhaped, inferted into the calyx. Stanio Filaments numerous, thread-haped, unequal, inferted into the calyx, and exceeding it in length; anthers roundifh, incumbent. Pi/d. Germen fuperior, roundifh; ftyle threadflaped, declining, longer than the flamens; ftigma obtufe.

## 1．A G

## L A G

Peric．Capfule ovate，pointed，of fix eells and fix valves， rarely but four．Seeds numerous，angular，comprelled，at－ tached to the central hexagonal column．

Eff．Ch．Petals fix，their claws inferted betwixt the tecth of the bell－haped fix－cleft calyx．Stamens unequal． Capfule of four or fix cells，with many angular feeds．

Obf．L．perviffora has but four，or uccafionally only three，cells and valves to the capfute．

1．L．indica，Linn．Sp．Pl．734．Curt，Mag．t． $405^{\circ}$ J．Miller Ic．－（Tsjin kin；Rumph．Amb．v．7．6x．t．28．） －I＇etals pointed，crifped．Six Hamens much longer than the reft．Panicle terminal．Leaves roundifloval，imooth． －Native of China，Cochinchina，and Japan．Kæmpfer fays it is very rare．The Hortus Kerecenfis records its having been introduced into this country by the late duke of Nor－ thumberland，in $\mathbf{1 7 5 9}$ ．Nothing could be a more defirable acquifition to the green－houfe or flove．In the latter it blooms moft freely，and is increaled readily by cuttinys． T＇he $/ b r u b$ is about the fize of a Pomgranate－tree，rather ftraggling，fmooth，with augular twigs．Leaves oppofite or alternate，nearly feffile，an inch or two in length，of a broadifh rounded elliptical form，flightly pointed，entire， finely dotted，fmooth，except fome fhort pubefcence at the rib and veins on both fides．Stipulas none：Buds axillary， ovate，comprefied．Flowers in a large，terminal，fomewhat racemofe panicle，of a fine rofc－colour，not unlike a double fitock at firlt light，but far more delicate and without feent． The petals are heart－fhaped，pointed，exceffively crumpled and curled，with long flender claws．Anthers yellow．

2．I．Regina．Roxb．Coromand．v．1．46．t． 65 ．（L． Flos Regine；Retz．Obf．faic．5．25．Adambea ghabra； Lamarck Diet．v．1．39．Adambor；Rheer．Hurt．Mul． v． 4 ． 45 ．t．20，28．）－Yetals bluntifh，wavy．Stamens all nearly equal．Panicle terminal，much branched．Leaves oblong，pointed，fmooth－Native of woody mountains in Malabar and Java，flowering during the hot feafon，and ripening feed in Augul．A moderate－fized tree，with fpreading branches，angular and winced when young．Leaves from thite to five i，ches in length，elliptic－oblong，entire， fmooth，generally oppofite，on very fhort ftalks．Panicle compound，fpreading．Flowers two inches broad，with rofe－coloured，round，bluntih，fhort－clawed petals，and very numerous，purplifh，almoft equal flamens，with yellow anthers．Capfules the fize of a large oblong acorn，pointed， woody，fmooth，accompanied by the reflexed calyx at their bafe，which is cowny while in flower．

3．L．birfuta．Willd．n．3．（Adambea hirfuta；La－ marck Dict．v．1．39．Katou－A damboe；Rheede Hort． Mal，v．4．47．t．22．）－Petals pointed．Six ftariens much longer than the re！t．lanicle terminal，muclr branched． Leaves oblone，pointed，hairy－Native of the provinces of Mala and Poiga in Malabar，according to Rheede，from whofe work alone we have any knowledge of this fpecies， and who reprefents it as the wild ftate of the preceding，dif－ fering in being taller，with downy or hairy leaves and lrancbes．The fruit allo is roughifl with fine hairs．In his plate morcover the petals are lefs wavy and much more pointed，and he mentions that five ftamens（we have ventured to prefume fis from anatogy）are alone confpicuous in each flower．The famens of $L$ indica emable us to underflamd this，and it is probable that the reft of the filaments are ghorter than the calyx，fo as to have paffed unobferved． Lamarck，after having firft，on Rheede＇s authority，defined and named this \｛pecies，fuggefts in his Dictionary，v． $3 \cdot 376$ ， that it may probably be only a variety of the lait．We muft leave this point in doubt，after having collected all the information in our power．

4．L．ATunchaufia．Lamarck Dict．v．3．375．Willd． n．4．（Munchaufia fpeciofa；Linn．Mant．243．Murray Gott．t．1．）－Petals bluntifh，wavy．Stamens all nearly equal．Clutter terminal，many－flowered，nearly fimple． Leaves ovate，pointed，almolt entire，fmooth．－Native of China，according to Limnxus．His fpecimen is marked as coming from India．Lamarck，in his Ditt．v．3．375，con－ founds this with L．Reginc，from which it is neverthelefs very diftiact．The leaves are not half fo long，much thin－ ner，and are ovate，with much longer and flenderer foot－ italks．The only leaf we have feen agrees precifely with that drawn by Murray，except in being fill lefs entire，the upper part being bluntly ferrated．＇The flazecrs are copious， racemofe rather than panicled，but they appear to differ very little in themfelves from thofe of $L$ ．Rcgime，the petals in Murray＇s plate being erroneoufly made flat，obovate and obtufe．Willdenow probably took his fpecitic character from thence，the plant being very rare，even in dried col－ lections．

5．L．parviflort．Roxb．Coromand．v．1．4ヶ．t． 66. Willd．n．5．－Petals wavy，blunt．Six fameris much longer than the refl．Flower－ttalks axillary and terminal，about threc－flowered．Leaves oblong，obtufe，downy beneath．－ Native of the Circar mountains of India，flowering during the hot feafon，ripening fced in Auguft and September， The inhabitants call it Chinamgbie，and ufe the woud for various economical purpofes．This is a little trice，differing from all the foregoing in the fmallnefs of its flowerers，which are lefs than the common Myrtle，white，chiefly axillary， ufually three on each of the flalks，which grow in pairs， and are（like the leaves）about two inches long．The petals are fix，round，with an undulated edge．The capfule has but three or four cells．Six of the flamens are as long as the corolla．Profeffor Willdenow，from mifundertand－ ing the Englifh defcription，defcribes the leaves as fca． brous．They are fmooth and hining above，downy at the back．S．

Lagerstromit，in Gardening，contains a plant of the exotic tree kind，for the green－houfe，of which the fpecies cultivated is L．indica．
Mretbod of Culture．－This plant is capable of being im－ creafed，either by layers or cuttiags of the young branches． The layers fhould be made from the young floots of the preceding fummer，and be laid down in the cutumn．When they are well rooted in the fucceeding autum，they fhould be taken off and planted out in feparate pots．

The fips or cuttings fhould be made from thoots of the fame year＇s growth，and be planted out early in the fummer：in pots of light earth，being plunged in a bark hot－bed，and covered with fmall bell hand－glaffes，due thace and water being given．When well－rooted in the fyring following， they may be taken up and planted in feparate pots，filled with light mould，being afterwards managed as cthier green－ houfe plants．

Thefe plants afford varicty in collections of potted plants of different kinds．

This tree is a native of the loftier mountains of Jamaion and Hifpaniola．Swartz fays it is thirty feet high，with a

## I. $\Lambda \mathbf{G}$

fomn' as thick as a man's thigh, the wood white and folid, the nuter bark cracked and greyilh; branches round and finooth. Letaves alternate, on thort ftalks, ovate or fomewhat heart-lhaped, more or lefs pointed, entire, from four to tix inches lonk, evergreen, very frnooth and hining, veiny, Hat except a dight undulation at the edges; the under fide paleit. Sp:ikes or claficrs terminal, either fample or panicled, each farcely a finger's length, of few flowers, which are white, four lines long, ovate, four-cleft, the mouth below the ftamens clofed with woul. Stamens eight, very fhort. Germen ciothed with long upright hairs. Drupa invelted with the permanent calyx, its pulp fwect and whitifh, its coat rough with puazent brifles. Sced ovate, brittle.

We cannot find fufficient reafons to make this a diftinet genus from Daphene, but having feen only a fingle leaf, without any parts of fruetification, we prefume not to decide with politivenefs. The inner bark of this tree is very beautiful and remarkable, confirting of many lavers, which are ealily pulled out laterally, into a fine white filky reticulated web, like lace or gauze, three or four feet wide, which has been uied in ladies' drefs on many occafions; and Charles II. is fuid to have had a cravat made of it, prefented to him by tir Thomas Lynch, then governor of Jamaica. Swartz afferts that articles of drels made of this web, may be walhed in foap and water without injury.

LAGGA, in Geography, a town of Sweden, in, the province of Upland; 9 miles S.E. of Upfal.

LAGHI, a town of Arabia, in the province of Hadramaut, on the coalt of the Arabian fea; 12 miles N.E. of Aden.

LAGNASCO, a town of the Ligurian republic; II miles N.W. of Genoa.

LAGNIEUX, a town of France, in the department of the Ain, and chief place of a canton, in the diftrift of Belley ; 22 miles N.E. of Lyons. The place contaius 2553, and the canton 10,266 inhabitants, on a territory of $207 \frac{1}{2}$ kiliometres, in $1+$ communes.

Lagny, Thomas Fantet de, in Biograbhy, an eminent mathematician, was born at Lyons in the year 1660 . He was intended for the bar, and was fent to purfue his ftudies for that purpofe, firft at the college of Lyons, and next at the univerfity of Thouloufe; but having accidentally met with Fournier's. Euclid, and a treatife on algcbra, his genus for mathematics was developed, and he refolved to devote himfelf to the purfuit of his favourite fcience. He came to Paris in the ycar 1686, and was foon after appeinted tutor to the duke de Noailles. He became a member of the Academy of Sciences, and was appointed by Louis XIV. royal hydrographer at Rochefort, but fixteen years afterwards he was recalled to Paris, and made libratian to the king with a confiderable penfion. He died in the year 1734, and in his latt moments, when he no longer knew the perfons who furrounded his bed, one of them, through a foolifh curiofity, anked him "What is the fquare of 12 ?" to which he replicd, as it were mechanically, 14.4. His works are, 3. News Methods for the Extraction and Approximation of Roots : 2. Elements of Arithmetic and Algebra: 3. On the Cubature of the Sphere: 4. A general Analyfis, or Method of refolving Problems: and 5 . Several Papers in the Memoirs of the Academy. Lagny excelled in arithmetic, algebra, and geometry, in which he made many important dilcoveries. He delivered the meafures of angles in a new fcience, called "Goniometry ;" in which he found the value of angles to great accuracy by means of compaffes, without fcales or tables of any kind. He paid great attention to "Cyclometry;" or the method of meafuring the circle, and ecalculated by means of infinite feries athe ratio of the circ:mo

## I. A (:

ference of a circle to its diameter to 120 plaees of figares. Moreri.

Lagny, in Gegrapby, a town of France, in the department of the Seine and Marne, and chief place of a canton, in the diltrict of Meaux, feated on the Marne, and containing three parith churches; 15 miles E.N.E. of Paris. N. lat. $48^{\circ} 53^{\prime}$. E. long. $2^{\circ} 46^{\circ}$. The placo contains 1836 , and the canton 12,257 inhabitants, on a territory of $157 \frac{1}{2}$ kiliometres, in 31 communes.
LAGO, a town of Italy, in the department of the Lower Po; 4 miles N. of Comacchio.

Lago Megiore. See Langensee.
Lago Niro, a town of Naples, in Bafilicata, at the font of the Apennines, near a lake from which it receices its dame ; 12 miles N.E. of Policatro.

LAGOA, a town of the ifland of May, one of the Cape Verde iflands.-Atro, a town of Portugal, ia Algarva; 5 miles N.E. of Silves.-Nlfo, a river of Africa, which runs into the Atlantic, N. lat. $6^{3} 55^{\prime \prime}$ - Alfo, a bay of the Indian fea, on the coalt of Africa. S. lat. $33^{\circ}$ $10^{\prime \prime}$.

Lagoa. Sce Dedagoa.
Lagon d'Allafeira, a lake on the W. coaft of Portugal, near the fea: 12 miles S.S.W. of Lifbon.

Lagon d Obidos, a lake on the W. coaft of Portugal, which difcharges itfelf into the fea, four miles N.E. from Cape Carvaciro, in the province of "Eframadura.

Lagoa de Patos, a bay on the coalt of Brazil. S. lat. $29^{\circ} 25^{\prime}$.

 lip), denotes, in Surgery, the deformity more commonly named a hare-lip. See Hane-lip.

LAGODA, in Gengrapby, a town of Brazil; 85 miles W. of Fort Rio Negro.

LAGOECIA, in Botany, fo named by Linneus, from $\lambda x y \omega 0$, a bare, and caxes, a dwelling, or foct, the plant being, according to Bellonius, Obf. 32, (in Cluf. Exot.) called in the ifle of Lemnos Lagochyneni, which means the form or feat of the hare-LLimn. Gcin. 112. Schreb; 156. Willd. Sp. Pl.v. 1. 1184 . Mart. Mill. Dia. v. 2. Ait. Hort. Kew. ed. 2. v. $2.53 . \mathrm{Sm}$. Prodr, Fl. Graec. v. 1. 162. Juff: 227. Lamarck Illuttr. t. 1.42. Gæertu. t. 23. (Cuminoides ; 'Tourn. t. 155.)-Clafs and order, Pentandria Monogynia. Nat. Ord. Umbellata, Linn. Umbelliferre, Juff.

Gen. Cl. Cal. General Involucrum of eight leaves, cut like a feather, fringed, reftexed, containing a fmall umbel ; partial one of four leaves, in feather-like capilary fegments, furrounding a folitary flower-ltaik, fhorter than itfelf. $P_{e-}$ riantb fuperior, of five leaves, in many capillary fegments. Cor. Petals five, two-horned, fhorter than the perianth. Stam. Filaments five, capillary, the length of the corolla; anthers roundifh. Pif. Germen roundifi, under the bafe of the perianth; ftyle as long as the ftamens; ftigmas two, one of them abrupt. Peric. none. Seed folitary, ovate-oblong, crowned with the perianth.
Obf. Grertner remarks that there are the rudiments of two feeds, though one only comes to perfection.
Eff. Ch. Involucrum both general and partial, pinnatifid. Perianth of five leaves, in many capillary fegments. Pctals cioven. Seed folitary, inferior.
I. L. Caminoides. Wild Cumin. Linn. Sp. Pl. 294 (Cuminum fiveltre; Math. Valge, vo 2. 117. Camer. Epit.

## L A G

519. Kypuroy ayproy; Diofc. lib. 3. cap, 60.) -This is the only known fpecies of its fingular genus, found in fields and vinesards, not uncommonly in Greece and the Levant. Its name in modern Greek is, according to Dr. Siththorp, Aypophavi, or Wild Marjoram; and Bellonius deferibes its fcent and tafte as like that of Origasum heracicolicurn. Diofco. rides fpeaks of the feed as a warm, rather acrid carminative, more powerful than the Garden Cumin. 'The ront is annual, tapering. Stem ten or twelve inches high, branched, zigzag, round, itriated, fmooth, leafy. Leazes pale green, fmooth, finply pinnate, with about a dozen pair if fellile, roundif, deeply cut, nearly oppofite leaflets, and an odd one; the upper leaves become very much diminifhed, and brilltepointed. Umbels terminal, globofe, denfe, halle an inch wide, befet with flining, filvery, brifty points.-A figure of this is deftined to apyear in the Flora (iraca, v. $3 .+{ }^{2} 243$. - We know not how the idea of a hare's form can bear any analogy to this plant, except it alludes to the feed, nefling amongit the fine briftly coverings of the Howers like a hare amongit grafs.

Lagoecia, in Gardening, contains a plant of the herbaceous kind, of which the fpecies cultivated here is the wild or baftard cumin, L. cuminoides.

Method of Culture.-Thefe plants may be increafed by fowing the feeds in autumn, on a warm border, foon after they are ripe, or where they are to remain ; or when permitted to fcatter, they come up and form good plants. They afterwards require only to be kept clean from weeds, and in the former cafes planted out when of fufficient growth where they are to grew.

Plants of this kind afford ornament and variety in the borders and other parts of frubberies and pleafure grounds.

LAGOON Island, in Geography, an ifand of the Pacific ocean, difcovered in lieuteiant Cook's voyage in r $7 / 6$. It is of an oval form, with a lagoun in the middle, which occupies much the larger part of it : the border of land circumfcribing the lagoon is in many places very low and narrow, particularly on the S. fide, where it chiefly confilts of a beach or reef of rocks: it has alfo the fame appearance in three places on the N . fide : fo that, the firm land being disjoined, the whole looks like many iflands covered with wood. On the welt end of the ifland is a clump of trees, appearing like a tower, and about the middle are two cocoar nut trees, which rife above all the reft, which in approaching the ifland appear like a fl.g. The whole ifland is covered with trees of different verdure ; but none could be diftinguifhed except cocoa-nuts and palm-nuts. The natives appeared to be tall, and to have remarkably large heads; they were of a copper colour, and had long black hair. Whilit they walked on the beach they feemed to be naked; but when they retired they covered themfelves with fomething of a light colour. Their habitations were under fome clumps of palm-nut trees, which appeared to Cook and his companions, who had long feen nothing but fea and fey, except the dreary hills of Terra del Fuego, to be a terreltrial paradife. S. lat. $18^{\circ} 47^{\prime}$. W. long. $139^{\circ}$ 28. Variation $2^{\circ} 54^{\prime}$ E. Hawkefivorth's Voyages, vol. ii.

Lagoon, Middle, a gulf on the coaft of Yucatan, in the bay of Horduras. N. lat. $18^{*} 7^{\prime}$. W. long. $88^{3} 59^{\prime}$. North Lagoon is a gulf in the fame bay. N. lat. $18^{\circ} 40^{\prime} . \mathrm{W}$. long. S8 $58^{\circ}$. South Lagoon in the fame bay lies in N. lat. $17^{\circ} 54^{\prime}$. W. long. $83^{\circ} 59^{\circ}$.
LAGOPHTHALMIA, or Lagophthames:, (derived from ravwos, a bare, and of $\theta x \lambda \mu 0 \%$ an eje, denotes, in Surgery, a particular cafe, where the patient experiences an -inability of clofing the cye-lids fo as to cover the eye. It is the defeet to which the term oculus leporinus, or liare-eye, has

Von. XX.
fometimes been applied. The ectropium, or gaping of the eye-lide, if the affection is coufined to the upper palpebra, now and then reccives one of the foregeing appellations. Some writers, however, with nuch reatun, are defirous of reitricting the term luy ththathe t, or larophishalmas, to cafes of fimple retraction of the cye-hel, unatlended with any degree of evertion.

Various and many are the insoaveniences which may be the confequence of this incapacity of properly covering the oye with the cye-lids. The tears are inceffinetly dropping over the check, becaufe the alternate opening and clofure of the eye-lids, fo effenti.1 to the propulfion of this fecretion into the puncta lachrymalia, are impeded. In a llrong light the patient is quite blinded ; for it is impobithe for him to leffen the quantity of rays which fatl upon the cye, by making the eyc-lids approach each other. From this caufe vifion gradually becomes very much weakered. Nor can the patient fieep well in any apartments which adnit the light. And, in addition to thefe unpleafant circumftancer, we mult mention the painful in lamed tate of the eye, frequently induced by the irritation which it fuffers from the ludgment of duft, and other extraneons fubflances upon it.

A preternatural fwelling, or protrufion of the eye from the orbit, is fometimes the caufe of lagophthalmus, which in this circumftance is to be regarded only as a fymptom of another difeafe, and generally gets well whth the primary affection. In the majority of cafes the defect is fituated in the upper eye-lid.

Several fpecies of lagophthalmus are noticed by Richter. In fome, though not many intances, the difeafe depends upon a weaknefs, or paraly fis, of the orbicularis palpebrarum mufcle. Here the upper eye-lid may readily be brought down over the eye with the fingers; but the patient is quite incapable of doing this without external aid. The cure can in general only be accomplifhed with difficulty. The treatment moft likely to prove beneficial confitts in applying corroborant and itimulating applications. Rubbing the flin of the eye-lids orce or twice a day, with a drop or two of fenneloil, electricity, frictions upon the eyc-lids with the tinctura cantharidis, blizers near or imazediate'y upon the eyc-lide', the application of cold water to the eye by means of compreffes wet very oftea in the courfe of the day; Sccare plans in repute. Letting the water of a flower-bath fall upon the hinder part of the head; cold applications iffifted with the interval employment of bark, ard camphorated remediec, are all likely means to do grood in cafes of the paralytic lagophthalmus.

A fifure in the lower, and efpecially in the upper eye-lid, whether an original malformation, or the confequence of a neglected wound, may produce a confiderable expofure of the ege-ball, when the patient attempts to thut his eye; for at this period the margins of the lit will be drawn furtheft afunder. This particular cafe requires a fimi'ar operation to that for the hare-lip. (Sce Hake-tip.) But inftead of the twilted future, the furgeon is to employ the interrupted. See Suture.

The moft common kind of lagophthalmus is undoubtedly that which originates from a contraction of the integuments of the upper eye-lid, in confequence of wounds, abfeffes, burns, \&c. Here the obfervations, elfewhere made concerning the diagnofis and cure of an analogous cafe, are ftrietly applicable. See Ectropium.

Sometimes lagophthalmus appears to depend upon aninčurated thickening and contraction of the levator palpebre fuperioris, and of the fkin of the eye-lid together. In this cafe no furgical operation will avail in curing the difeafe, and every chance of beaefit lies in a trial of other plans.

## L A G

In order to preferve the fight, it is proper to guard the cye with a green flade from the effects of throng light, until the infirmity is completely removed.

LAGOPODES, in Ornithology, a name given to a divifion of the genus Titrao, diftinguifhed by a naked fpor above the eyes, and hairy legs. See Tembao.

LAGOPUS, in Botany, from $2 a \gamma \mathrm{w} 0$; a hare, and me;, a foot, a name which has been applied to feveral different plants, whofe foft hairy heads of flowers have fuggefted the idea of a hare's foot. Among thefe are a fpecies of Plansago: one of Gnaphalium, called by Linuxus dioicun; fome graffes; and feveral of the Diadelpbia clafs." There are grounds of fufpicion that the Lagoecia, (fee that article, might primarily have been named with fome allufion to the foot rather than the form of a hare, which its round hairy tufts of flowers might very well juftify.

Lagopus, in Ornithology. See Grous, Red, Ptarmigan, and Tetrao.

Lagopus, in Zoology, is the name of a fpecies of the canis, with a fraight tail throughout of the fame colour. It is fometimes called the white fox, the ifatis, and the fkycoloured fox. It is found in Lapland and Siberia. See Fox.

LAGOR, in Geography, a town of France, in the department of the Lower Pyrenées, and chicf place of a canton, in the difrict of Orthés; 8 miles S.E. of Orthés. The place contains 1700, and the canton 10,588 inhabitants, on a territory of $177 \frac{\pi}{2}$ kiliometres, in 23 communes.

LAGOS, a fea-port of Portugal, in the province of Algarve, fituated in a bay of the Atlañtic, to which it gives name, defended by feveral forts: the harbour is deep, but full of rocks. This place is the refidence of the viceroy of Algarve, and contains two parifh churches, four convents, and about 4600 inhabitants; 96 miles S. of Lifbon. N. lat. $37^{\circ}$. W. long. $8^{\circ} 39^{\prime}$-Allo, a river of Africa, which rifes in Benin, and runs into the Atlantic, Nolat. $5^{\circ}$ $10^{\prime}$. Its navigation is ohflructed by a bar at its mouth. Alfo, a town of Mexico, in the province of Guadalajara; $3^{6}$ miles N.E. of Guadalajara.

LAGOUSA, in Geography, a fmall illand in the gulf of Engia; 3 miles N. of Engia.

LAGOW, a town of Auftrian Poland; 16 miles N. of Sandomirz.

## LA GRave. See La Grave.

LAGRimoso. See Lacrimoso.
LAGUA, in Geography, a town of the inland of Cuba; So miles W.N.W. of Villa del Principe.
la Guayra. See Guayra.
LAGUEN, one of the fmall Philippine iflands, near the north coaft of Samar. N. lat. $12^{\circ} .43^{\circ} .{ }^{\circ}$ E. long. $125^{\circ} 9^{\prime}$. LAGUERRE, Lovis, in Biography, a painter of hiftories on ceilings, ftaircafes, halls, \&c., and an affiltant and imitator of Verrio; with whofe name bis own has been moft unpropitioufly immortalized by Pope, in that characteriftic verfe,
" Where fprawl the faints of Verrio and Laguerre."
Laguerre, though the fon of a Catalan, was born in France; and his father being matter of the menagerie at Verfailles, he had the honour of having Louis XIV. for his god-father, and after him he was named. At firft he was -intended for the church, and was placed in the Jefuits' college for education; but having a hefitation in his fpeech, and therefore not fuited to fupport their ambitious projects, and
laving exhibited fome tafte in drawing, the god-father recommended to his parents to bring him up to the profeffion of painting.

He then fludied in the fchool of Le Brun, and in the Royal Academy of Paris; and made fo much progrefs, that, in the year 1683, at the age of 20, he came to England, and was immediately employed by Verrio upon the large work at St. Bartholomew's hofpital ; in which he fucceeded fo well, that he foon obtained confiderable employment on his own account, and executed a great number of ceilings, halls, and ftaircafes, in the houfes of the principal nobility of the country, particularly at lord Exeter's at Burleigh, at Devonflire Houfe, Piccadilly, Petworth, and Blenheim. King William gave him lodgings at Hampton Court, where he painted the "Labours of Hercules," and repaired the large pictures called "The Triumphs of Cæfar," by Andrea Mantegna.

His talents were not of alcaft to demand very high refpect, but they were fully equal to the mode in which they were employed,-which requiring a certain portion of ingenuity, is a certain walte of talents of a fuperior clafs. In a few years, it is probable his name will repofe for perpetuity on the records of liflory, and the unlucky fatire of Pope above mentioned.

His death happened in the year 1721, and in a place very feldom difturbed by fuch an event, viz. in the theatre of Drury-lane. He had gone there to fee the Illand Princefs aceed for the benefit of his fon, who was newly entered upon the flage as a finger; but before the play began, he was feized by an apoplexy, and carried away fenfelefs.

## laguna, in Botany. See Laguntea.

Laguna, in Geography, a town of South America, in the province of Venezucla, on the weft fide of lake Maracaybo; 80 miles S. of Maracaybo.
Laguxa, or St. Chrifobal de la Laguna, a city of Teneriffe, fo called from an adjoining lake, which does not now remain, about four miles from Santa Cruz. It ufed to be reckoned the capital of the illand, the gentry and lawyers living there, and the courts of juftice being held in this town; though the governor-general of the Canary iflands refides at Santa Cruz, as being the centre of their trade both with Europe and A merica. The place, though pretty extenfive, fcarcely deferves to be dignified with the name of a city. The difpofition of irs ftreets is very irregular; but fome of them are of a tolerable breadth, and have fome good houfes. In general, however, Laguna is inferior in appearance to Santa Cruz, though the latter is fmall compared with the former; and it is faid to be in a declining ftate; vineyards being now planted where houfes formerly ftood: whereas Santa Cruz is daily increafing. Laguna is fituated on an eminence, in a fertile plain of confiderable extent. Befide vines, it bears wheat, Indian corn, potatoes, and a fpecies of bean not unlike a lupin. From grounds ftill higher, water is conveyed to a variety of fountains in this city, as at Santa Cruz, in an aqueduct compored of wooden troughs, and fupported by poles fixed into the earth. To the plain now mentioned fucceeds a ridge of hills, of gentle afcent, from the fummit of which may be eafily traced the windings of a pleafant walley, ftretching to the weltward, along the feet of a range of hills that feparate it from the fea-coaft. The town of Ticoronta and numerous little villages form a fcene agreeable and picturefque. The bofoms of the mountains are well cultivated, and their more rugged fides are chiefly covered with the fpontaneous plants of warm regions, fuch as the Cacalia kleinia, the Agave americana, the Cactus tuna, befides others of little ornament or ufe, No lat. $28^{\circ} 28^{\prime}$. W. long. $16^{\circ} 20^{\prime}$.

Lagina.

Laguna Efoura, a cape of Portugal, in the province of Beira; 7 miles S.W. of Guarda.
LAGUNEA, in Botany, named by Cavanilles in memory of Andrew Laguna, a Spanifl botanift and phyfician of the 16 th century, who made a tranflation of Diofcorides, with a commentary, into his own language, and wrote alfo Some botanical as well as medical works.-Schreb. 463. Willd. Sp. Pl. v. 3. 733. Mart. Mill. Diet. v. 3. (Laguna; Cavan. Difl. 173. Juff. 273. Lamarck Illuftr. t. 577. Solandra ; Murr. in Linn. Syft. Veg. ed. 14. 623. Julf. 273. Lamarck Illuftr. t. 580. Cavan. Dift. 55. Triguera; Cavan. Diff, 41. t. 11.)-Clafs and order, Monadelphia Polyandria. Nat. Ord. Columnifera, Linn. Malvacea, Juff.

Gen. Ch. Cal. Perianth fimple, inferior, of one leaf, bell-fhaped, flightly angular, cut about half way down into five fegments, permanent. Cor. Petals five, ovate-oblong, obtufe, fpreading, attached to the bafe of the tube of the flamens. Stam. Filaments numerous, 25 to $3^{2}$, united below into a tube, at the top of which, as well as at its fides, they become feparate and diftinet; anthers roundifl. Peric. Germen ovate-oblong, fuperior; ftyle thread-fhaped, longer than the ftamens, either with five fpreading branches at the top, or only five notches; ttigmas capitate. Peric. Capfule ovate-oblong, obfcurely five-fided, with five cells and five valves; the partitions contrary to the valves. Seeds \{everal, roundifh, with three angles.

Obf. The Solandra of Murray has a deeply five-cleft calyx, and five diltinct ftigmas; Laguna of Cavanilles has a five-toothed calyx, burtting at one fide, and a . Itigma with Gire notches or teeth. Schreber has very judicioully united the two, from obferving fimilar differences among many fpecies of the genus.Hibijcus.

Eff. Ch. Calyx fimple, five-cleft. Stigmas five-cleft. Capfule of five cells, with contrary partitions.
I. L. lobata. Lobeal Lagunea, Willd. n. I. (Solandra lobata; Murr, in Comm. Goett. for 1784. 21. t. I. Cavan. Diff. 279. t. 136. f. I. Hibifcus Solandra; L'Herit. Stirp. v. Y. 103. t. 49. Ait. Hort. Kew. ed. X. v. 2. 455.) -Leaves heart-fhaped, three-lobed, unequally ferrated.-Native of the Ille of Bourbon. Root fibrous, annual. Stent branched, two feet high, round, clothed, like every other part of the herbage, with prominent hairs. Leaves alternate, on long ftalks, heart-fhaped, more or lefs deeply three-lobed, acute, unequally cut or ferrated, two or three inches long, and nearly as wide, of a light green. Stipulas linear-oblong. Flowers on long italks, in long terminal clulters, with bracteas like the ftipulas. Corolla white, about half an inch or more in diameter. It is a plant of little beauty, compared at leaft with the generality of its natural order.
2. L. ternata. Ternate Entire Lagunæa. Willd. no 2. (Solandra ternata; Cavan. Diff. 279. t. 136. f. 2.) Leaves ternate and fimple, entire.-Native of Senegal, whence Adanfon brought fpecimens, the only ones of which we have any account. The root appears to be annual. Stems feveral, about a foot high, flender, round, downy, like the other parts. Leaves alternate, diltant, on long Athlks, moflly ternate, the upper ones fimple; leaflets oblong, narrow and entire, the fide ones fmalleft. Stipulas fmall, acute. Flozvers on longifh, fimple, folitary, axillary or lateral italks, fhorter than the leaves. Of the corolla we have no information.
3. L. aculeata. Prickly Lagunea. Cavan. Difl. 173. t. 71. f. 1.-Leaves ternate, cut. Stem prickly.-Found near Pondicherry. The fem is a foot and half high, muri-

cated. Leaftets nearly equal, obtufe, cut. Flowers yellow. Sometimes the leafets are more than three.
L. Paterfonia, Sims in Curt. Mag. t. 769. (L. fquamea; Venten. Malmais. t. 42. Hibifcus Paterfonius: Andr. Repof. t. 286.) found in Norfolk illand by Col Paterfon, a very handfome fhrub with a large purple flower, appears to us at beft but a doubtful Lagunaa, nor is the account of the fruit given with fufficient accuracy in Andrews, for us to judge relpecting this matter.

LAGUNILLA, in Geograply, a town of South America, in the vice-royalty of New Granada; 14 miles S.W. of Merida.-Alfo, a town of South America, in the province of Cordova; 30 miles E. of Cordova.
LAGUNILLAS, Las, a town of Peru, in the diocefe of La Paz; 39 miles N. of Potofi.

LAGURUS, in Botany, from גaywos, a bare, and ovex, the tail, alluding to the appearance of the fpike or head of flowers. Hare's tail Grafs.-Linn. Gen. 37. Schreb. 52. Willd. Sp. Pl. vo 1. 453 . Mart. Mill. Die. v. 3. Ait. Hort. Kew. ed. 2. v. I. 173. Sm. Prodr. Fl. Græc. v. 1. 68. Fl. Brit. 143. Juff. 3o. Lamarck. Illuftr. t. 4 र. Gærtn. t. I. Clafs and order, Triandria Digynia. Nat. Ord. Gramina, Linn. Julf.
Gen. Ch. Cal. Glume fingle-flowered, of two long. linear, very thin, fpreading, feathery valves. Cor. of two firmer valves; the outermof longeft, terminating in two fmall ftraight awns, with a third awn from the middle of the back, twilted and more or lefs bent backward; inner valve fmaller, narrower, pointed, beardiefs. Nectary of iwo lanceolate blunt fcales, tumid at their bafe. Stam. Filaments three, capillary; anthers oblong, pendulous, cloven at each end. Pijf. Germen fuperior, oblong; ftyles two, thort; ftigmas long, cylindrical, feathery. Peric. none, except the permanent corolla attached to the feed. Seed folitary, obovate, clothed with the corolla and its awns.
Eff. Ch. Calyx of two valves, fingle-flowered, feathery. Outer valve of the corolla with two terminal awns, and a dorfal twitted one.
I. L. ovatus. Linn. Sp. Pl. i19. Sm. Engl. Bot. t. 1334. Fl. Grec. Sibth, v. I. 7I. t. go. Schreb. Gram. t. 19. f. 3.-Native of fandy open places in the fouth of Europe and north of Africa, llowering early in fummer. Being found in Guernfey; it is admitted into the lift of Britifh plants. The root is annual, compofed of downy fibres, like all graffes that grow in driving fand. Stem folitary, various in height, downy and foft like the leaves, whofe fheaths are long and rather tumid. Spike ovate, at firft erect, but foon bent to one fide, or drooping, from the power of the wind; it is not unaptly compared to the tail of a hare, which it refembles in denfity, fhape, lightnefs, and whitenefs. The name in modern Greek,

Lagurus cylindricus of Linnæus being properly removed to Saccharum, the above ftands a folitary fpecies of its genus. We know not of its having any ufeful property, except ferving to decorate flower-pots in winter, mixed with any everlalting flowers.
Lagurus, in Zoology. See Mus.
LAGUYO, in Geography, a town of Africa, on the Gold Coatt, in the country of Fantin.
LAHAAR, a town of Hindooftan, in the circar of Gohud; 40 miles E. of Gwalior. N. lat. $26^{\circ} 9^{\prime}$. E. long. $79^{\prime} 35^{\prime}$.

LAHADSI, a town of Arabia, in the province of Yemen; 16 miles N.W. of Aden.

LAHALL, a town of Sweden, in the province of Weft Gothland; ro miles N. of Gothenburg.

LAHAWANNOCK Creek, a river of Pennfylvania, which runs into the Sufquehanna, S. lat. 41 20'. W. long. 57 58.

Lahigian, or Lanigien, a town of Perfa, in the province of Ghilan, on the Ifperud, fituated on an eminence ; eisht miles E. of Refld.

LAHISZIN, a town of Poland, in the palatinate of Brzefc ; 12 miles N.E. of Pink.

LAHMEDIE, a town of Egypt ; 14 miles S.S.W. of Damietta.

LAHN, a town of Silefia, in the principality of Jauer, on the Bober. N. lat. 50 58. E. long. $15^{\circ} 44^{\circ}$-Alfo, a river of Germany, called Lohn, which rifes in the N.E. part of the principality of Siegen, about 10 miles E.N.E. from the town of Siegen, and runs into the Rhine near Lohnftein.
I.AHNSTEIN, or Lounstens, a town of Germany, at the conflux of the Lohn and Raine; four nuikes E. of Coblentz.

LAHO, a town of Africa, on the Ivory Coaft, which has been reprefented as a large and popuious place, extending a leagne along the coalt; the fhore being compofed of a beautiful yellow fand, againt which the fea beats with great rioler:ce. The natives, who are well fupplied with all kinds of provifions, are of a mild, tractable, and gentle dipefition; but ready to feize any opportunity for raifing the price of their ivory, according to the demand, and the number of fhips they obferve on the coait. They are vifited by interlopers of all nations, the free flips of England, Holland, Denmark, and furmerly the Hanle towns, whence the occalions of raifing their price frequently occur. Laho is planted, like Axim, with a great number of cocoa-trees; and thus the neighbouring countries of both diftricts very much refemble one another. Cape Laho is fituated in N. lat. $5^{\circ} 10^{\prime}$, equally diftana from Cape Palmas and Cape Tres Puntas, and the wellern frontier of that diffrict, called the country of the " Good People." Beyond Cape Laho the coaft falls in directly N.E., forming a fine bay, at the head of which opens the mouth of the lithle river, called Jaque Lahu, or Das Balbas, running directly N. and S. but not navigable. Farther ealtward is Korbi Laho, the little pool, called the "Bottomlefs pit," fo called both by the Englifh and Dutch, becaufe feveral onfucceffful attempts had been made to found it ; but at laft it was Iound to be no more than 60 fathoms; the difficelty of founding it refulting from a tide at the bottom which carried away the lead fatter than they could furnila line. Excepting this pool, there is no anchorage for feveral leagues along the coalt. The produce of the adjacent country conlilts of cloths and fuffs of Quaquas, ivory, and provifions. The negroes of this part are fingularly fkilful in fwimming and diving ; for if any pieces of coral, iron, glafs, \&ec. are thrown over board, the negroes will dive after them with fuch rapidity as to catch them before they reach the bottom.

LAHOLM, or Lagehoem, a fea-port town of Sweden, in the province of Halland, at the moath of the Laga, near the fea, with a good falmon fifhery, fortified by the Danes, and ceded to Sweden by the peace of bromtebro; 12 miles S.S.E. of Halmottad. N. lat. 56. 40'. E. lon $\therefore 12$ 45'.

LAHOOR, a town of Thibet, on the Setlege; 34 miles N.W. of Gangotri. N. lat. $233^{\prime} 0^{\prime}$. E. long. ${ }^{7} 6^{\prime} 25^{\prime}$.

LAHORE, or PanJab, a fubah or province in the N.W. part of Hindooftan, bounded on the N. by Cafhmere, on the E. by the mountains of Thibet, on the S.E. by

Delhi, on the S. by Moultan, and on the W. by the Indus, which feparates it from Cabul and Candahar ; about 300 miles in length from E. to W. and about 100 miles from N. to S. This country; which is now occupied by the Seiks, is extenfive, and very fertile; affording, in addition to all the neceffaries of lifes wine, fugar, and cotton-wool: the laft of which fupplies the manufactories of the province. It is watered by the Indus on the W., and the Setlege on the E., and alfo by the Behut, Chunaub, Rauvce, \& c . In the, tract between the Indus and Jhylum (Behut) there are faltmines, which are wonderfully productive, and which afford fragmen's of rock falt, hard enough to be formed into veffels, \&c. Gold (according to the Ayin Acbarce) was found in the channels of its rivers; and the fame is related of thofe of Kemaoon, which proceed from the fame ridge of mountains. See Panjab.

Lahore, a city of Hindooftan, and capital of the country above defcribed, fituated on the Rauvee. This city was the refidence of the firlt Mahometan conquerors of Flindooftan, before they eftablifhed themfelves in the central parts of the country. It owes its modern improvements, however, to Humaioon, the father of Acbar, who made it his refidence during a part of his troublefome reign. Thevenct fays, that, incleding the fuburbs, it was three leagues in length at that period, and when he faw it, about the year 1665 , the city itfelf was above a league in extent. Schauguive, fon of Acbar, allowed the Portuguefe to build a church there; and fome of its furniture remained at the time of Thevenot's vifit. It has 12 gates. It is now the capital of the Seik3; but by the defertion of its inmabitants, it has loit not only a confiderable part of its population, but much of its ancient fplendour. Here are manufactures of carpet., cotton, \&c. Ice is brought from the northern mountains to Lahore, and fold there all the year. The famous avence of fhady trees, fo much fpoken of by the early Indian travellers, began at Lahore, and extended to Agra, near 500 Englifh miles. N. lat. $31^{\prime} 50^{\prime}$. E. long. $73^{\circ} 50^{\circ}$. See Serks.

LAHOREY, a town of Hindooftan, in Baglana; 20 miles $S$. of Bahbelgong.

LAHORPORUM, a town of Hindooftan, in Oude; .25 miles W.N.W. of Kairabad.

LAHR, a town of Germany, in the bifhopric of Munfter ; 12 miles N.W. of Munter.

Lair, or Lobr, a lown of the principality of Naffau Saarbruck Ufingen, the capital of a lordfinip, on the river Schutter; 18 miles S.S.E. of Strafburgh. N. lat. 48 21\% E long. $7 \times 57^{\prime}$.

LAJA, La, a town of Peru, in the diocefe of La Paz; 14 miles N.W. of La Paz.

LAJAPOUR, a town of Hindooflan, in Guzerat; 10 miles S. of Surat.

LAIBEEDY, a town of Africa, in the country of Tunis; 18 miles S.E. of El Jemma.

LAICA, a torn of Abyffinia; 100 miles S. of Miné.
Laica vi rcmovenda. See VI.
LAID-UP is applied to a thip, when the is either moored in a harbour during the winter feafon, or laid by for want of employme.t ; or when the is become incapable of farther fervice.

Laid under meetal. See Metal.
LAIDA, in Geography, a town of Bengal; 14 miles S. of Curruckdeagh.

LAID. LLA, a town of Hindooftan, in Golconda; 1o miles N . of Warangole.

LAIGLE, a town of France, in the department of the Orme, and chief place of a cauton, in the diftrict of Mortagne.

## L. A I

Mortagne. The place contains 5947, and the cantom 14,388 iahabitants, on a territory of $207 \frac{1}{3}$ kiliometres, in 19 communes.
LAIGNES, a town of France, in the department of the Cote d'Or, and chief place of a canton, in the diftrict of Chatillon ! 19 miles W.S.W. of Chatillon-fur-Seine. The place contains 1559 , and the canton 11,103 inhabitants, on a territory of $497^{\frac{1}{t} \text { kiliometres, in } 23 \text { communes. }}$

LAILAKARI, a fmall iffand on the E. fide of the gulf of Bothnia. N. lat. $65^{\circ} 14^{\prime}$. E. long. $25^{\circ} 9^{\prime}$.

LAINEZ, James, in Biograpby, a Spanifh Jefuit, and the firlt general of the order after the death of the founder, (fee Loyola,) was born in the year 15:2. He ftudied theology at Paris, became the intimate friend of Loyola, and was one of feven who bound themfelvss by a vow at Mont-Martre to erect the new community : he is faid to have had a great flare in drawing up the conflitutions for their government. Upon the death of the general, he fucceeded as fuperior of the fociety, but was not formally elected till the year 1558. He affifted at the council of Trent, where he fupported the papal authority to a very extravagant degree. He obtained from pope Paul IV. the perpetual generalhip of the order, together with the following extraordinary privileges, ciz. the right of making all manner of contratts, without the privity or confent of the fociety: that of givisg authority and authenticity to all comments and explanations of the conftitutions: the power of making new, and altering the old ones, and alfo to ef. tablifh prifons, for the confinement of refractory and dif. obedient members, independently of the fecular power. In 1561, he went to France in the fuit of cardinal de Ferrara, the legate of pope Pius IV., and attended the conference at Pviffi, where he difputed with Beza and Peter l-fartyr. After his return to Rome, he refufed a cardinal's hat, which was offered him by the pope. He died in 1565 , leaving behind him fome theological and moral treatifes. Moreri.

LAINO, in Geography, a town of Naples, in Calabria Citra; 19 miles W.N.W. of Caffano.
LAJOUN, a town of Perfia, in the province of Mazanderan, near the coalt of the Cafpian fea; 12 miles $E$. of Refhd.
LAIR, in Agriculture, a term applied to land in a fate of grafs or fward. See Lay and Layer.

Lair, Layr, or Layer, among Sportfinen, denotes a place where deer harbour by day.

Lair, or Layr of a deer, is the impreffion which the beaft has made on the grafs and ground where he has lain down, or repofed.

Lair, among Hufbandmen, alfo denotes a place where cattle ufually relt, under fome fhelter; the ground being enriched by their dung.

LAIRE, Francis Xavier, in Biography, who was born at Vadans, in France, in 1739, and died at Sens in the year $\mathbf{1 8 0 0}$, was celebrated for his knowledge of bibliography, and publifhed, 1. Memoirs tow rds the Hiftory of great Men of the $15^{\text {th }}$ and 16 th Centuries, with a Supplement to Mattaire's Annals of Typography. 2. Specimen Hiftoricum Typograptix Romanxe cum Indice Librorum. 3. Epittola ad thbate Ugolini. 4. On the Oiigin and Progrefs of Printing in Franche Compte, and cther pieces.

LAIR ESSE, GERARD, a painter of hiftory and portraits, born at Liege in $16 .{ }_{f} 0$. His father firft inflructed him in the art, and he is fuppofed alfo to have been a difciple of Bertholet, whofe manner he wery much followed in his practice.

For a lonz time the ait of painting was an unprofitable purfuit to him; but as he made his pictures gay and agree-
able, he at latt, by the help of Vyterburgh, a picture nere chant at Amfterdam, acquired confiderable credit.
His Ityle of painting was a compound of thofe of Pouf. fin and the old French fichool. While he aimed at imitating the beft Italian malters, he never avoided thofe falfe airs of the head and limbs, which feem rather taken from the 将e than from nature; fo that his works do not rife to the level of true merit.

He was blind for fome years before his death : but having refected upon the principles of the art, and being a communicative man, he was conflantly attended by artits and amateurs, who were gratifed by his inltrutions. Thofe treatifes on defign which go under his name were not written by him, but collected from his obfervations, and publifhed after his death, by a fociety of artifts. He died in 1711 , at the age of 71 .
LAIS, the famous courtezan, born at Hyccara, a fmall city in Sicily; and being carried into Greece by Nicias the Athenian general, began her conquuells by mufic. We mention it not among the encomiums of the art ; but almoft all the celebrated courtezans of antiquity were originally muficians. According to Athenreus, (lib. xiii.) mufic was thought a neceffary female accomplifhment in the time of Darius; for Parmenio wrote Alexander word, that he had taken at Damafcus three hundred and twentynine of the Perfian monarch's concubines prifoners, who were all we'l fkilled in mutie, and performed on the flute, and other inftruments. Lais was fuppofed to be the daughter of the courtezan Timandra and Alcibiades. She began tirft to exercife her powers of inchantment at Corinth, in Greece. She is often called the Corinthian, from having paffed great part of her life in that voluptuous city. She fet fo high a price on her favours, that Demolthenes, of whom fhe required for one night ten thoufand drachmas, refufing to comply with her demands, faid, "he would not buy repentance at to high a price." As a caprice, fhe was more indulgent to the difgufing Cynic Diogenes. Arittippus, another philofopher, but much more amiable, almot ruined himfelf in facrifices to this terreftrial divinity, who loved him lefs than Diogenes. When he was rallied on her coldnefs, he faid, "I cannot flatter myfelf that either wine or fifh is in love with me, yet I enjoy, and feed on them both with great pleafure." This female fometimes ridiculed the frailty of the philofophers whom the had captivated. "I do not underitarid what is meant by the aufterity of philofophers; but with this fine name, they are as much in my power, as the reft of the Athenians." After having corrupted all the youth of Corinth and Athens, fhe went into Theffaly, to fee a young man with whom fhe was in love, when, it is faid, that fome women, jealous of her beauty, affaffinated her in the temple of Venus, about 340 years B. C. Greece erected ftatues to her memory.

LAISBY, in Geography, a town of Swedifh I.?pland, in the lap-rnark of Umea; 100 miles N.W. of Umea.

LAISCHEV, a town of Rulfia, in the government of Kazan, at the union of the Kama and Volga; 20 miles S. of Kazan. N. lat. $55^{\circ} 20^{\circ}$. E. long. 49 14.

LAISSAC, a town of France, in the department of Aveyron, and chief place of a canton, in the diftrict of Milhau. The place contains 1083 , and the canton 7453 inhabitants, ou a territory of $172 \frac{1}{2}$ kiliometres, in 12 communes.
LAI-TCHEOU, a city of China, of the firlt rank, in the province of Chantong, is built on a promontory, and has a convenient harbour, a numerous garrifon, and feveral armed veffels to defend the coatt. The jurifdiction extends over feven cities, two being of the fritt clafs. N. lat $37^{\circ} 9^{\prime}$. E. long. $119^{\circ} 46^{\prime}$.

1. AITY comprehends fuch of the people as are not included under the denomination of clergy; and may be divided into three diltinct itates, viz. the civil, the military, and the maritime. For the origin of this diftisction, fee Clergy

LAK, in Geography, a town of Hungary; 18 miles E.S.E. of Canifcha.

LAKE, in Phyfical Geograply, a body of water, molly of confiderable extent, fituate, uncounected with the ocean, in an inland place, and commonly in the immediate neighbourhood of lofty mountains. The form of thefe collections of waters is various; but thofe that receive and emit riscrs, are generally of an elongated fhape, and their longett diameter is in the direction of the rivers that traverfe them. Lakes are generally divided into four claffes: 1. Such as neither receive nor emit rivers. 2. Such as emit rivers, without vifibly receiving any. 3. Such as receive one or more rivers, without enitting any. And, 4. Such as both receive and fend forth rivers.

1. Lakes which neither receive nor emit rivers, are not frequently feen of any confiderable extent; but there are countries where they occur in great number, and as it were in groups. This is the cafe in the deferts northward of the Cafpian fea, and in the plains between the Ural mountains and the Irtifch, and in the valt defert of Baraba, between the Irtifch and the Obb. The foil of thefe countries is defcribed by the accurate Mr. Patrin as being uniformly compofed of a marle, varying only in the proportion of the admixed clay and fand. The numerous lakes found in that tract of country are for the molt part only depreffions or bafons filled by the rains and melted fnow: their greateit extent is fcarcely ever above three leagues in circumference, and generally they are much fmaller. Their depth, too, is ufually very inconfiderable, for it feldom exceeds a fathom, and is frequently not beyond a few feet. Moit of them are only temporary; for towards the end of the fummer they are generally found dry.

A remarkable circumitance, as obferved by the fame naturalift, is that in the fame plain, at the diftance of a few hundred paces, fome of thefe lakes are frefh-water lakes, while the water of others is abounding either with fea falt, or with fulphat of magnefia (Epfom falt) ; or they are impregnated with both thofe falts, either uniformly mixed, or each of them in a feparate part of the lake; in fome cafes the fea-falt and the Epfom falt are formed at the fame period; in others the latter of thefe falts manifeets itfelf only towards the end of the fummer.

The caufe of the faltnefs obfervable in fome lakes has been by molt authors on this fubject afcribed to falt fprings at their bottom; and probably they are in the right with regard to moft of them; but in the above inttance, feveral circumftances unfavourable to that hypothefis exift in the nature of the foil, and the mode and determinate quantity in which thofe falts are depofited at the bottom; whence Patrin conceives that the lakes in queftion, as well as molt other falt lakes of the fame kind, owe their faltnefs to principles or particles, with which they are furnifhed immediately from the atmofphere, in the fame manner as nitre is formed in particular fituations in warm climates, ceafing to be generated as foon as the foil has taken up the quantity of faline matter fuitable to its nature. The general rule laid down by Buffon, that lakes which emit rivers are freth-water lakes, and that fuch as do not fend forth any are falt lakes, appears to be inconfiftent with experience ; lince, on one hand, the great lake Titicaca, in Peru, fuppofed to be eighty miles in circumference, and giving out no river, is by Laet, Acofta, Garcilaffo della Vega, and others, defcribed as a frefh-water

## I. AK

lake ; while the largeft of all falt lakes, the Black fea, difcharges its redundant waters, with a rapid courfe, through the Bofphorus into the Mediterranean.

Dr. Halley is of opinion, that all great perennial lakes are faline, either in a greater or lefs degree; and that this faltnefs increafes with time; and on this foundation, he propofes a method for determining the age of the world.

To the lakes of this firit clafs likewife belong thofe lodged in the craters of extinct volcanoes, or at lealt in depreffions confidered by molt geologifts as the remains of volcanic energy. One of the molt remarkable, on account of its elevation, is that which travellers relate to exift on the fummit of the Adam's peak in Ceylon. This mountain is feen at a diflance of forty leagues; which appears to indicate its height to be at leaft that of Mount Ritna. Its cone, which is difficultly accellible, has 200 paces in diameter at its fummit, and in the middle of the platform is fituated a lake of confiderable depth. Ribeiro's Hitt. of Ceylon.

Dolomieu, in a letter to Faujas Saint-Fond, inferted in this naturalift's work, "Sur les V olcans éteints du Vivarais," defcribes a lake filling up the crater of an extinct volcano in the Serra de Eitrellia ; a ridge of mountains in the north of Portugal, denominated Mons Herminius by the ancients.

Allo the lakes of Agnano and Averne, near Naples, are fuppofed by many authors to have been craters of voicanoes. The former of thefe lakes, we are told by Lalande (Voyage. t. 6. p. 27.) appears fometimes to boil at its borders, efpecially when its waters are high. This ebullition, like that of the Acqua Zolfa near Rome, is occafioned by gafeous fluids traverfing the water. On the borders of this lake are the vapour-baths of San-Germano.
2. Lakes which emil rivers suithout recciving any.-Thefe are more numerous than the preceding. The more copious the fubterraneous waters by which they are fupplied, the more confiderable are the rivers fent forth by them. The Seliger lake, in the government of Twer, 60 leagues N.E. from Mofcow, gives origin to the largel river in Europe, the Volga; although no river is rifibly received by that lake. The fame may be faid of the lake called Kolo-nor, at the foot of the eaftern ridge of the Tibetan Alps, from which iffue two of the largelt rivers of Afia, the Hoanho, or Yellow river, and Kiam, or Blue river, which, after having traverfed part of the Chinefe empire, empty themfelves into the Japanefe fea.

Of the fame kind are the two fmall lakes in New Cattile, in Spain, called los ojos de la Guadiana, fituated near the Alcarraz mountains, and confidered as the fources of the Guadiana.

The lake of Mont-Cenis, though it does not emit a confiderable river, is yet remarkable on account of its great elevation, which is 6000 feet perpendicular above the level of the fea. This lake (together with the Cenife, which iflues from it) is fupplied by waters conveyed to it by fubterraneous channels, and which defcend from the neighbouring mountains, which are as elevated above the lake as this latter is above the plains of Piedmont. This lake is three quarters of a league long, and from 1800 to 2400 feet broad. Sauffure is of opinion that it has formerly been fituated at a greater elevation; fince, at a height of more than thirty feet above its prefent level, traces of erofion produced by the Cenife are till remaining, as well as calcareous layers, exactly like thofe ftill depofited by the waters of that river.

There are in the Pyrenees lakes which appear to have exactly the fame origin as the lake of Mont Cenis, and which equally emit rivers; and feveral of thefe lakes occur

## L AKE.

even at a greatcr clevation, (about 700 fect above the level of the fea, ) fuch as the lakes of Liens, las Cougous, and Oncet, in the mountains above Barège. They are frozen over for the greateft part of the fummer, and are only partially deprived of their icy covering in the interval between the months of June and Auguft. The lake of Mont Cenis, on the other hand, had, at the end of Scptember, when Sauffure obferved it, a very mild temperatare. It is fo well ftocked with fifl, efpecially trouts, that, in the year 1780, it produced a yearly rent of 636 lives.
3. Lakes which receive one or more rivers, without emithing
any--Moft of thefe formerly both received and fent forth a river; but the one emitted has become dry, on account of the diminution of the influent river ; or the cavity that contains it may have enlarged to fuch a degree, that the river it receives is barely fufficient to repair, by new fupplies, the lofs which the lake fuftains by evaporation. To this clafs belong, among others, the Cafpian fea, as it is improperly called, which receives the waters of the Volga, of the Ural, and of fome other rivers. This valt lake, which formerly occupied a much more confiderable fpace than at the prefent day, and not only included the lake of Aral, but probably had even a communication with the Euxine fea, (fee CasPIAN, ) ftill continues to decreafe, in proportion as the capacity of the rivers whichefupply it is found gradually to diminifh. Another lake of this kind is the Dead Jea, or lake Asphaltites, in Paleftine. See Aspialitites.
Such was the lake that formerly covered Ca/bmere, which fee. Lakes of this kind will be naturally formed in every cafe, where the waters of a river are inclofed, in any part of their courfe, by elevated lands. The firlt confequence of this ftoppage is, of courfe, the converfion of the inclofed lands into a lake; and if this happens near the fountains of the river, and the ground is folid, it is likely to remain a lake for ever; the river not having force enough in its infant ftate to work itfelf a paffage through the mountains. Hence it is that more lakes are found near the fources of rivers than in the lower parts of their courfe. If the river be inclofed 2 fter it has gained a great acceffion of water, and, of courfe, Arength; it will, indeed, at firt, form a lake, as before; but in time, the place at which it runs over, will be gradually fretted away, as in the cafe of the Behut. The Euphrates, in like manner, opens itfelf a paffage through mount Taurus; and the Ganges through mount Imaus; and even though the bafe of the mountain be of the firmeft texture, it will give way to the inceffant friction, through a courfe of ages; for either of thefe pafliages may have been an operation of many thoufand years. In the cafe of the Ganges, which paffes through mount Imaus, it may be fuppofed that the lower frata were fofter than the upper; for the upper ftill remain to a great height. In that of the Behut, the latter appears to have exitted long enough to depofit a vaft depth of foil, before it difperfed. Rennell's Memoir.

In the interior of Africa a vaft lake is faid to exift, which is fuppofed to receive the Niger. In America we have the lake Titicaca in Pern, into which runs a river, the fource of which is near Cafco..
4. Lakes which both receive and fend forth rivers, are the moit numerous of alls. They are generally found in vallies, or in plains, in the proximity of great chains of mountains. The moft remarkable among thofe of the Alps are-

The lake of Gcneva, traverfed by the Rhone. Its elevation above the level of the fea, according to De Luc, is 3126 feet, according to Shuckburgh 1152, and according to the obfervations of profeffor Pictet 1134 feet. The Rhone enters it in the neighbourhood of Villeneuve: at its leaving it, near Geneva, it divides into two branches, which encom-
pafs an illand, and foon again unite. This lake formerly extended as far as Bex; and the village Port-Vallay, which is at prefent at the diftance of more than an Englifh mile, was fituate clofe to its banks. The lake of Geneva is fubject to an amnual fwelling, by which its waters are raifed from five to fix feet above the ordinary water-mark. But befides this periodical rifing of its waters, a fluctuation is fometimes obferved, not unlike that produced by the flux and reflux of the fea. This motion, which generally continues for fome hours, is in thofe parts called Seiches. It is moft Atriking in the neighbourhood of Geneva. 'The caufe of this phenomenon is not well undertood. Fatio attributed it to gnits of wind, by which the water of the fmaller lake is protruded beyond the fand-bank that feparates it from the larger; and on falling back produces a fluctuation. Jallabert, obferving that the Seiches take place without any gults of winds, looked for the caufe of this phenomenon in the fudden diffolution of fnow by which the river Arve, becoming fuddenly turgid, retards the courfe of the Rhone which iffues from the lake. Sauffure, on the other hand, has witnefled the fudden fwelling of the Arve, without any accompanying Seiches in the lake. Bertrand is of opinion that electrical clouds attract and raife the waters of the lake, which, on falling back, produce that undulation: and Sauffure and Vaucher add, that fudden local variations in the preffure of the atmolphere, may contribute to the production of this phenomenon. Patrin is inclined to attribute fuch fudden fluctuations of lakes to the developement of fubterraneous gafes, which alfo, by mixing with the atmofphere, produce that violent agitation, which, according to him, cannot be the effect of a fimple difturbance of the equilibrium, but muft be looked for in a chemical fermentation taking place in the atmofphere. An ofcillation fimilar to the Seiches of the lake of Geneva, though in a lefs degree, has been obferved allo in fome other lakes of Switzerland. To the fame caufe Patrin afcribes the hollow found which fome lakes are known to emit, and which is not unlike the noife that precedes the eruption of volcanoes. Some writers inform us that fevera? lakes of Switzerland, and among them the lake of Geneva, give out a grumbling noife of this kind. Pallas has feen, in the Saian mountains, near the fource of the Yenifei, a lake called Boulamy-Koul, which, according to the account given of it by the 'Tartars of. its neighbourhood, emits, at the approach of winter, founds compared, by them to howling. Alfo the inhabitants of the borders of the lake Baikal have informed Patrin, that they have often. heard a dreadful howling proceed from that lake.

The lake of Lucern, in the Swifs canton of that name, (alfo called the Vierwallädter fea, is fituated 1320 feet above the level of the fea, according to Pfyfer; 1314: according to De Luc ; 1350, according.to Trembley; and 1392 feet, according to Wyfs. The river, Reufs enters it at Fluelin, and is again emitted near Lucern. This molt romantic of all lakes is furrounded by rocks confifing partly of limeftone, partly of the calcareons breccia, called Nagelfuhe, and by fand-itone mountains. The line of demarcation between thefe two formations of rocks runs in a direction from. E. to W. 3 to the S . of this line nothing is feen but lime-ftone, and nothing but calcareous breccia and fand-ftone in a northern direction. See more of this lake in Ebel "über die Schweitz, \&c."' 1805.

The lakes of Brientz and of Thun, in the canton of Berne, are both traverfed by the river Aar, which enters the former of thefe lakes at its N.E.extremity, and leaves it at its fouthern end ; when, at the diflance of about two miles, its waters unite with thofe of the lake of Thun. The rocks of both fides of the lake of Brientz confilt of lime and clay-Aate.

## I. AK E.

Dr. Ebel tells us, that on the N . fide formerly large maffes of the molt beautiful varietics of red and white fluor fpar were found, which, from the pure Buase of lime, pafted into blackifl-grey granular carbonate of lime. The lake of Thun is fituated about 1780 feet abore the level of the fea, and a few fathoms higluer than the lake of Brientz. Its northern banks are entircly mountainous; half of the fouthern bank is flat and level. The rocks on the north fide confift ehiefly of the remarkable breccia and fand-ftone formation, of which Mount Rigi, in the canton of Schweitz, is compofed. The breccia is made up of rolled pieces of all dimenfions, from 50 cubical feet, down to the fize of large grains of fand; the whole cemented by a coarfe grained calcareous grit poffefling great tenacity, fo that on the application of blows, the included flones, inftead of becoming detached from their cells, are generally fean cloven afunder. Thefe rolled picecs confifi of various kinds of granite, gneifs, porphyry, flint, and fint-Ihate, horn-flune, granular and compact lime--tone, and a variety of red, clayey, ferruginous boulders, which, on farther decompofing and diffolving, ftain the cement in which they are imbedded with a red colour. The mountains on the S. and E. fides confirt of lime-flone. The teaperature of the lake of Thun, in the beginning of the month of July, at a depth of 350 feet, was found by Sauflure to be 4 of Reaumur, while, at the furface, the fame thernoonetce irdicated $1^{\circ}$. The water of the lake of Brientz, at the fame time of the year, at the depth of 500 feet, flewed the temperature of $30^{40^{\circ}}$ while that of the furface was $16^{\circ}$, and that of the amof phere $15^{\circ}$.
The Lake of Zuricb.-The principal niver which enters this lake, is the Linth or Limmat, which, after having received the Mag, fent forth by the lake of Wallenltadt, falls into the lake of Zurich, near a mouncain called the Bufl-berg. The eleration of this lake above the level of the fea is 1279 feet. During the hot weather of the fum mer months its waters are feen to rife higher, and to overflow its banks, owing to the infucnce of the heat on the valt glaciers, and maltes of frow of the Alpine chain of mountains. Several geognottic facts render it lighly probable that formerly the Rhine, in its courfe to Germany, traverfed both the lake of Wahlenifadt and that of Zurichi.
The lake of Conflance, or the Boden See, is traverfed by the Rhine, which enters it at the S.W. extremity, and is again given out near Conltance. Its clevation above the level of the fea is 1089 teet. It is navizable for veffels of 3000 crlt. Within a period of eight centuries, it has only twelve times been covered with ice. This beautiful expanfe of water formerly extended as far as the Rheinthal, or the valley of the Rhine: a change effected by the flow but unintervupted depofition of alluvial land at the mouth of that river.
The Langen-See, or Lago Maggitre of the Itelians, the Lactus Verbanus of the Romans, a lake on the borders of Switzerland, Piedmont, and the Milanefe territory, receives and fends forth the river Te efin. Its length from Tenero to Sefto, is 44 Italian miles; its greateft breadth, between Luvino and Ferriole, is above feven Italan miles; its elevation above the level of the fea 762 feet, according to Pini, but only 6.6 according to Sauflure ; its depth, at the chapel of la Bardia, oppofite Locarno, is 335 feet. Many confiderable rivers empty themfelves into this lake, fuch as the Telfin, the Verafca, the Maggia, the Torcia, and the Trefa; in fhort it receives all the waters of the immenfe group of mountains that encompafs it.
The natural character of the Lago Maggiore is a fublime wildernefs, blended with the milder beauties of the Italian foil; a narrow compafs gradually widening into a valt es.
panfe. Towards the north and weftward it is furrounded by elevated granitic mountains; while the caft and north fides exlubit a feries of fmaller hills, which gradually lofe them. felves in the plain of Lombardy. From Magadino to Luvina, on the N.E., the dark and rugged mountains of Gamborogno rife 6000 feet above the furface of the lake; and the wooded Pino, with the mountain of Canobbio, which appear to clofe the lakc, form a long balin, abounding with filh, and known by the name of Lago di Locarro.
On the Piedmontefe fide of the Laso Maggiore, at Bar veno and its neighbourhood, are the quarries of granite, which have furnifhed the magnificent columns that decorate the churches and palaces of Milan. In thofe parts are likewife found the beautiful cryltals of feldipar, that were firlt difcovered by Pini. At the mouth of the river Toccia are the quarries of red and white granite, and behind Mergozzo thore of the beautiful variety of marble, of which the cathedral of Milan is conftructed. At Grantola are feei the veltiges of an extinguifhed volcano, which is, however, not confidered as fuch by the learned Abbate Pini, who vifited it in 1790 .
The Lake of Como, about 24 miles from Milan, receives, among other fmaller rivers, the Adda, which is again fent forth at its eaftern extremity. The elevation of this romantic lake, the favourite fpot of the younger Pliny, is, according to Oriani, 654 feet above the fea.
The Garda, a lake of Italy, between the Veronefe and Brellan, is traverfed by the Mincio.
A remarkable lake belonging to this clafs, on the French fide of the Alps, is the Lac de Joux; in the Jura mountains. It is traverfed by the river Orbe, which on iftuing from this lake, is ingulfed in valt funnels, hollowed out by its own waters in the calcareous Itrata, which at prefent are feen in a vertical pofition, owing to the effects of the rupture they expcrienced at the time when the revolution took place, which produced the lake ; and this fame river, after a hidden courfe of three quarters of a league, re-zppears in a valley, 680 feet below the funnel-hhaped cavities that conveyed it to its fubterranean channel ; from whence it proceeds towards and traverfes the lakes of Neufchatel and Bienne.
Sweden, and other mountainous parts of Europe, likewife abound with lakes traverfed by rivers. Of this kind is the lake of Bala, in North Wales. See Bala-pool.
Northern Alia has tiwo very confiderable lakes of this de. feription, viz. the lake Norzaijinn, in Clinefe Tartary, at
the fouthern bafe of the Altzic the fouthern bafe of the Altaic chain, where it is traverfed by the Irtifch and the Baikal, in Eat Siberia. This latter is traverfed by the river Angara. (See BAIK.AL.) M. Pas. trin, who has twice vifted this remarkable lake, has defcribed the highly deftroying effects which is waters, in their \&rat dual formation of the bafin, have produced in the flratified mountains that bound its welfern fhores. But it is not the Baikal alone which has thus formed its own bed, for the fame caufe has prevailed at the formation of thofe valt Canadian lakes, the lake Superior, Huron, Erie, and Ontario, connetted together by the river St. Laurence, which takes its courfe through their flupendous batins.
We are indebted to Sauffure for fome very interefting obfervations refpecting the temperatu $\omega$ of the waters of the principal Alpine lakes. It appears from the experiments of this celebrated naturalift, made with a thermometer of his own invention, that even in the hotteff fummer months, the cold which prevails at the hottom of thofe lakes far exceeds that obfervable in the dep th of the fea. The following are amang the refults he obtained.
In the lake of Geneva, on the 6 th of Auguif, at a depth ot 312 feet, the thermometer (having Reaunurur's fcale) indi-

## LAKE.

reated a temperature of $8 \frac{10}{2}$; that of the furface was $5^{\circ}$, and that of the atmofphere $20^{\circ}$. On the 11th of February, in a depth of 950 feet, (namely, near the rock of Meillerie, being the deepett part of the lake,) the temperature was $43^{\circ}$; that of the furface $4 \frac{1^{\circ}}{}{ }^{\circ}$; that of the atmofphere $1 \frac{30}{}{ }^{\circ}$. It is to be obferved that as the elevation of this lake (according to Deluc) is 1126 feet above the level of the Mediterranean, the bottom of its bafin is fituated only 176 feet above the fame level.

The waters of the lake of Annecy, fituated 210 fect above the lake of Geneva, had, on the $14^{\text {th }}$ of May, and at a depth of 163 feet, the temperature of $4 \frac{1}{2}^{\circ}$, while that of the furface was $11 \frac{1}{2}^{\circ}$, and that of the air $10^{\circ}$.

In the lac du Bourget in Savoy, the thermometer, on the 6th Oet., at the depth of 240 feet, indicated $4 \frac{\pi}{3}^{\frac{1}{\circ}}$; at the furface $14^{\frac{10}{\circ}}$; in the air $10{ }^{10}$. Sauflure obferves, that the cold of the water of this lake cannot be afcribed to any foreign caufe, fince it receives no ftream from the Alps, and its communication with the Rhone furnifhes it with water only during the turgidity of that river in fummer.

In the lake of Thun, in the canton of Berne, elevated about 630 feet abore that of Geneva, the temperature, on the 7 th of July, at the depth of 350 feet, was obferved to be $4^{\circ}$; the temperature of the furface was $15^{\circ}$, and that of the atmofplere 16. At the fame time the temperature of the lake of Brientz, which is contiguous to the lake of Thun, was $3 \frac{1}{1}^{8^{\circ}}$ at the depth of 500 feet.

The waters of the lake of Lucern, fituated 19I feet above the lake of Geneva, had, on the 28 th of July, and in a depth of 600 feet, the temperature of $3 \mathrm{~T}^{\circ} \mathrm{c}^{\circ}$; temperature of the furface $16_{T 0^{\circ}}$; of the air $188_{\mathrm{T}}^{6}{ }^{\circ}$.

Lake of Conffance. - The temperature on the 25 th of July, at the depth of 370 feet , was $3{ }^{4}{ }^{\circ}{ }^{\circ}$; on the furface of the water $14^{\circ}$; in the air $16^{\circ}$.

Lago Maggiore.-On the 19th of July, at the depth of 335 feet, the temperature was $54^{4} 0^{\circ}$; at the furface $20^{\circ}$; in the air $18^{\circ}$. It is remarkable that though the temperature at the bottom of this lake is fo low, yet olive and orange trees are feen to thrive on its borders in the open air.

The comparative experiments which Sauflure made on the temperature of the fea, gave the following refults. On the Sth of October, the farne thermometer, immerfed at Porto Fino, on the coaft of Genoa, to the depth of 886 feet, indicated $105_{10}^{\circ}$, while the temperature at the furface was $165_{10} 5^{\circ}$, and that of the atmofphere $15^{\frac{3}{10}} \mathrm{C}$. At Nice, on the 17 th of October, and at the depth of 1800 feet, the temperature proved to be $100^{6} 0^{\circ}$, while that of the furface of the water was $160^{\circ}$. From this difference between the temperature in the depth of the fea, and that of the bottom of lakes, it has been inferred that it is not the bulk of the mals of water which proves an obftacle to the free communication of the external caloric, and that the low temperature obferved in the lakes of the Alps is owing to a particular and local caufe.

Befides the general caufe which produces a gradual diminution in the extent and depth of all lakes, there are others, which, operating on particular lakes, effect a more or lefs fudden change in that refpect, according to the circumfances under which they take place. All rivers emptying themfelves into lakes, convey thither more or lefs of the fubftance of the mountains from which they defcend, and of the foil of the tracts of country which is traverfed by them. The nearer, therefore, a lake is to thofe high mountains from which ftreams, in their defcent, may carry away the detritus of rocks, the more fpeedily its bafin will be filled up; while, on the other hand, a lake fituated at a greater diftance, in the middle of a plain, and receiving only fand

Vol, XX.
and mud, part of which is carried off again by its outlet, will experience a much lefs rapid diminution. Some naturalifts have thought it poffible to determine the relative antiquity of lakes, by the extent of the alluvial land depofited in their bafins by thofe rivers which enter them; but, according to Patrin, it is a matter of great difficulty to obtain fatisfactory data on this head, and no gencral rules can poffibly. be laid down without a previous and careful examination of all the circumftances attending. the locality of each particular lake. Thus; for inftance, (fays the fame author,) we fee that the lake of Neufchatel, at the foot of the Jura mountains, has already experienced a very confiderable diminution through the mechanically forming effects of the waters of the Orbe, while thofe produced by the Rhone are fcarcely perceptible in the lake of Geneva, although this lake is probably of greater antiquity than the other. The lake of Annecy, which is wedged in between mountains, is already in a great meafure choked up with their detritur. The valley of Chamouni, according to Sauffure's obfervations, was alfo formerly a lake; but fituated at the foot of the highelt mountains of Europe its bafin bas long fince been levelled by the alluvial land carried into it from all fides by the Aveiron and other ftreams. The lac du Bourget, on the other hand, which occupies the middle of a valt bafin, where it receives its calm waters unfraught with foreign matter, is lefs than many others fuhject to the influence of this particular caufe of the diminution of lakes.

The large lakes, with which the northern regions abound, ferve for very good purpofes, inafmuch as the warm vapours arifing from them ferve for a defenfative againft the pinching cold of thofe climates. To this it is owing, that Ireland, Scotland, \&c. are lefs affected with frofts than much warmer countries.

They alfo furnifh exhalations and vapours, which diril on the countries bordering upon them in refrefling fhowers, and prevent their being barren deferts.

The lake Nefs, in Scotland, has been commemorated by many writers, but never with any degree of judgment, till Mr. Frafer gave a perfect account of it to the Royal Society. It never freezes though the winters be ever fo fevere, and is full of fprings in alnooft every part; and its waters, in the time of the fevereft frofs run fluid, and fmoaking for fix miles down the river into which they are difcharged, while every thing is frozen about them. The river runs very flowly notwithitanding, and from this fmoke of the water there is raifed a fort of fog which overfpreads the whole country for feveral miles. There is a mountain near its fide, of two miles perpendicular height from the furface of the lake; and on the fummit of this mountain there is another lake, which has no fpring vifibly running into it, nor any outlet, and yet always keeps of the fame degree of fulnefs, fummer and winter. Due weft from the river into which the lower lake difcharges itfelf, there is an opening of fea, or frith, of two miles long and fix miles wide; the middle of this is fometimes dry, and it is then ealily feen that this was once dry land, and an inhabited country. There are found there large bodies of trees felled, and lying ftraight along: the wood of thefe is black, but it is very found, and there are many tumuli, or heeaps of itones, to be feen under water in different parts of the frith, one of which is acceffible at low water, and theze have been found in it urns, which prove that they have been all burying-places. Phil. Tranf. N $2 ; 3 \cdot$ p. ${ }^{2} 3$ r.

As the fea wafhes away the banks of this frith, there is found in many places a large quantity of wrought timber: beams of fourteen, or more feet long, with the marks of the ase, and other infruments upon them; and at the depth C c
of

## LAKE。

of fisteen fect, in the fteep banks of the neighbouring river Beuly, there are found oak-trees and pieces of burnt timber. We find by this, that the face of the whole country about this lake is very different from what it was fome ages ago ; and there feems fome refemblance between the prefent face of things here, and that in the bogs of many parts of England. The trees found buried in thefe were felled by the conquering Romans, and perlaps thefe are of fome fuch origin.
"We have many" fungularities offering themfelves to our viw in the lakes of our own country; that of their freezing at peculiar feafons is not one of the leaft. Philofophical 'Trant. $\mathrm{N}^{\circ}$ If4.

Lake. Biluminous. The exitence of an expanfe of miseral pitch, fufficiently extenfive to merit the appollation of a lake, is a circumflance fo very remarkable, that it will not be deemed improper to fet apart an article for the deEription of the bituminous lake of the ifland of Trinidad. A deferjption of this celebrated pitch lake was firlt given Ly Mr. Anderfon, in the Philofophical Tranfactions for r-i.n, and fome notices relative to it were communicated hy MIr. T'ooin, in the eighth volume of the Linnean 'Iranlactions; but we now poffefs a more complete account of it by Dr. Nugent, who vifited it in October, Ino $n$, and whofe memoir is publified in the firtt volume of the Tranfactions of the Geolugical Suciety.

The pitch lake of Trinidad, by the French called La Braye, is fituated on the north fide of the gulf of Paria, on the high point La l3rayc, a confiderable hend-land, principally compaled, at its fouthern fide, of a kind of porceJan jafocr. It is not eafy to tate precifely the extent of this collection of pitch; the lines between it and the neighFowring foil not being always well detined; and indeed Dr. Nivgent fuppofes it to form the fub tratum of the furrounding tract of lend. It may, however, be faid, that it is bounded on the north and weft firdes by the fea, on the fouth by the jut mentioned rocky eminence of porcelain jafper, and on the eait by the ufual argillaccous foil of the country; the main body may, perhaps, be eflimated at three miles in circumference; the depth cannot be afcertained, and no fubjacent rock or foil can be difcovered. That part of this expanfe, which may properly be called a lake, is lituated higher than the acioning land, and you defeend by a gentle flope to the fea, where the pitch is much contaminated by the fand of the beach.

On approaching the lake a ftrong fulphureous and pitchy focll is perceived; and on a nearer approach, the bituminous plain itfelf opens to the view, appearing at firft fight to be an expanfe of fill water, frequently interrupted by clumps of dwarf trees, or inets of rufles and flhrubs. Dr. Nugent (from whofe memoir this article is abttracted) was fo ftruck by the fingularity of the fiene, that it was fome time before he could recover from his furprize fo as to invelligate it minutely. The furface of the lake is of the colour of aftes; and at the feafon when this traveller wifited the lake, not fufficiently fmooth to be flippery; it was not adhefive, though is received the impreffion of the foot, and the confiltence was fuch as to bear the travellers without any tremulons motion whatever; but in the dry feafon the furface is probably in a ftate approaching fluidity, as is thewn by pieces of wood and other fubltances being enveloped in it: different bodies have been known flowly to fink into it: If a quantity be cut out, the cavity left will be fhortly filled up. Numberlefs proofs are given of its being at times in this foftered flate; the negro houfes of the ricinage, for intance, built by driving pots in the earth; frequently are twitted or funk on one fide. In many places it eems to have actually overfown like lava, and prefents
the wrinkled appeapance which a nluggifh fubitance would exhibit in motion.

This bituminous plain is interfected by numerous interfices or chafms, filled with water in the wet feafon; they are generally deep in proportion to their width, fome being only a few inches in depth, others feccral feet, and many almolt unfathomahle. The people of the ifeighbourhood derive their fupply of water from this fource, and refrefh themfelves by bathing in it; the water is perfectly uncontaminated by the pitch, and fifh are caught in it. The arrangement of the chafms is fingular ; the fides are invariably fhelving from the furface, fo as nearly to meet at the bottom; but they bulge out towards each other with a confiderable convexity". Thefe crevices will now and then clofe up entirely; when marks or feams are left behind.
'I'he bituminous fubltance forming this lake prefents different appearances in different fpots: in fome parts it is black, with a fplintery or a conchoidal fracturc, of confiderable fpecific gravity, and with little or no luftre, refembling particular kinds of coal, and fo hard as to require a feverc blow of the hammer to break it; in other parts it is fo much fofter as to be ealily cut with a knife or fpade, when the interior appears veficular and oily. In one place it bubbles up in a perfectly fluid ftate, and in one of the neighbouring plantations it is faid to occur of a bright colour, fhining, tranfparent, and brittle, like bottle glafs or relin. The odour in all thefe inflances is ftrong, and like that of a combination of pitch and fulphur, which latter fubltance, however, is nowhere to be perceived. A bit of the pitch held in the candle melts like fealing-wax, and burns with a light flame, which is extinguifhed whenever it is removed, and in cooling the bitumen hardens again. It may be converted to many ufeful purpofes, and is, indecd, univerfally ufed in the country wherever pitch is required. The reports of naval officers who have tried it are favourable to its more general adoption; in which cafe this valt collection of bitumen would afford an inexhauttible fupply of an effential article of naval fores, and being fituated on the margin of the fea, would be wrought and thipped with little inconvenience or expence.
Immediately to the fouthward of this bituminous lake, the face of the country, as feen from La Braye, is a good deal broken and rusgred, which Mr. Anderfon attributes to fome convulfion of nature from fubtervaneous fires, in which idea he is confirmed by having found in the neighbouring woods feveral hot fprings. He is of opinion, that this tract has experienced the effects of the volcanic power, which, as he fuppofes, elevated the great mountains on the main and northern fide of the ifland. As the production of bituminous fubttances has been attributed to the action of fire on beds of coal, Dr. Nugent was particular in his inquiries with regard to the exiltence of fuch beds, but could not learn that there was any certain trace of coal in the ifland.

Dr. Nugent, in attempting to explain the origin of this bituminous lake, i:clines to the fide of the Huttonian geologits, grounding his opinion on the general character of the country, and fevcral local appearances, fuch as the amazing quantity of alluvial foil and bituminous fubflances brought down by the river Orinoko, and depofited on the fhores of the gulf of Paria, and the weft fide of Trinidad; as allo the traces of fubterrancan fire, fuch as hot fprings, vortices, frequent earthquakes, and two fingular volcanic nounds at Point Icaque.
"A valt river like the Orinoko," he fays, "muft for ages have rolled down great quantities of woody and vegetable bodies, which, from certain caufes, as the influence

## L $\Lambda$ K

of currents and eddies, may have been arrefted and accu:mulated in particular places; they may there have undergone thofe transformations and chemical changes which varions vegetable fubltances fimilarly fituated have been proved to fuffer in other parts of the world. An accidental -fire, fuch as is known frequently to occur in the bowels of the earth, may then have operated in feparating and driving off the newly-formed bitumen, more or lefs combined with filiceous and argillaceous carths, which forcing its way through the furface and afterwards becoming infpifated by expofure to the air, may have occafioned fuch feencs as I lave ventured to defcribe. The only other country accurately refembling Trinidad, of which I recollect to have read, is that which borders on the gulf of 'Iaman, in Crim Tartary. From the reprefentations of travellers, fprings of naphtha and petroleum equally abound, and they defcribe votcanic mounds precifely fimilar to thofe of Point Icrequi. X’allas's explanation of their origin feems very fatisfactory, and I think it not improbable that the river Don and fea of Azof may have acted the fame part in producing thefe appearances in the one cafe, as the Orinoko and gulf of Paria appear to have done in the other. It may be fuppoled that the deftruction of a foreft, or perbaps even a great favanna on the fpot, would be a more obvious mode of accounting for this fingular phenomenon; but all this . Part of the ifland is of a recent alluvial formation, and the land all along this coalt is daily receiving a confiderable accelfion from the furrounding water. The pitch-lake, with the circumjacent tract, being now on the margin of the fea, muft, in like manner, have had an origin of no very diltant date; befides, according to the reprefentation of captain DIallet, which has been frequently corroborated, a fluid bitumen oozes up and rifes to the furface of the water on both fides of the ifland, not where the fea has'encroached and overwhelmed the ready-formed land, but where it is obvioully in a very rapid manner depoliting and forming a new foil."

The obfervations of captain Mallet, above-mentioned, but the accuracy of which Dr. Nugent had no opportunity of afcertaining perfonally, are, that " near Cape la Brea (La Braye) a little to the S.W. is a gulf or vortex, which in flormy weather gufhes out, railing the water five or fix feet, and covers the furface for a confiderable fpace with petroleumt, or tar."-" On the E. coaft," he adds, "in the bay -of Magaro, there is another gulf or vortex fimilar to the former, which, in the months of March and June, produces a detonation like thunder, having fome flame with a thick black fmoke, which vanifhes away immediately; and in about twenty-four hours afterwards, is found along the fhore of the bay a quantity of bitumen or pitch, about three or four inches thick, which is employed with fuccefs." The fame author likewife quotes Gumilla as ftating, in his Defcription of the Orinoko, that "about feventy years ago, a fpot of land on the weftern coaft of this inland, near half way between the capital and an Indian village, funk fuddenly, and was immediately replaced by a fmall lake of pitch, to the great terror of the inhabitants." Mallet's Topographical Sketch of the Ifland of Trinidad.

Lake of the tew Mountaizs, a piece of water, that lies wefterly from Montreal, being properly the mouth of Ottawa river; 20 miles long, and 5 broad. It is furrounded by cultivated fields of the Iroquois and Algonquin Indians, whofe village ftands on a delightful point of land, that projects into the lake. Each tribe has a Roman Catholic mifionary. They attend public worfhip in the fame church. Their paftors have taught them to read and write. Their avarriors are about 500.

Lake of the Woods. Sec Woods.

## I. $\wedge K$

Lake Riter, a river of America, which runs into lios Mifilippi, N. lat. $4^{\prime, 3} 33^{\prime}$ W. Iong. $95^{\circ}$.

Lake Rivaz, Lithle, a river which runs into the Mifflippi, N. lat. $45^{\prime} 3\left(3^{\prime} . W\right.$. long. $94^{\prime} 23^{\prime}$.

Lakts, Subdrranean. That there are in many phace immenfe fubterranean lakes, can fearce be doubted, becaulis we fee them in fone placco ; but their efitects are often per. ceived where they are not feen, and puaz! the people who attempt to account for thofe effects upon other principles. The famous Zirchnizer lake in Carniola, whel fills and empties itfelf, at times, in an impetuous manner, bring 13 . up with its waters fifh, and even wild fowl, communicate's with another immenfe fubterrancan lake in the mouseain Savornick; and according to its lilling or emptying, the upper one is alfo filled and cmpticd. "Sce Duck.

The grotto Podfpetfchio, in the fame country, gives another intance of fuch a fubterranean lakc. The people of the neighbouring country enter the fide of the mountain where this lake is, by a fmall opering, through which they go to a cavern of a great width and height; and at the end of this is a fmall opening again, through which they gro on to the edge of a valt fubterranean piece of water: They gen with torches, and find the water very claar and fine. It is ten cubits deep at the edge, and doubtlefs is much more in the middle. The water runs into this lake by a large channel, and runs out of it again by arother, falling down a precipice into another lake, and that with fuch a noife, that the report of a pittol cannot be heard near it. Stones thrown in every way are heard to fall into water, and there is great reafon to fuppofe the lake a German mile long; for at this diftance there is another water difcovered through fuch another cleft of the rock, which flands at the fame horizontal height as this, and is fubject to the fame accidents at the fame time. This valt body of water fometimes all runs off in a few minutes, and leaves the bafor dry, and after fome weeks it fills again with a frightful noife. As thefe accidents always happen to both the waters above mentioned, at the fame time, they appear very plainly to be only the two fides of the fame lake. Phil. Tranf. Nigr.

We have in England many of thefe refervoirs, the water of which is always remarkably clear and cold, and is fo loaded with fpar, that it generally incrufts things very quickly that are put into it; and when raifed into vapours, as a part of it fometimes is, by the fubterranean heat, or carried up with other vapours, ftops at the ceiling of the vaults, and there forms Italactita, and other fuch concretions. In many of thefe lakes alfo are found the round balls of fpar, called fulagmitc. They are compofed of feveral crults gathering round fome central nucicus, and often exceed the fize of a fchool-boy's marble. Phil. Tranf. $\mathrm{N}^{\mathrm{J}} 144$.

In Pen-Park hole, in Gloucefterfhire, there is a remarkable inftance of this, that ftrange cavern containing one of the largett of the lakes in our kingdom.

It was accidentally difcovered by fome miners: it is twenty-nine fathoms deep from the furface, being a raft cavern of the fhape of a horfe-fhoe, furrounded with rugged rocks and rough walls of earth, containing in the midtt of it a river or fubterrancan lake, twenty fathon broad and eight fathom deep, of the fame cold and petrifying water with the other refervoirs of this kind.

LaKE, or LaQUE, a preparation of different fubitances into a kind of magiftery for the ufe of painters, dyers, \&c. One of the fineft and firft invented of which was that of gum lacca or lacque; from which all the rett, as made by the fame procefs, are called by the common name lacqubs. See Lac or Lacca.

We may oblerve more generally, that all vegetable colours, which are foluble in water, are found to have a certain degree of affinity for fome earths and metallic oxyds. Thefe combinations are called lakes. Thus, if a folution of alun is added to an infufion of madder, a mutual decompofition takes place, and part of the alumine falls down intinately united with the colouring matter of the madder: the feparation is much affifted by the alkali. They are chiefly of two colours only, red and yellow : the red owing their colour to madder, Brafil wood, or cochineal; and the yellow to the different yellow infufions ufed in dyeing. Both are generally ufed for water colours, and in oil painting as tranfparent colours. Thefe pigments are almoft invariably compoled either of alum, or fometimes the folution of tin, and fome other watery folution of a colouring natter.

Of the red lakes, that made with cochineal is the molt beautiful, and of the greateft value. It is called carmine, from its being applied to imitate the colour of the flefh. For the method of preparing it, fee Cochineal. See alfo Carmine.

On the receipt for making carmine, introduced under the article Cocrineal, a correfpondent has made the following obfervation.

The carbonat of foda and alum, added in the firft inftance, would be mutually decompofed, and the alumine, with the colouring matter, would be precipitated with the dregs, which are afterwards feparated from the clear liquor; fo that when the white of egge came to be added, the earth of the alum and a portion of the colouring matter, faid to be carried down by the albumen, cannot be prefent. Should the procefs here given have any analogy to that which is practifed, it would appear that the folution of cochineal in water has the white of egg added to it, in the firlt inflance, if it is at all neceflary, for the purpofe of clearing the coloured folution, a property for which that fubftance is remarkable. That after the liquid becomes clear, and is feparated from the dregs, the carbonat of foda and alum are added, when a precipitate, confilting of the alumine united with the finer parts of the colouring matter, may be expected. The remaining colouring matter, which is of lefs beauty, is then ufed for the red lake.

Inftead of ufing cochineal for making carmine, a much clearer colour may be extracted from the refufe of fcarlet cloth. The bits of cloth are boiled in a folution of potahh, which extracts the colour, and holds it in folution. If to this a certain portion of alum be added, the colouring matter will be precipitated with the alumine, of a greater or lefs intenfity, proportionate to the quantity of this earthy bafis. In Doffe's Handmaid to the Arts, we are told that the beft of the lakes conmonly fold is made from the colour extracted from fcarlet rags, and depofited on the cuttle-bone ; and that it may be prepared in the following manner: diffolve a pound of the belt pearl afhes in two quarts of water, and filter the liquor through paper; add to this folution two more quarts of water, and a pound of clean fcarlet fhreds, and boil them in a pewter boiler, till the fhreds have loft their fcarlet colour; take out the fhreds and prefs them, and put the coloured water yielded by them to the other: in the fame folution boil another poilnd of the fhreds, proceeding in the fame manner; and likewife a third and fourth pound. Whilt this is doing, diffolve a pound and a half of cattle-fifh bone in a pound of Atrong aqua-fortis, in a glafs receiver, adding more of the bone, if it appear to produce any ebullition in the aqua-fortis; and pour this ftrained folution gradually into the other; but if any ebullition be oceafoned, more of the cuttle-filh bone muft be diffolved as bcore, and added, till no ebullition appears in the mixture. The crimfon fediment depofited by the liquor thus prepared
is the lake: pour off the water, and flir tlie lake in two gallons of hard fpring water, and mix the fedinent in two gallons of, frefh water; let this method be repeated four or five times. If no hard water can be procured, or the lake appears too purple, half an ounce of alum fhould be added to each quantity of water before it be ufed. Having thus fufficiently freed the lake from the falts, drain of the water through a filter, covered with a worn linen cloth. When it has been drained to a proper drynefs, let it be dropped through a proper funnel on clean boards, and the drops will become fmall cones or pyramids, in which form the lake mult be fuffered to dry, and the preparation is completed.

Lakes are alfo made from madder and Brafil wood. The former is much more permanent than the latter, but does not poffers the fame beauty of tint. In order to make thefe lakes, ftrong infufions of thefe fubitances are firt obtained. The Brafil wood infufion is beft made by boiling the chips in pure water, and filtering the folution. (See Brasis, Wood.) The infufion of madder (fee Madder) is beft made in cold water, by which the purelt part of the colour is only diffolved. To each of thefe folutions are added a clear folution of alum, and then as much of an alkalias will precipitate fo much of the alumine as will make the colour of the precipitate of proper intenfity. A fmall quantity of muriate of tin increafes the brilliancy of thefe lakes.

A beautiful lake, it is faid ( $u b i$ infra), may be prepared from Brafil wood, by boiling three pounds of it, for an hour, in a folution of three pounds of common falt, in three gallons of water; and filtering the hot fluid through paper, add to this a folution of five pounds of alum in three gallons of water. Diffolve three pounds of the beft pearl athes in a gallon and a half of water, and purify it by filtering; put this gradually to the other, till the whole of the colour appear to be precipitated, and the fluid be left clear and colourlefs. But if any appearance of purple be feen, add a frefh quantity of the folution of alum by degrees, till a fcarlet hue be produced. Then purfue the directions given in the firft procels with regard to the fediment. If half a pound of feed-lac be added to the folution of pearl afhes, and diffolved in it before its purification by the filtre, and two pounds of the wood, and a proportional quantity of the common falt and water be ufed in the coloured folution, lake will be produced that will fland well in oil or water, but it is not fo tranfparent in oil as without the feed lac. The lake with Brafil wood may be alfo made by adding half an ounce of anotto to each pound of the wood; but the anotto muit be diffolved in the folution of pearl ahes. There is a kind of beautiful lake brought from Cbina; but as it does not mix well with either water or oil, though it diffolves entirely in fpirit of wine, it is not of any ufe in our kinds of painting. This has been erroneouly called fafflower. Handmaid to the Arts, vol. i. p. 61, \&c.

In making yellow lakes, the colvured infufions muft be fuch as to make the moft permanent dye. (See Dyeing.) The precipitation of the colour is performed precifely in the fame way, and by the fame fubitances, as the red lakes. A. very excellent yellow lake may be made from the infurion of querciiron bark. That from turmeric is very beautiful, but is not permanent. The process for the making of this is as follows: take a pound of turmeric-root in fine powder, three pints of water, and an ounce of falt of tartar; put all into an earthen glazed veffel, and let them boil together over a clear, gentle fire, till the water appears highly impregnated. with the root, and will ftain a paper to a beautiful yellow. Filtre this liqwor, and gradually add to it a frong folution of roch-alum in water, till the yellow matter is all curdled. together, and precipitated; after this pour the whole into a

## L A K

## L A K

filtere of paper, and the water will run off and leave the ycllow matter belind. It is to be wafhed many times with frefh water, till the water cones off inlipid, and then is obtained the beautiful yellow, called laque of turmeris, and ufed in painting.
In this manner may a laque be made of any of the tinging fubflances that are of a formewhat frong texture, as madder, logwood, \&s.; ; but it will not fucceed in the more tender fpecies, as the flowers of rofes, violets, \&ic. as it deftroys the nice arrangement of parts in thofe fubjects, on which the colour depends.
A yellow lake for painting is to be made from broomflower in the following manner: make a ley of pot-afhes and lime reafonably ftrong; in this boil, at a gentle fire, frefl broom-flowers till they are white, the ley having extracted all their colour ; then take out the flowers, and put the ley to boil in earthen veffels over the fire ; add as much alum as the liquor will diffolve; then empty this ley into a veffel of clear water, and it will give a yellow colour at the bottom. Let all fette, and decant off the clear liquor. Wafh this powder, which is found at the botom, with more water, till all the falts of the ley are wafhed off; then feparate the yellow matter, and dry it in the fhade. It proves a very valuable yellow.
All the lake colours are changed by acids and alkalies. An acid renders the red lake more fcarlet, and the yellow paler; while an alkali gives a purple tint to the red, and an orange or brown tint to the yellow. Artils fometines take advantage of this property to change their coluurs. The acid ufed for this purpofe fhould be the muriatic do. luted, and the alkali aqua ammonia.
Lake, Orange, is the tinging part of anoto precipitated together with the earth of alum. This pigment, which is of a bright orange colour, and fit for varnith painting, where there is no fear of fying, and alfo for putting under cryytal to imitate the vinegar garnet, may be prepared by boiling four ounces of the beft anotto and one pound of pearl-afhes half an hour in a gallon of water ; and ftraining the folution through paper. Mix gradually with this a fclution of a pound and a half of alum in another gallon of water; defifting, when no ebullition attends the commixture. Treat the fediment in the manner already directed for other kinds of lake, and dry it in fquare bits or round lozenges. Handmaid to the Arts, vol. i. p. irg.

LAKEN, in Geography, a town of Pruffia, in the province of Oberland ; eight miles E. of Mulhaufen.
LAKSHIMAN, in Hindoo My Pthology, an incarnation of the mighty ferpent Selja, (which fee,) born of Sumitra, fecond wife of Dafaratha, raja, or king of Ayadeha (Onde): Lakihiman was thus the half brother of Rama, and became incarnate for the purpofe of affifting him in his wars againft Ravana, the tyrant of Lanka. (Šee Lanka, Ravana, and RAMA.) Lakhhiman was farther connected with Rama by efpoufing Urmila, daughter of Janaka, the adoptive parent of Rama's wife Sita. See Janaka and Shta.
LAKSHMENI, one of the eight regular wives of Krifhay $y$ and he being the Apollo of the Hindoos, thefe right wives may puffibly be only a perfonification of the natural notes. (See Krishma.) Her name is fometimes written Lakhhimany.
LAKSHMI, is the faktio or confort of Vinnu, the pre-
fervative power of the deity. (Sce $\mathrm{S}_{\mathrm{K}} \mathrm{TTI}$ and $\mathrm{V}_{\text {isirnv. }}$ ) The extenfive feet of Vaifhnava, or worfhippers of Vifhnu, efteem Lakfhmi as mother of the world, and then call her Ada Maya; and fuch Vaifhnavas as are faktas, chat is. adorers of the fupremacy of the female energy, or natureactive, worhip her extenfively as the type of the eternal Being, and endow hier with fuitable attributes. (See farthicr hereoin under Lisva, Maya, and Sakta, Sects of Hindoos; Vaisisava, and the articles before referred to.) Sive is reprefented by the poets and painters as of perfect beauty. Hindoo females are now commonly named afticr her : and there are few in the long catalogue of their deitics whofe various names and functions are fo frequently alluded to in converfation and writing, either on theogony, mythology, poetry, or plillofophy. Her terreftral manifeetations have been frequent, and her origin various. As Rhemba, thie fea-born goddefs, the arofe one of the fourteen gems from the ocean when churned by the good and evil beings for the amrita or beverage of immortality. (See Ruemba.) Shie then affumes the character of Venus Marina, or Aphrodites of the Greeks; who, as Hefiod and Homer fiug, arofe from the fea, afcended to Olympus, and captivated all the gods. The operation of churning the ocean is noticed under Kurmavatara, and the production of Rhemba, Sri, or Lak flmi is thus deffribed in the 36 th fection of the firlt book of the Ramayana. (See Ramayaxa.) "The gods, the afura, and the gandharvas, again agizating the Iisa, after a long time appeared the great goddefs, inhabiting the lotus; clotied with fuperlative beauty, in the firlt bloom of youth, covered with ornaments, and bearing every aufpicious fign ; adorned with a crown, with bracelets on her arms, her jetty locks flowing in ringlets, and her body. which refembled burning gold, adorned with ornaments of pearl. Thus was produced the goddefs Padma, or Sri, adored by the whole univerfe, Padma by name. She took up her abode in the bofom of Padma-nabha, even of Heri,"' that is, of Vihnnu, of whom thefe are names. Sri, as this deity is frequently called, diftinguifhes her more particularly as the godders of fortune, the word meaning proferity; but it is not given excluffively to Lakfhmi. (See SRr, PADMA, and Kamisa.) Others of her names are derived from the lotus, which is the emblem of fenale beauty, and efpecially applicable to this goddefs. (See under thefe articles.). Heripriya denotes the wife of Heri or Vihhnil. As the deity of riches or fortune Lak fhmi would be invoked for increafe of wealth, by a defiring Hindoo, rather'than Kuvera, the Plutu: of their Pantheon. (See Kuvera.) In this charater fhe is fometimes called Locki, or Laki, meaning ffickle; and it may be only a fhortening or rapid pronunciation of Lak hami, her mott common name, which is derived from the Sanfrcit word lakjb, light, Splendour ; equivalent to the Latin lux, and it meaus farther luck, luxury, fortune, \&c. This goddefs (as the fakti, or confort of Vinnuu, or Krifhna) being the energy of the fun, is appropriately defignated by a luminous appellation derived from fuch a fource.
In images and pictures of her, which are very common in India, Lakhmi is generally reprefented as a mere woman; fometimes, however, four-armed; oftcn holding a kimal, or lotus, in an eafy and elegant atttrude, and always very handfome. With her lord Vifhnu fhe is frequently feen on the ferpent Selfa; he repofing, fhe in refpectful attendance, while a lotus fpringing from Vifhnu's navel to the furface of the fea (for this fecene is fubaqueous) bears 'in its expanded caly $x$, Brahma, the creator of the world, about to perform the work of renovation. (See Kalpa and Sesha.) Sometimes fhe is feated with her lord on Garuda, or Superna, cleaving the air, of which Vifhou is a perfonification: (See.

Surerna.)

## L A K

Superna.) In Vilhnu's molt fplendid avatara, or incarnation of Krinhna, fhe became manifetted as Rukmeni, or Radha, the molt adored of the amorous deities, and mother of Kama, the god of love; here again correfponding with our popular Venus, the mother of Cupid. (See Kama, Kmana, Radia, and Rukmexr.) In the avatara of Rama, Lakfhni was his faithful foufe in the form of Sita, as noticed under thofe articles. In that of Narfingha, fle was Narfinhi, or Nitimhi; when Varaka, Varahi; and as the Salkti of Narayam fhe is by her own fectaries called Narayani; and in molt of the many incarnations of Vifhus flic appears to have defcended with him, frequently under her own celeitial name: as his conlort generally, the is called Vaifhnavi. See reipectively thofe articles.

The following extract from Moor's Hindoo Pantheon will thew the veneration paid to this popular and benchicent deity, of whom a mileh-cow feems an apt fymbol. "In the Sradha, or obfequies in honour of deceafed anceftors, Lakfhmi is, among other deities, earne:lly invoked, particularly when, as the ritual expreffes, a votary is defirous, by gifts to Brahmans, of obtaining celeftial blifs for the defunct." A donation of a milch-cow is attended by many appropriate ceremonies, finifhing with the following prayers; the acceptor holdiag, during the recital, the facred animal by the tail.
I. May the goddefs, who is the Lakfini of all beings, and refides anong the gods, alfume the fhape of a milch-cow and procure me comfort.
2. May the goddefs, who is Rudrani in a corporeal form, and who is the beloved of Siva, affume the flape of a milchcow and procure me comfort.
3. May fhe, who is Lakfhmi repofing on the bofom of Vifhnu; fhe, who is the Lakflmi of the regent of riches; the, who is the Lakfinmi of kings, be a boon-granting cow to me.
4. May fhe, who is the Lakfhmi of Brahma; fle, who is Swaha, the wife of fire; the, who is the exerted power of the fun, moon, and ftars, alfume the fhape of a milch-cow for my profperity.
5. Since thou art Swadha, the food of them who are the chief among the manes of anceftors, and $S$ waln, the confuming power of them who eat folemn facrifices; therefore, being the cow that expiates every fin, procure me comfort.
6. I invoke the goddefs, who is endowed with the attributes of all the gods, who confers all happinefs, who beftows abodes in all the worlds, for the fake of all people.
7. I pray to that aufpicious goddefs for immortality and happinefs. P. 138.

Under the following names and words fome particulars will be found of the mythological perfons mentioned in the preceding extract, not before referred to from this article. Sradha, or obfequies in honour of departed anceltors. Rudrani, the beloved of Siva, a name of Parvati. Surabhi, the boon-granting cow. Swadha, Swaka, the fakti, or energy of Pavaka, or firc.

Lakfhmi allo prefides over marriages, and is confidered, indeed, among certain fects of Hindoos, as the general fource of all happinefs. She is found, by mythologits, to have characteriflic attributes and powers fimilar to the Ceres 'of the Greeks (Sri is, in one cafe, Sris, correfponding here, likcwife, in name), and the lis of the Egyptians. On thefe, and other points connected with the fubject of this article, fee fir William Jones, and Mr. Colebroke, Afat. Ref. vols. i. iii. and vii. Many plates of her in her vazous forms, and Puranic legends and anecdotes, are like.
wife given in Moor's Hindoo Panthcon, whence this articto is chiefly taken. See alfo Gentoos.

## LALAND. See Lafand.

LALANDE, James de, in Biography, was born at Orleans in 1622, and became diftinguimed in the profefiion of the law. He was famed as well for his extenfive and very profound erudition, as by the public and private virtues which he maniffted, in paffing through a long life, in the exercife of various important functions. He attained to the higheft rank in his profeffion in his native place, and was made mayor. He died in`1703, fincerely regretted by all who knew him ; he was author of feveral works, of which the moit important were "A Commentary upon the Cuftom of Orleans;" and "A Treatife on the Ban, and Arrier. ban." His integrity, beneficence, and zeal for the interefts of his countrymen, obtained for him the honourable title of "father of the people." Moreri.

Lalande, Josepi, Jerome le Français, a celebrated French aftronomer, was born at Lourg, in the department of 1 'Ain, on the 1 th of July 1733, of very refpectable parents. His father, who was polfefied of property, intended him for the bar, and accordingly fent him to Paris to ftudy the law, to which, for fome time, he applied with fo much ailiduity, as to more than anfwer the moft fanguine expcctations of his friends, when the fight of an cbfervatory awakened in him a propenfity, which deranged the projects of his parents, and became the ruling paffion of his life. He put himfelf under the inftructions of Le Monnier, one of the then molt celebrated aftronomers of France, and profited fo much by the leffons of his able inftructor, as to afford him the highelt degree of fatisfaction, who, on his part, conceived for the young man a truly paternal affection, and was determined to promote his interelts. An opportunity foon offered; the great aftronomer Lecaille was preparing to fet out for the Cape of Good Hope, in order to determine the parallax of the moon, and its difance from the earth. To accomplifh this purpofe, it was neceffary he fhould be feconded bv an obferver placed under the fame meridian, and at the greatelt diltance that could be conveniently chofen on the globe. Berlin was fixed on, and Le Mornicr fignified his intention of undertaking the bufinefs himfelf, but the moment when he flould be ready to depart, he had the credit to get his pupil appointed in his ftead. Frederic, to whom Maupertuis had explained the delicacy and difficulty of the enterprize, could not forbear fhewing fome aftoniflument when the youthful altronomer was prefented to him, "However," faid he, "the Academy of Sciences has appointed you, and you will juftify their choice." From that moment his age, i.cing only eighteen, was an additional recommendation; he was admitted at court, welcomed by the academy, and became intimate with the moft diftinguihed perfons at Berlin. On his return, the account which he gave of his miffion procured him free accefs to the Academy of Sciences, and its Tranfactions were enriched every year hy important trommunications from the young aftronomer ; " the active part which he took in the labours of the academy, was not confined to the aftronomical fcience, we have from his pen, a defcription of feven arts, as different from each other, as they are re-
mote from the objects of his habitual meditations." He publifhed the French edition of Dr. Halley's tables, and the hittory of the comet of 1759 , and he furnifhed Clairault with immenfe calculations for the theory of that famons comet. Being charged in 1760 with the compilation of the "Commoifance des Temps," he entirely clanged the form of that work, and of this collection he publifhed thirty-two votumes, viz, from 1775 to $180 \%$.
In $r_{7} 6 \neq$; appeared the firlt edition of his ", Traité Aftronomique," which he afterwards completed, and upon which lis chief claim to glory retts. Lalande was the firt who calculated the perturbations of Mars aud Venns, and ia the theory of Satellites, in which but little progrefs had been made, he esplained a motion which Baillie claimed as his own difcovery. A litcrary difpute arofe out of this circumilance, which, however, was conducted with every regard to decency, and the probabic refult, as feen by difintercetted fpectators, was, that both had been led to the fame difcovery. He compofed all the altronomical articles for the "Encyclopedia of Y verdun:" thofefor the fupplements to the "Eacyclopédie de Paris," and thofe for the "Encyclopédie Me. thodique," fublituting for the articles furnihed by d'Alenbert, and which he had compiled from the works of Le Monnier, fuch as were more complete and m:ore modern, from his own obfervations and improved theories.

To his written works he joined oral inftruttions during a fpace of forty-lix years; for from the year 176 br he had replaced the firlt mailer, De Lifle, in the chair of aftronomy, in the college of France, and gave a new lultre to this curious part of public inftrustion in a celebrated fchool, which poffeffed the molt diftinguifhed profeflors of every kind, and which enjoyed and merited the extraordinary privilege of outliving the tremendous thornis of a revolution, and efcaping the almolt univerfal deftruction which levelled all around it. As a profeffor, he taught with fo much ability that his fchool became a feminary of difciples who peopled the differeni obferratorics of the world. In the mardit of his other labours he drew up his "Voyage d'Italic," the moit complete collection of curious cbjects that travellers can confult; his "Traité des Canaux;" and his "B Bibliographie Aftronomique," which is an immenfe catalogue of ail the works that lave appeared on the fubject of that fcience.

In the year ${ }^{1793}$, Lalande publihed "Abregè cee Navigation hiltorique, theorique, et practique," containing many valuable rules and tables; and in 1802 he publihed a reev edition of Montucla's hiltory of mathematics, in 4 vols. 4to. the latt two volumes being prepared from Montucla's papers, with the affitance of La Place, La Croix, and other French mathematicians. He publifhed alfo this year a collection of tables of logarithms, fines, tangents, \&c. acapted to the pooket.
Afociated to almot all the difinguifhed fcientific focieties in the world, he was their common bond of union by the correfpondences which he taintained; and he promoted a circulation of intelligence from one to another. He employed the credit ariiling from the univerfal reputation which he erjoyed, for the general benefit of the fciences and their cultivators. To the extraordinary ardour and activity of his character, he joined a love for the truth, wlich he carried to the borders of faraticifm. Every degree of concealment appeared to him unworthy of an honeft man, and he therefore, without referve, u:tered his fentiments on all occalions, and by the bluntnefs of his manners, he fometimes made himfelf enemies, who not only calied in quettion his real merits, but who excited agzaint him a crowd of detractors, and becaufe they could not rival his high reputation, they attempted to blaft his well earned fame. He was not without his fingu-
larities and failings, but they were trificre in comparifun of his commendable çualities, yet his long and important tervices were frequentiy forgoten in the recollection of trivial failings.

In a work, not of the moft liberal caft, now under publication, in this country, Lalande has been cha:ged with profanenefs and atheifm, but no authority is produced to fupport fuch charges, which, if true, otaght to have been fanctioned by fome fort of proof, or by well afcertained facts; and if not true, the editors of that work are guilty of a crime againtt fociety not eafily obliterated. One of his culogifts fays, " he always manifefted a benevolent difpofition, and approved himfelf a man of honour, probity, courage, full of activity for all ufeful things, and of love and zeal in behalf of his fellow creatures. To imitate the great bencfactor is the moit worthy homage we can pay to the infinite goodrefs ; the fupreme intelligence which groverns the uriverfe." He rendered ineltimable fervice to fcience curing his life, and confulted its intereits after his death, by foundin! an annual prize to the author of the beft aftronomical memoir, or molt curious obfervation. He died April $4^{\text {th }}$ 1807 , in the 75 th year of bis age. Eulogy pronounced. over his grave by De-Lambre and Dupont.

Lalixde, Michel Richardde, mafter of the king of France's band, maitre de chapelle, and compofer in ordinary of the chapel royal, and chévalier de l'ordre de St. Michel, born in $165 \%$, was the fifteenth fon of a tailor at Paris, and brought up a chorifter of St. Germain l'Auxerrois. Excited by a Itrong pafion for mufic, he foon furpaffed his matter Chaperon. The violin was the firft initrument to which he ferioully applied; but being recommerded to Lulli, as a performer in the opera orcheitra, he was fo piqued at being rejected, that he broke his liddle, and renounced the practice of it for ever. The era of his profperity was, the being employed in teaching mademoifelle de Noailles, wha married the Marcechal de Grammont, and the Maréchal faid fo many kind things of him to the king, that he was appointed mulic-matter to mademoifelles de Blois, ard de Nantes. In 1683, his majelty having created two new places of chapel-maters, gave one of them to Lalande, whofe compolitons pleaied the king fo much that he anpointed him fuccefively to the two places of chapel-mater, that of chamber-mufician to his majelty, and mafter of hisband; and foon after conferred on him the order of St. Michel. The king married him to Anne Ribel, who had an admirable voice, and fasg wonderfully. He had only two daughters by this marriage, whom he loft in myI at 24 years of age. In 172 I he loft lis fpoufe, asd the year following, wanting confolation and a companion, he married. the demoifelle de Cury, daughter of the furgeon to the princels of Conte, but foon after being feazed with a confumptive cough, and pein in his chelt, he died in 1726 at 67 : 45 years of which time he had fpent in the fervice of Louis XIV. and XV. Lalande left behind him 60 motets, or anthems, which have had the higheit reputation, and fet feveral operas, but he never would let any of them be ferformed under his name. It was under this able matter, (iays M. Laborde, the zealous defender of French mufic of every kind,) that a new fpecies of church mufic liad tirth, which altonifhed and ravilied the whole court. "He banithed the ufual monotony and drynefs of the choruffes and recitatives. His fugues were compoled on hevely fubjects, and mixed with agreeable fymphonies, and agreeable melodies, which, before his time, had no exiltence. He was the firft who had the time beaten by a coryphreus, and compoled pathetic recitatives, and airs of fpirit. In floort, he wis the creator of church mufic; and evien foreigners, fince ilie time

## L A M

of Lalande, give the Erench the pre-eminence in this kind of mufic, over all the nations of Europe." Effai fur la Mufique.
The Englifh, the Germans, and the Italians, we profume, will difpute this point with M. Laborde, and remind him of their Purcel, Handel, Leo, \&c. We hcard fome of this fublime mufic, at the Concert Spirituel, in 1770 ; and in looking back at our memoranda for the effect which it had on our feelings, we found that it was coarfe and noify, with fcarcely a new paffage to make amends for the worlt finging which we had ever heard, in or out of the church.

Lasas, or Lamas, the title of an order of priefts among

## L A M

the weftern Tartars, on the frontiers of China; and particularly in Thibet, who are held in great veneration. Lama, in their language, is a priett or minilter of religion; and Lamifla is the wife of the Lama.
About the year 1426, the bonzes of Thibet aflumed the title of "Grand Lama." The moft powerful among them made Laffa the place of his refidence, and was acknowledged chief of all the lamas. He eftablifhed the law refpecting the yellow cap; for it muft be obferved, that there are two kinds of lamas, diftinguifhed by red and yellow caps. His fucceffor was the firlt who appointed a "typa," or prime minitter, whom he entrufted with the government of his ftates. The next in order was the firft who took the diffinguifhing title of "dalai-lama," by which he was raifed far above the reft ; for "dalai" fignifies "morally and phyfically extended, great, and almoft without bounds." The lama princes, however, were not fole fovereigns of Thibet. The dalai-lama was indebted to a prince of the Tartars of Kokonor, named Kouchi, for his fovereignty over all Thibet : and in order to continue his protection to him, he eftablifhed himfelf, together with his troops, in the reighbourhocd of Lafla. In 1714, the Eleuthes made an irruption into Thibet, committed the moft horrid ravages, put a great number of the lamas to the fword, and fent feyeral of them into Tartary, inclofed in facks, and thrown on the backs of camels. Their king pretended to be the only and real fovereign of Thibet; and ordered the lamas to renounce their authority over the people, to retire to their monafteries, and to employ themefelves only in faying their prayers. The dalai-lama loft no time to implore the protection of the emperor Kang-hi; who affembled a numerous army, and caufed it to march into Kokonor, from whence he drove the king of the Eleuthes, and then entered Thibet; while another body of Chinefe troops penetrated thither alfo by the province of Se-tchuen. The dalai-lama was re-eftablifhed, and the reft of the lamas were put in porfeffion of their pagodas. Thofe that remained of the troops of the Eleuthes made their efcape through the defiles of the mountains; and as the reigning emperor has ever fince protected Thibet, the Thibetians have nothing more to fear from the incurfions of the Eleuthes, who, fince 1759, have been fubjects of the empire. The tribute which the fovereign of Thibet fends to the emperor of China confifts generally of gold or copper ftatues of the god "Fo," perfumes, amber, coral, precious ftones, woollen ftuffs, and fword-blades. The emperor alfo requires from the dalailama a certain number of veffels or fmall pitchers, filled with water from the Ganges. Ever fince the expulfion of the Eluth Tartars, the kingdom of Thibet is regarded as depending on the emperor of China, which they call Cathay: and at Laffa, the capital, two mandarins relide, with a garrifon of 1000 Chinefe to fupport the government; but their power does not extend far; for in reality the lama, whofe empire is founded on the fureft grounds, perfonal affection and religious reverence, governs every thing internally with unbounded authority. It is well known, that the dalailama is the great object of adoration for the various tribes of Heathen Tartars, who roam through the immenfe tract of continent which flretches from the banks of the Volga to Corea, on the fide of Japan;-the molt extenfive religious dominion, perhaps, on the face of the globe. He is not only the fovereign pontiff, the vicegerent of the deity on earth ; but as fuperffition has ever the greateft influence, where it is removed fartheft from its object, the more remote Tartars abfolutely regard him as the Deity himfelf. They believe him immortal, and endowed with all knowledge and virtue. They annually affemble from different parts to wor-
thip and make rich offerings at his fhrine; and even the emperor of China does not fail to make acknowledgments to him in his religious capacity, and actually to entertain at a great expence, in the palace of Pekin, an inferior lama, deputed as his nuncio from Thibet. Accordng to Mr. 'Turner's account, the Thibetians conceive of him as immaculate, immortal, omniprefent, and omnifcient. They view' Lim only in the molt amiable light, as perpetually abforbed in religious duty ; and when called to beflow attention on mortal beings, as employed only in the benign office of dif. tributing confolation by his bleffing, and in exerciling the firtt of all attributes, forgivenefs and mercy. He is alfo the centre of all civil government, which derives from his authority all its influcnce. It is the orthodox opinion among the votaries of the grand lama, that when he feems to die either of old age or of infirmity, his foul only quits a crazy habitation to feek another and better; and that it is difcovered agaia in the body of fume child, by certain tokens known only to the lamas or prielts, in which order he always appears. The dalai-lama, who prefided in Thibet in 1774, when Mr. Bogle was commiffioned by the governorgeneral of Berigal to vifit that country, was an infant, and was difcovered a few years before by the Teeftoo lama, who, in authority and fanctity of character, was next to him; and, confequently, during the other's minority, acted as chief. The refidence of the dalai-lama is at Pateli, or Pontela, an immenfe palace on a mountain near the banks of the Burrampooter, about feven miles from Laffa. On this mountain there are many pagodas, in the molt fumptuous of which he refides. He pafles great part of his life on a kind of altar, where he fits motionlefs, in a crofs-legged pofture, on a large and magnificent culhion, and receives with the greatelt gravity the adorations, not only of the Thibetians, but of a great multitude of pilgrims, whe undertake long and difizult journics to go and worthip him on their bended knees, and to receive his benedictipn. The grand lama falutes no one; he neither uncovers nor rifes up to any perfon, whatever his rank may be; with the farne eyes he beholds at his feet the greateft princes and the meaneft of his fubjects. He contents himfelf with laying his hand on the head of his worfhipper, who imagines that he obtains, by this impolition alone, the remiffion of all his fins. His votaries conceive, that all the divinity of " Fo " relides in him; and they afcribe to him all the attributes and prerogatives already mentioned. Their whole care is employed in difcovering the place where it fhall pleafe him to be born again ; and even fome of the Tartar princes themfelves have allited in this interelting fearch; but they are obliged to be directed by certain lamas, who alone are acquainted with the figns by which the new-born god may be diffovered, or rather, they only know what child the preceding dalai-lama appointed to be his fucceffor. The Teefhoo-lama has feveral palaces or caltles. The cafte in which the lama refides is built of tone or brick, with many courts, lofty halls, terraces, and porticos: and the apartments are in general roomy, and highly finifhed in the Chinefe ftile, with gilding, painting, and varnifh. Stair-cafes and windows are conveniences to which they are utter ttrangers. There is no accefs to the upper rooms but by a fort of ladders of wood or iron ; and in lieu of windows they have holes in the cielings, with pent-houfe covers, contrived fo as to thut up on the weather-fide. Firing is fo fearce, that little is ufed except for culinary purpofes; and they truft altogether for warmth in their houfes to their furs and other clothing. In the northern parts of Thibet there are gold-mines, which are the referved property of the lama, and rented out to thofe who work them. Particular and diferiminativg refpect is paid Vol. XX.
to the forereign lamas after their death. The bodies of thefe are depofited entire in flrines prepared for them, which are ever after confidered as facred, and vifited with religious awe; whereas the bodies of inferior lamas are ufually burnt, and their athes preferved with great care in little metallic idols, which have places affigned them in their facred cabinets.

The lamas, who form the mot numerous as wel! as the molt powerful body in the thate, have the priefthood ertirely in their liands; and beffes they fill up meny munaltic orders, which are held in great vencration among them. The inferior cradations, from the prefident of a monaftery, who is always iflled lama, in addition to the name of the flation to which he belongs, are Gylong, Tohba, and T'uppa. On the eftablifment of the monaflery of Teefhoo Laombon, there were reckoned at that period no lefs than 3700 gylongs for the performance of cialy fervice in the Goomba, or temple: and four lamas, chofen from among them, fuper. intend and direct their religions ceremonies. (Sce Gylosas.). Youth intended for the fervice of the monattery are received on the pllablithment at the age of eight or ten years, and then called "Tuppa;" at fifteen they are ufually admitted into the order of "Tohba ;" and from that of Tolba, if they are found, upon examination, duly qualified, they are advanced to the clafs of Gylongs, between the age of 21 and 24 ; and with fufficient interef, they may then be promoted to the fuperintendence of fome endowed monaftery, and obtain the rank of lama. The priefts are hubited in long robes of yellow cloth, with a conical cap of the fame colour, having flaps to fall down and cover the ears. 'lhis peculiarity of colour diltinguifhes one of the two religious fects that divide almoft the whole of Tartary', from Turkettan to the eattern limits of this continent. The other colour is red; and the tribes are known as belonging to the red, or ycllow cap. The former differ principaily from the fectaries of the yellow, in allowing the marriage of their priefts. But the latter are conlidered as the molt orthotox, as well as poffefled of the greatelt iufluence. The emperor of China is decidedly of this tribe, and has fanctioned his preference of the yellow colour, by a funptuary law, which limits it to the fervice of religion, and the imperal ufe. The two fects are ditinguifhed by the appellations of Gyllookpa and Shammar ; the former having adupted the yellow colour, and the latter the red. Thrce samas are placed at the head of each fect; Dalai-lama, Teeflooo-lama, and Taranaut-lama, prefide over the Gyliookpa, who have their refidence at Pootalah, Tefhoo Loomboo, and Kharka. This fect prevails over the greatelt part of Thibet, and a divifion of it is eltablifhed in a province of the Deccan, called Seurra, or Sirrote. In like manner three lamas a'fo prefide over the Shammar, and have their refidence in llootan, in feparate monafteries. Great contentions formerly prevailed betweer thefe fects; and the Shammar was under a neceflity of retiring, and of fixing in a trait of country bordering on Thibet, towards the fouth, marked by a line, inhofpitable and intemperate in the extreme. Here they ellablifhed them. felves, as in a fecure afylum; while others, thyled Dukba, ftill live in tents and tend their flocks in a vagrant ftate. But to return from this digreffion.-The inhabitants of Thibet are not the only people who may attain to the dignity of lama. Tartari, and even Chinefe, have afpired to the priefthood, and repaired to Laffa in hopes of obtaining it. If they can be admitted among the difciples of the grand lama, the number of whom is fixed at 200 , they confider their admiffion as the commencement of their promotion, and the firlt ftep towards dignity and power; the fubaltern grand lama being chofen from among thefe difciples. When

Dd they

## L. A M

they have arrivel at this dignity, they live in Eplendour and opulence, and are continually timrounded by a crowd of adorers, who load thens with prefents. The richuct and mof conliderable of the Tartar lamas, who inkalit Thibet, are thofe whom the Clinefe call "Mong-fan ;" they pulfefs extenfive domains to the north of the procince of Yun-man, between the beautiful rivers of Kinche-kiang and Vouleang. Thefe lands were granted to them by Oufan-guei, who became mafter of Yun-nan, when the Mantchew Tartars fubdued China, in order to bring them over to lis party, and that by their means he might gain the fupport of all the lamas of Thibet. Although the Mantclew Tartars had never any lamas, they no fooner undertook the conqueft of China, than they protected them openly through policy; and foon after, government caured magnificent pagodas to be erected for them. The example was folloved by a grear number of princes, princeffes, and wealthy people, who vied with one another in zeal for building tem. ples for them, and thus the lamas greatly multiphied in China. They are alfo rich there; for moit of thefe lamas appear in public in veltments of red and yellow fattin, ornamented with the moft valuable furs. They are all mounted on excellent horfes, and followed by a number of donsitics, correfponding to their rank as mandarius; for the emperor pernits them to carry a cunlion and the other badges of dignity which belong to the quality of mandarin. The lamas of Thibet are lefs magnilicent in their drefs; wearing only a napped kind of woollen ftuff, cailed in Chira'" poulou," which is ufed for coverins feat, becaule it generally latts long and retains its colour. Belides a cap, the lamas have feveral bonnets, or tijras, that are the dithinguinhing marks of the different degrees of hoonour to which they have arrived. The cap, which ftrikes the Eurupean moll, very much refembles a billop's mitre : it is worn by them on horreback as well as on fuot. The obligations which the office of lama impofes are ueither. fev nor trifling; but there is not one among them who ensarges to ditclarge them all. They divide and flare the burden. One takes the clarge of obferving one precept, and another oblizes himfelf to pratife amother. They have alfo certain common prayers, whicl- they chaunt in a very agreable nannur ; and they are obliged to renounce the winities of the world, to live in celibacy, and to have no concera in trade or commerce.
The lamas are extremely fuperflitious, and much addicted to magic. Grolier's China, vol. i. Phil. Tranf, vel. 1 svii. part ii. Turner's Account of an Embalify to the Court of the Tefhoo Lama, in, Thibet, 1805 .
LATIALMON, in Gegrrapbj, a lofty'mountain and fpacious dittrict of Abyflinia, where is the pafs through which the road of all caravaus to Gondar lics; and where they take account of all bagexage and merchandize, which they tranfmit to the Nagade Ras, or chief officer of the culltoms at $G$ ondar. Here is alfo levied, with great rigour, and for the molt part with injuftice, a payment due to the proprictor of the ground. From its bafe this mountain has the appearance of being flarpp-pointed; but on the top of it is a large plain, called Lama, part laid out in palture, but the greater part bearing grain. It aboinds with fprings, and feems to be the great refervir from which arife molf of the rivers that water this part of Abyfinia. A multitude of treams iffue from the fummit in all direc. tions; the fprings boil out from the earth in large quantities, capable of turning a mill. They plough, fow, and yeap here at all feafons; and the hurbandman mult blame lis own indolence, and not the foil, if he bas not three hasreels. In one place, fays Mr. Bruce, wc faw people
bufy curting down wheat; immediately next to it, others at the plough; and the adjoining lield had green corn in the car, and a little further, it was not an inch above the ground. Lamalmon is on the N.W. part of the mountains of Samen: that of Gingerohha, with two pointed tops, joins it on the north; but neither Lamalmon nor Gingerohha, though ligher than the mountains of Tigré, are equal in height to fume of thofe of Samen. The mercury in the barometer on the top of Lamalmon Hood at $20 \frac{7}{8}$ Englifh inches. The language of 1 ,amalmon is Amharic; but there are many villages where the language of the Falatha is fpoken. Thefe are the ancient inhabitants of the mountains, who Atill preferve the religion, language, and manners of their ancelors, and live in villages by themfelves. Their number is confiderably dimininned, and they are now wholly addicted to agriculture, hevers of wood, and carriers of water, and the only potters and mafons in Abyfinia. In general they live better than the other Abyffinians, which they, in revenge, attribute to their Akill in magic, not to fuperior induftry. Their villages are generaly ftengly fituated out of the reach of marcling armies, or otherwife they would be conttantly rilled, partly from hatred, and partly from hopes of finding money. The river Macara is the boundary between Lamamon and Waggora; and the latisude of fume fmall villages called Macara was $136^{\prime} 8^{\circ \prime}$. Bruce's Travels, vol. iii.

LAMANON, Robert Pacl, in Biograppy, a member of the Acadeny of Sciences at Paris, and member of the Mufemm in the fame city, was born at Salon, in Provence, in 1752 , of an old and refpectable family. He was deftined for the church, and fent to Paris to comp'ete his theological thudics. He rofe to the dignity of canon, but by the death of his father and elder brother he came into property, which enabled him to fullow the bent of his inclinations, by deroting limfelf to the phyfical fciences. He travelled through Provence and Dauphince, and faled the Alps a:rl Pyrenees: "at the fiyht of thefe vaft natural laboratories the bent of his mind burtt forth initantaneouly; he climbed to the fummit of rocks, and explored the abyfs of caverns, weighed the air, analyfed fpecinens, and, in this ardent fancy, having attained the fecrets of creation, he formed a new fyitem of the world." Upon his return home, he applied with great arduur to the fludy of metecrology, natural philofophy', and the other branches of the hiltory of mature. He fent three years at Paris, and gave to the learned focieties, there many very valuable papers, particularly a memoir on the Cretans, a memoir on the theory of the winds, and a treatife on the alteration in the courfe of rivers, particulatly the Rhone. He again wifted Sxitzerland and Italy, going fir! to Turin, where he allied himfelf to the learned of that country: after his return, laden with the fpoils of the countries which he traverfed, he employed hinfelf in the arrangement of the interclting fruits of his foursey. It was at the time when Lananens was preparing for the prefs his great work on the "Theory of the Earth," that the French government conceived the valt project of compleing the difcoveries of capstain Cook: the A cademy of Sciences was entrufted with the care of felecing men capable of reaifying the common nutions of the fouthern hexifphere, of improving hydrography, and advancing the progrefs of natural hiftory ; they invited, at the recommendation of the ilultrious Condorcet, Lamanon to Ghare the danger, and to partake in the glory, of this great enterprize. He eageriy catched at the offer, haltened to Paris, refufed, in a conference with the minifer, the falary offered him, and taking a hatty leave of his friends, departed for Dreft. On the att of Auguit,

y 785 , the armament fet fail under the orders of La Peroufe, an experieuced commander: the commencement of the vogage was highly profperous. After fome delays, and having embraced overy opportunity of making obfervations, the veffels arrived at the ifland of Maouna, one of the fouthern Archipelago. Lamanon, eager to affure himfelf of the truth of the accounts of that conntry, debarked with Langle, the fecond in command. Having explored the place, and being upon the point of returning, they were attacked by the natives; a combat enfued, and they, with feveral of the boat's crew, fell a facrifice to the fury of thefe barbarians. Thus periflued 1 amanon, a young man ardent in the purfuits of fcience, dilinterefted in his principles, and a zealous advocate for the interells of freedom. His culogit, M. Ponce, faid of him, "that he feemed born to bring about a revolution in fcience; the depth of his ideas, the energy of his character, the fagacity of his mind, united to that lively curiofity, that can draw in!truction out of every thing which he faw, and which leaves nothing unexplored, would have led him to the molt valuable difforeries."

LimANTEA, in Geograply, a town of Naples, in Calabria Citru; 12 miles S.W. of Cofenza.

LAMARCKIA, in Botany, is a cryptogamic, and, in every fenfe, very obfcure genus of marine plants, founded by the Abbate Jofeph Olivi, in his Zoologia Adriatica, an Italian work in quarto, publifhed at Baffano in 1792, and treating of various matters relative to the natural hillory of the gulf of Venice. What relates to the prefent genus is copied into Utteri's Annalen, $f=1 \mathrm{c}, 7,76$. It was named in honour of the celebrated French botanift John Baptilt Monet, Chevalier de la Marck, who, fince the French revolution, has adopted Lamarck as his furname. His indefatigable application and fkill in the fcience of botany, are evinced by his Dictionaire, and his Illufiration des Genres, fo often quoted by us. He has, however, for fome time withdrawn himfelf from the former work, devoting his attention to conchology. Of his claims to botanical commemoration, there can be no doubt ; but he has already received this reward of his labours, in the Monetia of L'Heritier, adopted in Willdenow, Sp. Pl. v. I. 669, and the new edition of Hort. Kew. v. 1. 264 ; nor can we on any occation confent to the unauthorized and truly foolifh contrivance, of naming two different genera after one and the fame perfon. If we retain the Butea of Koenig, for inftance, it mult be in honour of the late marchionefs of Bute, not of the firft earl, already jully immortalized in the Stuartia of Linnxus. It is however extremely probable that Olivi might be ignorant of the Mionetia; or be might prefer for it the name Azima, fubfequently given by Lamarck himfelf, but whofe meaning we know not. See his Dict. v. I. 343 .

The Burfa marina of Crfalpinus and Bauhin, and the Vermilara retufa of Imperato, have given occation to the eifablifment of the prefent genus, whofe character is thus given by Olivi.

Plant rooted, fomewhat coriaceous, foft, compofed of minute bladders, perpendicular to the axis, which are membrayous, green, cylindrical, approxımated, terminating at each end in very flender, tubular, connecting tilaments. Fruaification confifting of finall globes, fcatered among the bladders and filaments.

The fpecies are
x. L. Burfa. Pouch Lamarckia. (Alcyonium Burfa; Linn. Syit. Nat. v. 1. 1295. Pallas Zooph. 352. Burfa maxina; Cæfalp. 608. Bauh. Pin. 368. Fucus Burfa; 'Tum. Fiit. Fucor. v. 3. G. t. s36. Engl. Bot. t. 2183.)
-Globofe, depreffed, hollow, with fine, fcattered, internal threads. - Found in the fca in various places, efpecially upon limeitone rocks, moft commonly attached by ita roots to fome fmall calcareous fragments. "Each plant is a hollow fpongy ball, from one to ten inches diameter, green, compofed of entangled, pellucid, jointed fibres, bearing numerous concentric oblong veficles, whofe obtufe fummits, reaching to the outfide of the ball, give it a papillary or velvety appearance. Such at leaft was the flructure of the fpecimens deferibed in Eingl. Bot, mor have we found the bladders connected at each end with the filaments. The roots were attached to fragments of flectls. No frutification could be detected, and the plant was referred to Fucus, after Mr. 'Turner's exampie, merely till the whole fubject of fubmarine plants fhould be better underftood. Ohns fays, that when cut it contracts mechanically, by means of the internal fibres, which he fuppofes gave rife to the opinion of its being an aminal, or Alcyonium.
2. L. Vermilara. Branching obtufe Lamarckia. Ver. milara ritufa; Imperat. Hilt. Nat. 646. Ulva decorticata; Woodw. Tr. of Linn. Soc. v. 3.55 )-Branched, fomewhat forked, cylindrical, and obtufe.-Native of the Mediteranean fea, in deep water - This has the form of Fucus loreus, with a refemblance in its furface and colcur to F. tomentofiss. Mr. Woodward, who faw but one \{pecimen, brought from the Mediterrancan, found great difficulty in fettling its genus. Its it macture refembles an Uiva Itripped of the cuticle. There can be little doubt of ats generic affinity to the abave. S.

Lamarceia is alfo the name of a genus eftablihed by Moench, and adopted by Decandolle in his new edition of Lamarck's Flore Frangaife, v. 3. 30, as well as by Bivona Bernardi, in his Sicularum Planlarun, Cenuuria 1, n. 40. This genus confifls of one fpecies only, as far as we are informed on the fubject, which is Cynofurus aureus of Linnæus, figured in the Flora Greca, t. 79, a beautiful grafs, but we are at a lofs to imagine any character by which it can be feparated from Cynofurus; fee that article

A New Holland flrub, belonging to Tefrandria Monogynia, has been called Lamarckia dentata, in Donn's Horto Cantabr. ed. 5. 32. We are not acquainted with it characters, but prefume it is what fume have named Hoy 3 ferrata.

LAMAS, in Geograpby, a town of Portugal, in the province of Tras los Montes; is miles S.W. of Braganza. -Alfo, a town of Spain, in Galicia; 15 miles E.S.E. of Lugo.-Alfo, a town of Peru, in the diocefe of Truxillo; 180 miles E.N.E. of Truxillo.

LAMB, in Agricalture, a general name applied to the young of the fheep kind. When lambs come early in the feafon, great care fhould be taken to keep them dry and warm, as well as to provide a plentiful fupply of food for the ewes, and always to let them have the drieft paflures, as without due attention to fuch circumitances, much lofs will frequently be fuftained by their dying, or remaining long in a weakly ftate, almoft without growth.

It is obferved by Mr. Young, that "there is no bufinef3 on a farm that demands more care, attention, and a/fiduity," than that of ewes in lambing feafon. "As foon as the farmer looks for the ewes beginning to lamb, they ought, he thinks, every night to be folded in the itanding littered fold, on one fide of which there fhould be a fmall cottage hur, built to be warm, with a chimney and Itove'for heating mik' and a bed for the fhepherd to lie down upon. Here he is to neep through the lambing feafon, that he may be ready to watch, aflith, and tend any ewes that he fees very near lamb.
ing, and, if neceflary, to give the lamb fome warm cow's milk. Some of the confiderable Norfolk farmers, have, he obferves, thefe huts on four wheels, to draw about with the flock wherever they may be; but to have one littered and well fheltered ftanding-fold, on a moderate farm, and two or three conveniently placed on a large one, to take the flock to, without any ditant driving, is, he fuppofes, far preferable to that method. And he advifes, that upon inclofed farms, where the referve of rouen may be fuppofed to be much greater than is generally poffible on flock-farms, the theep, as they drop their lambs, thould be drawn from the flock of ewes, and put to this food, upon which an entire reliance may be had;" and that i: ीoouk be remembered, that all turnips fhould be confumed in February, which circumatance proves the valt importance of referved grats as a fubltitute. Towards the clife of Jniv the lambs of the flock thould be watened; in this bufinefs, it is noticed, that they are much earlier in Suffex, than in Suffolk. And that "clovei in blofom is, of all other food, the molt forcing ; fintfoin rouen exceilent; and if the farmer has neither, he ought to have made a reforve of a fweet good bite of frefh grats for them;" and that it is effential that due provifion thould have been made before this period. See Sirmer.
L.smb-houfe, in Rural Economs', by the farmer the common name of the place where lambs are fattened. It is fometimes termed fuckle. A proper rack and trough mould be fixed up in it. See Lamb fucking.

Lamb-fuckler, a common name applied to the perfon who practifes or carries on the bulinefs of fattening huefe-lamb. See the next article.

Lamb-fickling, a name ufed to fignify the art of fattening houfe-lamb.

It has been obferved by the author of the Agricultural Report of the County of Middlefex, that, in the performance of this bufinefs, the ewes which begin to lamb about Michaelmas, are kept in the clofe during the day, and in the houfe during the night, until they have produced twenty or thirty larbs. Thefe lambs are then put into a lamb-houfe, which is kept confantly well littered with clean wheaten ftraw; and chaik, previoully baked in the oven, both in lump and in powder, is provided for them to lick, in order to prevent loofenefs, and thereby preferve the lambs in health. As a prevention againtt gnawing the boards, or eating each other's wool, a little wheat ftraw is placed, with the ears downwards, in a rack within their reach, with which they amufe themfelves, and of which they eat a fmall quantity: In this houfe they are kept, with great care and attention, until fit for the butcher. Whe mothers of the lambs are turned every night, at eight o'clock, into the lambhoufe to their offspring. At fix o'clock in the morning, thefe mothers are feparated from their lambs, and turned into the paltures; and at eight o'clock fuch ewes as have loft their own lambs, and thofe ewes whofe lambs are fold, are brought in, and held by the head till the lambs by turn fuck them clean: they are then iurned into the patture; and at twelve o'clock the mothers of the lanbs are driven from the palture into the lamb-houfe for an hour, in the courfe of which time each lamb is fuckled by its mother: At four ockcek all the ewes that have not lambs of their own are again brought to the lamb-houfe, and held for the lambs to fuck; and at eight the mothers of the lambs are brought to them for the night. And where an ewe gives more milk than her lanib will fuck, the fuperabundance is given to the twins, or to any other lamb whofe mother may not be ablé to furnifh it with fufficient food. The fhepherd mult in this cafe hold the ewe, or fhe would not fuffer the Atrange lan $b$ to fuck. From their timid nature, it is extremely effential
that they fhould be kept free fron every fpecics of un. neceffary difturbance. 'This method of fuckling is, it is ohferved, continued all the year. The breeders felect fuch of the lambs as become fat enough, and of proper age (about eight weeks old) for flaughter, and fend them to market during December, and three or four fucceeding months, at prices which sary from cne guinea to four, and the relt of the year at about two gumeas each. 'This is fevere work for the ewes, and fome of them die under excefs of exhaultion. However, care is taken that they have plenty of food: for, when grcen food, wiz, tumips, cole, rye, tares, clover, \&c. begrins to fail, brewer's grains are given them in troughs, and lecond-crop hay in racks, as well to fupport the ewes, as to fupply the lambs with plenty of milk; for if that fhould not be abundant, the lambs would become ftunted, in which cafe no food could afterwards fatten them. It is renarked, that grains were firlt given to ewes by the late Mr. Naylor, of this county, and that he allo was the firt perfon who pulled out all the remaining front teeth of a broken mouthed ewe; obferving that they fed much better without teeth than with the lofs of one or two.

The ewes for this purpofe thould be kept free from the foot-rot and icab; and if they have any pitch-mark on them when they lamb, it muit be cut of before the lambs be taken into the houfe, or they will eat it, and thereby greatly prejudice their future growth.

And thele ewes are always, the anthor of the Middlefex Report fays, without exception, of the Dorfethire breed; and even of thefe there is not more than one in three that will lamb fufficiently early for the purpofe of houfe-lamb. The early lambing ewes are fought for by the breeders of this county with great duligence throughout the county of Dorfet, and at the fairs where fuch flock is ufually fold. The prices vary from 35 s. to 42 s .

Such lambs as can be warranted of a fair complexion after being burchered, are held in the highelt elteem, which thofe bought promifcuoully in Dorfetfhire, or at the fairs, cannot be: this preference induces thofe breeders and fucklers who are in the lecret, to felect rams which they can depend on for getting lambs whofe mest fhall be of that quality. The fucklers, falefmen, and butchers of London, he afferts, are aware that $f:$ ch lambs as have fharp barbs on the infide of their lips are certainly of a deep colour after being butchered; and all thofe whofe barbs are naturally blunt do as certainly produce fair meat. This knowledge has been the occafion of many lambs of the latter kind being kept for rams, and fent into Dorfet thire, exprefsly for the purpofe of improving the colour of the fleh of the houfe-lambs. The iffue of fuch rams can generally be warranted fair, and fuch meat always fells at a higher price : heace he fuppofes arofe the miftaken notion, that Middlefex rams were neceflary to procure houre-lambs. And it has been further obferved, that, " in order to conduct this fort of fattening with profit and fuccefs, a lamb-houfe or fuckle of proper dimentions muft be provided." And that, "it iṣ found from practice, that a range of building from fixty to feventy feet in length, and fifteen or eighteen in breadth, with three or more coops or divilions of different fizes at each of the ends, for feparating the lambs according to their ages, is fufficient for containing and conducting the bufinefs of from one hundred and fixty, to one hundred and eighty lambs. That the lambs may be enabled to find their mothers with facility, the ewes, when they are feparated from them, fhould be kept apart with deal hurdles in the middle of the houfe, fo that they may be convenient for the lambs in the coops at the ends.

But this is a practice which can only be undertaken with advantage,

## L A M

## L $\AA \mathrm{M}$

advantage, in fituations at no great difance from large towns, where there is great demand for early lamb; as upon their being ready at an early period, as towards the latter end of December, depends the great prolit to be derived from the fyitem.

The principal objects in this fort of management are thofe of attending to the regular feeding of the ewes, the varying of their food with propriety, and keeping the houfe perfectly warm, clean, and fiveet, fo that the procefs of fatiening may proceed in a regular manner without any check being fuftained.

The writer of the Middlefex Report obferves, that a friend of his, who is well acquainted with the fubject, fays, the farmers of Middlefex do not now rear half fo many houlelambs as they did about forty years ago. In Surrey they are likewife falling off. The fuckling fyltem is removing to a greater dittance from the metropolis, to which place many fat lambs are now fent alive, in light fou:-wheeled covered carriages.

Lanb, Grafs, the name of fuch lamb as is principally fattened while the ewes are at grafs, or other kinds of green food. In the Report of Midd'efex, it is remarked, that the vicinity of Smithfield market, makes early grafs. lambs an object of confiderable importance to the farmers of that county. The Dorlet ewes are chiefly iclected for this purpofe. They are purchaled at Weyhill, Kingllon, and other fairs, forward enough to drop their lambs in January. The price from 30 . to $35^{s}$. The breeders keep the ewes and lambs principally on turnips and fecond-crop hay. They fell the lambs in the months of April and May, fat, at from 25 . to upwards of 35 s. each. The ewes, being dried early, are fattened and brought to market about Michaelmas, and fold at the fame prices. The wool is about three pounds, which, at $10 . l$. amounts to 2 s .6 d . The whole of the itock is cleared within the year, and the profit or lofs thereby afcertained. The account in general is as follows:

Statement.

Lamb, Houfe, a term applied to that fort of lamb that is fed and fattened in houfes conltructed for the purpofe. The principal art in this bufinefs, as has been feen above, is to have the lambs fuch as will turn out of a fair delicate colour on being killed, and having them ready at an early period of the feafon. See Lamb-fuckling.

Lamb-Earth, in Hufbandry, is a whitith fony loam. The name feems only a corruption of the word loam-carth.

Lamb Hea.l, in Geography, a cape of Ireland, forming the morthern point of the entrance to Kenmare river, in the county of Kerry. N. lat. $51^{\circ} 41^{\prime}$. W. long. 10 $1^{\prime}$.

LAMBASSA, in Ancient Geograply, a town of Africa, in Numidia, which became an epifcopal lee.

LAMBATIVES, or rather Lambitiven, in the Matcria Medica, a form of medicine to be licked off the end of a liquorice-ttick.

Lambatives amount to the fame with linchefes, lolocks, and celegmas.

LAMBAY, in Geograpby, an ifland belonging to the county of Dublin, Ireland, lituated in the Irifh lea; 2 miles eaft from the Mainland. It is ahout three miles in length, and $\mathrm{I} \frac{1}{3}$ mile in breadth, and is remarkable for salic quantities of rabbits and fea-fowl. Crabs, lobtters, and oyfters are taken in great plenty; and abundance of kelp is made on it. N. lat. $53^{2} 30^{\prime}$. W. long. 6. Carlifle, \&c.

LAMBAYEQUE, a town of the vice-royalty of Peru, and capital of the jurifdiction of Sana. in the diocefe of Truxillo, in a pleafant and fertile fituation, and containing about 1500 houfes, fome of which are built of brick, fome of cane and plaiter, and others altogether of cane. The inhabitants amount to about 8000 ; fome are opulent ; but the greater number confilts of poor Spaniards, Mulattoes, Meftizos, and Indians. The parifh church, constructed of ftone, is large and beautiful, and fplendidly adorned. It has four chapels, called "Ramos," with an equal number of priefts. This town is the refidence of a corregidor, who has many other towns under his juriddiction. It is wafhed by a river of the fame name, 95 miles W.N.W. of Truxillo. The high road from Piura to Lima paffes through this town. Some wine is made in the vicinity, and the poor are occu. pied in weaving coarle cotton cloths. S. lat. $640^{\prime}$. W. long. $79^{\circ} 56^{\prime}$.

LAMBDOIDES, in Anatomy, the future connecting the occipital to the two parietal bones, and fo named becaufe it confilts of two lateral divergent branches like thofe which compofe the Greek capital lambda. See Cranium.
LAMBECIUS, Petir, in Biograpby, was born at Hamburgh in 1625 , where he received the early part of his education, and from whence he proceeded to the univerfities of Holland and France to purfue and complete his ftudies. He made great progrels in polite literature and the law, and at the age of ninetcen he became known by a work on Aulus Gellius. He was elecied licentiate-in-law at Touloufe; he fpent two years at Rome with cardinal Barberini ; and on his return to Hamburgh he was appointed to the profefforthip of hiftory in $16 ; 2$; and in 1660 was made rector of the college in that city. He was rendered extremely uneafy by being charged with feepticifm, and by the temper of his wife, whom he had married probably becaufe the was rich, but who refufed to let him fare in her abundance. In 1662, he therefore abandoned his family and country, and went firit to Vienna, and from thence to Rome, where he
reas favourably received by Chriftins, queer of Sweden, and pope Alexander VII. He now openly abjured Lutheranifm, and declared himelf a Catholic, to which religion he had beer converted many years before. Returning to Vienna, he was appoiated fub-librarian, and then librarian-in-chief to the emperor, in which poft he died in 1680 . Lambecius was author of many works, as "Origines Hamburgenfes," in 4 to. ; "Codini et alterius ano. nymi excerpta de Antiquitatibus Comlantinopul." Greek, with a Latin verion and remarks, fol. 1655: "Prodromus Hitorice Litterarix," fol.; "A Colicction of Latin Difcourfes on varions Oecalions," to. 1660; but the moft laborious of his performances was entitled "Commentariorum de Augufla Bibliotheca Cxfaria Vindobonembi," in cight volumes, fulio. This work contains a hittory of she imperial library at Viema, with a deferiptive cataloguc of its mumerous MSS. upon a critical and hillorical plan. Moreri, Bayle.

## LAMbeNT Fime. See Frre.

Lambert', Anaa-Thereid de Marguriot de Councelles, Miurcbionejs of, in Biorruphy, a celebrated literary lady, was born at Paris in i $10+\%$. Her father died while fhe was an infant, and her mother took for a fecond hufband MI. Bachaumont, who was exceedingly careful to cultivate the promifteg talents of his daughter-in-liww. She married Heary Lambert, marquis of St. Brie, in 1666, who died in 1686. leaving her with one fon, and a daughter. She was involved in tedious law-fuits, which, by her great addrefs, were brought to a happy conclufion. When fle felt herfelf unembirrafied, and miltrefs of a confiderable eftate, the fixed her relidence at Paris, and devoted herfelf to letters, and the fociety which culivated them. The latter days of this lady were crowded with fufferings, which the confolations of religion ewabled her to erdure with fortitude. She jlied at a very advanced age in 173 , Her principal works are "Les Avis d'une Mere à fort Fils: et d"une Mère à fa Fille ;" "Nouvelles Reflections fur les Fernmes, ou Metaphyfique d'Amour ;" "Traité de l'Amitie"," Of thefe, and of her other works, the tyle is elegant, and the thoughts ingenious. The "Advice" to her children breathes all the tendernefs of a parent, joined to the correctnefs of fentiment of a philufophical moralilt. The heart of Madame de Lambert was as warm as her underftanding was enlarged; the ferved her friends with zeal, and delighted in acts of generofity.

Lasbert, Fraxcis, a French monk, who quited his convent to embrace the reformed religion, defcended from a noble family, was born at Avignon in the year 1487 . At the age of fifteen he entered himfelf among the Francifcan friars: and continued in the community twenty years; during which time he acquired celebrity as a preacher, and was made general of the order. He was a thoughiful man, and $\lambda$ diligent enquirer after the truth; and in the courfe of his invertigations he faw reafon to renounce the doctrines of the Satholic church, and to adopt thofe of the Reformation. Ife, of courfe, found it neceerary to withdraw from his native country, and in 1522 he went into Switzerland. He became a popular preacher among the Proteltants, and having continued fome time at Batil, he fet out for Wittemberg to vilit Luther, in the year 1523 . With that eminent reEormer be grew into high efleem, and it was determined he thon!d go to $Z$ urich, to affilt in diffeminating the principles of the reformation through France. The project was abandoned, and he was fettled in fome employment in the univerfity of Wittemberg, where he molt probably continued till the year 1526 . In the following year he was appointed divinity-profeflor at the univerfity of Marpurg, and in 1530
he dicd at the age of forty-three. He was author of commentarics on alnoft all the parts of the Old and New Teftament, and of many theological and controverfial picces. Bayle. © Moreri.
lambyrt, Johs Hemry, an eminent mathematician and aftronomer, was born at Muhlhaufen, in the Sundgaw, a town in alliance with the Skifs cantons, Aug. 29th, 1728. Ifis father was by trade a ftay-maker, and with difficulty provided for the wants of his familf. Having no better profpects for his fon than by bringing him up to his own butimef, he endeavoured to obtain for him an education fuitable to his fituation, and fent him to a public fchool, where he was taught the rudiments of learning, at the expence of the corperation, till he was twelve years old. Here he dittinguifhed himfelf among his !chool-fellows, and fone attempts were made to provide him with the means of Aludying theology as a profeffion. Lincouragement fufficient for the parpofe could not be obtained, and he was under the neceifity of relinquilhing all thoughts of a ftudious life, and ubliged to begin learning his father's trade. Though occupied a! the day, yet he devoted a confiderable part of the night to the profecution of his ftudies; and to furnifh himfelf with cardies, he fo'd for half-pence or farthings finall drawings which the delinented while employed in rocking his infant filter in a cradle. He met with an old book on the mathematics which gave him inexpreffible pleafure, and which proved that he had a genius for fcientific purfuits. Seeing the turn which the young man had for knowledge, feveral learned men afforded him affiltance and advice, and they had the pleafure of firding him improve, under their patronage, with a rapidity beyond their molt fanguine expectations. He was now taken from the drudgery of the fhop-board, and M. Ifelin, of Bafil, engaged him as his amanuenfib, a fituation which afforded him an opportunity of making further progrefs in the belles-lettres, as well as philofophy and mathematics. In 1748 , his patron recommended him to baron Salis, pretident of the Swifs confederacy, to become tutor to his children, in which office he gladly engaged. His talents as a philofopher and mechanician began to difplay themfelves in his inventions and compolitions. After living eight years at Coire, he repaired, in 1756, with his pupils, to the univerfity of Gottingen, where he was nominated a correfpanding member of the Scientific Society in that place, and from thence he removed, in the following year, to Utrecht, where he continued twelve months. In 1758, he went with his pupils to Paris, where he acquired the efteem and friendhip of D'Alembert and Meffier ; and from thence he travelled to Marleilles, where he formed the plan of his work "On Perfpective," which he publifhed in the following year at Zurich. In 1\%60, he publifhed his "Photometry," and was elected a member of the Electoral Bavarian Scientific Society. Lambert was author of many other pieces befides thofe which have been already mentioned: among thefe were his "Letters on the Conitruction of the Univerfe," which were afterwards digelted, tranflated, and publifhed under the title of "The "Syltem of the World." In the year 1764 , he made an excurfion to Berlin, where he was introduced to Frederick II., who, fenible of his great fervices to fcience, gave directions to have him admitted a regular member of the academy; this appointment enabled him to devote himfelf wholly to the purfuit of his favourite ftudies. He enriched the tranfactions of feveral learned focieties with his papers and freatifes, fome of which he publifhed feparately. He died Sept. 25th, 177\%, when he was in the 5 cth year of his age. Molt of his mathematical pieces were publifhed in a collective form by himfelf in three volumes, in which almoll every branch
of mathematical feience has been enriched with additions and improvements. Eulogy prefixed to "The Syftem of the World." London, 1800.

Lamaent, Jons, a ditinguined general on the fide of parhament during the civil wars of Charles I., was defcended of a good family, and was, at the commencement of the troubles, a fludent of law. He had a fuperior command at the famous battle of Nafeby, and on account of his akill and prowefs he became a favourite of the independent party, who endeavoured to obtain for him the lieutenancy of Ireland, but the Prefbyterians carried it againit him in favour of Waller. He was conlided in by Cromwell, to whom he was confidered as fecond in rigour and military talents, and whom, it is faid, he equalle! in ambition. He oppofed the project of making Cromwell king, though he had a great hand in placiug lim protector at the head of the flate. He fell into difgrace, and retired with a penfion to Wimblecion, where he employed himfelf in cultivating his garden; but upon the death of the protector he returnced to public life, and was extremely ufeful to the party of Richard. Monk was the great rival of Lambert, and as the former was fucceffful, the latter was not only humbled, but made prifoner and committed to the Tower. At the reltoration, he and fir Heary Vane were excepted from the act of indemnity: he was brought to trial and condemned, but by humble fubmiffion he was reprieved at the bar. He was banihihed to Guernfey, where he furvived forty years. Hume.

Lambert, Geonge, was among the firl Englilh artifs who obtained celebrity upon the revival, (if it may be fo called,) of painting in this country; which now itands fo juftly exalted in arts as well as arms, among the nations of Europe.

Lambert's tafte led him to admire and to imitate the ftyle of Gafpar Pouffin in landfcape; and he has produced feveral works of confiderable merit ; which, if they have not the brilliancy and force of Gafpar, are rich, and abound with beauties of a gentler kind. He alfo painted ficenes from common nature, and at the Founding holpital may be feen one he prefented to that inftitution, which is deferving of very great praife. He was engaged to paint fcenes for the play-houfes, for which his pencil was peculiarly qualified, and, in concert with Scott, painted fix large pictures of their fettlements for the Laf India Company, which are placed at their houfe in Leaderhall-ftreet. He died in 1765 .

Lambert, Michel, was the favourite finging malter, and compofer of fongs in France, about the middle of the feventeenth century. He had fo many fcholars, that he was obliged so teach a confiderable number at a time, and at his own houfe, where he formed a kind of academy, and where he finithed every leffor with linging, to his own accompaniment, feveral fongs to a briliant and enraptured audience. Marcel, the celebrated da:cing-mafter, did the fame, dancing with his beft fcholars at the end of the leffons which he gave at hume on his public days. The reputation of Lambert, like that of Abelard, was fo great, that his pupils followed him into the country as far as Puteaux, where he had a villa. Lulli married the daughter of this mulician, who was born in 1610, and died in 1696.

Lambert, Abbéde St. Bemtin, in 1095 taught grammar, dialectics, theology, and mulic.

Thefe fciences, at that time, were equally refpected, mufic having no other object than the praifes of the divinity.

Lambert, de, Saint, publifhed, in 1702, "Les Principes du Clavecin," or Inftructions for the Harpfichord, containing, a clear explanation of all that concerns the clavicr, or keys, in their rutation on that inftrument; and "A Treatife of Accompaniment," for many infruments. St. Lambert,
in his influctions for the harpfichord, propofes the reducing all ciefs to one, in order that the two hands thould play from the fame clef. Monticlair has new-modelled this fyltem, to adapt it to the five lines, or thaff, and grencral compafs of the voice: and the abbé de la Callagne, in his lifennents of Singing, has adopted this fyttem and extended it. The batis of which being nothing more than tranfpofition, it is now become wholly ufelefs, by the clear and fimple manner in which mufic is taught, that is, without traufpofirion, and by playing every thing juft as it is written. This is M. Laborde's account of thefe publications, in which he feem; not to know, that the plan of abolifhing all clefs bnt nus belongs not to any of the gentlemen who have pultiihed it. in France, but io our countryman Salmon, who, in the tine of Charles II. publifhed "An Effay to the A dvancement of Mulic, by calfing away the Perplexity of differen: Clefs, \&ec." and when M. Laborde fays, that fuch a reformation is not wanted, becaufe mufic is now tanght in fo clear and fimple a manner, as to render all clefs but the treble and bafe ufed in harjpichord pieces unneceflary ; that inteiligent author forgets to tell us how performers un seyed inftruments are to be enabled to play, from the foore of a chorus for voices and inftruments, in which the rocal parts and many of the initrumental are all written in different clef. But for a further difcufion of this fubject, fee the article Cles.
Lasbbert, in Geograpby, a town of Canada, on the river St. Lawrence. N. lat. $45^{\prime} 34^{\prime}$. W. long. 73 14'.

erum of many leaves, imbricated, coloured, deciduous. ceptacle fat.

Obs. We have borrowed feveral corrections of the original characters of this genus, from the able performance of our fricnd Mr. R. Brown, publifhed in the Tranfasions of the Limncan Socicty, v. so, illuttrative of this who'e natural order of P'roteacec. If we differ from him in terming corolla what he calls caly, it is a matter of opinion, attended with much doubt. 'T'ine late Mr. Dryander, however, agreed in this point with us.

One fipecies of Lambertia only was originally known, the formofit, to which Mr. Brown adds three others. We hall give them in the order he has chofen. He remarks, that "they are all very beautiful florubs, with whorled branches. The leaves are three in a whorl, montly undivided, entire. Involucrums terminal, folitary, coloured, moftly fevenflowered, rarely fingle-flowered; in the former cafe the flowers are ranged in two whorls, correfponding with the difpolition of the foliage, and having an odd terminal one; hence it is probable fome fpecies with four flowers only may exill. The folicle is almoit wedge-fhaped, furnihed at the edges, upwards, with points, fométimes clongated into horns, and fometimes the fides are armed with prominences."
I. L. uniffora. Brown Tr. of Linn. Soc. v. 10. 188."Flowers folitary in each involucrum. Leaves abovate, with a foint, limooth, reticu'ated. Follicle pointed at one fide, without horns. "-Gathered by Mr. Brown in Lewin's Land, on the fouth coatt of New Holland, growing about rocky inlets, near the fhore.
2. L inermis. Ibid.-"Flowers feven in each involucrum; twice as long as is inner leaves. Style fmooth. Follicles pointed at one fide, without horns. Leaves oblanceolate or obovate, pointlefs"-Native of the flony lides of hills in Lewin's Land. - L. formofi, rar. longifolia, Andr. Repor. t. Go, agrees in muft refpects with this, though not cited in Mr. Brown's Prodromus, where he has omitted it as a fynonym of true formoftu. The fruit drawn in this plate may belong to the latter. The iuvolucrum is reprefented green.
3. L. formofa. Sin. Tr, of Linn. Soc. v. 4. 223. t. 20. Cavan. Ic. v. $6.3^{2}$. t. 547. (Protea nectarina; Wendl. Sert Hannov. fafc. 4. 5. t. 21.) -" Flowers feven in each involucrum; the leng th of its inner leaves. Style hairy. Follicle pointed at cne fide, two-horned at the other. Leaves linear-lanceolate, fharp-pointed, recurved at the edges." - Native of fony heaths near Port Jackfon, New South Wakes, from whence we received fpecinens among the firf that were fent to Europe by Dr. John White. The litives are green and fmooth above; white, and reticulated with veins, beneath. Involucrum and flowers of a fine rofe-colour or crimfon.
4. L? echinata. Brown ". 4.-"Leaves linear, fmooth, reticulated; dilated, lobed and pointed at their extremities. Follicles two-horned, thorny all over." -Native of the Itony fides of hills in Lewin's Land. where Mr. Brown gathered it in fruit, but never faw the flowers. Hence its genus remains doubtful, efpecially, as that intelligent writer obferves, - on account of the leaves being lobed, which is contrary to the nature of the other fpecies.

LamDes $A$ ), or Lambese, in Ancient Geografby, (Tcezoute), a town of Mauritania Sitifenfis, lituated on mount - Audus. It was the moft confiderable town of the country, and the third legion of Auguftus was quartered in it. Its suins and infcriptions are still noticed.

LAMBESC, in Geography, a town of France, in the department of the mouths of the Rhone, and chicf place
e-
of a eanton, in the diffrict of Aix; 12 miles N.W. of Aix. The place contains 4000 , and the canton 10.530 inhabitants, on a territory of $257 \frac{1}{\text { kiliometres, in } 7 \text { communes. }}$

LAMBESE, a town of Algiers, in which are magnificent ruins of an amphitheatre, a temple of Efculapius, \& c.; 45 miles S . of Contantine. See Lambesa.

LAMBETH, an extenfive parifh, feated on the fouthern bank of the river 'thames, in the hundred of Brixion, and county of Surrey, England. It is directly oppolite to Weftminfter, to which city it is connected by a handfome fone bridge acrofs the river. The whole is bounded by Southwark to the "alt, Newington Butts and Camberwell to the fouth, and Batterfea to the weft. The circumference is about 16 miles. In Domefday-book, it is faid to contain $20 \frac{1}{2}$ plough-lands. At the beginning of the feventeenth century, it appears, by the churchwardens accounts, to have confitled of 1262 acres of arable land, 1026 of pafture, 125 of meadow, 13 of ozier, 27 of garden ground, and 150 of wood, making in the whole 2603 ; the commons and wafte land, fuppofed to be about 330 acres, not being charged, will increafe it to: 2933 acres. At prefent, the whole extent is about 4000 acres ; of which about 1390 are occupied by houfes and other buildings, wharfs, manufactories, ftrects, and roads; $41 ;$ by pleafure gardens, including thofe of Vauxhall; 80 by market gardens; 300 by farming gardens; 40 by nurferies; 250 are now incloing from common; and 30 are to remain common. The parifh is divided into fix liberties or precincts, refpectively called the Billop's, the Prince's, Vauxhail, Marfh and Wall, Lambeth-Dean, and Stockwell; the whole containing, according to the return to parliament in the year 1800, 5009 houfes, and 27,985 inhabitants, of whom $514^{〔}$ were ifated to be cmployed in various trades and manufactures, and 955 in agriculture. Archbifhop Hubert Walter obtained from king John a grant of a weekly market, and a fair of fifteen days, upon condition that the fame fhould not be detrimental to the interelts of the city of London. In the archbilliop's MS. library, is a charter from the city, fignifying their confent, ftipulating only, that the fair thould begin on the morrow after the anniverfary of St. Peter ad vincula. The market and fair are both dilcontinued. The earlieft hiftorical fact on record relating to Lambeth, is the death of Hardicanute, which happened here in the year 1041, while he was celebrating the marriage feaft of a noble Dane. Here alfo, Harold, who ufurped the throne on the death of Edward the Confeflor, is faid to have placed the crown on his head with his own hands. Henry 111. held a folemn Chriftmas hcre in the year 1231; and a parliament on September 14, in the year following. A moft violent outrage was committed in Lambeth church, on Sunday February 19, 1642-3. The fory is varioelly told by the different parties; but it flands on record as an inftance of the fatal effects of civil difcord, from the outrages of which no place, however facred, is exempt.

Of the archbiflop's palace, the chief object of note in the parih, it will be proper to flate a few particulars. It is fituated near the river; and is certainly a very large pile of building, exhibiting the architectural ityles of various ages. It appears that this palace was, in a great meafure, if not wholly, rebuilt by archbifhop Boniface in the year 1262. If any part of this ftructure now remains, it is the chapel; the architecture of which might induce one to afcribe it to a more early period. Under the chapel is a crypt, the arches of which are built with ftone, as is the chapel; the roof of the latter is of wood and flat ; the windows were formerly of painted glafs, pat up by cardinal Morton. In the chapel were interred the remains of archbihop Parker. The gredt

## L A M

LAMI

Iall was rebuilt by archbifhop Juxton, after the civil wars, at an expence of $10,500 \%$. It is 93 feet long by 38 wide; and has a fine carved wooden roof. The guard room, built before the year 1428 , has a roof fimilar to that of the hall. Cardinal Pole is faid to have crected the long gallery, which meafures $9 \circ$ feet by 16 . In this room are fiveral portraits of archbifhops, and osher illuttrious characters. In the great dining-room, 38 feet by 19, are alfo portraits of all the archbifhops from Laud to the prefent time; this feries is particularly interelting, as, among other things, they thew the gradual change of the clerical drefs. Archbilhop Tillotfon was the firit to wear a wig; which however refembled the natural hair, and was worn without powder. A noble library occupies four galleries, over a finall quadrangular cloilter. The firlt collection of books was bequeathed by archbilhop Bancroft; but thefe were feized in the civil wars, and though much injured, and fome lott, yet the chief itock was reltored by archbíhop Juxton, after the reftoration. Archbilhops Sheldon, Tenifon, and Secker augmented the library; and the number of books is now fuppofed to be, at leaft, 25,000 volumes. In the windows is fome fine painted glais. (See Brayley and Herbert's Illultrations of Lambeth Palace, 4 to. 1805, for various views of this palace, and portraits, \&c. from the painted glafs). The MS. library contzins a large and valuable collection of records and MSS. At the weit end of the chapel is a lofty building, cailed Lollards' tower, built by archbifhop Chichele in the years 1434 and 1435 . At the top is a fmall room called the prifon, in which it is faid the Lollards were confined The gateway, and the adjoining tower, which are of brick, were built by archbifhop Morton about the year 5490. The gardens and park, which contain nearly thirteen acres, are laid out with great talte; they were much improved by the late archbifhop, who made a convenient accefs to the houfe, for carriages, through the park. It has been faid, but erroneoufly, that Stephen Langton is the firlt archbifhop upon record avho refided at Lambeth. Hubert Walter was there in 1198 ; and many of the public acts of the metropolitan were performed at Lambeth prior to that period.

Contiguous to the palace is the parifh church, which was rebuilt between the years 1374 and 1377. The tower, which is of fres-Itone, ftill remains; the other parts of the prefent ftructure appear to be about the age of Henry VII. The church now confilts of a nave, two aifles, and a chancel. Two chapels, called Howard's and Leigh's, were built in 1522; they were incorporated with the church when it was repaired in 1769. Among the numerous fepulchral memorials in this church, thofe molt worthy notice are for the archbifhops Tenifon, Hutton, and Cornwallis, and a marble - Nab to the memory of the celebrated antiquary Elias Afhmole.

In this parifh are fituated the Afylum, inflituted in 1758 , for the reception of female orphans; and the Weftminiter Lying-in-Hofpital, built in 1765.

About the end of the feventeenth century, a manufacture of plate glafs was eftablifhed at Vauxhall, in this parifh, under the patronage of the duke of Buckingham; the principal artilt was Roffetti. It was carried on with great fuccefs, and the glafs was thought to excel that made at Venice. (See Glass and Lookrng-glass.) The importation of foreign timber, which for many years has formed a confiderable and important branch of our commerce, has been a fource of wealth to this parifh, where are feveral Wharf3 for that trade, fupplied with fores which are almolt incredible. At Vauxhall are fome very large diftilleries, and feveral potteries; the manufacture of fone earthenware pots is faid to have been firlt introduced here from Vol. XX.

Holland. On the feite of Cuper's gardens (formerly a plac of public entertainment, are Meifrs. Beaufy's extc:fis vinegar works. Mr. I'ennant, who went over the premife, mentions a veffel full of fweet wine, containing 58,109 gan lons, and another full of vinegar, containing 56.799 gallun; belides thefe cnormous vetfels there are feveral others whin contain from 32,500 to $16,207+$ yallons each. In the yer ${ }^{1766}$, Mrs. Coade eftablifhed in this parifh, uar Wetminte bridge, a manufacture of artilicial iteme, which is catk a moulds and burnt. It is intended to anfuer the purpole i flone, for every fpecice of ornamental architecturc, at : much cheaper rate than carving, Where it has been place in expofed fituations it has been found to end re the from Meffirs. Watts have lately eltablihed a manufucture of patent thot in this parih : the principle of making this fho: is, to let it fall from a great height into the water, that it may cool and harden in its paffage throuth the air, and thereby better retain its fpherical Thape. The heish: of the tower at this manufactory is about 140 fect: the fot fallo 123 feet fix inches. About the fame time Mrems. Bulton, Morgan, and Co. eftablihed a manufacture bere under the tithe of the woollen yarn company ; every branch of the clothing manufacture, from forting the wool to making the cloth, was carried on eatirely by machinery; but the undertaking was fcon given up. About a century ago, there was a place of eutertainment called Lambetii Wells, fituated in what is now calied Lambeth Walk. A riding-fehool, for the exhibition of feats of horenamhip, was opened in this parifia about the year 1768 , by Mr. Philip Aftley. At firit it was an open area; in 1780 it was converted into a covere: amphitheatre, and divided into boxec, pit, and gallery $\mathrm{S}_{\mathrm{r}}$ ring Gardens, Vauxhall, (which is mentioned in the Sped tator as a place of great refort,) is open during the great part of the fummer, being illuminated with a great numb of lamps; the entertainment confifts of a concert of muff performed, in fine weather, in the open air ; the price admiffion, till I 796 , was one fhilling; it is now three fhillin, and open three times each week during the fummer mont Lyfons's Environs of London, rol. i. \&to.

LAMBIN, Dexvis, in Biography, an eminent cri was born at Mostreuil-fur-Mer in the year 1516. He, appointed profeffor of the belles lettres at Amiens; this he refded long in Italy with cardinal de Tournon, on his return to Paris obtained the Greek profefforhit the royal college. He acquired a great reputation ar the learned by his commentaries on Lucretius, Cicero, tus, and Horace. He tranflated from Greek into the language, the Ethics and Politics of Ariflotle, and f orations of Demofthenes and 雄fchines. He died in the occafion of his death was the great faock which ceived from the news of the murder of his friend Rar the maffacre of St. Bartholomew. He was a man dt found erudition and great induftry. Mureri.

Lambourne, or Lameorx, in Gegraphy, $1-$ cient market town of Berkibire, Enghand, is about ps N.E. of Hungerford, and 65 W. of London. A ct was ellablifhed here at a very remote period; an a charter of 1227 , it is called Choping-Lambuorn, ${ }^{2}$ fair was gianted to the family of Fitzwarren. In tlign of Henry VI. the charter was renewed, and twdditional fairs granted in farour of the dean and chapte St. Paui's, London. The market is much declined; here are 率ll held three fairs annually. In the market $p$ is as ftone crofs of a tail, plain fhaft, on fteps. 'The rifh is co-extenlive with the hundred to whish it gives ne. In the year 1800 , the population of the town, with dependant lamlets, was 2045. The parifa church is pacious

Ee
ond handrome building, in the form of a crofs; on its duthern lide are two chanting-chapels, one of which was punded by John Eltbury, who died in 1372, and the other y his defcendant of the fame name, who died in 1485. Lear the church is an alms-houfe, or hofpital, founded by Lhan Eltbury, for ten poor men. In the north tranfept of pe church is a monument for fir Thomas Effex, who dicd 1558, with effigies of himfelf and his lady, in alaballer. Lyfons's Magna Britannia, vol. i.
LAMBRA, a town of European Turkey, in Livadia; ${ }^{2}+$ miles S.S.E. of Athens.
LAMBSDORFF, a town of Silefia, in the principality of Neiffe; 9 miles N.E. of Neiffe.
LAMCAL, a town of Pegu, on an ifland in the Ava; 56 miles N.E. of Perfaim.

LAME, in the AIanege, is ufed in feveral phrafes of that art; as lame of an ear, called in French boiteux de loreille, is faid of a horfe, when he halts upon a walk or trot, and keeps time to his halting with the motions of his head; for all lame horfes do not keep time in that manner. See Halting.

Lame of the bridle, is ufed by way of raillery, to fignify the fame thing.

LAMECH, in Scripture Biography, the fon of Methufael, of the race of Cain, the fifth in defcent from him, and the father of Jabel, Jubal, Tubalcain, and Naamah. He married two wives, Adah and Zillah, and is fuppofed to have introduced polygamy. To his wives he faid, "Hear my voice, ye wives of Lamech : for I have flain a man to my wounding, and a young man to my hurt: if Cain fhall be avenged feven-fold, furely Lamech feventy and feven-fold." (Gen. iv. $24,25^{\circ}$ ) 'Thefe words have perplexed Biblical critics. Some interprctations have been given of this paffage which mult be confidered as founded on mere fables, and they are not worthy of recital. Onkelos, who wrote the firft Chaldee paraplirafe on the Pentateuch, reads the words with an interrogation: "Have I flain a man to my wounding, and a young man to my hurt ?" and accordingly he paraphrafes it thus: "I have not killed a man, that I fhould bear the fin of it; nor have I deftroyed a young man, that my offspring should be cut off for it." Dr. Shuckford has improved this interpretation, by fuppofing that Lamech was endeavouring to reafon his wives and family out of their fear of having the death of Abel revenged upon them, who were of the polterity If Cain. As if he had faid, "what have we done, that re fhould be afraid? We have not killed a man, nor fered any injury to our brethren of any other family ; and God would not allow Cain to be killed, who had murdered s brother, but threatened to take feven-fold vengeance on y that fhould kill him ; doubtlefs they mull expect much sater punithment, who lhould prefume to kill any of us. erefore we may furely look upon ourfelves as fafe under protection of the law and of the providence of God."
Amicuif was alfo the fon of Methufelah, and father Voah ; at whofe birth he was 182 years of age; and he after it 595 years, fo that his whole life was 777 years, $\hat{r}^{5}$ born A.M. 874 , and dying 1651 . See A MTEDILU-
IMEGAL, in Geography, a town of Portugal, in the price of Prira; 9 miles N.W. of Pinhel.
-IEGO, city of Portugal, in the province of Bai. the fie of a bithon, fuffragan of Braga; fituated on a plair ear the J) uero, and furrounded with mountains. It contis two catherlal churches, an horpital, four convents, and aut 4500 indabitants. The adjacent country pro-
duces excellent wines; $3^{6}$ miles E. of Porto. N. lat. $48^{\circ}$ $7^{\prime}$. W. long. $7^{\circ} 27^{\prime}$.

LAMELAN, anifland in the Baltic, near the S.E. coaft of the ifland of Aland; eight miles long and four wide. N. lat. $60^{\circ} 5^{\prime}$ E. long. $37^{\circ} 45^{\prime}$.

LAMELLE, derived of lumina, and fignifying as much as little lamina, little, thin plates, or laminx, whereof the fcales and fleells of fimes, \&c. are compofed.

Lamelles, in Botmy, the gills, or thin vertical plates which compofe the bymcnium, or fructifying membrane of that great genus of fungi called $A_{y}$ aricus, to which the common eatable mufhroum belongs. (See Hymenium and Agaric.) Schæffer and Hedwig lave found the feeds to be lodged copioufly in the fubflance of thefe plates.

Lameness, Claudicatio, in Surgery. Lamenefs arifes from a variety of caufes. From native deformity, or from the thigh being put out of joint in the birth; from the bad conformation of the cotyloid cavity of the oifa innominata; from the weaknefs of the hips; from external accidents; and from difeafes. See Leg and Luxation.

LAMENTATIONE, Ital. applied to a mufical movement, requires that it fhould be fung or played in a plaintive and mournful manner.

LAMENTATIONI, in the plural, implies complaints and lamentations. Between the time of the reformation and Charles I., there was a kind of maudlin piety, which had feized Chriftians of all denominations. Among Calvinifts, it exhaled itfelf in pfalmody, and in others in lamentations. The Scots, among their old pathetic airs, have many laments. The Italians fung them in Latin, like the Salmi penitentiale; and in their own language. The fixteenth century was very prolific in lamentationio But in England even the lute was to weep, and be forrowful: for Dowland, the famous lutenift, publifhed Lachrimæ, or " feven tears, figured in feven paffionate Pavins." The poetry of thefe whimperings feems much inferior to that of Sternhold and Hopkins. However, the beft Englifh compofers of the times thought them worthy of the beft mufic which they could fet to them, in four and five parts. Sir William Leighton, knt., who fet many of them himfelf, was the editor of a collection of lamentations to four and five voices, with an accompaniment for the lute ; and in the lift of the compofers we have Bird, Dr. Bull, Orlando Gibbons, Dowland, Robert Jhonfon, Forde, Hooper, Kinderfley, Nat. Gyles, Coperario, Pilkington, Luffo, Peirfon, Jones, Alfonfo Ferrabofco, Ward, Wecikes, Wilbye, and Milton, the father of the great poet.

LAMENTATIONS, a canonical book of the Old Teftament, written by the prophet Jeremiah, according to archbifhop UTher and fome other learned men who follow the opinion of Jofephus and St. Jerom, on occation of Jofiah's death. But this opinion does not feem to agree with the fubject of the book, the lamentation compofed by Jeremiah on that occafion being probably lolt. Some have fuppofed that the fifty-fecond chapter of the book of Jeremiah was probably added by Ezra, as a preface or introduction to the Lamentations.

The learned bifhop Lowth, in his admirable book entitled "Prælectiones de Sacra Poefi Hebræorum,"' has treated at large of this elegiac poem; illultrating its general nature and form, its metre or verfilication, and its fubject, fentiments, and imagery. The Lamentations, he fays, confift of a number of plaintive effufions, compofed upon the plan of the funeral dirges, all upon the fame fubject, and uttered without connection as they rofe in the mind, in a long courfe of feparate ftanzas. Thefe were afterwards put together, and formed into a collection, or correfpondent whole. In the character

## L A M

character of a mourner he celebrates, in plaintive frains, the obfequies of his ruined country ; whatever pretented itfelf to his mind in the midit of defolation and mifery, whatever ftruck him as particularly wretched and calamitons, whatever the inftant fentiment of forrow dietated, he pours forth in a kind of fpontaneous effufion. He frequently paufes, and, as it were, ruminates upon the fame object; frequently varies and illuftrates the fame thought with dufEerent imagery, and a different choice of language; fo that the whole bears rather the appearance of an accumulation of correfponding fentiments, than an accurate and connected feries of different ideas, arranged in the furm of a regular treatife. The nature and defign of the poem neither required nor admitted of a methodical arrangement. The whole poem, however, may be divided, according to cur author, into five paris ; in the firft, fecond, and fourth, the prophet addreffes the people in his own perfon, or elfe perfonifies Jerufalem, and introduces that city as a character: the third part is fuppofed to be uttered by the chorus of Jews, reprefented by their leader, after the manner of the Greek tragedies; and in the fifth, the whole nation of the Jews, on being led into captivity, pour forth their united complaints to Almighty God. This lait, as well as the other, is divided into twenty-two periods, according to the number of the letters of the alphabet with this difierence, that in the four other parts the initial letters of each period exactly correfpond with the alphabetical order. The form of compofition employed in this poem is a fpecimen of the acroltic or alphabetical poetry of the Hebrew: and the manner and order of this kind of verfe are as follow: Each of the five parts, or grand divifions, is fubdivided into 22 periods, or flanzas; thefe periods in the three firlt parts are all of them triplets, or they confift each of three lines, only in each of the two former parts. There is one period confifting of four lines. In the four firft parts, the initial letter of each period follows the order of the alphabet; but the third part is fo very regular, that every line in the fame period begins with the fame letter, fo as neceflarily to afcertain the length of every verfe or line in that poem: and though the lines are not thus dittinctly marked in the other parts, their limits may be afcertained by refolving the fentences into their contituent members. By this method of computation it appears, that in the fourth part all the periods confift of diftichs, as alfo in the fifth, which is not acroftic ; but in this laft the lines are extremely fhort, whereas in all the reft they are long. In this poem there are lines and verfes which are longer by almoft one-half than thofe which occur ufually, and on other occafions. The length of them feems, on an average, to be about twelve fyllables: and the prophet feems intentionally to have adopted this kind of metre, as being more diffufe, more copious, more tender, in all refpects better adapted to melancholy fubjects.

That the fubject of the Lamentations is the deftruction of the holy city and temple, the overthrow of the flate, the extermination of the people, and that thefe events are defcribed as actually accomplifhed, and not in the ftyle of prediction merely, muft be obvious, as our author conceives, to every reader. The prophet has fo copioully, fo tenderly, and poetically bewailed the misfortunes of his country, that he feems completely to have fulfilled the office and duty of a mourner. In the opinion of the learned prelate, there is not extant any poem, which difplays fuch a happy and fplendid felection of imagery in fo concentrated a ftate. What can be more elegant and poetical than the defription of that once flourihing city, lately chief among the nations, fitting in the character of a female, folitary, afflicted, in a ftate of widowhood, deferted by her friends, betrayed by her deareft
connections, imploring relief, and feeking confolation in vain? What a beautiful perfonification is that of "the ways of Sion mourning becaufe none are come to her folemn fealts?" How tender and pathetic are the complaints that occur in ch. i. 12 and 16 ? But to detail its beauties, fays Lowth, would be to tranferibe the entire poem. Gregory's 'Tranf. foct. 22. voll ii.

Indeed the fubject of this book is of the molt moving kind; and the tyle throurhout lively, pathetic, and affeeting. In this kind of writing the prophet Jeremiah was a great mafter, according to the character which Grutius gives him: "Mirus in aftectibus concitandis." See Jenkм1.aI.

LAMENTIN, $I_{A}$, in Geograply, a town of the ifland of Martinico, on the W. coath. N. lat. $14^{\circ} 36^{\circ}$. W. long. $60^{\circ} 57^{\prime}$.

LAMENTUNG, a town of Thibet; 25 miles E. of Jhanfi Jcung.

LAMETOUNAH, a town of Africa, in Sahara, about feven days' journcy S. of 'Tripoli.
LAMETUK, a town of the flate of New Jerfey ; 15 miles N.W. of New Brunfwick.

LAMGI, a petty kingdom of Afia, that lies to the weft of Nipal or Napaut; which fee.
LAMIA, in Biography, the molt celebrated female fluteplayer in antiquity. Her beauty, wit, and abilities in her profeffion made her regarded as a prodigy. The honours the received, which are recorded by feveral authors, particularly by Plutarch and Athenæus, are fufficient teftimonies of her great power over the pafions of her hearers. Her claim to admiration from her perfonal allurements, does not entirely depend, at prefent, upon the fidelity of hiftorians; fince an exquifite engraving of her head, upon an amethyit, with the veil and bandage of her profeffion, is preferved in the late king of France's collection, which, in fome meafure, authenticates the account of her beauty.

As the was a great traveller, her reputation foon became very extenfive. Her firft journey from Athens, the place of her birth, was into Egypt, whither fhe was drawn by the fame of the flute-players of that country. Her perfon and performance were not long unnoticed at the court of Alexandria; however, in the conflict between Ptolemy Soter, and Demetrius, for the ifland of Cyprus, about 312 years B. C. Ptolemy being defeated in a fea-engagement, his wives, domeftics, and military flores fell into the hands of Demetrius.

Plutarch, in his life of this prince, tells us, that "the celebrated Lamia was among the female captives taken in this victory. She had been univerfally admired, at firft, on account of her talents, for the was a wonderful performer on the flute; but, afterwards, her fortune became more fplendid, by the charms of her perfon, which procured her many admirers of great rank.". The prince whofe captive fhe became, and who, though a fuccefsful warrior, was faid to have vanquifhed as many hearts as cities, conceived fo violent a paffion for Lamia, that, from a forereign and a conqueror, he was inftantly transformed into a flave; though her beauty was now on the decline, and Demetrius, the handfomeit prince of his time, was much younger than herfelf.

At her inftigation, he conferred fuch extraordinary benefits upon the Athenians, that they rendered him divine honours; and as an acknowledgment of the influence, which fhe had esercifed in their favour, they dedicated a temple to her, under the name of "Venus Lamia."

A thenxus has recorded the names of a great number of celebrated Tibicinx, whofe talents and beauty had capti-
vated the hearts of many of the moft illuftions perfomaces of antiquity.

Horace fpeals of bands of ferale flute-players, which he calls Ambubaiiarum collegia (Ambubaiza is faid, by the commentators, to be a Syrian word, which, in that language, implies at flute, or, the found of a flute), and of whom there were Atill colleges in his time. But the followers of this profefion became fo numerous and licentious, that we find their occupation probibited in the Theodofian code; however, with little fuccefs: for Procopius tells us, that in the time of Jutinian, the fifter of the emprefs Theodora, who was a Tibicina, appeared on the ttage without any other drefs than a flight fearf thrown loofely over her. And thefe performers were become fo common in all private entertaimments, as well as at public fealts, obtruding their company, and placing themfelves at the table, frequently unafked, that, at the latter end of this reign, their profeffion was regarded as infamous, and utterly abolifhed.

Lania, in Ancient Geography, a town of Grecce, in Theffaly, famous for the war which the Greeks waged againft the Macedonians, after the death of Alexander the Great.
Lamia, in Icbtbyology. See Squalus Carcharias.
LAMIE, Azprit, among the Ancients, a kind of dæmons, or evil fpirits, who, under the form of beautiful women, are faid to have devoured children.

Horace makes mention of them in his Art of Poetry. Some authors call them I.anix, à laniando. Philofratus fays, they are alfo called Larve, or Lemures, as if they were all the fame. Bochart will have the word to be Phoenician, and derives it from TiTh, to devour ; alleging, that the fable of the Lamix came from Lybia. Sce Limicm.
LAMINA, in Anatomy, a term applied in anatomical defcriptions to parts which take the form of thin plates. In this fenfe we fpeak of laminze of cellular fubitance, of membrane, of bone, sc.

Lamins, in Botany, the expanded part of each petal of a polvpetalous corolla, fupported by the unguis or claw, and analogous to the limb of a monopetalous one. (See LimsBus.). It generally fpreads, fo as to form a confiderable angle with the claw, in order that its upper furface may be prefented to the ftrongeft light, as in the pink, and wall-flower, or ftock. The term lamina is alfo ufed by Forfäll, and adopted by fome others, for the expanded part of a leaf, that is, for the leaf itfelf; fuch application of the word is therefore altogether fuperfluous. See Leaf.

LAMINA, in Phyrology, thin plates, or tables, whereof any thing confifts.

LAMIODONTES, is the name given by Dr. Hill to the gloffopetre.

LAMIOLA, in Icbthyology, is the name given by the modern Italians to a fifh called in Cornwall the tope. See Squalus Galeus.

LAMIRAS, in Brography, a famous poet and mufician of Thrace, who, according to fome authors, was the inventor of the Dorian mode. He lived before Homer, and is faid to have been the firft mufician who united the voice to the found of the cithara.

LAMISA, in Geograpby, a town of the principality of Gcorgia, in the province of Carduel ; 60 miles W. of Tefis.

LAMIUM, in Botany, a Latin word of difputed meaning and derivation, ufed by Pliny to defignate the Dead Nettle, for which it has ever fince ferved as the botanical generic name. Some derive it from the fuppofed place of growth of the plant or plants in queftion, ad lamas, that is, about ditches or puddles by the way fide; but this is by no tio
means appropriate. Linncus in his Pbilofophia Bolunicar p. 167, explains the word by Lamia larvata, a maaked forcerefs, as if the flape of the flower, refembling a naak, or rather a gaping mouth befet with fharp teeth, had fuggefted that idea. Ambrolinus, howevery indicates the molt direct etymology, from $\lambda a \operatorname{sos}$, the throat, alluding to the fhape of the flower, from which word alfo that of lamia itfelf, as the appellation of a certain voracious beaft or fifh, or of a forcerefs fuppofed to devour children, evidently ori-ginated-Linn. Gen. 202. Schreb. 2S8. Willd. Sp. Pl. v. 3. 86. Mart. Mill. Dict. v. 3. Ait. Hort. Kew. ed. 2. v. 3. 392. Sm. Fl. Brit. 626. Juff. II3. Tourn. to 85. Lamarck Illultr. t. 506.-Clafs and order, Didynamia Gymno/permia. Nat. Ord. Verticillate, Linn. Labiata; Juff.
Gen. Ch. Cal. Perianth inferior, of one leaf, tubular, dilated upwards, with five, nearly equal, awned teeth, permanent. Cor of one petal, ringent; tube cylindrical, very fhort; limb gaping; throat inflated, comprefled, gibbous, its margin furnihhed, at each fide, with one or more little reHexed teeth; upper lip vaulted, roundifl, obtufe, undivided or two-lobed; lower lip fhorter, inverfely heart-flaped, emarginate, more or lefs reflexed. Stam. Filaments four, awl-haped, concealed by the upper lip, two of them longer than the others; anthers incumbent, oblong, hairy. $P i / \rho_{2}$ Germen in the bottom of the calyx, four-cleft; Atyle threadfhaped, of the fame length and fituation as the ftamens; ftigma cloven, acute. Perric. none, except the open-mouthed calyx, containing the feeds at the bottom. Seeds four, leveltopped, fhort, triangular, convex at one fide, abrupt at each end.
Eff. Ch. Calyx five-cleft, with fpreading, brifle-pointed teeth. Upper lip of the corolla vaulted; lower two-lobed; throat inflated, its margin toothed at each fide.

A very natural genus, well diltinguifhed by its effential character, of the mouth of the flower being furnifhed with one or more teeth at each fide. Thefe are fometimes flender, and almoft capillary ; fometimes dilated and oblique. Linnæus thought the upper lip was neceffarily undivided, or at moft only toothed; but in fome recently difcovered fpecies. it has a two-lobed termination, above the vaulted part. The fpecies of Lamium are as yet but imperfectly afcertained, notwithftanding what has been done in Willdenow and the new edition of the Hortus Kerwenfis. The 14th edition of Syf. Veg. enumerates but eight; Willdenow has thirteen. To thefe we have fome to add, even from the gardens; and many miftakes to correct, refpecting fpecies already eftablifhed. A review of the whole is neceffiary, though fome may be lefs particularly mentioned than others. Our whole lift amounts to twenty.

1. L. Orvala. Great Dead Nettle, or Balm-leaved Archangel.-Linn. Sp. Pl. 808. Curt. Mag. t. 172. (L. pannonicum ; Scop. Carn. ed. 2. v. 1. 406. t. 27. L. melitiæfolium; Mill. Ic. to 158. Galeopfis maxima pannonica; Cluf. Hilt. v. 2. 35.)-Leaves heart-fhaped, unequally and fharply ferrated. Throat of the corolla inflated; upper lip fharply toothed. Calyx coloured. Stem nearly cylindrical, fmooth.-Native of Hungary, Carniola, and Italy. We have gathered it, of a very large fize, near Caftello Nuovo, 19 miles from Rome. The magnificence of its great crimfon inflated flowers entitles it to a place in the flower-garden, where it is a hardy perennial, bloffoming in April or May, and fometimes fuffers from our inclement fprings. The flem, two or three feet high, is remarkable for its roundnefs and polifhed finoothnefs. The leaves are three or four inches long, and nearly as broad, rugofe, dark, fcarcely at all hairy. Orvala is às old name for Clary, ufed by Dodourus; we know not why it was applied to this
planta:

## LAMIUM.

plant: If Lamium montanum, faxatile, forme , glabrum, fore amplo, purfurco, cum labio fuperiori crenato; 'Till. PiC 92. t. 34. f. ${ }^{1}$; quoted with doubt by Limeus, be this prefent fpecies, the figure is very bad, yct we know no other to which it is more appropriate.

The Orval\& garganica, Linn. Sp. PI. 807. (Papia garganica, foliis urticre, altiùs et eleganter incifis, flore purpureo ; Mich. Gen. 20. 2. 17.) is now acknowledged to be a varicty of $L$. Orvala, differing only in an accidental deeper divifion of the corolla, as well as of the leaves. Curtis in his fpecific character of the fpecies in queltion, copied from $S_{y / f} \mathrm{~V}_{\mathrm{g}}$. ed. 14 , retains an crror of the tranfcriber or printer, caulitus culoratis for calyce colorato.
2. L. levigatum. Smooth Dead Nettle, -Linn. Sp. P1. 808. Krock. Silef. n. 926, by the defeription. Sabbat. Hort. Rom. v. 3. t. 34 . IVillden. (L. purpureum fretidum, folio parvo acuminato, fl re majore; Pluk. Phyt. t. 198. f. I. L. folio oblongo, flore rubro; Segu. Veron. v. 3. 131. Galeopfis five urtica iners, flore purpurafcente majore, folio non maculato; Bauh. Hitt. v. 3. 321.)-
 fmooth as well as the ftem. Upper lip of the corolla abrupt, entire. Calyx nearly fmooth, with taper teeth much longer than its tube, and almoft equal to the corolla.-Native of Italy. Pallas mentions finding it in Siberia, Krocker in Silefia. The Linnæan fecimen was fent by Seguier, with his own fynonym and that of J. Bauhin, the latter being rerified by the place of growth, near Vicenza. The root is perennial, in fotne degree creeping. Stem a fuot high or more, fquare, purplifh, leafy, finuoth, or nightly befprinkled with foft hairs curved downward. Leazes broac-heart-fhaped, ftrongly and unequally ferrated, with an elongated entire point, fcarcely rugofe, very little downy, rarely if ever fpotted; the lower ones on loug ftalks, upper on fhort ones." Flowers eight or ten in a whorl. Tube of the calyx.curved, but little dilated, pale, veiny, fmooth or nlightly downy, about a quarter of an inch long; teeth almoft twice that length, very taper, fomewhat hairy, extending besond the fuil-grown unopened ccrolla, widely fpreading. Corolla about the fize of the common L. albsm; upper lip blunt, entire, gibbous, flightly downy, and bright purple externally, pale and fmooth within; throat wide, often fpotted, with one fhort narrow wooth, and the radiment of another, at each fide; lower lip finall, of two rounded ferrated fpreading lobes.-Such is the plant of the Linnæan herbarium, but the long defcription in the Spec. Plant. feems to agree better with the mofchatum hereafter defcribed, which therefore fome have taken for the lavigatum. Plukenet's figure is totally erroneous as to the calyx. Willdenow retains Boccone's fynonym, mifapplied to this plant by Linneus, and repeats it under rugofum, to which it properly belongs! Haller miltook his own $\mathrm{N}^{\circ} 27 \mathrm{O}$, which is $L$. maculatum, for lavigatum, and tranfcribes from Linnæus saule brevi inttead of lavi.
3. L. rugofum. Wrinkled Dead Nettle.-Ait. Hort. Kew. ed. I. v. 2. 296. Willd. n. 3. (L. hirfutum; Lamarck Dict. v. 3. 410. L. amplo, ferrato, nigricante, fubrotundo, rugofo folio; flore rubro; Bocc. Muf. 35 t. 23. L. montanum hirfutum, folio oblongo, flore purpureo; Till. Pif. 93. t. 35. f. 1.)-Leaves heart-flhaped, acute, roundly ferrated, rugofe, hairy as well as the ftem. Upper lip of the corolla abrupt, notched; lateral tecth folitary, brittle-fhaped. Calyx flightly hairy, with teeth fhorter than its tube.-Native of Italy, Sicily, and France; cultivated in our more curious gardens for at lealt 45 years palt. It is perennial, flowering in July and Auguft. The whole plant is much more hairy than the laft. Lateves rather
crenate than ferrated, all on longifin falks, dark, rugcfe, and hairy. Flowers purplifh red; tube of the corolla finooth, curved, longer than the calyx-tecth; throat and upper lip hairy; teeth at cach fide of the mouth folitary, very long and narrow; lower lip fmall. There can furcly be no doubt of Tilli's fymonym, though hitherto ncglected.
4. L. garganicum. Woolly Dead Nettle--Linn. Sp. Pl Bes. "T'rew. Ehret. t. 75. Sm. Exet. Bot. v 1. 13. t. 48. (L. garganicum fubincanum, fore purpurafente, cn:a labio fuperiori crenato; 'Till lif. 93. t. 34. f. 2.)Leaves heart-fhaped, bluntly ferrated, purnfe, downy as well as the flem. Corolla inflated; with a fraight tube, much longer than the calyx ; orifice with two teeth at each fide.-Native of Italy. It has beea cultivated in Chelfea garden ever fince 1729, and flowers in May. Its fuft downy greyih afpect, and finely rugofe leaves, at once diftinguifh this fpecies. The flom is thick and clumfy, two feet high. Flowers large, copious, and handfome, with a pale tube ftreaked with red, and light purple lips, the upper oue cloven at the fummit; the throat is nearly as much inHated as that of L. Orrala. Trew's figure was overlooked, or there would not have been another of this plant given in Evotic Botany, the latter work being intended for feccies not properiy reprefented already. It is much to be wifted that other periodical publications would fo far pay regard to the fame principle, as to give fuch plants a preference.
5. L. maculatum. Spotied Dead Nettle.-Linn. Sp. Pl. Sog. (L. Plinii campoclarenfe et montanum ; Column. Ecphr. 190. t. 192. f. I. L. n. 270 ; Hall. Hirt. v. 1. 118.)-Leaves heart-fhaped, Atrongly ferrated, acute, hairyTube of the corolla curved. longer than the calyx; upper lip entire ; lateral teeth folitary, flender. Flowers about ten in a whorl.-Native of Italy, France, Greece, Switzerland, and Germany, flowering in the fpring; it is imperfectly naturalized about Bayfwater, having probably efcaped formerly from the neighbouring garden of fir John Hill, Its natural fituation is in walte ground, or about banks and hedges, where the radical leaves, diftinguifhed by a broad irregular central Itripe, make an elegant appearance through the Italian winter ; but this mark conmonly difappears from the upper leaves. The root is perennial, fomewhat creeping. Stems a foot high, rather hairy. Leazes heart-hhaped, rather acute but not pointed, ftrongly but bluntly ferrated. Flowers purplifh red, downy. Caljx thimid, nea:ly fmooth, with fringed teeth about its own iength, and much fhorter than the tube of the corolla. The lower lip of the flower is concave and finely crenate.

Haller properly, perhaps, quotes the Galeopfis of Rivinus for this fpecies; but the Galeopfis of Camerarius, Epit. t. $86_{5}$, though faid to have a red hower, is mainfelly a reprefentation of Galcobdolon luteum, Sm. Fl. Brit. 63 r. Both thefe are cited by Linnzus under Lamium album; Rivinus having confounded album and maculotum. Pallas, as appears by his herbarium in the hands of A. B. Lambert, efq. mittook maculatum for purpureum.
6. L. album. White Dead Nettle,-Lien. Sp. Pl. ScgCurt. Lond. fafc. 2. t. 45. Engl. Bot. t. 76 6 . -Leaves heart-fhaped, pointed, ftrongly ferrated, hairy. Flowers about twenty in a whorl. Tube of the calyx fhorter than its teeth. Upper lip of the corolla notched ; lateral teeth folitary, lanceolate. - Native of watte ground, almott throughout Europe, flowering in fpring, fummer, and autumn. The leaves are more pointed than in the latt, and unfpotted; the flowers white and more numerous, rarely afluming a blufh of pale purple. There is commonly a confiderable diftance, or naked part of the ftem $\mathrm{I}_{1}$ between the flalked lower leaves,
and the more feffile upper ones where the flowers are fituated. The fummit is overtopped by one or two pair of leaves without flowers. The tube of the corolla is longer than the calyx ; its lower lip flattifh, wavy, fcarcely crenate.
7. L. cabitatum. Mufin Dead Nettle,-Leaves heartfhaped, bluntifh, crenate, hairy, on longifh ftalks. Flowers overtopping the item. Thube of the calyx equal to its teeth. Upper lip of the coroll: notched; lateral teeth folitary, very, llender.-We know not the native country of this fpecies, which we obtained from Chelfea garden, and have long cultivated. It is fometimes overlooked as a variety of the lalt; fometimes fold for $L$ moll hereafter mentioned; yet nofpecies can be more diftinct. It is peremial, flowering in July; when the copious and delicate femitranfparent white flowers, which rife in two whorls above the top of each them, look as if a thin mufin veil had been thrown over the plant, efpecially while the dew is upon them. The lateral teeth are peculiarly flender; the anthers pale, with fcarlet pollen. The liaves are fmall, roundih, light green, fpeckied with paler or whitifh fpots. Stens rather decumbent. We can find no fynonym for this plant.
8. L. firiatum. Pencilled Dead Nettle.-Sin. Prodr. F1. Græc. Sibth. 405. Fl. Græc. ined. t. 557.-Leaves heartfhaped, bluatifh, ferrated, on longifh ftalks. Upper lip of the corolla cloven; its fegments fpreading and toothed; lateral teeth double. Found by Dr. J. Sibthorp, (who fufpected it to be the Ba $\lambda \lambda$ umply of Diofcorides), very plentifully in all the wafte ground of Greece and the Archipelago; yet no other modern botanilt appears to have noticed this elegant and ftriking plant. Its habit is not unlike L. album, but the leaves are rounder, with longer ftalks, and the fem is more uninterruptedly leafy. The flowers are fingularly large and handfome, white ftriped with crimfon, compoling feveral whorls, the upper ones rifing above the top of the ftem, as in the laft. Their upper lip ends in two oblong toothed divaricated lobes; the lower is convex and crenate; the lateral teeth are in pairs, acute and fpreading.
9. L. bifflum. Cloven White Dead Nettle.-Cyrill. Rar. fafc. I. 22. t. 7. Willden. (L. parvum, flore albo, cum labio fuperiori bifido; Till. Pif. 93. L. æquicolorum ; Column. Ecphr. 191. t. 192. f. 2.)-Leaves triangular-heart-fhaped, deeply cut and crenate; the upper ones crowded. Calyx tumid, with fhortifh triangular teeth. Upper lip of the corolla cloven; its fegments fpreading, emarginate, lateral teeth folitary.-Found in wafte ground about Naples, towards the fea, where the writer of this gathered it in March 1787. Its general habit approaches to $L$. purpureum, but the flowers are fnow-white, with a cloven fummit, and the floral leaves, crowded (as in that fpecies) about the top of the feen, whofe middle part is almolt naked, are of a triangular heart-fhape, deeply cut and lobed as well as crenate, hairy, and marked with a narrow central white Itripe, juft as Columna reprefents them, concerning whofe fynonym we prefune there can be little doubt, though he appears not to lave feen the corolla. Spirits of wine extract an orange colour from thefe flowers, which we do not perceive in any nther Lamium.
10. L. mofchatum. Mufky White Dead Nettlc.-Mill. Dict. ed. S. n. 4. Ait. Hort. Kew. ed 2. v. 3. 394. (L. orientale, nunc mofchatum nunc foxtidum, magno flore; Tourn. Cor. y. ; according to Miller, but the Hort. Kew. rejects this fynonym, without affinging a reafon.) - Stem very fmooth. Leaves heart-fhaped, obtufe, crenate; the foral ones nearly feffile. Calyx-teeth nearly equal to the corolla. Upper lip of the corolla entire; lateral teeth folitary, dilated.-Native of the Levant. Miller cultivated it
in 1739, but it found no place in the firft edition of Hort. Kew. This we believe arofe from its having been taken for, or confounded with, the lavigatum. Into this crror we ourfelves have formerly fallen, mifled by the long defeription in Limn. Sp. Pl. 808, which fo precifely accords with the mofchatum, rather than with levigatum, that we have no doubt from which of the two it was made. This is an annual fpecics, cultivated, or rather fpontancoufly fowing itfelf, from time immenorial in Chelfea garden near the entrance, and flowering in the fpring. The leaves of the young plants that come up in autumn remain through winter, and according to Miller, are prettily marked with white like the Cyclamen. The ftens, from to to 20 inches high, are remarkably fmooth, with blunt edges, and purplifh. Leaves of the flem heart-lhaped, approaching to triangular, rather elongated but obtufe, veiny, of a light glaucous green, fmooth or finely downy, the margin crenate rather than ferrated; the floral ones nearly feffile. W borls feveral, not reaching to the top of the Item, each of about ten white flowers, whole calyx is pale and fmooth, with very long tapering rough-edged teeth, extending beyond the mouth of the corolla. The upper lip of the latter is downy, convex, abrupt, and entire ; lower of two rounded, flattifh, flightly crenate lobes; lateral teeth folitary, broad, pointing forward. We have not noticed the mulky fcent.
II. L. glechomoides. Ground-ivy-leaved Dead Nettle.(Moldavica orientalis, hederæ terreftris folio; Tourn. Cor. 11.)-Leaves heart-fhaped, ftrongly crenate, on long ftalks. Calyx-teeth fhort, triangular. Corolla longer than the leaves; upper lip notched; lateral teeth in pairs.Gathered in the Levant by Tournefort, one of whofe fpecimens is before us. No recent author feems to have known this โpecies, which is perhaps more akin to our friatum, $\mathrm{N}^{\circ} 8$, than any other. The leaves are fmall, not an inch long, correctly heart-fhaped, ftrongly crenate, or ferrated, flightly hairy, on foottalks moltly twice their own length, except thofe of the floral ones, which fcarcely exceed the calyx. The teeth of the calyx are fhort, triangular, awnlefs, roughin. Corolla purple, downy; tube full twice the length of the calyx ; throat inflated; lateral teeth fmall, double; upper lip abrupt and deeply notched; lower of two rounded wavy lobes. Anthers very hairy.
12. L. tomentofun. Downy Dead Nettle.-WWilld. n. II. (L. orientale incanum, flore albo, vel purpurafcente, cum labio fuperiori crenato ; Tourn. Cor. II .)-Leaves roundifh-heart-fhaped, ftrongly crenate, downy on both fides, ftalked. Calyx-teeth lanceolate, very hairy. Upper lip of the corolla crenate, very hairy ; lateral teeth folitary, awl-fhaped, narrow.--Gathered by Tournefort in Armenia. This is remarkably downy and hoary, efpecially the younger foliage, the calyx, and the upper lip of the corolla. The leaves are much under an inch in length, very deeply and fharply crenate, the upper ones moft pointed, all denfely villous, on ftalks of various proportions. Teeth of the calyx as long as its tube, lanceolate, narrow, acute, denfely villous. Corolla about the fize of L. album, purplifh or white; its tube as long as the calyx, fmooth; throat but little inflated; lateral teeth folitary, long and flender; upper lip much arched, minutely crenate, villous; lower of two rounded, flat, entire lobes.
13. L. molle. Pellitory-leaved White Dead Nettle-Ait. Hort. Kew. ed. I. v. 2. 297. ed. 2. v. 3. 394. (L. parietariz facie; Moris. Hort. Blæs. 278. L. album, parietarix foiio, virginianum; Pluk. Almag. 203. Phyt. t. 4 I. f. r.)-Leaves pointed; ftalked, nearly entire; the lower ones heart-haped, the upper ovate. Calyx-teeth briftlefhaped. Upper lip of the corolla crenate, hairy ; lateral
teeth folitary, awl-flaped.-Native of Virg:nia, as appears by Plukenet's fynonym, overlooked by fucceeding writers. This plant feems to have been early in our gardens, but is now little known, if not totally loft. Another fpecies, hereafter defcribed by the name of ocymifolium, is generally miftaken for it, and is referred to as molle in F\%. Brit. under L. purpureum. The true molle is, however, now well known to us, by dried fpecimens from the French gardens. Its habit and fize approach to the albun, but the leaves are remarkable for being cither quite entire, or very flightly toothed about the middle part only; they are an inch and a half loug, broad at the bafe, and often heart-flaped, the extremity pointed and acute; both fides fomewhat downy, veiny, even, not rugofe. The falks of the foral leaves are very fhort ; thofe of the relt longer. Flowers the fize of L. album, white; their tube as long as the calyx-teeth, which are brifte-fhaped, narrow and hairy. Seeds very fmooth.
14. L. ocymifolium. Bafilleaved Red Dead Nettle.-(L. pufillum rubrum, parietarix facie, americanum ; Pluk. Almag. 204. Phyt. t. 41. f. 2.)-Leaves ovate, obtufe, entire, ftalked ; the upper ones crowided. Stem naked in the middle. Calyx-tecth lanceolate. - This has long been in Chelfea garden, where it is almolt a weed. From Plukenet's fynonym it appears to have come from America. No fucceeding author has noticed the plant. The root is fmall and annual. Stem a foot high, or fomething lefs, fimple, except a fmall branch or two near the bafe, erect, fquare, fmooth, leafy at the bottom and top only, being for the greater part of its length entirely naked, like the ftem of L. purpureum, but ftill more remarkably fo. The lower leaves are few, roundifh-ovaie, flightly crenate, on longifh ftalks, and rearly fmooth ; floral ones about fix or eight pairs, croffing each other, crowded together at the top of the ftem, compoling a fort of pyramid, each leaf about three quarters of an inch long, ftalked, ovate, obtufe, tapering at the bafe, entire, except here and there a cafual notch in fome of them, all flightly hairy, paler underneath. Whorls crowded, of numerous imall purple flowers, much like thofe of L. purpureum. Caly.x nearly fmooth, its teeth as long as the body, fpreading, broad at their bafe, with taper rigid points. Seeds curiounly befprinkled with pale, prominent, minute, tubercles, as is more or lefs the cafe in the three following.
15. L. purpureum. Common Red Dead Nettle-Linn. Sp. Pl. 809. Curt. Lond. fafc. 1. t. 42 . Engl. Bot. t. 769. Fl. Dan. to. 523.-Leaves heart-fhaped, obtufe, unequally crenate, ttalked ; the upper ones crowded. Stem naked in the middle. Calyx-teeth lanceolate. Tube of the corolla clofed with hairs near the bottom.-Very common, in wafte as well as cultivated ground, thoughout molt parts of Europe, flowering at various feafons. The root is annual. Stem from fix to twelve inches high, fquare, afcending, often branched at the bottom, naked in the middle, crowded with leaves and flowers at the top. Leaves broad-heart-flaped, bluntifh, rugofe, unequally crena:e, downy, on ftalks of various lengths. Flowers in whorls among the upper leaves, reddifhpurple, variegated with white, and fpotted with dark purple, their lateral teeth fmall, in pairs, very near the under lip. The infide of their tube was found by Mr. J. D. Sowerby to be clofed near its bafe with a denfe circle of hairs; fee Engl. Bot. to. 1933. The calyax is like the laft fpecies.-A curious variety was found near Sudbury, by Mr. Jofeph Andrews, who communicated it to the late profeffor Martyn, fen., and whofe original fpecimen is in our hands. In this the margin of all the leaves is perfectly entire. The flowers are rather fmaller than ordinary, and were faid to produce no feed. This variety is in Engl.

Bop p. 760 , at tise end, minaken for our comifotium lat duferbed.

16 I. incifum. Cutleaved Kect 1) ad Netele-Willd. n. 9. Engl. Bot. 1. r933. (L.. diPcécum; With. 527. I.: purpureum $\beta$; Sm Fl Brit. 627. L. rubrum minus, fohis profunde incitis; Raii Syn. 240. Pluk. Phyt. t. 4 1. f. 3.) -Leaves heart-fhaved, dilated, ottufe, !talked, mrergular:y cut ; the upper ones crowded. Stem naked in the middic. Calyx-tceth lanceolatc. 'lube of the comolla perviou:Found in cultivated ground in France and England. We have it from Norfoll and Suffoll. This is fo like the latt, except the leaves being mure deeply cut, that we flould have Alill conlidered it as a variety, but for the want of hairs in the tube of the flower. 'The whole fhape of the corolin, indeed, is more flender, approaching to that of L. ocymio folium, or of the following amplericaule.
17. L. amplexicaule. Conmon Henbit Dead Nettle, - Linn. Sp. Pl. Sog. Curt. Lond. fafc. 2. t. 46. Engl. ! ot.t. $777^{\circ}$ FI. Dan. t. 752. (Galeopfis folio caulem ambiente, major et minor; Rivin. Monop. Irr. t. 63.-Floral leaves feffile, kidney-fhaped, obtufe, frongly crenate, or fumewhat lobed, embracing the ftem. Teeth of the calyx linear-awl-fhaped, as long as its tube-Native of fandy fields of Europe, flowering in the fpring. Eafly diftinguihhed by the rounded, feffile, Atrongly crenate, and often in fome degree lobed, leaves of the ttem, in which it effentially differs from the two laft. The calyx, moreover, differs in being extremely hairy, with more upright teeth, as long as the body, and of a very narrow awl-fhaped, almof linear, figure, by which latter character it is alfo diltinguifhed from two hereafter defcribed. The little red flowers are fingularly pretty, the bright crimfon of their downy upper lip, while the reft of the corolla is fmooth and paler, gliftens, like minute rubies, when moilt with dew, and attracts the eye at a confiderable diftance. A fmall undivided tooth ftands at each fide of the mouth, though Willdenow once thought otherwife, and on account of that fuppofed deficiency, founded a new genus on this plant and Galeobdolon luteam, by the name of Pollicbia; a meafure now happily abanconed, as thofe tuo plants have fcarcely any charater in common. Some of the earlier flowers of L. amplesicaule never expand, but the internal organs are perfect, and produce good feed. Linnæus fays all its flowers are generally thus cloied in Sweden, owing, probably, to the coldnefs of the feafon when it bloffoms.

1S. L. palmatum. Palmate Henbit Dead Nettle.-(Li. multifidum; Pallas. It. v. 1. 168.)-Floral leaves fefinie, embracing the ftem, palmate; lobes three or five-cleft. Teeth of the calyx lanceolate, pointed, as long as its tube. -Gathered on the banks of the Wolga by Pallas, who, as appears from his fpecimens lent us by Mr. Lambert, firlt took it for amplexicaule, which it molt nearly refembles, and afterwards for multififum, under which name it is mentioned in his travels, quoted by Willdenow. From the latter it differs totally in fize and afpect, as well as in the character of its leaves and caly.x. From the former it is fatisfactorily diftinguihed, however like at firft fight, by the deeply palmate floral-leaves, whofe lobes are fubdivided into three or five broad fpreading fegments; and ftill more decidedly by the broad bafe of the culyix-teeth, which contract fuddenly into a fharp point. The corolla varies in fize, or degree of expanfion, as in the preceding. The root, like that, appears to be annual, throwing up feveral fems about a fpan high. The lower leaves are ftalked, but otherwife refemble the upper ones, except, indeed, thofe near the root, which are fmaller and lefs cut.
19. L. multifidum。 Finely-cut Oriental Dead Nettle.-

Linn.

## L 1 M

## I. A M

Linn. Sp. Pl. 809. (L. orientale, foliis elegantèr laciniatis; Tourn. Cor. 11 . Commel. Rar. 26 t 26.)-Florak leaves feffile, divided to the bafe, into many lobed or pinnatifid fegments. Tecth of the calyx triangular, pointed, one-fourth the length of its tube--Gathered by Tournefort in the Levant. He probably brought home feeds, by which it was introduced to the gardens of France, Holland, and, if Miller be correet, Chelfea phyficegarden. On his authority this feecies has fomd a phace in the new edition of Hort. Kew, though long fince a itranger amonglt us. Indeed the plant is very litile known to botanits. We have an indubitable fpecimen, but whether wild or cultivated we know not. It is in all its parts thrice the fize of the two tate. The rort frems to be annula, throwing up feveral fyuarc, leafy, Fiwely downy, often branched ficms. The floral buge sate an inch or finch and half long, Seflite, nearly fmooth, divided almott, or quite, to the bottom into five fegment:, the motlle one being the largelt, all narrow at the bafe, dilated outwards, deeply lobed or pinnatifid, the lobes rounded or blentifl. Flowers many in each whorl, as large as thofe of L. albun, or larger, of a fine red, with fo very hairy an upper lip as to refemble fome kind of Phlomis. The bateral teeth are folitary and acute. Calyx denfely clothed with filky hairs, its teeth broad, about a quarter as long as its tube, pointed, one rather wider than the relt.
20. L ? bipidshum. Rough-falked American Dead Net-tle-Michaus Boreal-Amer. v. 2. 4.-Stem rather brittly. Leaves on long talks, broad-heart-fhaped, nightly downy. Flowers axillary, folitary.-Found in fhady woods about the river Timnaffe, by Micha:x, who mentions that the corolia is moderately large and white. The flowers being folitary in the bofom of each floral leaf, excttes a great doubt of its genus, but havins no other information refpecting this fpecies, we here fubjoin it to the reft, till further information can be procured. S.
LAMJUNGH, in Geograpby, a country of Afia, dependent on Thibet, N. of Gurkah.
Lamlash, or Holy Island, an ifland fituated before the bay of Lamlath, about tivo miles long and half a mile wide; the whole being a mountain covered with heath, but having fufficient palture and arable land to feed a few cows, fheep, and goats, and to raife a fmall quattity of corn, and few potatocs. LAMOIGNON, William de, in Biography, marquis of Baiville, defcended from an honourable lamily, was born at Nivernois in 1617. He was admitted a counfellor of Paris in 1635, made matter of requetts in 1644, and in 1658, on account of his great probity and honour, he was raifed to the office of firft prefident of the parliament. Upon his nomination to the prefidentihip, cardinal Mazarin faid to him, "If the king had known a worthier and fitter man, he would not have appointed you;" but he paid him a much higher compliment, by refuling a large fum of money, oflered by another perfon for the fituation, at the fame time obferving, "Whatever occation his majefty may have for money, it would be better to expend it for a good prefident, than reccive it." Lamoignon did not difappoint the expectations formed of him: he fulfilled all the duties of the fituation with equal zeal and prudence, fupporting the dignity and privileges of the body over which he prefided, difcouraging the chicanery of the bar, raifing his voice for the people, and-devoting his health and life to the public fervice. He was once founded with regard to his opinion of a criminal, over whofe trial lie was to prefide as judge, by Colbert the miniter, to which he replied, "A judge gives his opinion but once, and that is from the bench." He died at the age of fixty, in the year 1677. His "Arretès," on various important points of French law, were firft publifhed in 1702, and again reprinted in 1781. In his manners he was limple, in his conduct rather auftere, but to the widow, the orphan, and the friendlefs, he was the mildeft of all human creatures. He relaxed from the toils of his office, in the pleafures of literature, and literary men. Boileau, Racine, Bourdalouè, \&c. were his particular friends. Moreri.

Lamoignon, Christian Francis de, eldeft fon of the preceding, was born at Paris in $16+4$ : of his education the molt exact care was taken by his father, and at a proper rige he was placed in the Jefuits) college, under the particular tuition of the celebrated father Rapin, whofe favourite difciple he was. Having finifhed his ftudies, he travelled through different countries for the improvement of his mind, and in 1666 he was admitted a counfellor of parliament. In 1674, he was appointed to the office of advocate-general, which he held during the fpace of 25 years, with the higheft and moft unblemifhed reputation, diftinguifhed as much for his cloquence, as by his zeal for juftice and the public good. In 1690 the king nominated him to a polt of more eafe, and better adapted to his health, but his love of employment retained him feveral years longer at the bar, till at length, being urged as well by his own feelings, as the reprefentations of his family and friends, he fought for an honourable repofe. He then indulged in the love of letters, and, in 1,04 , was admitted a member of the Academy of Iufcriptions, of which he was foon appointed the prefident. In this flation he difplayed as much talent and readinefs in difcuffing a literary queftion, as he had formerly done a, point of jurifprudence. He died in 1709. Many of his fpeeches were publifhed, but the only work which he fent to the prefs was "A Letter on the Death of Father Burdalouè." Moreri.

LAMOILLE, in Geography, a river, which runs into lake Champlain, 28 miles N. of Newhaven, N. lat. $4437^{\prime}$. W. long. $73^{1} 4^{\prime}$.

on the coaft of Cornwall, at the mouth of a fmail river, which joins the Fale; 3 miles S. of Truro.

LAMOTIS, in Ancient Geograply, a fmall country of Alia, in Cilicia, which took its name from the town of Lamus. Ptolemy.

LA MOTTE, in Biograpby, an admirable violinif, born in Flanders: when very young, he was regarded as the firlt folo player at Vienna. In 1777 he cane to Evgland. He had his firft regular inftructions from Giardini, and it is related of him, that when he quitted Giardini, he travelled through Italy, thll in fearch of another matter; and being arrived at Leghorn, where Nardini then lived, he would have become his fcholar; but after hearing that celcbrated performer execute one of his own folos, of the molt difficult kind, and being, in his turn, akeed to play, he detired leave to perform the fame folo which he had juft heard, and which was new and in MS. fo that he never could have practifed it ; however, he acquitted himfelf fo well, that Nardini declined taking as a fcholar one who was aiready fo able a nuaflor of his inflrument.

The concestos which he played at the Pantheon concerts were full of new difficulties of execution, expreffion, and double ftops, which he performed with fuch grace and feeming facility, that none but fiddle-players, who know the finger-board of the violin, and the dificulty of bowing certain paffages, would imagine that he had any difficulties to encounter. His tone was not very powerful, but perfectly fiweet and even, from the loweft note on the violin, to the end of the finger-board. His high notes were of the fiute kind, nearly as fweet as the fons barmoniques.

This performer, whofe conftitution was very delicate, feemed confumptive, when he left Enghand in $17 / 9$, at which time he returned to the continent, where he died.

Lamotte, Wilifam, an eminent French furgcon and accoucheur, was of Valogne, in Normandy. He ftudied his profeltion at Paris, where he attended the practice of the celebrated hofpital, l'Hotel-Dieu, during five years: He was diltinguifhed particularly by his fkill and fuccefs as an accoucheur, not only at his native town, but throughout the neighbouring country, during a long period. He left three fons, two of whom were phyficians, and the third fucceeded him in his own department.

His fritt publication, entitled "Traité des acconchemens naturels, niwn naturels, et contre nature," was firit publifhed in 1715 . It went through many editions, and was tranflated into feveral languages; and was generally deemed the beit treatife of the time, after that of Mauriceau, which Lamotte cenfured. It contained an account of four hundred cafes, with judicious practical reflections, the refult of thirty years' practice. His next publication was a "Differtation fur la Generation, et fur la Superfétation;" containing alfo an anfwer to a book, entitled "De l'In. decence aux Hommes d'accoucher Ies Femmes, et fur l'Obligations aux Mères de nourrir leurs Enfans," Paris, 1718. He denied the occurrence of fuperfretation, and combated the opinions of the ovarits, and the doctrine of animalcules: and in his reply to Hecquet, he relates a number of untoward accidents, occafioned by the ignorance of midwives. In $1 ; 22$, he publifhcd, "Traité complet de Chirurgie, contenaut des Obfervations fur toutes les Maladies chirurgicales, et fur la Manière de les traiter," which has been feveral times reprinted. The laft edition was publifhed in 1771, with notes by profeffior Sabatier. This was a valuable practical work, but disfigured by the egotifm of the author, and his contempt for his profeffonal brethren; whence Haller obferves, "laudes fuas non nedgligit, non
Vol. XX.
perine fome enllogarum fudiofus." Haller Bibl. Che Eloy. Dict. Hill. de Med.
L. AMP, an inftument ufed for the combultion of liguis inflammable bodies, for the purpofe of producing artimicta: light.

The molt fimple lamp confifts of a veftil of altont any flape, containing oil or alleohol, with a tube projecting : little above the furface of the liquid, and worm an an fibrous fubltance cap:ble of railing the havid to the inp if the tube, by capillary attraction. 'I'he ont, thus raifad and diffufed through the fibrons fub?ance, is to detached from the main body of the liquid, as to admit of being heateri io a temperature fufficient to volatilize the oil, the vapour of which, in a fate of combuftion, conltituscs the thame of the lamp.

In the management of the lamp of the noft firmpie kins, fo far as relates to the fupply of oil, three thines ate ner... fary to be ohferved. I. The wick muit be of fuch a fu: thance as beft to promote capillary attraction. 2. It the that not be twilted too much, in whish cafe its capacity for tho oil is too little; nor frould it be fo loofe as to dininifh materially its capillary attractive power. This is frequentithe cafe, when the wick has been ton long immerfed in ti. . oil. 3. With regard to the diftance of the Alame from the furface of the oil.- If the flame be too near the furiace, a leffer quantity of oil will acquire the intente heat nece (Tary to raife it into vapour, fince the heat communicates with the fluid. On the contrary, when the flame is too high abowe the oil, the capillary attraction, which decreefes in fome ratio of the diftance, is infuficient to fupply the neceffary quantity of oil.
Experience has long ago eflablifhed, that cotton is the beft medium for the tranfmiffion of the oil, which is prepared in a particular way for the purpofe.

During the flow combution of oil, as obferved in the common lamp, as well as that of tallow in candles, the fatty matter is decompofed, producing a quantity of rapour, which infames in contact with oxygen; and a cloudy exhalation in the form of fmoke, confilting of numerous fmall particles of carbonaceous matter, which, if collected, conflitute the article, called lamp-black. Befides the oftenfive fmell and appearance of this fublfance, there is an evident walte of combutible matter, capable of producing both light and heat.
The ceil arifing from the fmoke and finell of lamps was formerly fo great, as to prevent their introduction into domeftic ufe, notwithftanding the flrong inducement of con. venienice and economy.

The public have long been in peffefion of a complete remedy for this, and feveral other difadrabtages in lamps, by the invention of the Argand lamp. This invention embraces fo many improvements upon the common lamp, and has hecame fo general throughout Europe, that it may be jufly ranked among the greateft difesveries of the age. As a fubitute for the candle, it has the advantage of great economy and convenience, with much greater brilliance; and for the purpofe of producing heat, it is an important inltrument in the hands of the chemilt.

We may with fome propriety compare the common lamp and the candle to fire made in the open air, without any forced method of fupplying it with oxygen; while the Argand lamp may be compared to a fire in a furnace, in which a rapid fupply of oxygen is furnifhed by the velocity of the afcending current. This, however, is not the only advar. tage of this valuable invention. It is obvious that if the combufitle vapour occupies a confiderable area, the or-
gen of the atmofphere cannot combine with the vapour in the middle part of the afcending column. The outfide, therefore, is the only part which enters into combultion; the middle conllituting fmoke. This evil is obviated in the Argand lamp, by directing a current of atmofpheric air through the flame, which, inflead of being raifod from a folid wick, is produced from a circular one, which furrounds the tube through which the air aifends. Betore we enter more fully into the merits of the Argand lamp, we fhall give a defcription of it, with reference to drawings of its different parts. Thefe drawings are taken from the lamps of modern conflruction, which have recently been much improved. The wick is now raifed by a fcrew, initead of the rack and pinion; which is fo great an improvement upon the latter, both in fimplicity and convenience, that it is becoming general.

Fig. I. (Plate Lamps) is a view of the lamp complete, to a fcale of one-third the real fize. A is a refervoir, which is on the principle of the bird-fountain, keeping the oil always at the fame height in the burner B , through the communication C.

The burner B is compofed of three tubes, $a, b$, and $a$. The two firlt are feen in lection only; while the whele of one fide of $c$ is fees.

Fig. 2. The tube $c$ is foldered-into the bottom of the tube $a$, and open throughout, communicating with the receptacle D , which fcrews on the outfide of the tube $a$, and ferves at once to catch the oil which may accidentally run over the tube $a$, and admit the air through the apertures $n, p$, which has to afcend through the tube $c$.

The oil which comes in through C will occupy the cavity $g b$, between the exterior furface of the tube $c$, and the interior of $a$, which mult, of courfe, rife to the height of the aperture $t$, in the refervoir A , as feen in fig. 3. The part $d e$, fig. 2, called the bucket, is a fhort tube to receive the circular wick. This part is feen in fig. 4, with the wick upon it, $d f$. It is made to work freely upon the tube $c$. The latter has a fpiral groove cut upon it, into which a pin at o enters; fo that when the bucket is turned round by a catch $r$, which works in a longitedinal fit in $b$, it will be raifed or lowered by turning the tube $b$ in different directions, and is, therefore, the means of raifing or lowering the wick.

A wire, $s$, is attached to the tube $b$, which bends down parallel to, and touching the outfide of, the tube $a$. The part $k l x z y$ fits upon the tube $a$. The part $k l$ is provided with fhallow fides to receive the glafs E, and is connected with a ring $y$, by wires $x, z, f i g$. I. The whole of this part turns with the glafs E , and at the fame time carries round the tube $b$, by means of the wire $s$, which is connected to $k l$ and $y$, for the purpofe of raifing or lowering the wick. When oil is to be introduced into the refervoir, $A$ is fcrewed off, and inverted. The aperture $t$, fig. 3 , is then opened, by purhing down the fliding focket $v$, which ought to fit the interior cylinder pretty accurately. The globe mult now be filled at the hole $t$ : the focket $v$ is next pulled over the hole. The ball may now be held in an erect pofition, and replaced in the lamp; after which the focket $v$ may be puhed below the hole $t$, by means of the handle $w$. The oil will now rife to a height in $F$, and in $B$, till it reaches the higher part of the aperture $t, f_{\text {fg. }} 3$, and will maintain the fame height till the oil in the globe gets to the fame level. The reafon of this hydroftatical phenomenon will be eafily perceived. When the oil in $B$ and $F$ gets a little below the aperture $t$, a bubble of air enters and afcends into the globe, the fame quantity of oil defcending to give it place.

[^0]gular fupply of oil, is attended with one difagreeable property. The air in the upper part of the globe being much more expanfible by heat than liquid bodies in a warm room, its fpring becomes greater than the preflure of the exterior air ; in confequence of which, the oil is apt to flow over the tube $a$, and liable fometimes to overflow the veffel D. Another difadvantage is alfo attendant on this bulky refervoir. When the lamp is ufed on a table, the fhadow renders one fide of it ufelefs. The above inconveniences in the Argand-lamp have been, in fome meafure, obviated by the invention of Mr. Peter Kier of Kentifh Town. He raifed the oil by means of a column of a heavier fluid. In the plate, figs. 5 and 6, are exhibited an elevation and fection of one of thefe lamps; the fection only requires to be explained. From the flender figure of the vafe, it is evident that the flame is permitted to throw its light in all directions, downwards and upwards, nearly in the fame manner as a candle. The interior part is divided into feveral compartments by the diaphragms at F and C . The fpace A A above F is open to the atmofphere; but the fpace BB , beneath C , is clofe. A tube F G proceeds from the fipace A A to the fpace B B, fo as to reach nearly to the bottom at G, and another tube, C D, proceeds from B B upwards through A A, without communicating with this laft fpace, and is enlarged at the upper part, fo as to receive a wick with the apparatus of Argand, or any other. A folution of fea-falt, or the mother water of falt, being firlt poured in, by meafure, at E , flows down the tube into $\mathrm{B} B$, and fills that fpace. A like meafure of oil is next poured, which alfo defcends into B B, and forces the denfe faline liquor upwards through G F into the fpace A A. The fecific gravity of this laft is adjuted by dilution; fo that when the fpace A A is properly filled, the oil fhali ftand in equilibrio at the requifite height near $E$, viz the furfaces in $A$ and at $E$ are elevated above the lower orifice at $G$, in the inverfe proportion of the fpecific gravitics.
This proportion is ufually about three to four ; fo that if any of the oil be taken away from E by combultion, or otherwife, there will be a fublidence of the heavy fluid in A A to preferve the equilibrium; and during the whole fublidence in A A, there will be a correfpondent depreffion of the upper furface of oil, near E, which will be meafured by four-third parts of the firt clevation of the denfe fluid above the partition FD. Now, the fall in A A may be rendered very fmall, by enlarging the diameter of the veffel at that part, and at $B B$; and the elevation of $E$ above A, and, confequently, the infulation of the radiant flame, may be governed at pleafure by prolonging the interval DC .

It is poffible, in the maniptiation of this lamp, that fome oil, or pieces of fnuff, may fall into the fpace A A, and float upon the liquid. This effect is, to a certain extent, beneficial, becaufe the covering of oil prevents evaporation; but if this fhould require to be remedied, it is eafily done, by pouring the whole contents of the lamp into a bafin, and after a few moments repofe, or ftraining, returning the liquids again into the lamp at E by a fyphon, or funnel, in which they will take their proper places by means of their relative weights. We may recapitulate the good qualities of this lamp in a few words. 1. It is capable of any form or ap: paratus for the burners. 2. It prefents no obftacle to intercept the emitted light. And; 3. As it raifes the oil by the mere gravitation of a non-elaftic fluid, it cannot, in any cafe, like the fountain lamp, raife more than is wanted.

A great variety of other lamps are at prefent expofed for fale, having different means of fupplying the oil, but none fo fufficiently ftriking as to merit minute defaription.

The grand and moft effential properties of the lamp are confined to the means of fupplying the flame with oxygen, fo as to produce the moft perfect combultion, and for which we are almoft entirely indebted to Argand. We fhall therefore conclude this article with fume remarks upon the merits of this valuable invention, and fhew in what inftances it has been improved in its molt effential points.

In the original lamp of Argand, a perpendicular column of air was perpetually afcending through the glafs chimney of the lamp; one part of it pafling through the central tube $c$, figs. I and 2 ; and the reft through the holes $q$ and $n$, round the circular plate \& \& . This part was formerly a cylinder extending down to the receptacle D .

With this perpendicular current alone, it is well known that the Argand lamp would not burn whale oil, and the purification of this oil, to render it fit for the purpofe, became a defideratum, on account of the high price of the fermaceti oil. This great object was not accomplifhed by purifying the oil, but an improvement was made in the lamp itfelf, which effectually anfwered the defired purpore. For this difcovery we are indebted to an ingenious and fcientific manufacturer of Derby. It is curious to obferve, however, that no advantage was taken of this invention for twenty years, during which time it had been ufed in the cotton mills of this difcoverer, and now the fame end is accomplifhed by a fimpler contrivance. The above improvement conlifted in placing over the mouth of the tube $c$ a plate of metal about the diameter of the tube, and at fuch a height as to be a little fhort of the apex of the flame. By this means the afcending column of air was turned out of its perpendicular courfe, and thrown immediately into that part of the flame where the fmoke was formed, and which, by this means, was completely confumed, producing at the fame time a more than ordinary brilliant light.

The fame effect is now produced by the fhape of the lamp glafs E , in the figures already alluded to. The exterior current of air which enters the holes $q, m, \& c$. rifes with a velocity proportioned to the length of the glafs chimney, and to the rarefaction of air in the fame, ftrikes upon the fhoulders N and O , by which it is propelled into the upper part of the flame. This happy form in the glafs appears to have been the refult of accident. Had the manufacturer been aware of its importance, it would have either been the fubject of a patent, or at lealt ftrongly recommended to the public in the way of puffing. We fee at the prefent time different fhaped glaffes, fome of which are rather worfe than the original plar., inflead of improvements.
The theory of the action of the chimney lamp, is fo nearly allied to the principles of furnaces, which we have given under that article, that the reader will no doubt get iome ufeful hints, relative to the conftruction of lamps, by perufing the fame.

The hydro-pneumatic lamp is conftructed upon fimilar principles to the celebrated water engine erected by father Hell, at Chremnitz, in Hungary ; the defcent of one-balf of the fluid to a certain depth below the fource, raifes the other half an equal height above the fource. This principle has been, with great fuccefs, applied to the lamp, we believe at firft by the French, but has lately been brought to perfection by Mr. R. W. King, of Holborn, who manufactures thefe articles. Figs. 1, 2, and 3, of Plate II. explain the conftruction of this ingenious contrivance. Figs. I and 3 are fections to which our defcription will principally apply ; A A is a cylindrical veffel, divided by horizontal partitions into four chambers, viz. B, C, D, and E. The upper one, B, is to contain the oil which is for the immediate fupply of the
flame: the next, $C$, is for the portion of oil which defcends into the inferior chamber E, through the pipe $a$, and forecs the contained air tp through the pipe $b$, into the upper chamber 1 , and prefling upon the furface of the oil contained therein, caufes it to afcend the pipe $d$, to the lamp $F$, which is on Argand's principle, and of the fame conflruction as before explained : $e$ is a pipe to conduct the external air down into the chamber $\mathbf{C}$; and $f$ is a pipe to convey the walte oil, which may drip down from the lamp, into the middie chamber D , which is merely a refervoir for fuch wate oil. G is a tube paffirg down to the fecond chamber C , to fill it with oil ; it is clofed at pleafure by an air-tight plug $h$, fitting into the end of it ; the lower orifice of the pipe $a$ is clofed by a piece of hat $i$, acting as a valve, which is fhut by a fpiral ipring beneath it, but opened by a wire paffing down the tube $a$, and alfo through the filling tube G, the plug of which, when in its place, preffes down the wire, and opens the valve: fuppofe the plug removed, the fpring will cofe the valve $i$. Oil is now poured in at the end of the pipe $G$; it runs down into the chamber C , and fills it, then rifes in the pipe, which having a hole in one fide, near its upper end, the oil alfo flows into, and fills, the upper chamber B. The plug $b$ is now inferted into its place; this thuts off the communication of the open air, both with the chambers B and C, but depreffing the wire, as before explained, opens the valve $i$, and the oil in the middle chamber C defcends, by its gravity; through $a$, as Shewn by the arrow, and enters the lower chamber $\mathbf{E}$, from which it expels the air by the pipe $b$, into the chamber B . The end of this pipe being covered by an inverted hood, the air afcends by bubbles, through the oil, into the top of the chamber, and preffing on the furface of the oil, forces it up the pipe $d$, to the lamp in which it flands at the level of the dotted line $k$, at which level it will evidently cortinue, till the upper chamber is exhaufted, and the contents of C defcended into E . The lamp is now replenifhed by the following means; the whole apparatus is inverted, as fhewn in ffg. 3 ; the oil now runs down the pipe $b$, and filling its hood, flows over into the upper chamber B, which it fills, the atmofpheric air entering the pipe einto the chamber C , and thence by the pipe $a$ into the chamber E , the air contained in the chamber B efcaping at the pipe $d$. The lamp is held inverted for about a minute, and is then fet upright. Frefh oil is now poured in at the plug $h$, to fill the fecond chamber C , and then the plug being put in, the above operation is repeated.

By this ingenious application of the principles of hydroftatics, the lamp $F$ is conftantly fupplied with oil at precifely the fame level, which does not vary by any diminution of the quantity of oil, or by the expanfion of the air by heat, as in the fountain lamp, the included air being only applied as the medium to tranfmit the preflure of one column of oil, from $C$ to $E$ to act upon, and raife a fimilar column from B to the dotted line $k_{\text {. }}$. The lamp is furnifhed with a glafs chim. ney H , fimilar to that before defcribed, and for fome purpofes this is furrounded by a glafs globe K , ground withinfide to take off the glare of the light. The cylindric veffel A $A$ is included in an elegant columnar pedeftal, fown in for. 2, where the ring $L$ is that which is turned round to elevate the wick. Fig. 4. is a cap to cover the top, when the glafs chimney is removed. The principal objection to this lamp, as originally confructed, was, that after inverting it, the oil would, in certain pofitions of the lamp, return down the pipe, and fill the lower chamber again, in which ftate it would not burn. Mr. King has completely remedied this, by bringing all the tubes, except the air and filling tubes as near as poffible into the centre of the lamp. Lamps of this

## L A M P.

kiad have been made fo contain a fufficiency of oil to laft two months, the veftel having the appearance of an ciegant pedeltal to ornament a hall or flaircafe.

A patent lamp, invented by John Barton, efqo is delineated in fig. 5 . of our plate; it is contrived fo as to always have a fupply of oil maintanced at a level, very near the point of combultion, by floating the oil upon a fluid of greater foecific gravity. The oil is contained in a cylindrical veffel A, fog. 5 , having a pipe, $B$, extending upwards from it to the hirners at $a, a, a$, where the wicks are placed. The bottom of the veftel takes off with a ferew joint. fimilar to a fnuff-box, that the infide of the veffol may be cleared; and in the centre of the botom is an aperture of about half an inch in diancter always open. This oil-vefiel is immerfed in a heavier Huid, contained within the external veffel DEFG. A float is attached to the oll-veffel at H , and another, in addition to it. is fixed to the twhe B at I. In this fituation of things, the column of heave fluid, (which may be falt water,) from its furface at $c$ to $d$, where the oil prefles upon it, 'through the hole in the bottom of the oil-vefiel,) will fupport a column of cil, of a greater height, in proportion to the diference of their fpecilic gravties, from $d$ up to $e$ for inftance, within an irch of the burners $a, a$, which is a fufficiently fmall diftance for the capillary attraction to draw up a fupply of oil to the wick. As the oil dimininhes by burnins, the water cnters the hole in the bottom of the cill-vefich, and ftill continues to fupport the column of cil, as at firlt, the oil-wefel foating in the water by the floats at $H$ and $I$. By this means it is freed from the inconvenience we have before afcribed to Mr. Kier's lamp, becaufe the burners defcend as the oil is comfumed; and therefore, though the oil is not mantained at the fame identical level, yet, with refpect to the burners, it is always at the fame diltance belory their wicks. The external reffel unfcrews at $\mathbf{F}$, to get in the oil-vefel A. The enlarged part or vafe D, at the top, should contain very nearly, buc not quite, as much as the oilveffiel. In preparing the lamp, the external veffel is firt filted with the water (poured in at the top of the vafe D) as high as E : the oilveffel is now full of water, and retts upon the bottom, becaufe the upper foat I is not fupported. The oil, being poured in at the top of the tube B, expels the water from the velfel, and fills it at the fame time, raifing theswater in the vafe D , and floating the oilveffel. In this ftate the lamp will continue, with the oil flanding at $\ell$, until it is all confumed.

A very fimple and efficacious lamp has been lately prefented to the public, under the title of the Automaton lamp, laving fomething ingenious in the manner of fupplying it with oil. We have given three figures of it at ffss. $6,7,8$, of the laft plate; it confilts of a tin box, $a b c d$, with a burner conifting of wo wicks of cotton at $a$. The box is fufpended upon pirots at $e$, entering eyes in the wire $f_{s}$ which is fimilar to the fufpenfion part of a fcale-beam. When this lamp is full of oil, which is poured in at $d$, it affumes the horizontal pofition fig. 6 , becaufe the mafs of oil, $a b c d$, is chiefly fituated behind the centre $c$, and balances the weight of the wick at $d$; but as the oil diminifhes by burning, the weight belind the cencre is leffered, whilit that of the wick continues without alteration. This occafions the lamp to librate, as in figs. 7 and 8 , fo that the oil is always kept very sear the wick, by which means it will burn oil which is too impure for the capillary action of a common lamp. The nicety of its performance depends upon the figure of the veffel, and the place of the centre a correfponding with the weight of the tubes at $d$. This the makers bave by experience determined to the greatelt accuracy.

The Automaton lamp is in very general ufe in the north of Eugland in cotton-mills, and other manufactorics where the gas-lights are not introduced, which is undoubtedly the beft method.

Lasp, Cardan's, is a contrivance of an author of that name, which furnifhes itfelf with its own oil.

It confilts of a little column of brals, tin, or the like, well clofed every where, excepting a fmall aperture at bottom, in the middle of a little gullet or canal, where the wick is placed.

Here the oil cannot get out, Bus in proportion as it waftes, and fo opens the paflage of that little aperture.

This kind of lanp was nutuch in wife fome years ago ; but it has feveral inconveniences: fuch as that the air gets into it by farts and gluts; and that when the air in the cavity comes to be much rarefied by heat, it drives out too much oil, fo as fometimes to extinguifh the lame.

Dr. Hook, and Mr. Bogle, have invented other lamps that have all the converiences of Cardan's without the inconvenimences.

The flame in a lamp never confurnes the wick, till the wick be expofed to the air by the flame's falling downward ; and from thence it may be inferred, that a way found out to keep the fuel, and confequently the flame, at the fame height upon the wick, would make it laft a long time. Many waye have been devifed to arrive at this, but it feems only pofible to be done, in any degree of perfection, by hydroflatics. Thus, let a lamp be made two or three inches deep, with a pipe coming from the botton almoft as high as the top of the veffel; let it be filled fo high with water, as to cover the hole of the pipe at the bottom, to the end that the oil may not get in at the pipe, and fo be loft. Thens let the oil be poured in, fo as to fill the veffel alnoft brimful, which mutt have a cover, pierced with as many holes as there are wicks defigned. When the veffol is thus filled, and the wicks are lighted, if water falls in by drops at the pipes, it will aluays leep the oil at the fame height, or very near; the weight of the water being to that of the oil as 20 , to 19, which in two or three inches makes no great difference. If the water runs fafter than the oil waites, it will only rum over at the top of the pipe, and what does not run over will come under the cil, and keep it at the fame height. Phi'. Tranf. No. 245, p. $3^{98}$.

The accefs of air is of the greatelt inportance in every procefs of combuftion. When a lamp is fitted up with a very flender wick, the flame is fmall and of a very brilliant white colour: if the wick be larger, the combultion is lefs perfect, and the flame is brown : a fill larger wick not only exlibits a brown flame, but the lower internal part appears dark, and is occupied by a pertion of volatilized matter, which does not become ignited until it has afcended towards the point. When the wick is either very large or very long, part of this matter efcapes combultion, and fhews itfelf in the form of coal or fmoke. The different intenfity of the ignition of flame, according to a greater or lefs fupply of air, is remarkably feen by placing a lamp with a: fmall wick beneath a flade of glafs, not perfectly clofed: below, and more or lefs covered above. While the currentof air through the glafs fhade is perfectly free, the flame is white; but in proportion as the aperture above is diminifhed, the flames become brown, long, wavering, and fmoky; it inflantly recovers its original whitenefs when the opening is again enlarged. The inconvenience of a thick wick has been long fince obferved, and attempts have beens made to remove it; in fome inflances by fubltituting a number of fmall wicks intead of a larger; and in others, by

## L. A MI

## L A M

making the wick flat inflead of cylindrical, The moft fcientific improvement of this kind is the lamp of Argand, defcribed in the preceding part of this article. In this the wick forms a hoilow cylinder or tube, which flides over annother tube of metal, fo as to afford an adjuftement with regard to its length: when this wick is lighted, the flame ittelf has the figure of a thin tube, to the inner as well as the outcr furface of which the air has accefs from below. And a cylindrical thade of glafs feries to keep the flame Ateady, and in a certain degree to aecrlerate the current of air. 'I'he inconvenience of a long wick, which fupplice more oil than the volume of farme is capable of burning, and which confequently emits froke, is feen at once by railing the wick ; and on the other hand, the effect of a Thort wick, which affords a diminutive flame merely for want of a fufficient fupply of conbullib?e matter, is obfervable by the contrary procefs. The molt obvious inconvenience of lamp; in general, arifes from the fluidity of the combultible material, which requires a veffel adapted to contain it, and even in the beit conltruited lamps is more or lefs liable to be fpilled. When the wick of a lamp is once adjuited as to its length, the flame continnes nearly in the fame thate for a very confiderable time. Nicholfon's Journal, vol. i. $4^{\text {to }}$.

By 17 Geo. II. cap. 29. a convenient number of ghafs lamps fall be put in fuch places of the city of London, as the mayor, aldermen, and commonalty fhall think fit; to be kept lighted and burning from fun fet to fun-riling throughout the year ; and rates flall be made not exceed. ing $6 d$. in the pound, nor above 50 . a year on any one perfon, for defraying the charges of them. Every alderman, with confent of his deputy and common council, may contrast yearly for the fetting up lamps, and their lighting, triaming, \&c. and perfons malicioufly breaking down or extinguifhing the lamp, fhall forfeit fos. for the firlt offence; 5 os. for the fecond ; and $3 I^{\prime}$ for the third, lewable by juffices, or to be fent to the looufe of corrccion. By itat. ${ }_{11} 1$ Geo. III. c. 29. for paring and lighting London, the wilfully breaking or extinguifhing of any lamp incurs the penalty of 20s. for each lamp or light deflroyed or extinguifhed. None but Britilh oil is to be ufed for lamps in private houfes, under penalty of tos. 8 Ann. cap. 9 .
The ufe of lighted lamps in churches, and places of dcvotion, is very ancient. In the city of Fez is a mofque, wherein are 900 brazen lamps burning every night. In Turkey, all the illuminations are made only with lamps. Polydore Virgil aferibes the firt invention of lamps to the Egyptians; and Herodotus defcribes a feaft of lamps held annually- in Egypt.

Kircher fhews the mainer of preparing lamps, which ftall diffufe a light fo difpofed, as to make the faces of thofe prefent appear black, blue, red, ow of any other colour.
There has beeas a great difpute among the learned about the fepulchral lamps of the ancients: fome maintain, they had the fecret of making lamps that were inextinguiflable, alleging feveral that have been found burning, at the opening of tombs fifteen or fixteen hundred years old. But others treat thefe relations as fables; and others think, that the lamps, which were before extinguifhed, took light afrefh upon the admiffion of freth air.

Dr. Plott, however, is of opinion, fach perpetual lamps are things practicable, and has himfelf made fome propofals of this kind. The linum afbeftinum, he thinks, may do pretty well for the wick, and that the naphtha, or liquid bitumen, conftantly fpringing into fome of the coal-mines, would anfiver for the oil.

If the abellos will not make a perpetual wick, he thinks
there is no matter in the world that will; ancid argues, that the tradition of fuch lanps mult be fabulous, or clfe that they made thens without wicks.
Such a lamp he thinks it poffible to make of the bitumen fpringing into the coal-mines at Pitchford, in Shropfliare ; which, he fays, like other liquid bitumen, will burn without a wick.

Thofe lamps that kindle on the immiffion of frefla air, the fame author thinks, might be imitated by inclofing fome of tho licuid phofyhorus in the recipient of an air-pump; which, under thofe circumitances, will not fhine at all ; but on letting the air into the recipient, there will poffibly, fays he, appaar as grod a perpertual lamp as fome that have been found in the fopulchres of the ancients.

Lasri, Rolling, in AIcchanics, is a $\operatorname{lamp} \wedge 1$ (Plate I. Lamps. fir. 7.) that has within it the two moreable cireles D E and $\mathrm{I}^{\mathrm{E}} \mathrm{Q}$, whofe common centre of motion is at K , where their axes of motion crofs one another, in which point alfo is their common centre of gravity. If to the inward circle you join withinfide the lamp K C, made pretty heavy, and moveable atout its axis HI , whofe centre of gravity is at C , the common centre of gravity of the whsle machine will fall betwen K and C , and by reafom of the pivots $\mathrm{A}, \mathrm{B}, \mathrm{D}, \mathrm{E}, \mathrm{H}, \mathrm{I}$, will be always at liberty to defcend ; and, therefore, let the whole lamp be rolled along the ground, or moved in any manner, the flame will always be uppermott, and the oil cannot be fpilt. In this manner the compafs is hung at fea; and thus fhould all the moonlanthorns be made that are carried upon a pole before coaches or carriages which travel in the night. Defag. Exp.-Phil. vol. i. p. 57.

Lasprblack. Of this kind there are two forts; one of which is the light foot, obtained from burning pine and other refinous wood $j$, and another, which is the heavy black, obtained by calcining bones in clofe veffels. See Black. See alfo Bone and Charcoal.

Lavp-blowers are perfons who form various articles of glafs for toys, and for more important philofophical
 fee.

The apparatus of thefe artifts confits of a folid table, to the bottom of which is fixed a doubie bellows with a foot-board, from which proceeds a pipe that conducts the blaft to the lamp. This lamp is a large bundle of cotton threads, placed in a tin veffel in the mape of a horfe-fhoe, and fupplied by lumps of tallow depofited by it, and pufhed into the flame as the continued combultion requires. The fmoke is convered away by a fimall chimney fufpended over the lamp. The bla!t-pipe in front of the table, at which the artiit is feated, drives the jet of flame away from him, fo that be fufers no inconvenience from it.

The other articles of his apparatus are glafs tubes of various dimenfions, and two or three very fimple iron tools, fuch as a fmall forceps, files, \&c. The ilame in fuli vigour is about four inches in length, which near its extremity is of a clear light blue, when it is the hotteft, and beyond of a pale yellow. The tubes, befure the operation commences, are well dried, fo as to be quite free from moifure. They are then gradually heated by being firlt held in the flame of the lamp without blowing, and then at-the calge of the cuter yellow part of the jet of Hame, and flowly brought to a llate of fufion. The flame is fufficiently ftrong to bring to a very white-red heat a folid mafs of glafs, about the fize of a playing marble, or even larger ; and this, when blown out. very thin, will make a bulb of the capacity of three ounces, which is nearly the extent of the power of the common lanp-blowing. The bulbs for thermometers and other phi-
lofophical

## L A M

lofophical purpores are much lefs. (Aikin's Dict. vol. i. art. Glafs.) For an account of the operation of hermetical fealing, performed by the lamp-blowers, fee Hermetical Scaling. For bending and joining glafs-tubes, forming bulbs to tubes, and finning out glafs-threads, fee T'ube, Tuermometer, and Thieads.

Lamp furnace, is a furnace, in which the heat is produced and maintained by the flame of a lamp introduced within it. This furnace has no occafion for an ahh-hole, a grate, or a fire-place. It has only one opening below, through which the lamp is introduced, and a kind of fmall chimney in its upper and lateral part, fur circulation of air, to keep up the flame of the lamp, and to give vent to the fmoke. For the delcription of an improved furnace of this kind, fee Lewis's Com. Phil. Techno p. 29. See Furnace.

LAMPA, in Geograpby, a town of Chili, fituated on a lake; 20 miles N. of Valparaifo.-Alfo, a town of Peru, and capital of a jurifdiction of the fame name, in the bi-
 fertile and partly unproductive: the vicinity abounds with filver mines. S. lat. $14^{\circ} 55^{\prime}$. W. long. $81^{\circ} 44^{\prime}$.

LAMPACAN, a fmall ifland in the Eaft Indian fea, a little S. of Junk Feilon.

LAMPADARIUS, Emanuel, in Biograply, an author who has written on the mufic of the Greek church. "De Pfallendi arte, et ipfius et aliorum Poemata Eccléfiattica, ad notas Muficas accommodata." The Abbate Martini of Venice, to whom we have affigned an article, found this book, and made extracts from it, in Greece; but we never met with it in any public library, either at home or on the continent, except the royal library at Turin. The title of the Greek treatife, by Lampadarius, is the following:
 Abbate Martini, which is in our poffeffion, is too long for infertion here, nor would it be of much ufe could we allow it room, as no equivalents to the Greek characters are given in modern notation; but with refpect to the author, we find among the memoranda made in the king of Sardinia's library at Turin, in 1770, an account of a Greek MS. of the $15^{\text {th }}$ century, No. $353^{\circ}$ b. i. 24 . in which Lampadarius is often mentioned as author of the mufic to the hymns and prayers it contains. Fabricius, likewife, Bibl. Grac. vol. ii. P. 269. 564. and 586, fpeaks of a MS. in the Selden Collection at Oxford, and another in the Jefuits' library at Louvain, in which there are explanations of the notes ufed by the modern Greeks, and mufical compofitions by feveral authors, particularly Lampadarius.

LAMPADARY, Lampadabius, an officer in the aneient church of Conflantinople, whofe bufinefs. was to fee the church well lighted, and to bear a taper before the emperor, the emprefs, and the patriarch, when they went to church, or in proceffion. The taper borne by the lampadary before the emperor was encompaffed with divers circles of gold, in manner of crowns; thofe held before the emprefs and patriarch had but one. It feems they were of emblematical ufe, and were intended to keep thofe great perfons in mind, that their light was to illumine thofe in inferior ftations,

There were alfo lampadaries in the emperor's palaces; and others in the houfes of the grandees. At firlt, the privilege of having a lampadary, or torch-bearer, was only granted to the principal officers of the crown, and the chief magithrates ; but afterwards the emperor allowed it to other inferior officers, as queftors, treafurers, \&c. They alfo bore before the magittrates the emperor's image, \&c. And it was probably on account of this image, that they were firft permitted to have a lampadary,

## LA M

LAMPADIAS is ufed by fome authors for a kind of bearded comet, which, as they pretend, refembles a burning lamp, being of feveral fhapes; its flame or blaze tapering upward fometimes like unto a fiword, and being at other times double or triple pointed.

LAMPADIUS, in Biography, a chantor of the church at Luneberg, publifhed a fmall work in Latin, intitled "Compendium Muficx," 12 mo . 1537. This fhort traEt, which is in dalogue, and a kind of mufical catechifm defigned for incipients, has, at the end, a few fhort rules for compofition, with examples.

LAMPAS, or Lampers, a kind of fwelling in the palate of a horfe; fo called, becaufe it is cured by burning with a lamp, or a hot iron; and arifing from abundance of blood reforting to the firit furrow of the mouth, near the fore-teeth, which caufes that furrow to fwell as high as his gatherers; it hinders the beaft's feeding, and makes him let his meat fall, half chewed, out of his mouth.

LAMPASKE, in Geograpby, a town of Pruffia, in Natangen; 20 miles S.S.E. of Konigfberg.

LAMPE, Fnedericus Adolphus, in Biography, paftor of St. Stephen's church in Bremen, became an antiquary at 15 years of age; and in 1703 publifhed, in 12 mo ., a work of great learning and refearch, intitled "De Cymbalis veterum, Libri tres, in quibus quecunque ad eorum Nomina, Differentiam, Originem, Hiftoriam, Miniftros, Ritus pertinent, elucidantur, cum Figuris æreis Trajecti ad Rhenum," 1703.

This author, in a way fimilar to Bartholinus, in treating of the flutes of the ancients, has given us all the information which could be gleaned from antiquity on the fubject of the cymbal, which is hardly a mufical inftrument, but rather a cbronometer to meafure and mark the time, in its military ufe. In its religious employment, indeed, hefore large bells were caft, it ferved both Pagans and Chrittians as a fignal and call to terhple worfhip. Its clafhing tone in the field may regulate the fteps of the foldiery in their march; but even this purpofe feems better performed in China by the gong and pierre fonore, or mufical fone, ufed in proceffions, as well as in the army : for thefe have real mufical tones, to which there is no difficulty in tuning other inftruments. Our author, by his clafical knowledge and diligence, has nearly found as many names in ancient authors for the different kinds of cymbals, as the Perfian language furnithes for a horfe or lion. As nothing on the fubject has efcaped the notice of the author, this little book will be found to contain much precious information for a claffical antiquary in mufic. Its learned author died of a hæmorrhage at Bremen, in 1729 , at the age of 46.

Lampe, John Frederic, a Saxon, who arrived in England about the year 1726, began firlt to be noticed as a compofer about the year 1732. On the 25th of February of that year, the following paragraph was inferted in the "Daily Poft:" "We hear that there is a fubfcription for a new Englifh opera, called "Amelia," which will fhortly be performed at the new theatre in the Haymarket, by a fet of performers who never yet appeared in public."' This opera, written by Harry Carey, and fet to mufic by Lampe, was firft performed March 15th, 1732; in the principal character of which, Mifs Arne, afterwards fo celebrated as a tragic actrefs, by the name of Mrs. Cibber, firft appeared on the ftage as a linger. The mufic, which, according to the advertifement, was fet in the Italian manner, having been much applauded, was foon avowed by Lampe; and Mifs Arne's performance interefted every hearer. The

## L A M

year 1737 was rendered menorable at Covent-Garden theatre by the fuccefs of the burlefque opera of the "Dragon of Wantley," written by Carey, and fet by Lampe, "after the Italian mauner." This excellent piece of humour had run twenty-two nights, when it was Itopped, with all other public amufements, by the death of her majeity queen Caroline, November 2oth; but was refumed again on the opening of the theatres in January following, and fupported as many reprefentations as the "Beggar's Opera" had done, ten years before. And if Gay's original intention in writing his mufical drama was to ridicule the opera, the execution of his plan was not fo happy as that of Carey; in which the mock heroic, tuneful montter, recitative, fplendid habits, and ftyle of mufic, all confpired to remind the audience of what they had feen and heard at the lyric theatre, more effectually than the molt vulgar ftreet tunes could do; and much more innocently than the tricks and tranfactions of the moft abandoned thieves and proftitutes. Lampe's mufic to this farcical drama was not only excellent fifty years ago, but is ftll modern and in good talte.

In 1745, his wife, (the fecond daughter of Charles Young, filter to Mrs. Arne, ) with Mifs Young, Sullivan, the two Meflings, and Jemmy Worddale, went to Prefton Gild, and afterwards to Chelter, where they performed the "Dragon of Wantley," " Margery," the "Sequel to the Dragon of Wantley," \&c. all compofed by Lampe. He fet "Nancy, or the parting Lover," "Pyramus and Thife," which had great fuccefs; and publifhed, in an octavo volume, a tract, intitled "The Art of Mufic," in 1740. But in 1737 he had publifhed a treatife, under the title of "A plain and compendious Method of teaching Thorough-Bafe," \&c. 4 to. ; a work of great merit, and the firlt in our language, by which a ftudent can profit much without a mafter, as the chords, engraved on copper-plates, are all placed over the figured bafe, and the examples tranfpofed into different keys.

Lampe was a truly ingenious man, well verfed in the theory of the art, with a molt happy turn for humour, without buffoonery, in his comic operas; and, moreover, a man of probity, with great fimplicity of manners, and poffeffed of a kind and benevolent heart. This excellent mufician and worthy man, quitting London, with his family, in 1748 , refided two years in Dublin; and in 1750 went to Edinburgh, where he was fettled very much to the fatisfaction of the patrons of mufic in that city, and of himfelf; but in July ${ }^{1751}$, he was feized with a fever, which put an end to his exiltence at the age of $\operatorname{fifty}$-nine.

Lampe, in Geography, a town of Sweden, in the government of Wafa; 28 miles E. of Gamla Karleby.

LAMPEDOSA, an uninhabited but pleafant and fertile inland in the Mediterranean. The Catholics and Mahometans vifit a building upon it, which is divided into a church and a mofque. Near it is a magazine, containing the depofits of the vifitants, which are taken up by fome Sicilian monks, and applied to the hofpital at Trapani. The ifland is abour 12 miles in circumference, has a good port, is well fupplied with frefh water, and has, on the coalt, an excellent fifhery; 63 miles W. of Malta. N. lat. $35^{\circ} 40^{\circ}$. E. long. $12^{\circ} 24^{\prime}$.

LAMPERN, in Icbthyology, a river fifh, being the petromyzon branchialis of Linnzus, found in many parts of England, particularly in Oxfordhire, and the neighbouring counties, and there called the pride of the I/sis. The Latin authors call it the lampetra minima and muftela fluviatilis. See Petromizon Branchialis.

The word lampern is ufed by the common people in Eng-
land for one fpecies of the lampctra, and is not to be confounded with the other called the lamprey, or the lampreyeel. Sec Petromyzon.

No lamperns are to be taken in the river Thames and Medway, except from Auguft 24 to March 30. 30 Geo. II. cap. 21 .

LAMPETEER, in Geography, a townhip of America, in Lancafter county, Penufylvania, containing 2028 in. habitants.

Lampeter. See Llanbeder.
LAMPETIA, in Ancient Geography, a town of Italy, in Magna Gracia, in the country of the Brutii.

Lampetians, Lampetiani, in Ecclefiafical Hiftory, a fect of ancient herecics, in the feventh century, who fell in with fome of the opinions of the Aerians.

Their founder, Lampetius, is faid to have been one of the chief of the Marcionites. They condemned all kinds of vows, particularly that of obedience, as inconfiftent with the liberty of the fons of God.

LAMPETRA, Lamprey, ì lambendo petras, becaufe this fpecies is fuppofed to lick the rocks, in Ichthyology, belongs, in the Artedian and Linnæan fy flems, to the genus of petromyzon. See Petromyzon Marinus.

This is a fifh that equally lives in falt and fref water. In the month of March it commonly runs up into the rivers, and is then moit valuable for the table, as being fat and full of eggs ; fo that the beft feafon for lampreys is in the months of March, A rill, and May, becaule they are moft firm when they firft leave the falt water, and become wafted and flabby at the approach of hot weather ; they are found in fereral of our rivers, but the Severn is the moft noted for them. They are taken in nets along with falmon and fhad, and fometimes in weels laid in the bottom of the river. It has been an old cuftom for the city of Gloucefter, annually; to prefent his majefty with a lamprey pye, covered with a large raifed cruft ; and as the gift is made at Chriftmas, the corporation procure fref lampreys at that time with great difficulty. They are reckoned a great delicacy, either potted or ftewed; but are a furfeiting food, as one of our monarchs fatally experienced, Henry the Firtt's death being occafioned by a too full meal of this fifh. They are fometimes found fo large as to weigh four or five pounds. The leffer lamprey, or petromyzon fluviatilis of Linnæus, fometimes grows to the length of ten inches. Thefe are found in the Thames, Severn, and Dee, and are potted with the large fpecies, and are reckoned of a milder tafte. They are fold to the Dutch as bait for their cod-fifhery. Above 450,000 have been fold in a feafon at 40 s. per thoufand. Of late, above 100,000 have been fent to Harwich for the fame purpofe. It is faid the Dutch have the fecret of preferving them till the turbot fifhery. A nother fpecies is the lampern, which fee.
Lampetra Indicu, the name of an Eaft Indian fifh of the lamprey kind, caught in ftanding waters, and called by the Dutch there bont ael, and ncegen oog, or mine ejes.

LAMPI, in Gcography, a diftrict or country of Guinea, governed by a king, fubject to Aquambo.

LAMPICHELEON, a town of Hindooftan, in the circar of Adoni ; 10 miles $E$. of Candanore.

LAMPIS, a town of Sweden, in T'avafland; 25 miles E. of Tavalthus.

LAMPO, a town on the weft coaft of Celebes. S. lat. $3^{\circ} 55^{\circ}$. E. long. $120^{\circ} 4^{\prime}$.

LAMPOCARYA, in Botany, fo denomisated by Mr. Robert Brown, from $\lambda a \mu \pi w$, to Joine, and raguv, a nut, or any fruit zuith a bard faell, alluding to the hard and polifhed feeds.-Brown. Prodr. Nov. Holl. v. 1.238 .-Clafs and order,
arder, Teiram,rian Monozynia. Nat. Ord. Calumaria, Lim? Cyproidee, Julî.

Efi. Ch. Spikelets imbricated on all fides, fingle-fowered, the outer fcales being empty. Stamens four, fometimas three or fix, with permanent elongated filaments. Style awl-haped, thrececleft. Stigmas undivided. Nut bony, fhining, pointed with the permanent bafe of the ftylc, its thell thickened upwards; the kernel fincoth.

Obf. This genus is intermediate between Cladium of Brorne's Jamaica, and Gaknia of Forther, differing from the former in having the filaments elongated after flowering, and a farp-pointed nut; from the latter in having a fmooth or even kernel. Gabmia folbanoides of Forlter appears, by a foecimen in the Banklian herbarium, to be a Lampocarya.

1. L, afpera. Stamens four. Spike compound, leafy; the partial unes fearecly divided. Spikelets cluftered. Inner icales obtufe, fmooth. - Gathered by Mr. Brawn near Port Jackfon, as well as in the tropical part of New Holland. The four ftamens are a very unufual number in this family.
2. L. bexandra. (Gahnia trifida; La Billard. Nov. Holt. v. 1. 8g. t. 116.)-Stamens fix. Panicle clofe: branconcs fightly divided. Spikelets collected into round heads. Scales atl tharp-pointed. Gathered by La Billardiere in Van Diemen's land. 'The ferms are two feet high, round, leafy, finooth. Lecves fheathing, awl-fhajed, long, and flender. Panicle flender, erect, con'pofed of feveral falked heads of flowers, with two or three lanceolate bracteas at the bafe of each. Mr. Brown doubts whether this fecond fpecies be properly referred to the genus in queftion. Wie fhould be much inclived to reduce both of them to Galnia.

LAMPOL, in Geography, a town of Poland, in the palatinate of Braclaw, near the Dnielter; 56 milcs S.S.W. of Braclar.

LAMPON, in Bigraphy, a performer on the cithara, who taught Socrates mulic in his old age, and who fung at a fertival which Xenophon gave to the philofophers. Socrates tells us, that he only began to compofe verfes, after the was imprifoned, on account of the many dreams, in which he was advifed to attach himfelf to mufic ; believing that it was impoffible to arrive at one without the other.

He compofed hymus in praife of Apollo, and fet them to muffic; but he was put to death fonse days after. Others E=il us, that Damon was the mufic-malter of Socrates. See Damos.

Lampos, or Lampoon, in Gengrafty, a country of Sumatra, which is a portion of the fouthern extremity of the inand, beginning, on the weft coatt, at the river of Padanggoúchie, dividing it from Paffummah, and extending acrofs as far as Palembung, on the nurth-eaff fide, at which latt place the fettlers are mottly Javans. On the fouth and eatt lides it is wafhed by the fea, having feveral ports in the Itraits of Sunda, particularly Keyfen and Lampoon bays; and the great riser Toolang-bouang runs through the heart of it, rifing from a confiderable lake between the ranges of mountains. That divifion of Lampoon, which is included by Padang-gocchie and a place called Naffall, is dittinguifhed by the name of Briuran; and from thence fouthward to Flat-point, by that of Laont-cazvour, although Cazoour, properly fo called, lies in the northern divition. 'The country of Lampoon is belt inhabited in the central and mountainous parts, where the people live independent, and in fome meafure fecure from the inroads of their eattern meighbours, the Javans, who, from about Palembung and the traits, frequently attempt to moleft them. If you afk the Lampoun people of thete parts, whence they originally
came? they anfwer, from the hills, and point out an inland place near the great lake, whence, they fay, their forefathers emigrated. Thefe, of all the Sumatrans, have the Atrongelt refemblance to the Chinefe, particularly in the roundnefs of face, and conftruction of the eyes. They are alfo the faireft people of the ifland; and the women are the talteft, and efteemed the moolt handfome. Their languare differs confiderably from that of the Rejangs, and they ufe characters peculiar to themfelves. The titles of povernment are Pangeran (from the Javans), Carceoo, and Kildimang or Nubcelie? the latter anfivering nearly to Dupaty among the Rejangs. The diltrict of Ciooe, near mount Poogeng, is governed by five magiftrates, called Panyosu-lecmo, and a fixth, fuperior, called by way of eminence Pangrov; but their authority is faid to be ufurped, and often difputed. The word, in common, fignifies a gladiator, or prize. fighter. The Pacraran of Socko in the hills is computed to have four or five thoufand dependants ; and fometimes, on going 2 journey, he levies a fallie, or eighth part of a dollar, on each family; which flews that his government is more arbitrary, and more ltrictly feudal, than among the Rejangs, where the government is rather patriarchal. The Javancefe banditti often advance into the country, and make depredations upon the inhabitants, who are not, in general, a match for them. They do not ufe fire-arms, though in the northera part of the illand they are manufactured. Befide the common weapon of the country, they fight with a long lance, carried by three mien; the foremof guiding the point, and covering himfelf and his companions with a large thield. Inland of Samankz, in the ftraits of Sunda, there is a diftrict, as the Lampoons fay, inhabited by a ferccious people, who are a terror to the neighbouring country. Their mode of atoning for offences againft their cwn community is by bringing to their doofoen the heads of ftrangers. Thefe reports, however, depend on the credibility of a people who are fond of the marvellous, and addicted to exaggeration. The marners of the Lampoons are more free, or rather licentious, than thofe of any other native Sumatrans. An extraordinary liberty of intercourfe is allowed between the young people of different fexes, and the lofs of female chartity is not a very uncommon confequence. Both men and women anoint themfelses before company, when they frepare to dance; the women their necks and arms, and the men their brealts. They allo paint each others' faces, making fantaltic fpots with the finger on the forchead, temples, and cheeks, of white, red, yellow, and other hues. In every doofoon there is appointed a youth, well fitted by nature and education for the office, who acts as maller of the ceremonies, regulating every circumftance that pertains to the dances and the affembly. The Lampoons eat almolt all kinds of ficth indifcriminately; and their goolies (curries or made difhes) are faid by comoiffeurs to have no flavour They entertain ftrangers with sereater profufion than any that is met with in the relt of the inland. One man lias been known to entertain a perfon of rank and his fuite for fixteen days, during which time there were not lefs than 100 difhes of rice fpread each d:y. Their difles of chiva or earthen ware are very coltly, being valued at to dollars a-piece. The terms of the jogjoor, or equivalent for wives, is here the fame nearly as with the Rejangs The father of the girl never admits of the postoos tallic kooloo, or whole fum being paid; and thus withholds from the huband, in every cafe, the right of felling his wife, who, in the event of a divorce, returns to her relations. . Where the pootoos talice is allowed, he has a property in her littie differing from that of a dave. The value of the maiden's golden trinkets is nicely eltimated, and her jonjoor regulated accorcing to that, and the rank of
her parents. The fines and compenfation for murder are, in every refpect, the fame as in other countries of the ifland. The Mahometan religion has made confiderable progrefs among the Lampoons, and moft of their villages have mofques; neverthelefs, an attachment to the original fuperftition of the country induces them to regard with particular veneration the crammats, or burying-places of their fathers, which they pioully adorn, and cover in from the weather. The Dutch have a refident here. S. lat. $5^{\prime}$ qo'. E. long. $^{\prime}$ $105^{\circ} 5^{\prime}$. Marden's Sumatra.

Lampon Bay, a bay on the eaft coaft of the ifland of Luçon. N. lat. $14^{\circ} 4^{6}$. E. long. $122^{\circ}$ I4'.

LAmprey, Blind. See Einblinder and Petromyzon brancbinlis.

LAMPRIDIO, Benedrct, in Biography, a diftinguifhed Latin poet, who flourihed at the commencement of the fifteenth century, was born at Cremona. He went to Rume in his youth, and was firf domeflicated with Paul Coteff. He then became a teacher in the Greek college, inflituted by John Lafcaris, in the pontificate of Leo X. After this he went to Padua, and was eniployed many years as private teacher of the learned languages, and much efteemed by perfons of eminence. He was afterwards appointed, with a liberal falary, to undertake the education of the fon of the duke of Mantua. Lampridio died in the year 1540: he is known as an author by his Greek and Latin poems, confilting of epigrams and odes: in the latter he was an imitator of Pindar. There are extant three Italian letters written by him to cardinal Bembo, and one to cardinal Pole. An edition of his Latin poems, together with thofe of J. Bapt. Amaltheus, was printed at Venice in 1550.
L.AMPRIDIUS 閸ius, was a Roman hitorian in the fourth century under Dioclefian and Conltantine. He is fuppofed to have been the author of the lives of Commodus, Antoninus, Diadumenus, Heliogabalus, and Alexander Severus. The ftyle and arrangement of Lampridius will not allow him a place among hithorians of the fuperior clafs, but he is valuable for his facts. His lives make a part of the "Hiftorix Augultæ Scriptores." Moreri.

LAMPRILLON, or Lamprelon, a name by which fome authors have called the particular fpecies of lamprey, which "e, by way of diftinction, call lampern.

LAMPROPHORUS, an appellation anciently given to the neophytes, during the feven days that fucceeded their baptifm.

In the ceremony of baptifm, the hew Chriftian was clothed with a white robe, which he wore for the week following ; and was thence called lamprophorus, which fignifies a perfon wevaring a ßinining garnent; from $\lambda \alpha \mu \pi F_{0} ;$, ßining, and eppu, I bear.

The Greeks allo gave this name to the day of the refurrection, becaufe their houfes were adorned and illuminated on that day with a great number of torches, as a fymbol of the light which that myftery diffufed in the world.

LAMPSACUS, in Ancient Geography, a town of Afia, on the banks of the Hellefpont, more anciently called Pityoufa, which was founded by the Phocreans. The object of worfhip in this place was Priapus, the god of the gardens. This town rofe from the ruins of Pæfos, whofe inhabitants eltablifhed themfelves here. Its territory was fertile; and it was alfigned by Artaxerxes to Themiftocles, in order to furnith his table with wine.

LAMPSAKI, in Geography, a town of Natolia, celebrased for its wine, anciently Lampfacus; 40 milez W. of Artaki. N. lat. $40^{\circ} 20^{\prime}$ E. long. $26^{\prime} 44^{\prime}$.

LAMPSAMANDUS, in Ancient Geograpby, a fmall Vol. XX.
ifland of A fia, on the coaft of Caria, in the Ceramic gulf. Pliny.

## LAMPSANA, in Botany. See Lapsana.

LAMPUGA, in Ichllyology, a name given by fome authors to the fin more ufually known by the name of Aromatcus.

LampuGNANI, Jonn Baptist, in Biggraphy, of Milan, an opera compofer of great fancy and firit. He was not a deep contrapuntitt, but there was a certain gaiety and fpirit in his ftyle, which amufed his hearers and.engaged attention. He came into England in 1742, during the regency of lord Midulefex, and while Montrelli was the chicf inger, for whom he compofed fome very captivating airs. The Englifh, long accultomed to a more folid, grave, and learred fyyle, thought him inaccurate, wild, and frivolous, and his ftyle was only tafted by fuch of our nobility and gentry as had been in Italy, and had been initiated into the new opera thyle. The charatter of this compofer is drawn with fo much judgment, tafte, and difcrimination in M. Laborde's "Effai fur la Mufique," and fo exempt from the national prejudices with which that work abounds, that we fhall venture to tranflate it, and guefs at the name of the author.
"Lampugnani was a profeffor much efteemed among the moderns. He excelled much in his melodies, and owed more to nature than to fludy. He applied with great perfeverance to produce new effects from iniltruments. Confequently to him has been afcribed the new manner of ufing the opera orcheftra. Inftrumental mufic, and its performers, have doubtlefs greatly increafed their importance by this innovation. But, how has it been abuted! It fometimes happens, that the noife of the orcheftra is all that can be heard, from the beginning of the opera to the end. And that a beautiful paffage can only now and then penetrate through the inftrumental phalanx, to convince us that a voice has any concern in the bufinefs. There are certain compofers, who have no refource but in noife. There are others, likewife, who have no time allowed them for any thing elfe." Voiture, in one of his letters, begs pardon of a friend for writing him fo long a letter, as he has not time to write a fhorter. But in Italy, an opera mult be compofed in a fortnight, fo that the compoler loads his inftruments as much as he can, and leaves the voices at full liberty to do nothing, or to do as much as they pleafe. In the operas of Lampugnani, the voice governs the orcheftra, and upon her all the inttruments wait, as on a fuperior. He is autthor of a great number of works, that have had complete fuccefs in Italy; but it is in vain to name them, as mulic of more than a year old, is as difficult to be found as a coin of the emperor Otho.

We faw Lampugnani at Milan, nearly thirty years after he had been in England, where, as a compoier, he was laid on the fhelf. He taught ladies to fing, and had gained great credit from fome of his fcholars. He refided conItantly in that city, where he played the firlt harpfichord at the opera, in the abfence of the compofer, and arranged the pafticcios. He was a pleafant old man, with the fpirits and good nature of a young one.

LAMPUGO, in Ictithyology, a name given by many to the bippurus, a fea fifh, caught on the coatt of Spain. See Coryphena.

LAMPYRIS, in Entomology, a genus of the coleoptera order. The mott familiar fpecies of this kind, and which may be confidered as an inftructive example of the genus in general, is that known in our own language by the name of glow-worm, and in other counties by names of fimilar tendency, the female being deftitute of wings, the body elon-

Gg
gated,
gated, and the pofterior part beneath emitting, during the night time, a brilliant ohofphoric light. The fpecies of this genus are rather numerous; the greater part are natives of A.frica and America; a few only imhabit Europe, and of thefe but three kinds are found in Britain, two of which are rare.

The females of the fpecies moft commonly known are deftitute of wings; all the lampyrides of the latter fex fhine during the obfcurity of the evening, or at night, and fome of the males poffefs the fame ability, while others are in this refpect deficient. The males throughout all the fpecies are furnifhed with wings; the females, on the contrary, are always apterous. The luminour property in the lampyris tribe re*ides in the two or three polterior rings of the abdomen, and is only vifible on the under furface. In the day time the laminous fpace appears paler, and more inclining to yellow than the relt of the infect : the light, when emitted, partakes of various hucs, being either a clear brilliant white, or white tinged with greenifh or blueifh, and this it can vary or heighten in brilliancy at pleafure, as it does not depend on any external caufe: it is an inherent ability, governed only by the will or caprice of its poffeffor, and, according to the general perfuafion of naturalitits, is an ordinance of nature, by means of which the males, in their excurfions through the air, can readily difcover their apterous crawling mates among the grafs and herbage beneath them.

This luminous appearance of the glow-worm has at various periods excited confiderable curiofity in the minds of fpeculative men. Forfter firft announced that this extraordinary property was fo ftrong and retentive, that he could diftinctly read by the light emitted from glow-worms plunged into oxygen gas. The fame experiment was verified by Beckerhiem, who proved befides that they live a long time in other kinds of gas, and continued to fhed their light vigoroully, as in the oxygen gas. With the acid, the nitrous, muriatic, and fulphureous gafes, he did not however fucceed fo well; when placed in either of thofe, the infects died in a few minutes. A variety of other experiments have been made on the lampyrides by Spallanzani, Carradori, and others, the refult of which proves, among other curious circumitances, that this luminous property is inherent. Theféinfects were oblerved to poffefs the power of moving various portions of the vifcera, independently of the others; and it was likewife afcertained that a portion of the luminous rings of the abdomen, when cut out of the infect, retained its brilliant appearance for fome feconds afterwards. Thefe experiments were made chiefly on the L. italica, the luminous properties of which are more confpicuoufly brilliant even than that of our common glow-worm.
The lampyrides are found molt commonly about the months of June and July, appearing among the bufhes, the grafs and herbage on the firts of lanes leading through meadows, and woody fituations. The males of fome kinds, as before intimated, are luminous; and thefe, when on the wing durng the night time, exhibit a moft lively and fplendid afpect, like fo many fparks of fire darting through the air. Tho females nearly refemble the larve, being of a lengthened form, divided into a number of diltinct fegments, the head fcaly, and the anterior part of the body furnifhed with fix fcaly feet. The larva feed on leaves. The eggs, which are numerons, are ufually depolited near the roots of grafs.

Among the ancients, the names lampyris, noctiluca, cicindela, \&c. were beftowed, without difcrimination, on almoft erery creature of the infect tribe, poffeffing the luminous property of the glow-worm. Geoffroy endeavoured to unite the lampyrides together, but with thefe he confounded fome other genera. Linnæus alfo blended them with the
lycus and pyrochroa; and Schæffer followed Geoffroy. Fabricius has adopted the lampyris genus, with fome material devistions from either, and his authority is, in this refpect, rather generally approved. Linnæus, fo lately as the roth edition of Syit. Nat. confounds the lampyrides under the genus cantharis; it is in a fubfequent edition they appcar under the name of lampyris, with the following effential character. Antennæ filiform; wing-cafes weak and flexible; thorax flat, femi-orbicular, furrounding and concealing the head; fcgments of the abdomen terminating in folded papilix ; females in general deftitute of wings. This is the claracter admitted by Gmclin, who, befides the true lampyrides, by this means includes the genera omalyffus of Geoifroy, coffyphus of Olivier, pyrochroa of Geoffroy and Fabricius, and the lycus of Olivier and moft other modern authors. The Fabrician character of the lampyris genus conlifts in having four fub-clavated feelers; jaw bifid ; lip horny and entire ; antennx fliform.

## Species.

Noctiluca. Oblong, brown, fhield cinereous. Linno Cantharis nociluca, Fn. Suec. Gloweworm, Donov. Br. Inf. \&c.

Frequent in meadows, and near woods in Europe: the female is rather larger than the male.

Splendidula. Oblong, brown; fhield hyaline at the tip above the eyes. Marh. Ent. Brit. Lampyris Jplendidulu, Linn. Donov. Br. Inf. Cantharis nodiluca, Scop. Le ver luifant à femelle fans ailes, Geoffr.
"An European fpecies, very rarely found in Britain ; the fpecimens recorded (in Brit. Inf.) were received by Mr. Drury from Yorkfhire, and are preferved in his cabinet now in our poffeffion. It refembles the common glow-worm in fize and appearance, but is diftinguihed from that infect principally by the hyaline fpot at the anterior apex of the thield above the eyes." This kind is obferved by Fabricius to be moft refplendent in fhowery weather.
Cornusca. Dull black; fhield with a rofy crefent each fide. Linn.

Inhabits North America. Fabricius fpeaks of a variety twice the ordinary fize.
Obscura. Black; fhield with a rufous fpot each fide. Fabr.

Defcribed from a fpecimen in the Bankfian cabinet, a native of Terra del Fuego. The fhield is entire, and depreffec at the fides; wing-cafes brown and without fpots; abdemen and legs black.
Laticornis. Ovate, black; fhield with rufous margin antennæ comprefled. Fabr., Olivier, \&c.

A fpecies of moderate fize; the flield rounded; wingcafes fomewhat friated; abdomen with two or three white pellucid dots on the left fegment.
Pyralis. Shield rufous; in the middle black; wingcafes black, the edges with the abdomen white. Linn.

Native of South A merica.
Cneta. Fufcous; thorax, edge of the wing-cafes, and tip of the abdomen fulvous. Olivier.

Native of Pulicandor. The head brown; abdomen black, the laft fegment but one fulvous; legs black ; and thighs fulvous.

From the Bankfian cabinet.
Marginata. Oblong, black; margin round the thorax, wing-cafes, fcutel, and pofterior part of the abdomen yellow. Linn.

Native of America; the antenne fufcous, with the bafe yellow ; the legs variegated.

Pectinata. Black; outer bafe of the kides of the
thield, and apex of the abdomen and wheg-cafes, white; antennæ pectinated. Fabr.

An American fipecies. The anternx nearly as long as the body.
Flabellicornis. `Black; fhield before the margin, with marginal line at the bafe of the wing-cafes and tip of the abdomen, white. Olivier.

Native of the Brazils; the antennæ very large, and fanshaped; wing-cafes flightly friated.

Hespera. Ovate ; wing-cales brown, with a triangular marginal yellow fpot. Olivier.

Inhabits America.
Ignita. Ovate; wing-cafes broun, with an ovate mar. ginal yellow fpot. Linn.

Native of South America.
Lucida. Oblong; wing-cafes brown, the outer margin pale yellow; abdomen yellow. Linn.

Inhabits South America, and refembles the common glowaworm.

Nitidula. Oblong, fufcous; thorax yellowifh, with a black fpot in the middle; apex of the abdomen with two yellow fpots.

An African fecies.
Piosphorea. Oblong, fub-teftaceous; abdomen black, behind fine yellow: Degeer, \&c.

Native of America.
Japonica. Yellow; lait fegment but two of the abdo. men black. Thunb. Nov. Sp.

This fpecies inhabits Japan, and, according to Thunberg, flies about in the evening during the months of May and June, and emits a vivid phofphoric vapour from two veficles at the end of the tail. The antennx, eyes, wings, and lait fegments of the tail, except the two at the apex, black.

Atra. Deev black; margin of the thurax rufous. Fabr. Lampyris atra, Olivier.

A North American fpecies. The antennre ferrated.
Capensis. Livid; thorax yellowifh; pofterior part of the abdomen fine yellow. Olivier.

Antenna fufcous; fcutel yellowih.
Australis. Yellowifh; head and wing-cafes brown; tip of the abdomen clear white. Fabr.

Refembles the following fpecies; the thorax and fcutel ferruginous; ends of the legs black, the reft yellow. Inhabits New Holland.

Italica. Black; thorax tranfverfe, and with the legs sufous; abdomen clear white at the tip. Linn.

Inhabits among trees in Italy; the antennæ are black; thorax without fpots.

Vittata. Rufous; wing-cafes black, with a yellow margin, and abbreviated fillet in the middle. Olivier.

Found in Guadaloupe.
Mauritanica. Wing-cales livid; body yellow. Lim.
Native of Africa.
Hemiptera. Black; wing-cafes very fhort. Geoffr.
A fmall fpecies found in France; the antennæ are com--preffed; fhield rounded, entire, black, and without fpots; wing-cafes ov3te, very fhort, and black ; abdomen flat, and with the legs black.

Pusilla. Deep black; tip of the antennre, with the wing-cafes, fanguineous. Marfh. Ent. Brit. Lampyris ni-gro-rubra. De Geer.

This appertains to the lycus genus of Fabricius, in which it occurs under the fpecific name minutus; it is alfo pyrochroa minuta of that author's Mantiffa. The feecies is two lines and a half in length.

LAMSPRINGE, in Geography, a town of Weftphalia, -is the bifhopric of Hildelheim, at the fource of a fmall riven
called Lame, which foon after runs into the Inner-fec ; is miles S. of Hildefheim.

LAMUS, in Ancient Geography, a fmall river of Greece. in Beotia, which had its fource on the fummit of mount Helicon. Paufanias.-Alfo, a town and river of Afia, in Cilicia. Ptolemy places the mouth of the river betwect Sebafte and Pompeiopolis, and the town in a canton, which takes from it the name of Lamotide. This town was epifcopal, and is placed by Leon-le-Sage and Hierocles in Iau. ria, under the metropolis of Seleucia.

LAMUZO, in Geography, a town of Afiatic Turkey. in Aladulia, on a river of the fame name; 24 miles W . of Tarfus.
LAMY, Bernard, in Biograply, who flourihed in the feventeenth and eighteenth centuries, was of noble defecut, and born at Mans in the year 1640; having been carefully initiated in the elementary parts of learning, he entered amon: the religious of the congregation of the oratory at Paris; from thence he went to Saumur to ftudy philofophy. From 1661 to 1667, he was employed in giving inftructions in the claffics and the belles lettres, and in the latter of thefe yeare he was ordained prieft. He now taught philofophy at Saumur and at Angers, till the year 1676, and while inltructing others, he applied himfelf with the utmolt intenfenefs to the ftudy of every branch of literature and icience, and made 2. very confiderable proficiency. He was now directed by his fuperiors to go to Grenoble, where cardinal le Canus had eltablifhed a feminary, for the edacation of ecclefiaftics, in which Lamy was appointed profeflor of divinity: In every duty in which this excellent prieft engaged, he was indefatigable; and as an author he published a great many valuable works; of thefe the moft valuable, and which engaged his attention for thirty years, was entitled "De Tra bernaculo Foderis de Sancta Civitate Jerufalem, et de Templo ejus, Lib. Ceptem," illuftrated with many plates. This work, which was replete with valuable information and'very curious difcuffion, wa3 not publifhed till the year 1720, five years after the author's deceafe. The death of father Lamywas occafioned by the burting of a blood-veffel, though he had been in a declining ftate fome years previouly to that accident. He was much efteemed for the modefty of his manners; for his unaffected piety and deep learning. Among the numerous works which he left as memorials of his induftry, may be mentioned his "Reflections on the Art of Poetry ;"" "A Treatife on the Equilibrium of Solids and Fluids;" "A Treatife on Magnitude in general, comprehending Arithmetic, Algebra, and Analyfis;" "D Dialogues on the Sciences and the belt Manner of ftudying them ;" "Elements of Geometry;" and "A Treatife on Perfpective."
Lamy, Francis, a French Benediaine monk, born at Montyreau, in the diocefe of Chartres, in the year 1636, was intended for the military profeffion, which, at the age of twenty-three, he exchanged for the ecclefiaftical. He made a rapid progrefs in the feveral departments of literature, and his writings thew that he was deeply filled in the knowledge of the human heart. He died in the year 1711, at the age of feventy-ive. His biographers have highly praifed him for the benevolence which he manifefted on all occafions, and likewife for his candour, amiablenefs, and extraordinary piety. One of his mott popular pieces was, "A. Treatife on Self-knowledge," in fix volumes, which pafted through feveral editions. Many of his other works were bighty efteemed as good defences of natural and reyealed religion; fuch were his treatife "On the evident Truth of the Chrifo tian Religion ;" "The New Atheifm overthrown," in ano fwer to Spinoza; "The Unbeliever conducted to Keligion by Reafon." Lamy wrote on natural as well as theological
fubjects:

## LAN

fuhjects; fuch is his work entitled " Phyfical Conjectures on the Effects of Thunder, and on other Subjects in Natural Philofophy." His ityle, though not wholly free from faults, is faid to be more correct and polifhed than that of any writer in the French language of that clafs to which he belonged.

LAN, in Geography, a town of Perfia, in Oberland; $I 4$ miles N.N.E. of Joldau.-Alfo, a city of China, of the fecond rank, in the province of Petcheli, on the river Lan; 113 miles E. of Peking. N. lat. $39^{\circ} 4^{\circ}$. E. long. $118^{\circ} 24^{\circ}$-Alfo, a city of China, of the fecond rank, in Chen-fi, on the Hoang. It is fituated near the great wall, and in the vicinity of the principal poris on the weftern coaft, and it is therefore claffed among the moft important cities of the empire, and has been made the capital of the weftern part of the province, and the feat of government. The trade of this city confits only in flins, which are brought from Tartary, and different kinds of woollen ftuffs. A coarfe kind of tuff is made here of cow's hair, which is ufed by the inhabitants for making great coats to defend themfelves from the frow. N. lat. $36^{\circ} 6^{\prime}$. E. long. $103^{\circ}$ 29.- Alfo, a river of China, in Pe-tcheli, which runs into the gulf of Leao-tong, N. lat. $39^{\circ} 15^{\prime}$ E. long. $118^{\circ} 36^{\prime}$.
I.ANe Petra. Sce Petra.

LANAGLA, in Geography, a town of the ifland of Fortaventura, fituated on the E. coaft.

LANARIA, in Botany, fo called from lana, wool, on account of the woollinefs of the flower.- Ait. Hort. Kew. ed. I. v. I. 462. v. 3. ${ }^{2} 10$. ed. 2. v. 2.289. Schreb. 794. Willd. Sp. Pl. v. 2. 181. (Argolalia; Juff. 60. Lamarck. Illuftr. t. 34.) -Clafs and order, Herandria Monogynia. Nat. Ord, Erjiate, Limn. Iridilus aifine, Juff.

Gen. Ch. Cal. none. Cor. fuperior, of one petal, fomewhat bell-fhaped, clothed externally with feathery wool; tube fhort; limb in fix deep, linear-lanceolate, flightly fpreading, equal fegments, coloured within. Stam. Filaments fix, thread-flaped, fhorter than the corolla, inferted into the bafe of its fegments; anthers ovate, fomewhat incumbent. Pija. Germen inferior, turbinate, externally woolly; ftyle thread-fhaped, erect, the length of the ftamens; itisma three-cleft. Peric. Capiule ovate, of three cells. Sceds two or three in each cell.

Eff. Ch. Corolla fuperior, externally woolly, longer than the filaments; its limb in fix deep fpreading fegments. Capfule of three cells.

1. L. plumnfa. Woolly Cape Hyacinth.- (Hyacinthus lanatus; Limn. Sp. Pl. 455.)-Native of the Cape of Gcod Hope, from whence it was fent to Kew in $11_{7} 8$, by the late Mr. Miaffor, and is kept there in the green-houfc, but has not yet flowered. Its habit is that of a Dilatris; fee that article. Root fibrous, peremnial. Stent erect, angular, hairy, molt leafy in the lower part, terminating in a denfe corymbofe tuft of numerous fowers. The leaves are iinear, keeled and chamelled, fmooth. The whole inflorefence is denfely clothed with white feathery hairs.

Lanaria has formerly been applied as a name to feveral plants, cither on account of their woollinefs, as the larger sinds of Verbafoum; or of their ufe in dycing, or dreffing, wool, or woollen cloths. Of the former defcription is the Dyer'sweed, Refida Luteola; of the latter the Teafel, Dipfacus fullonum. Perhaps Saponaria offrinulis, Soapwort, was called lanaria radi, from its fcouring quaiity.

LANARIUS, in Ancient Geography, a river of Sicily, placed by Antonine in his Itinerary on the route between Agrigentum and Lilybra, between Ad aquas and Mazara.

Lanarius, in Ornithology. See Falco.
LANARK, in Gegraphy, a royal borough, and the county-town of Lanarishire, in Scotiand, is fituated about

30 miles to the W. of Edinburgh, near the left bank of the river Clyde. It is a place of great antiquity, having received its original charter as early as the reign of Alexander I. The government is velted in a provolt, two bailiffs, a dean of guild, thirteen merchant-counfellors, and feven deacons of trades. The town confits of one principal ftreet, which defcends towards the Clyde, and five inferior ones branching off from it, befides lanes and clofes. Many new buildings have been added within thefe few years. The ftreers are in general well paved with whinltone, and exhibit, efpecially near the centre of the town, a confiderable degree of neatnefs. In early times Lanark appears to have been a place of fome note. The eminence called Cafle-hill, which lies between the town and the river, was the fcite of a caftle, which, according to tradition, was built by king David I. and was for feveral centuries the refidence of the Scottih monarchs. The charter of the town of Ayr, granted by William the Lyon, is dated from this place, and many fpots in the neighbourhood are diftinguifhed by names of royal origin. The firft affembly or parliament mentioned in the hillory of Scotland was convened in this town by Kenneth II. in the year 978. It is allo rendered remarkable as the ficene of the firft great military exploit of the celebrated fir William Wallace, that patriot having here commenced his glorious but unfortunate career by the defeat and death of William de Hefelrig, or Hefliope, the Englifh fheriff of Lanarkfhire. It is faid that this town was formerly fortified, but no traces of fuch works can now be difcovered. The riling ground, named Caftlehill, however, bears fome refemblance to an artificial mount, and may probably have been fortified in the time of the Romans, as a fine filver coin of Faufina was found on it feveral years ago. The old parif church lies in ruins about a quarter of a mile to the fouth-eatt of the town, and retains confiderable marks of former elegance. The hofpital of St. Leonard's, which thood to the eaftward of the town, was founded by king Robert I. Upon digging up its ruins fome time fince, to prepare the ground for the plough, an urn, together with a variety of carved ftomes and other curiofities, were difcovered under them. The fame monarch was alfo the founder of a monaltery of Francifcan, or Grey friars, fituated to the weit of the prefent church, where a general chapter of all the Grey friars in the kingdon was held on the 1 yth July, 1400. This town unites with Linlithgow, Selkirk, and Peebles in fending one member to parliament. The population of the town and parifh, as afcertained in the parliamentary cenfus of 18 Sco , was 4692 perfons, who occupied $6+3$ houres. Sinclair's Statiftical Account of Scotland.
Lavark, New, is deferibed in the courfe of the following articlc.

LANARISHIRE, an inland county in the fouth of Scotland, is frequently denominated Clydefdale, from the river Clyde, which flows through it longitudinally in a winding courfe of more than fixty miles. The fituation of this county is between $55^{\circ} \cdot 22^{\prime}$ and $55^{\circ} 5^{\prime}$ north latitude, and between $3^{\circ} 15^{\prime}$ and $4^{\prime} 19^{\prime}$ weft longitude. It is bounded by Dumfries-fhire on the fouth, by the flires of Ayr and Renfrew on the wef, by the counties of Dumbarton and Stirling on the north, and by thofe of Linlithgow, Edinburgh, and Peebles on the eaff. Its leng th from north to fouth is about fort y-feven miles, and its breadth nearly thirty-two. The parifhes it contains are forty-eight in number, inhabited, according to the parliamentary returns in 1800 , by a population of 150,690 perfons. The furface contents are 927 fquare milcs, or 593,280 flatute acres. Lanarkfhire anciently formed a great pertion of one of the principalities into which Scotland was divided at the time of the Roman invafion. The name given to this kingdom was Strathclyde, which comprehended, befides the counity of Lanark, thofe
of Stirling, Dumbarton, and Renfrew. This fhire is divided into three diftricts, or wards, formerly known by the appellations of Clydefdale, Douglardale, and Avondale, but thefe are now more frequently termed the upper, middle, and lower wards. Each of thefe diftricts is fubject to the particular juriddiction of a fubititute appointed by the meriff.depute of the county.

With refpect to the foil and appcarance of this county, the upper parts of it, except in the vicinity of the Clyde, are fo hilly and moorifh, as fcarcely to be fufceptible of any improvement from agriculture. The elevation of the hills is in general very great; fome of them rife to the height of 600 feet above the level of the fea. Notwithltanding this, they exhibit but little grandeur, the perception of their fize and altitude being much modified by the clofenefs with which they are crowded together. The chief part of the arable lands in the upper diftrict, lies in the parifhes adjoining to the hill of Tintne, round which the Clyde flows with a flow and gentle current, wafhing, in its courfe to Lanark, twelve miles of the finett meadow fields in Scotland. In the neighbourhood of Biggar, one of the towns in this diffrict, the foil is uncommonly rich and fertile. This fertility is in many places principally owing to the inundations of the Clyde, which are likewife often the fource of irreparable damage, by carrying off, not only the crops, but even the very foil it had formerly enriched. Proceeding down the river, the foil' is found to be dry, light, and friable, but lefs productive than in the vicinity of Tintoe. Carlicke parifh is of a clayey foil, but excellent in quality. This parifh, and indeed all the parifhes fituated along the river, are particularly diltinguifhed for the richnefs and variety of their fcenery. Within this diftrict are the falls of the Cliyde, celcbrated both by the poet and the painter. Above, as well as below thefe falls, the banks of the river are adorned with numerous country feats, and villages filled with indultrious inhabitants.

The middle ward, or diftrict of this county, is not nearly fo elevated as that above mentioned. When viewed from any conliderable height, indced, it has the appearance of a level country, though in fatt it is much divertified with hill and dale, the former being much lefs abundant than the latter. The foil of this ward is in general of a clayey texture, and within fix miles of the river extremely fertile. The fcenery here is no lels beautiful than that of the upper ward, the banks of the Clyde being covered with hamlets, orchards, and plantations of various kinds: beyond the range of fix miles, however, the country is of a very different defcriptian. It is fuppofed that there are not lefs than 40,000 acres of mofs-land within this diftrict, and fuch fpots as are free from that covering, difplay a foft clayey foil, formed from a fort of hard clay, lamellated in a horizontal direction, which is called by the farmers sill, and is known to mineralugits by the name of fehiftus.
The lower ward is extremely limited in extent, but may rank as the molt important of the three, on account of its containing the city of Glafgow, which is juftly denominated the Manchefter of Scotland, and is perhaps fcarcely. inferior to Liverpool in point of commercial importance. The lands in this diftrict are naturally barren and unproductive, but in the neighbourhood of Glafgow, the overflowings of a very profperous commerce have added greatly both to its fcenery and fertility. See Glascow.
'The chief towns in Lanark תhire are Glafgow, Lanark, Rutherglen, Hamilton, Douglas, Biggar, and Carnwarth. Of thefe the three firft are royal boroughs, and will be found defcribed under their refpective names. Many confiderable villages are likewife fcattered throughout the county. The moft worthy of notice among thefe are thofe of Leadhills and

Wilfon-town, which are indebted for their profperity to the mineral productions of the county. Nerv Leenark, which owes its origin to, the cottun works effablifned there by David Dale, efq. of Glafgow, is alfo a thriving and populous place. Thefe works were firtt erected in the year 1785 , and are perhaps the molt extenfive of their kind in Scotland. "They afford employment to upwards of 1500 perions, many of whom are children. Great attention is paid to their morals and education. The fituation of the mills is extremely fingular and romantic, being uearly furrounded by high grounds of very Iteep afcent. They were built on this fipot chiefly on account of the great command of water that could be obtained. For this purpofe a fubterraneous aqueduct has been cut through the foid rocks, for the fpace of feveral hundred yards. Woth the works and the feenery around are objects of peculiar interelt and curiofity. One of the mills contains no lefs than 6080 fpindles.
Befides the Clyde, already fo often mentioned, there is a number of other flreams in this county, all of which, however, difcharge themfelves into that river. The chief of thofe on the northern fide are, the Elwin, Glengonan, the Little-Clyde, the waters of Duneaten and Coutten, and the two Calders. None of them are remarkable, except that the two latter are well fhaded with wood, and adorned with a number of neat villas. The itreams on the fouthern fide of the river are rather more deferving of attention. The Moufs-water is particularly remarkable for that part of its banks cailed Cartlane-Craigs. Thefe form a curious and romantic den, or dell, fomewhat more than a quarter of a mile in length. The rocks on either fide rife to the height of fous hundred feet, exhibiting a terrific and rugged appearance in one fpot, while, in another, the eye is relieved by a pendent covering of coppice wood. At the bottom runs the river Moufs, fo clofely confined as fcarcely to al. low room for the lonely traveller to traverfe the den.. At all the windings of this river the fcenery varies, and whenever a rock is furnd to project on one bank, a correfponding, recefs may be feen on the other. One of thefe carerns is flill called " Wallace's Cave," from a tradition of its having been for fome time the place of that hero's concealment. Io-gan-water, which rifes in the mountain feparating the parifh of Lefmahago, from that of Muirkirk in Ayrfh re, is a beautiful paftoral river. The Avon, which likewife takes its rife on the confines of Ayrfhire, after being joined by feveral minor Atreams, empties itfelf into the Clyde near the town of Hamilton. In its courfe it paffes through the inclofures of the duke of Hamilton, where its bold and lofty banks, covered wi:h a variety of flurubs and trees, afford many extremely fine and picturefque views.
No county in Great Britain is more interefting to the geologitt, or abounds with a greater variety of mineral troducticns, than Lanarkfhire. The furface of the upper divifion of'the county generally refts upon whinftone, itanding in perpendicular columns. The middle and lower diftricts, for the molt part, exhibit fome kind of freeflone for their bafe, but are interfected, at different points, by ridges of whinttone running off from the rocky mountains, downwards, througho out the whole extent of the county.. Under the flrata of freeftone immenfe ftrata, or beds of coal, are difcovered, extending over all the plain country, and branching out, more or lefs, along the courfe of the principal waters. The feams of this ufeful mineral are not entirely of one kind. Where the whole ftrata remain untouched, a variety of thin and lefs valuable feams, or ftrata, prefent themfelves in dig. ging down to what is commonly called the upper coal, becaufe it is the firt that is found to be worth mining for to any extent. This ftratum is compofed of the rough coally

## LANARKSHIRE.

except a fmall portion in the middle of it, which is of the kind called fplint. After this, comes the ell coal, which is much efteemed for the black [mith's forge. At from ten to feventeen feet beneawh this ftratum, the fean called the main coal is found. It is fo named becaufe it poffeffes all the good qualities of the other ftrata, and is preferred, by confumers in general, to every other fpecies of this mineral. Below the main coal are four more feams. The higheft of thefe is compofed of the bumph coal, the fecond of the bard coal, the third of the foft coal, and the fourth and latt feam of the lean or four-milk coal. Beneath all are found feveral ftrata of excellent limeftone, probably as extenfive and inexhauftible as the valuable mineral which covers it. Independently of thefe frata of coal in the plain, there are others in the higher grounds, but of a diffimilar nature and arrangement. The hills in the parifh of Shotts, like the tracts of the fame elevation in the upper ward, are found to confift of an enormous bed of whinttone, but in defcending along their fides, the freeftone rock fhows itfelf lying in a horizontal pofition beneath the whinitone. Below the free-coal, ironftone and limeftone are difcovered in fuch vaft profufion, as feemingly to defy the utmoft efforts of human induftry to exhauft thern. Near the Douglas river alfo, extenfive collieries, fimilar in quality to thofe of Shotts, are wrought, which fupply the higher diftricts of this county and Tweedale, where no coal has yet been difcovered. To the vaft fupplies of this valuable mineral, and its confequent cheapnefs, the manufacturing profperity of the weft of Scotland is to be principally attributed, as, without abuncance of fuel, fcarcely any manufacture can be carried on.
Lead and Iron.-A Another great fource of induftry and opulence beftowed on this county by nature, is derived from its mines of lead and iron. The former of thefe metals is chiefly' wrought at Lead-bills, a range of mountains in the uppermoft part of the county, immediately adjoining to Nithfdale. Thefe mines belong to the earl of Hopetoun, and are carried on by two feparate companies. The number of miners employed in them is very great. They work only fix 'hours out of the twenty-four, fo that they have much leifure time, a great portion of which is dedicated to reading. To facilitate this worthy employment of their time, a library was eftablifhed many years ago by an overfeer named $M$-Sterling, who prevailed on the workmen to fubfcribe for that purpofe. Since that event the miners have been remarkable for induttry and fobriety of manners, the ufual concomitants of a tafte for literature; and the example has been followed with fimilar effects at the neighbouring mines of Wanlockhead.

The iron of this county is found every where in the fame tract with the ftrata of coal. In many places it is imbedded between the different feams of that mineral, and is ufually wrought at the fame time with it. Iron ore, that is, the metal in its richeft ftate, has not yet been difcovered here in any great quantity, but ironftone exifts in great profufion. It is found either in the form of beds of rock, or in collections of nodules or ironftone balls, as they are called by the workmen, of various thapes, fize, and qualities. Among thefe balls is the curious foffil called ludus Helnontii, Jeptuarium, or wazen veins. It is of a fpherical flape, more or lefs oblate or depreffed. Above and below then are alternate ftrata of ironftone and fchiftus. They lie on their depreffed fides, in a regular direction, making a fort of interrupted ftratum, one tone being feveral inches and fome even a foot or two diflant from the other. The ironftone of which they are compefed is of excellent quality, yielding fometimes fifty per cent. of iron.

The Antiguities in this county are not fo numerous, in pro-
portion to its extent, as in fome other counties of Scolland. The Roman road, which formerly croffed the parihes of Lamington and Biggar, and defcended along the fouth bank of the Clyde, is now only vifible in a few detached fpots. Different parts of the upper wards, in particular, abound with excavations in the earth, or vaults which were ufed as ftrong holds by the aboriginal inhabitants, when the haughty chiettains of Clydefdale and Annandale were engaged in mutual hoftilities and depredations. At Cold-chapel are the remains of a Roman flation, and in the fame neighbourhood is a fpot called Wallace's Camp. It is faid that a chair, which formerly belonged to that hero, is itill preferved at Borrington.

Near Biggar are feveral artificial mounds. The church of that town is one of the moll venerable relics of monaftic architecture in Scotland. Here is preferved an ancient vafe or urn, fuppofed to be Roman, which was ufually appropriated to facred purpofes by the Popih priefts. Boghall caitle, about a mile from this church, was formerly furrounded by a marfh, and acceffible only by a caufeway or mound of earth. The entrance is through a large and magnificent gate-way, which leads into a fpacious court in the centre. This caftle is flanked with towers. It was formerly the refidence of the Flemings, earls of Wigton, and has evidently been one of the moft extenfive and iplendid fortreffes in Scotland. This neighbourhood is reprefented in the popular hiltories of far William Wallace, as having been the fcene of a fanguinary conflict between his band of patriots and the army of Edward I.

Cuthally caftle, or, as it is vulgarly called, Cowdaily cafte, the feat of the ancient family of Somerville, is fituated in the parifh of Carnwarth, and appears to have been formerly a place of great ftrength. At the foot of Tintoe is an artificial mount, and near it a circle of large flones fet up perpendicularly. On an adjacent farm is a place called Sheriffs' flats, where it is fuppofed the fheriffs anciently held their courts. Tradition reports, that a bullock's hide, full of gold, is buried under this fpot. Here are alfo the walls of a cattle which belonged to the family of Lindfay. In Pittimair parifh are the veftiges of a large encampment, the figure of which approaches to a circular area. A fmall fort belonging to it is ftill diftinctly vifible at a little diftance from the walls. Several urns have been lately found here inclofed within four large flag ftones. At Douglas are the remains of a caftle belonging to the powerful family of that name. The greater part of this building was unfortunately confumed by fire about fifty years ago. In the old church of St. Bride's, in Douglas, are a number of monuments in honour of the Douglafes. The parih of Carftairs, in the vicinity of the Clyde, contains the veltiges of a Roman camp, the caufeway leading to which can itill be traced for many miles. Pots and difhes of different kinds, as well as various inftruments of war and facrifice, have been dificovered here. A number of coins have alfo been dug up, bearing the infcription of Marcus Aurelius, and Marcus Antoninus. At Cleghorn is another Roman camp, fuppofed by general Roy to have been the work of Agricola. Befides thefe remains of antiquity there are a number of others; as the priory of Lefmahago, the caltles of Cudzow and A vondale, \&c. but the limits of this article will not allow us to particularife the whole. Many of them, however, will be found either defcribed or noticed in our acounts of the refpective places. Rothwell catlle, in this diltrict, is one of the moft magnificent ruins in Scotland. The ftructure itfelf is fuperb, and all the objects around have an afpect of grandeur. The whole work is executed with fmooth flone of a red colour. It is adorned with lofty towers at both
ends, and has undoutcedy been a place of confiderable firength.

The principal feat in Lanark fhire is the palace of Hamilton, belonging to, and the occafional refidence of, the Hamilton family. It is a large maffive pile, of a dull and heavy appearance, fituated in the neighbourhood of the town, from which it derived its name, and deferves notice chicfly on account of the beauty of its feenery, and the valuable collection of paintings it contains.

Lanarkfhire has long been celebrated for its horfes, which are reckoned among the mult powerful in the world. As contaiuing the town of Glafgow, it mult be ranked among the firt manufacturing and trading counties in Great Britain. Forfyth's Beauties of Scotland, rol. iii.
LANAWEN, in Georrafby, one of the fmaller Sooloo iflands, in the Eatt Indian fea. N. lat. $6^{\circ} 15^{\prime}$. E. long. $122^{\circ} 3^{\prime}$.

LANCARIM Spring, the name of a medicated water of Glamorgankire. It has its name from a village near which it rifes, and has been very long famous in the place for the cure of the king's evil. The body of water is about an ell broad, and runs between two hills covered with wood. About twelve yards from this fpring the rill falls from a rock of about eight or niae feet high, with a confiderable noife. The fpring is very clear and rifes out of a pure white marle. The cures that have been performed there are proofs of a real power in the water; but there is fome queltion, whether the water, or its motion and coldnefs, does the good; for the people, who come for relief, always drink of the Spring, and bathe the part afterwards in the fall below. It is generally fuppofed that the lime-ftone rocks communicate a virtue to it, by which it cures intermally; but it has been often found, that the holding a limb difordered with the evil, in the ftrong current of a mill tail, has cured it; and there is the fame advantage in the fall of this water. Phil. Tranf. N ${ }^{\circ}$ 233, or Abr. vol. ii. p. $233^{\circ}$

LANCASHIRE, in Geography, a county palatine in the northern part of England, furrounded by Cumberland and Weftmoreland to the north, by Yorkßhire to the eaft, Chefhire to the fouth, and the Irifh fea to the weit. Its area comprifes about 1,130,000 acres of land, of which above 350,000 are in a ftate of tillage, 450,000 in pafturage, and about 400,000 in wood-lands, moors, \&c. According to Mr. Yates, who has publifhed an Agricultural Survey of Lancafhire, the greatelt length, from north to fouth, is 74 miles, by about 44 in breadth: the circumference is $3+2$ miles, and furface 1765 fquare miles. It is divided into the fix hundreds of Amoundernefs, Blackburn, Leyland, Lonftuale, Salford, and Welt-Derby: and contains fix boroughs, viz. Clitheroe, Lancafter, Liverpool, Newton, Prefton, and Wigan ; 21 market towns, viz. Blackburn, Bolton, Burnley, Bury, Cartmel, Chorley, Colne, Dalton, Ecclefton, Garltang, Hallingdon, Hawkfhead, Hornby, Kirkham, Manchefter, Orm@kirk, Poulton, Prefcot, Rochdale, Ulverfon, Warrington; and 62 other parifhes. The whole contains, according to the return to parliament in the year $1800,117,664$ houfes, and $672,73 \mathrm{r}$ inhabitants, of whom 269,259 were itated to be employed in various trades and manufactures, and 52,018 in agriculture.

In the ancient hittory of this county, we find that it was originally inhabited by the Setantii, or Segantii, who were fucceeded by the Brigantes, who allo had a very extended tract of country. (See Brigantes.) The Romane, under Julius Agricola, appear to have conquered this diftrict in A. D. 79 : and foon afterwards, according to Mr. Whitaker, that general eftablifhed the following fations within the
limits cf this county: "Ad.Alaunum and Bremetonace in the north; Portus-Siltuntiorum in the welt; Rerégorium and Coccium about the centre ; Colonea in the eaft ; and Veratinum and Mancunium in the fouth." The precife fcites of all thefe flations are not fatisfactorily afcertained: nor is it generally adinitted, by other antiquaries, that there were fo many permanent flations in the county. In the ltinerary of Ansoninus only three are fpecified : viz. Bremetonacea, xxviio m. p. from Galacum in Wettmoreland; Coccium, xx. m. p. from the former ; and Mancunium, xvii. m. p. from the latter. To connect thefe towns or Itations, roads or military ways were formed, and thefe were difpofed in the moft direct line from one place to another, and conftructed in the moft fcientific and filful manner. Mancunium, now Manchefter, was a fation of large extent and importance; and from it roads branched off northward to Coccium, (Ribchefter,) two north-eait ward into Yorkfhire, one fouth-welt ward to Condate, now Middlewich in Chefhire, and a fifth foutkealtward to Derventio, Derby. The whole of this county was denominated by the Romans, Maxima-Cxfarienfis, or Britannia-Superior. The Saxons included it in Northumbria; and, according to Mr. Whitaker, "formed it into a feparate county about 680, and foon after the conqueft of it by Egfrid." At this period, the Roman Alauna was "made the metropolis of the fhire, and lent its own appellation to the county." Soon afterwards the whole was divided into hundreds, tythings, \&c. That part called South Lancafhire was firlt divided into three ; but fubdivided into fix juft before the Norman conqueft : thefe are called Blackburn, Derby, and Salford; Newton, Warrington, and Leyland.
The ecelefiaftical hiftory of this county commences with the Anglo-Saxons: after the fee of York was eftablifhed, the kingdom of Northumbria was fpeedily fubdivided into feveral diocefes, and the whole of North Lancalhire was connected with the fee of York. But foon after the confolidation of the feven kingdoms into one, the fouth of Lancalhire was fevered from the diocefe and province of York, and annexed to the province of Canterbury and diocefe of Lichfield; and thus continued till the year 154r, when the two parts were again combined, as they bave erer fince continued, under one bifhop, and reunited to their ancient and original fee of York. At the firlt partition of the bihopric into archdeacosries, the principal towns of the latter would naturally be conltituted the capitals of them : and the Roman colony of Chefter was made the metropolis over the fouth of Lancaffire, as the archdeaconry of Richmond was over the north. The next ecclefiaftical divifion of the county was into rural deaneries, and by the "Valor Beneficiorum," which was taken in 1292 by command of pope Nicholas IV., the whole county of Lancafter, exclufive of Furnefs, which then belonged to Weftmoreland, was partitioned into thirty-fix parifhes only. By the fame record it appears, that thefe parifhes were included in the four deaneries of Blackburn, Leyland, Manchefter, and Warrington; all in the archdeaconry of Chether. The deanery of Amoundernefs and Furnefs is in the Richmond archdeaconry.

The landed property, which the king poffeffes in this county, as duke of Lancafter, is of great extent; but the revenues arifing therefrom are but fmall. The principal part of this property confifts in what are generally ftyled the forefts of Myerfcough, Fulwood, Blearidale, Wyerfdale, and Quern, all fituated in the moft northern parts of the county. In thefe his majefty is intitled to the eftrays and the game, and the right of holding courts, \& $c_{-}$; and mult be confidered as lord of the manor of all the forefts. The townhip of Quernmose is fituated in the hundred of Lonfdale;

## LANCASHIRE.

dale, and contains above 3000 acres of inclofed and walle land. W yerfdale, which is fimilar in fituation, contains more than 20,000 ftatute acres; the greater part is mountainous land, not worth inclofing, but producing abundance of game. Bilcaridale is in the hundred of Amoundernefs, and contains nearly 4000 acres of inclofed land, and about the fame quantity not inctoled. Myerfough is fituated about eight miles from Pretton; and contits of nearly 2200 acres, all inclofed; of whath about 1600 , belonging to the king, is called Myerfeough Park, and is held under a leafe by Mr. Heatly. The ancient forelt of Fulwood comprifed a large quantity of land which is now inclofed: the uninciofed parts are about 908 acres. Pretton race-ground is a portion of the foref. Befides the duchy lands, a few large proprietors hold extenfive eftates in this county. But the prevalence of trade, manufucture, and commerce has tended greatly to tubdivide the property, in the vicinity of the large towns efpecially, and hence Lancafhire has a greater number of landowners than any other county in England, excepting Middlefex. Canden remarked, that Lancafhire was diftinguifhed for the number of aucient families whofe names were the fame as their manorial cftates. This remark fill applies, though not to the Eame extent, as many old family manfions are now deferted. Previous to, and under the Norman dynafty, this county was diftinguilied as an bonor, and was of the fuperior clafs of feigniories, on which inferior lordfhips and manors depended, by the performance of certain cuftoms and fervices to the lords who held them. Landed honors origimally belonzed to kings exclufively, but were afterwards granted in fee.to noblemen. Thefe kept their honor courts "every year at leaft, or oftener if need be ; at which court all the freeholders of all the manors that fland united to the jaid honor, thall make their appearance, which fuitors fhall not fit, but jtand bareheaded." That the honor of Lancafter exitted befnre the conqueft, is demonftrated by an agreement, fill preferved, between king Stephen and Henry duke of Normandy. From this period till the reign of Henry III. the honor was held by feveral great perfonz. That monarch conferred it on his fecond fon Edmond, when it became an carldom. The title of duke of Laricatter was created by Edward III. in favour of Henry Plantagenet, whofe daughter and heirefs, Blanche, married John of Gaunt, fourth fon of Edward III., for whom the privileges and revenues were confiderably increafed: he, being created duke of Lancalter on the death of his father-iu-law, obtained a patent for advancing this county to the dignity of the palatinate. The court belonging to this duchy has the power of deciding every caufe relating to it : the officers are, a chancellor, attor:ley-general, king's ferjeant, king's counfel, receiver-general, clerk of the council and regilter, furveyor of lands, attorney in the exchequer, attorney in chancery, four counfellors, \&c. The offices of the duchy court are at Somerfet place, London.

The foil and furface of Lancanire are various; and its features in fome parte, particularly towards the north and along the eaftern border, are ftrongly marked. Here the hills are bold and lofty, and the vallies narrow and irriguous. On the fea-coalt, and nearly the whole of the fouthern fide of the county, following the courfe of the river Merfey, the land is low and flat. In the diltrict which lies between the Ribble and the Merfey, the greater part of the furface is a fandy loam, well adapted to the production' of almoot every king of vegetable, and that to a degree which renders it impoffible to eltimate the advantages which might be derised from an improved cultivation. The fubftratum is generaily the red rock, or clay marle, one of the mott defirable foils that can be found. Moor-lands which are in a flate of na-
ture, and produce heath and other wild plants, are of sarious qualitics; and are much more extenfive than might have been expected in a county fo populous, where land mult confequently be very valuable.

The mineralogical hiftory of this county has never been publicly developed; and though the internal contents are lingularly rich, the varied reculiarities and characterifties of thefe riches have not been made known. With fingular advantages of natural and artificial navigation, the coals, which conllitute its moft prolific and ufeful production, are cheaply conveyed to the various manufactories of Manchefter, Bolton, \&cc. and alfo to the coalt. Coal is found in immenfe beds, both on the fouthern part and towards the middle of the county, but cliefly in the hundreds of Weft Derby and Salford, and in part of Blackburn. It is not obtained much farther north than Chorley and Colne; but great abundance of this ufeful foffil is again procured at Whitehaven, and about Newcaltle-upon-Tyne. At Haigh, near Wigan, a feccies of coal is produced, fimilar in appearance to black marble, and of a very bituminous quality. It is called Cannel Coal, and burns with a peculiar clearnefs of flame, confumes very rapidly, and is apt to fly in pieces in the fire; but if previoufly immerfed in water, it is faid to lofe this property. It is of a dull black colour, breaks eafily in all directions; and if broken tranfverfely, prefents a fmooth conchoidal furface. Towards the north and north-eattern parts of the county, lime-ftone is very abundant. It is found at Halewood, near Liverpool, at various depths, but inconfiderable in quantity. In the vicinity of Leigh, and alfo at Ardwick, near Manchelter, is lime-Atone of fuch peculiar quality, as to refitt the power of water: it is therefore applied to the conftruction of cifterus, and to making mortar for building under water. Stone of various denominations is produced en this county. Upon the common, near Lancalter, is a large quarry of excellent free-flone, which bears a tine polifh, and of which that town, equalled by few in the kingdom for neatnefs, is wholly built. Flags and grey flates are found at Holland, near Wigan. The mountains, called Coniftone and Telberthwaite fells, near Hawk fhead, afford a large quantity of blue Ilates, of whick there is a confiderable export: they are divided into three claffes, called London, Country, and Tom flate, of which the firft is efteemed the beft. Scythe-ftones are obtained at Rainford, and are well wrought on the fpot. Iron-ore is found in abundance between Ulverftone and Dalton, in Lows Furnefs. In the north, fome copper mines have been worked; but they have not been productive. At Anglefack, near Chorley, is a lead mine belonging to fir Frank Standih, bart.: it confifts of feveral veins, which interfect the Atrata of the diftrict almoft perpendicularly, and run in various directions. The matrix of thefe veins is formed of carbonat and fulphuret of barytes. The former, which is a very rare mineral, is found in the greatelt abundance near the furface; and as it defcends, it becomes progreflively contaminated by the fulphuret, which, in the loweft flrata, feems completely to ufurp its place. The exiftence of carbonat of barytes, as a product of nature, was firf diltinctly afcertained by Dr. Withering; but he feems to have been miltaken as to the place where his fpecimens were obtained. To James Watt, jun. efq. the public are indebted for a defrription of the external character of this fubitance, and its effects on the animal body, when taken internally. See Manchefler Memoirs, vol. iii.

The principal rivers in this county are the Loyne or Lune, the Wryer, the Ribble, the Calder, the Douglas, the Irwell, and the Merfey; Befides thefe there are feveral fmaller ftreams or rivers, all which, directing their courfes
towards the weft, empty their waters into the Irin fea. The Loyne or Lune, emanating from the fells of Weftmoreland, enters this county near Kirkby Lonfdale. Soon afterwards its fream is augmented by the waters of the Greta and the Wenning from YorkThire; and the expanded river then paffes through the much admired valley of Lonidale. Purfuing a fouth-wefterly courfe, it reaches the county town, where it becomes navigable; and at the diftance of two miles from Lancafter, is calculated to bear thips of confiderable burthen. The approach to Lancafter is indefcribably friking, where the river becoming wider, and winding in feveral bolder fweeps, opens to the view of that fingular town, defcending from a lofty hill, whofe fummit is crowned by the baltions of its caftle, and the lofty tower of its church. The Wyer, which has its fource among the moors on the north-ealtern part of the county, meanders through a very romantic diltrict; and purfuing a fouthwefterly courfe towards the fea, receives the waters of feveral other mountain-Atreams before it reaches Garftang-church town. Near this place its current is greatly increafed by the waters of the rivers Calder, \&c.; and paffing near the town of Poulton, expands into a broad bafor, called W yerwater; and, again contracting its banks, joins the Irifh fea between Bernard's-Wharf and the North Scar. The Ribble, like the Loyne, unites to the fea by a very broad eftuary; and, like that alfo, has a Roman flation on its banks. "This river," Dr. Whitaker obferves, "by the general confent of moft antiquaries, has been underftood to be the Beliffima of Ptolemy." The Ribble is one of the largeft rivers in the north of England, and has its fource in the high moors of Craven in Yorkfhire. Taking firft a fontherly courfe, it paffes by the town of Clithero, and, forming the boundary of the county for a fhort fpace, is joined by the Hodder and the Winburne from Whalley. The chief courfe of this river is through a highly commercial and well cultivated country; and near the thriving town of Prelton, its banks are bold, and adorned with hanging woods. A little to the weft of this place, the Ribble forms a fpacious eftuary, which is enlarged by the mouth of the river Douglas. The latter has its fource in the vicinity of Rivingtonpike, and, after paffing the town of Wigan, procceds northwefterly by Newburgh, and near Rutford is joined by the Elder-brook from Orm\&irk, After receiving the united ftreams of the Yarrow and Loftock rivulets, it empties itfelf into the eftuary of the Ribble, at a place called MuckStool. The Irwell originates in the moors, near the Yorkfhire and Lancafkire boundaries, whence it flows, fwelled by other ftreams, through the manor of Tottington to Bury. Hence it proceeds to Manchefter, where it unites with the Medlock and the Irk. Paffing through Barton, where the duke of Bridgewater's canal is carried over it by means of a grand aqueduct, it falls into the Merfey below Flixton. The Alt, rifing near Knowlley, and flowing in a north-wefterly direction, joins the Irifh fea near Formby Point. The Crake connects the lake called Thurdon-water with the fea at Leven Sands. The waters of Winandermere lake join the fea through the channel of the Leven nearly at the fame place.

Although canals in a commercial and manufacturing country are of almolt incalculable utility and importance, yet their origin in this kingdom is but recent ; and from the beft authority it appears that the firft complete artificial canal was planned and formed in Lancafhire. This was known by the name of the Sankey; but long previous to the mak ing of this canal, different acts of parliament had been obtained, and companies formed, for rendering the rivers Irwell and Merfey, alfo the Weaver, sce, navigable. By the affit-
ance of the tide, which nows with rapidity up the channel of the Merfey, veffels were enabled, without any artificial help, to navigate nearly to the town of Warrington. To render the higher parts of the river, through its communicating branch the Irwell, acceffible for veffels as far as Manchelter, was an improvement much wanted by the manufacturers of that town and its vicinity. To effect this, an aft of parliament was obtained in 1720 , whereby certain perfons of Manchefter and Liverpood, but moftly thofe of the former town, were empowered to make the Irwell and Merfey navigable beyond thofe towas. Though the aft fpecified this extent of river, yet as the Merfey was already navigable from Liverpool to Bank.key, near Warrington ; and as all the flipulated demand for connage was confined to the navigation between that place and Manchefter, it appears that the projectors meant only to open the upper part of the river. This has been effected by means of weirs, locks, \&cc.; and in places where the ftream formed confiderable curvatures, cuts were made acrofs the necks of the principal bends. While the narigation of the Merfey was thus an object of commercial fpeculation, that of the Douglas was equally attended to. The country round Wigan being particularly rich in coal, the proprietors of the mines in that diftrict obtained an act, in 1719, for rendering that river navigable. This being completed in 1727, enabled the fpeculators to convey their coals to the mouth of the Ribble, and thence coaftwife to the northern parts of Lancalhire, Weitmoreland, \&-c. The Douglas navigation has fince been purchafed by the proprictors of the Leeds and Liverpool canal, who have in part fubftituted an artificial cut for the natural channel of the river. The Sankey canal originated with a company of gentlemen and merchants, who, in 1755, obtained an act of parliament, authorifing them to make Sankey brook navigable from the Merfey river, which it joins about two miles weft of Warrington, to near St. Helen's. This act empowered certain commiffioners to purchafe lands and other requiftes for the intended navigation. It was, at firit, defigned to extend and deepen the bed of the brook; but, after due deliberation, it was ultimately determined to clet a detached channel or canal. To effect this more completely, a new act was obtained in ${ }_{7} 61$, which empowered the undertaker to make a canal ; to extend from a place called Fiddler's Ferry, on the Merfey, to a fpot about $25^{\circ}$ yards from the loweft lock. Thus navigable canals had their rife in England; and the peculiar advantages and fuccefs of this at Sankey led to many other fimilar undertakings: in the execution of which, the genius of the engineer, and the fpeculating fpirit of the nation, were fully brought into action. But many things which were then imagined to be unattainable, and infurmountably impracticable, have been recently effected. The chief article conveyed by the Sankey canal is coal, of which, in the year 1771, according to an account laid before par. liament, were carried to Liverpool 45,568 tons, and to War. rington, Northwich, and other places, 44,152 tons. Some of the firft collieries on its banks are worked out, and others have been opened. Its bufinefs has been increafed by the large copper-works belonging to the Anglefea company* erected on one of its branches; and by the plate-glafs manufactory, and other works founded near it, in the neighbourhood of the populous town of St. Helen's. Befides the Sankey, this county is interfected by nine other canals, of which four communicate with Manchefter. Of all thefe canals an account has been given under Canal, to which we fhall here add fome further particulars and local circumftances not already detailed. The Afhton-under-Line canal, which commußicates between Mancheiter and the town of Hh

Ahton.

Afhton, was made in confequence of an act of parliament pafted in 1792. The whole length of this canal is eleven miles, with a rife of 152 feet. Bridgewater's canal originated, in 1759, with the late parriotic duke of Bridgewater, who devoted an immenfe fortune to the effeeting his plan. That part of the canal more immediately connected with this county, commences at the Caftle-ficid, in the fuburbs of Manchefter, and terminates at Pennington, near the town of Leigh. At Worfley is a fhort cut to the entrance bafin of the underground tunncls. Here it buries itfelf in a hill, which it enters by an arched paffage, partly bricked, and partly formed by the folid rock, wide enough for the admiffion of long flat-battomed boats, which are towed by means of rings and hand-rails on each fide. The canal, or tunnel, penetrates above three quarters of a mile before it reaches the firlt coal-works; where it divides into two channels, branching to the right and left. In the paffages, at certain diftances, are funvels cut through the rock, and iffuing perpendiculariy at the top of the linl. The arch, at the entrance, is only about fix feet wide, and five in height, above the furface of the water. In fome places within it widens, to accommodate two boats to pafs each other. To this fubterraneous canal the coals are brought from the mines in low waggons which hold about a ton each, and thefe are eafily pulled down a gentle declivity, on an iron railway by one man. Lancafter canal takes its courfe through nearly the whole county. Commencing at Kirby Kendal, in Weftmoreland, it enters Lancafhire near Burton, having paffed under ground about half a mile near Medway. At Borwick, a little fouth of Burton, it finks to its mid-level, which it preferves for feveral miles, making for this purpofe a very winding courfe, in fome places approaching almoit clofe to the fea-beach. After paffing Prefton, it afcends through a feries of locks to its higheft level, on which it proceeds acrofs the Douglas, and arrives at its termination at Weft Houghton. The principal object of this canal is to open a ready communication between the coal and limeftone countries, thereby interchanging and conveying thefe articles to different places, and to open the port of Lancafter to other populous towns. All the country north of Prefton is deftitute of coal, and the canal is directed through a diftrict abounding with this valuable mineral from Weft Houghton to Whittle Hills. From Kendal to Lancalter, the whole country confifts of lime-ftone; and on Lancafter Moor fome good freeftone is obtained. The Leeds and Liverpool canal enters Lancafhire a little north of the town of Colne, near which it croffes the grand ridge by means of 2 fubterraneous tunnel at Foulridge, 1630 yards in length. Near Bark Mill, not far from Wigan, it croffes the Lancafter cut by means of an aqueduct bridge fixty feet above that canal. A navigation between the eaftern and weftern feas had been often propofed: this great defideratum has been at length effected; and a canal has now been made between the towns of Liverpool and Leeds, including a line of $107 \frac{3}{4}$ miles, and communicating at the latter place with the river Aire, and at the former with the river Merfey, both of which are navigable to the German ocean on the eaft, and to the Irifh fea on the weft. The fall of water in this courfe, from the high ridge of mountains which divide Lancafhire and Yorkfhire, is 527 feet weltward, and 446 eaftward. Manchefter, Bolton, and Bury canal takes a north-wefterly direction from the former to the latter town. Its northern end is confiderably elevated, and its whole courfe comprehends a line of fifteen miles one furlong. The Rochdale canal opens a navigation from the Bridgewater canal at Manchefter, to the Calder at Sowerby-bridge, near Halifax. At the commencement of this fcheme it encountered much
oppolition; and the proprietors, in obtaining their acts, were obliged to bind themfelses not to ufe any of the waters of the Irk, Calder, and Roach rivers, fo as to affect their mills, \&ec. They were, therefore, obliged to make feveral large refervoirs on the hills to fupply the watte of lockage and leakage. At Ulveritone is a fhort cut or canal of about one mile and a half, communicating from that town to the Irifh fea. Douglas River Navigation commences in the tide-way, in the eftuary of the river Ribble, near Hefketh, and terminates in the Lecis and Liverpool canal. Hallingdon canal, not yet completed, is intended to communicate, in a diflance of about thirteen miles, between Bury, where it joins the Bolton and Bury canal, to Church, where at joins the Leeds and Liverpool. The commercial and fpeculating fpirit of the inhabitants of this populous county, is Atrongly exhibited in the conftruction of thefe canals and navigable rivers; the good effects of which are cfpecially felt by the manuf.eturing towns. To that of Manchelter, in particular, the canals have proved eminently beneficial, and the thriving ports of Liverpool and Lancalter, with the central towns of the county, have all derived from the fame fource many important advantages. Whilft the natural produce of the county is readily and cheaply conveyed to various marts, and the coals fent to the devouring factories; the manufactured goods of the latter are thereby diftributed over the kingdom, and to the fea-ports for foreign exportation.

Peculiarly characteriftic of this county are the bogs and moraffes with which it abounds, and which bear the provincial name of Moffes. The principal of thefe are called, from the chief places in their vicinity, Chat, Pilling, Trafford, Rifley, Afhton, Road, Bickerftaff, Rainford, Marton, St. Michael's, and Catforth. The component parts of thefe chiefly confilt of a fpongy foil, containing roots of decayed vegetables, intermixed with a fort of rotten mould. The origin and peculiarity of moffes have occafioned much difference of opinion with the writers on agriculture and natural hiftory, but when their precife lituations are accurately defined, it feems ealy to account for the latter, and thereby to difcover fome clew fur the former. The laws of nature are immutable; and when certain natural caufes are known to produce certain effects, and thefe are invariable, it does not appear difficult to aifertain the primary fource. Thus, mofles or bogs are always found near fpring-heads, and in fuch hollows as prevent a regular and conftant difcharge of the oozing waters. Thefe muit confequently remain ftagnant, and from the perpetual generation and decompofition of vegetable matter, muft progreffively acquire fubftance. Among the moft common vegetables in thefe fituations, are the Erica vulgaris, the Ornithogalum luteum, and the different fpecies of Eriphorum, or cotton-grafs; alfo, bilberry, cranberry, crowberry, Andromeda polifolia; Lancalhire afphodel, fun-dew, and the fragrant myrica-gale, or bog-myrtle. As thefe plants decay, and depofit their fubitances, a confiderable addition is annually made to the mofs, in cutting a fection of which, in fome places, the progreffive Atratification or lamina may be diftinctly difcovered. Thefe plants, and particularly the moffes, feem to derive their nutriment and fructification from their own ruins, and grow more luxuriant as the fubftance increafes: at length the whole takes the appearance and confiftency of a large fungus; and continuing to increafe, it at length grows greatly above the level of the adjacent lands, till the weight of the furface becoming too great to be fupported by the fpongy fubftance below, it overflows its original boundary, and covers the adjoining grounds. A remarkable inftance of this occurrence, in the year 1771, is related of Solway-mofs in Scotland; and, according to fome

## L A N

of our ancient chronicles, a great portion of Chat-mofs wais carried into the Irwell, thence into the Merfey, and on to the fea. (See Leland's Itin, vol. vii. p. +6.) It may be proper juf to mention three of the moffes in this county which have been brought into a fate of improvement. Trafford-mofs, on the fouth fide of the river Irwell, containing about five hundred acres, has been brought into cultivation by Mr. Wakefield and Mr. Rofcoe of Liverpool. They began their improvements about the ycar 1793 ; and the whole of this hitherto ufelefs tract of land is converted into excellent arable and pafture ground, worth four or five pounds per acre, per annum; but previous to that period it was wholy unproductive. The manures ufed in the improvement have been blue marle, of a ttrong calcareous quality, which is found under the mofs itfelf, and compoft brought by the canal from Manchefter. Chat-mofs, which lies on the north fide of the river, and contains fome thoufands of acres, has been brought into a ftate of progreffive improvement, with every profpect of fimila: fuccels, by Mr . Rofcoe, who cominenced the drainage in the year $\mathbf{1 8 0 5}$. Rainford-mofs, near Prefcot, has alfo been amazingly ameliorated under the judicious management of Mr. Chorley, who began his operations on this apparently fterile wafte in 1780, and has rendered it capable of bearing oats, barley, clover, potatoes, \&c.

The agricultural productions of Lancalhire are principally oats and potatoes; both which are ufed for human fuftenance; and many of the labouring claffes, in the northern and ealtern parts of the county, are chiefly fupported by this food. A confiderable quantity of barley, and fome wheat, are cultivated in Low-Furnefs, the Filde, and in the fouth-weftern parts of the county; but it is fuppofed that Lancalhire does not produce one quarter of the grain confumed by its own inhabitants. The firf potatoes faid to be cultivated in England were grown in this county. They were originally introduced into Ireland from North America, about the year 1565; and in confequence of an Irifh veffel being caft away on the weftern coaft, near North Meols, in Lancafhire, fome of thofe roots were planted in that part of the county; but it was not till many years after that they were adopted as an article of food in London. They are now grown in amazing quantities in this county; and many are annually exported hence to Ireland. They are produced both from cuttings, and from the apple, or feed. The ox-noble and clutter potatoe are chiefly grown for the catte; and the pink-eye, with various kinds of the kidney, are ufed for the table. The produce of a crop of potatoes in this county is generally from two to three hundred bufhels per acre. Many ufeful particulars relating to the beft mode of planting, growing, and preferving potatoes, are detailed in Holt's " General View of the Agriculture of Lancalhire."

This county boafts a peculiar breed of horned cattle, which forms a variety with thofe of Lincolnhire. The cows are rather fmaller than thofe of the latter county, and are known by their wide-fpreading horns and Atraight backs.

The climate of Lancalhire is proverbially zef, and this feems a natural confequence of its peculiar fituation, between the broadeft part of the Irifh fea and the high ridge of hills which form its eaftern border. All this fide of the county is more fubject to rains than the fide bordering on the coalt; for as the clouds are wafted over the Irifh fea from the Atlantic ocean, they are firft checked and broken by the mountainous ridge, which has a direction north and fouth; and hence the rains are almoft perpetually falling on the weftern fide of thefe intercepting eminences. At Town.
ley, near buratey, it has been found by experiment, that forty-two incles of rain fall annually, at a nedium; while the anual fall at Manchefler has been only thirty-thrce inches. At Liverpool the average has been confuderably lefs, whild that at London has been fill bower.

Lancalhire fends feurteen members to parliament ; two knights for the flire, and two reprefentatives for each of the boroughs of Lancalter, Liverpool, Prefton, Newton, Wigan, and Clithero: one of the menbers for the county is returned through the intereft and influence of the earl of Derby; the other by what is termed the independent in terelt. The county is included in the northern circuit, and the affizes are held at Lancaiter, as are alfo the quarterfeffions.

This county, though not abundant in antiquities, formerly poffeffed a few caftles and monaftic buildings: viz. caftesat Clithero, Gleafton, Holland, Hornby, Lancafter, I'eele, and Thurland. Religious houfes -at Buricough, Cartmel, and Coningfhead. Auguttine priory-at Cockerfand; a Premonitratentian abbey; Furnefs and Whalley, Ciftertian abbies; Holland, a Benedietine priory; Hornby, a Premonftratentian priory; Lancafter, Lathom, and Penwortham, Benedictine priories ; Manchefter, a college.

Lancafhire contains 490 public bridges; of which nine arc repaired by the county, and the others by the different hundreds.

The manufactures and commerce of this populous counts. are both of great extent and importance. Many particular refpecting the former have been already narrated under the article Cotton. Further details will be given under Manchester, and the commerce of the county will be defcribed at Liverrool. Beauties of England, vol. ix. Aikin' Hiftory, \&c. of the Country round Manchefter, 4 to. Whitaker's Hiiftory, \&c. of Manchefter, 2 vols. 4to. Whitaker's Hiftory of Whalley, 4to. Holt's Agricultural Report relating to Lancafhire, 8 ro.
LANCASTER, County Palatine of. See Countr.
Lancaster, Duchy Court of. See Court.
Lancaster, in Geography, a fea-port, market, and the county town of Lancafhire, England, is fituated on the banks of the river Loyne, or Lune, 239 miles diftaut from London. Few of the county-towns in England have been more neglected by the biltorian, or more inaccurately defcribed by the togographer, than this of Lancatter. That it was a Roman itation is evinced by the Saxon termination calter, or caltre; and the fame is confirmed by the various remains of the domeltic economy of the Romans that are continually difcovered in the town and its vicinity. Camden contends that the Roman name of this place was Longovicum : and Mr. Whitaker afferts, it was the Ad-Alaunum of Richard of Cirencefter's Itinerary. Reynolds, in his "Iter-Britanniarum," identifies this place as the Bremetonacis of Antoninus: but this is improbable; though we do not hefitate in confidering it to be the fcite of one, if not both, the other names. Dr. Leigh, in his "Natural Hiftory of Lancafhire, \&c." defcribes and refers to various coins, pieces of pottery, burnt bones, \&c. that have been found in this town. In 1772, an altar-ltone, with an infeription, was dug up here. In the Archrologia, vol. v. is a dif. fertation, by the Rev. Mr. Leigh, on certain Roman veftigia belonging to Lancafter. This place was a fortrefs of confiderable confequence alfo under the Anglo-Sax on dynafty. Indeed it appears to have been the chief obftacle and barrier to the Piets, or Scots, in the progrefs of their conquefts in Eagland. Having being demolifhed by thefe marauders after the retreat of the Romans, it lay a confiderable time in ruins, but was at laft rebuilt by the Sasons; who, foom

## 1. ANCASTER.

after their fettement in Britain, perceived the importance of this poft, and the facility of defence afforted by its commanding feite. That it was conflituted the chief and defignating town of the county, is a fufficient indication of its confequence. This event is Atated by Mr. Whitaker to have occurred in the feventh century, when he obferves, the "Roman Alauna received the honour which it retains at prefent, and was made the metropolis of the thire." During the Saxon heptarchy we have no records whatever of this town, but foon after the Norman conqueft it affumes tome hiltorical confequence. In Domefday-book, however, Laneafter and Cherca-Longcaltre appear fimply as two vills, or Borwit, among the twenty-two which thea compofed the manor of Halton. At this time there was no church at Loncafter, but the name Cherca-Longcaftre, affixed to one of the villages, renders it probable that it had a church during the time of the Saxons, which had probably been deftroyed during the ravages of the Danes. Lancafter, it is likely, was granted either by the Conqueror or his fucceffor, William Rufus, to Roger de Poitou, for the purpofe of erecting a cattle upon its hill. This perfon alro founded the church of St. Mary, and granted it as a cell to the abbey of Sees, in Normandy. To this monaltery it continued annexed till the abolition of alien-priories, in the reign of Henry V. when it was given to the Carthufian abbey of Sion, in Middlefex, and remained attached to that inilitution till the general diffolution of monaflic eftablifhments by Henry VIII. The great tower of the cafte, which is ftill ftanding, is an excellent fpecimen of the maffive ftyle of architecture adopted in that age. The walls are of uncommon thicknefs, and the buttrefles have narrow projections, whilft the lower windows have fhort rounded arches, with fingle flaft columns on their fides. This caftle was befieged by IIubert, archbihop of Canterbury, in the year 1r99, at which time it was held by the brother of king John, in truit for that monarch when he came to the throne. In the feventh year of the reign of the fame prince, it was in poffeffion of Ranulph Blundevil, earl of Chefter, and in the early years of the reign of Henry III, was held by William de Ferrars, earl of Derby.

Lancafter, however important it may have been as a military ftation, owes its chief celebrity to Edward III., who, upon the completion of the fiftieth year of his reign, folemnly, and in full parliament, created his third fon, John of Gaunt, duke of Lancafter. By the charter granted at this period, the duchy of Lancalter was conitituted a fort of petty kingdom, and all the privileges of royalty conferred upon the duke within the county. During the civil wars between the houfes of York and Lancalter, this town fuffered fo much by its adherence to the Lancattrian line, that it was nearly depopulated, and even in the time of Camden was only the refidence of a few hufbandmen. Charles II. having confirmed its ancient charter with additional privileges, it began again to revive, and has ever fince been increafing in trade, extent, and population.

The caftle, which has fucceffively been the fafeguard, terror, and glory of the town, is now fitted up as the county-gaol, with its neceffary appendages of a gaoler's houfe, prifoners' rooms, cells, work-hops, courts of juftice, \&c. From the appearance of its prefent remains, and the commanding fituation on which it ftands, it muft, doubtlefs, have been a grand and magnificent object in former times. Much as it has fuffered from the changes it has more recently undergone, its architectural features are ftill entitled to general admiration. The encircling walls embrace an area of 380 feet from eaft to weft, by 350 from worth to fouth. Within this fpace is a large court-yard,
with feveral of finaller dinenfions, and a number of towers of various thapes. The chief entrance is towards the ealt, and communicates with the town. It is a ftrongly fortified tower gateway, confifting of two femi-octangular projections, which are periorated, near the bottom, with apertures for the difcharge of arrovs, and on the fummit are feveral bold machicolations with embrafures, \&c. Within this entrance is the large court-yard already mentioned, furrounded with towers and fortificd walls, and on the oppofite fide is a large fquare keep, the walls of which are of amazing thicknefs, and its apartments of grand dimentions. One of the rooms is nearly fixty feet long, by about thirty in width. The floors are arched, and covered with compofition, forming flat furfaces, From the fummit of this tower, the views are very grand and impreffive. To the north of the keep are the fhire-hall and county-courts, with feveral apartments and offices connected with them. Thefe have been recently erected at the expence of the gentlemen of the county, and from the defigns of Mr . Harrifon of Chefter, an architect, who has difplayed fo much claffical tafte and fcientific knowledge in the conftruction of a county-gaol in that city. The finihing of thefe works has been from the defigns of Mr. Jofeph Gandy, of London, an artift of eminent talents. The grand jury room here, and thire-hall, are peculiarly elegant and novel: the firft being of circular form, and the fecond being femicircular ; but both finifhed with cluftered columns, panelling, tracery, \&c. partly in imitation of the elegant ecclefiaftical architecture of the fifteenth century. Over the judges' feats are two full-length portraits of the county members, by Mr. Allen; and a full-length of George III.' on horfeback, by Northcote. This grand and fpacious pile of buildings, whether viewed as an ancient baronial fortrefs, as a picturefque object, or as a fuite of public ftructures for the gaol and courts of the county, mult demand our admiration. An engraved ground plan of this cafte is publifhed in a fmall Hiftory of Lancatter, 8 vo. $180 \%$ On an: eminence near it is the parih-church, a fpacious building, with a lofty tower, which ferves as a land-mark for veffels coming up the river. At the eaft end of the church is a wooden fcreen mont elegantly carved. Among the monu-: ments, is one by Roubiliac, for William Stratford, L. L. D. In the church-yard is the fhaft of a ftone crofs, with carving, and an infcription in Runic letters.
The other public edifices of this town, are a town-hall, a chapel of eafe to the parifh church, a theatre, an affemblyroom, a range of fhambles, a Quakers' meeting-houfe, and chapels to the following claffes of diffenters, Prelbyterians, Quakers, Independents, and Methodifts. An ancient bridge, now in ruins, connected the oppofite fhores of the Lune, near St. George's Quay, but the increafing opulence and population of the town rendered a new and more commodious one neceflary. This was erected from the extremity of Cable ftreet to Skerton, at an expence of nearly 12,000 l. paid by the county. The length of this fuperb ftructure is 549 feet ; the arches, five in number, are equal and elliptical; the defign was by Mr. Harrifon. Among other benevolent inftitutions in this town are feveral alms-houfes for men and women, a free-fchool for the education of 60 boys, and two charity fchools for 50 boys and 40 girls. The manufactories of the town are inconfiderable, and chiefly confilt of cabinet-making, fpinning of twine, cotton-printing; and weaving of fail.cloth. Ship-building has been greatly encouraged, and many large veffels conftrueted, particularly by Mr. Broockbank, who has fent fhips, launched at his dock-yard, to London, of 450 tons burthen. Lancafter trades to America with hard-ware and woollen manufac-'

## L A N

tures; and a confiderable quantity of candles is exported to the Weft Indies : 40 or 50 hijps trade alfo to Norway. It appears from the Cuftom-houfe entries, that in the year 1799, 52 veffels cleared out for the Welt Indies, with cargoes to the value of two millions and half pounds flerling. The Cuttom-houfe is a fmall neat building, with a portico fupported by four Ionic columas, fifteen feet in height, each a fingle tone. The ' Town hall is a large commodious edifice ; in the council room is a full-length portrait of lord Nelfon, painted by Mr. Lonfdale, an artift of talents, who is a native of this town. He prefented it to the corporation, who have allo a fimilar portrait of Mr. Pitt. The borough of Lancafter originted from a grant, made in the 4th of Richard I. and members were firt fent to parliament ${ }_{23}$ Edward I. Returns were alfo made at various periods in the two fucceeding reigns ; after which there were none till the reign of Edward VI., when the privilege was reflored. The corporation is compoled of a mayor, recorder, 12 aldermen, two bailiffs, 12 capital burgeffes, 12 common burgeffes, a town clerk, and two ferjeants. In the vicinity of the town is an excellent falt marih, adjoining the banks of the Lune : this marfh is paflured and divided into what are termed orI graftes ; that is, a privilege for the inhabitants of turning a horfe or two cows to fummer on the common. By the late inland navigation, Lancafter has communication with the rivers Merfey, Riblle, Oufe, Trent, Dervent, Severn, Humber, Thames, Avon, \&c., which narigaticns estend above 500 miles, into the counties of Lincoln, Nottingham, York, Weftmoreland, Chefter, Warwick, Leicefter, Oxford, Worcetter, \&c. About one mile north-ealt of the town is a grand aquedue-bridge, which conveys the Lancalter canal over the river Lune. This flupendous fabric was defigned and fuccefsfully executed by Mr. John Rennie, civil engineer, who has hereby difplayed much fill and fience in this and feveral other fimilar works. The bridge confilts of five circular arches, each of 70 feet $f_{p a n}$, rifing 39 feet above the furface of the river. The peculiar difficulties which the architeet had to encounter, in the bed of the river, made it neceffary to have a foundation, a flooring of timber, which alone coft 15,000 . The fuperltructure came to double that fum.
In the return to parliament in the year 1801, Lancafter is itated to contain 16 rir houres, and 9030 inhabitants. Markets are held on Wednefday and Saturday; and here are three annual fairs.
About three miles fouth of the town is Afhton Hall, the feat of the duke of Hamilton and Brandon. Two miles further is Thuraham Hall, the feat of John Dalton, efq. In the vicinity of the town are allo Wyerfide, the feat of John Fenton Caxthorne, efq.; Quernmore Park, the feat of Charles Gibfon, efq- ; Grals-jard Hall, the property of Thiomas Edmondfon, efq.; Halton Hall, the feat of W. B. Bradhaw, efq.; and Halton Park, the feat of Thomas Bateman, efq.
Five miles north of Lancalter, is a cavern, called Dunald Mill-bole, of a peculiarly grotefque and aiveful appearance, which, probably, from its obfcure fituation, has been but little noticed by topographers.。 An Hirtorical and Defcriptive Account of the Town of Lancafter; with four engravings, 8vo. 1807. Beauties of England, vol. ix.
Lancaster, a populous and wealthy county of America, in the interior part of Pennfylvania, extending $S$, to the Maryland line. It is about 42 miles fquare, is divided into 25 townhips, and contains 566,240 acres of land, and 43,303 inhabitants, including 178 faves. The lands of this county are rich and well cultivated. The hills in the northern parts abound with iron ore; for the manufacture of

## L A N

which two furnaces and eirht forges have been eretted. Copper and lead, and abundance of limellonc, have been found here, -Alfo, a county of Virginia, bounded E. by Chefapeak hay, and S.W. by Rappahantock river. It is about 40 miles long, and 15 broad, and contains 2249 free inhabitants, and 3126 naves. The lands are generally poor. -Alfo, a diftrict of South Carolina, containing 50 Iz inhabitants, of whom 1076 are flaves.-Alfo, a pult-town in Gerrard county, Kentucky, 621 miles from Wafhington.Alfo, a handfome and flourifhing poftetown, the capital of Lancatter county, in Pennfylvania, and the largeft inland town of the United States. It is pleafantly Gituated upon the defcent of a hill, $1 \frac{1}{2}$ mile W. of Coneftoga creek, which falls into Sufquehanna river, nine miles $S$. by W. of the town. Its trade is already great, and muft increafe in proportion to the increafing population of the furrounding country. It contains about 900 houfes, chiefly of brickand ttone. The legillature meet here till a permarent feat of government fhail be eftablifhed. The public buildings are, a handfome court-houfe of brick, a market-houfe of the fame materials, and a ftrong ftone gaol. Here are fix places of worhip for German Lutherans, German Calvinitts, Prffyterians, Epifcopalians, Moravians, and Roman Catholics. The manufactures of this town are carried on by individ:als. There are three breweries, and two or three valuable tanneries. Franklin college is eftabliflied hicre for the Germans. Its endowments are the fame as thofe of Dickinfon college, at Carlife. The truftees confit of Lutherans, Calviniits, Prefbyterians, and Epifcopalians, of each an equal number. The principal is a Lutheran, and the vice-prefident a Calvinilt ; 58 miles W. by N. from Philadelphia. N. lat. $40^{\circ} 3^{\prime}$ W. long. $76^{2} 20^{\circ}$ - Alfo, a poft-town of South Carolina, 36 miles from Camden. - Alfo, a pleafant poft-town in Worcefter county, Maffachufetts, fettled in 1645 , and incorporated in 1653 . It is fituated on two branches cf Nafhua river, which runs into the Merrimack: over thefe branches are nine large bridges, and on thcir banks the land is excellent. Many perfons of education and fortune have been induced, by the pleafantnefs of this town, to make it the place of their relidence. It is famous for its abundant fupply of good flates and of ftones for tombs and graves, which are articles of exportation. Camberry pond in this town is obferved to rife as much as two feet before a form, and Sandy pond rifes in a dry feafon. It contains $158+$ in-habitants.-Alfo, a poft-town in Grafton county, New Hamplhire, on the E. bank of Connecticut river, about 45 miles above Hanover ; incorporated in 1763, and containiag, in 1800,410 inhabitants.-Alfo, a fine town, she capital of Fairfield county, in the ftate of Ohio, on a branch of the Hockhocking river, about 25 miles N.E. from Chillicothé. -Alro, a townfhip of Upper Canada, in Glengury county, on the river St. Lawrence, and the lowell in the province adjoining Lower Canada. Morfe.

LANCAT, a river on the N.E. coatt of Sumatra, which runs into the Ealt Indian fea, N. lat. $4^{\circ} \cdot 5^{\prime}$, E. long. $9^{8} 2^{\prime}$.
Lancavy, Lascakuy, or Pulo Lada, an inland in the Eaft Indian fea, near the coalt of Queda; about i6 miles long, and from three to eight broad. N. lat. 6. 19'. E. long. $99^{\circ} 40^{\prime}$.

LANCAYAN, a fmall illand in the Eaft Iodian fea, near the N. coaft of Borneo. N. Lat. $625^{\prime}$. E. long. $118^{\circ} 9^{\prime}$.
LANCE, LANCEA, a fpear, an offenfive.weapon, borne by the ancient cavaliers, in form of a half pike.
The lance confifted of three parts, the fhaft or handle, the wings, and the dart. Pliny attributes the iarention of lances.

## L $\Lambda \mathrm{N}$

## L. A N

fances to the Rtolians. But Varro, and Aulus Gellius fay, the word lance is Spanifh; whence others conclude the ufe of this weapon was borrowed by the people of Italy from the Spaniards. Diodorus Siculus derives it from the Gaulifh, and Feftus from the Greek royxr, which fignifies the fame.

The lance, or fpear, is among the oldeft weapons recorded in hiltory, and is nearly coeval with the fivord or bow; it probably originated in a pole or ftake, fharpened at one or both ends, afterwards armed with a head of Hint, and in procefs of time, on the difcovery and ufe of metals, with copper, brafs, and iron. Fhnt heads for both fpears and arrows are frequently found in England, Scotland, and Ireland, and fo are alfo fpear, javelin, and arzow heads of a metal nearly refembling brals. The fpear, lance, javelin, darts of different kinds, and even the more modern pikes, are all comprehended under one common defcription of a long ftaff, rod, or pole, armed with a pointed head of ftone or metal at one or both ends, conflructed for the purpofe of piercing, or wounding with their points only, either by being puhted or thrown with the hand. Long fpears and lances were ufed by the Saxons and Normans, both horfe and foot, but particularly by the cavalry of the latter, who, in charg$\mathrm{i}_{\mathrm{F}}^{\mathrm{K}}$, refted the butt end of the lance againint the arçon or bow of their faddle; the mail-armour not admitting of the fixture of lance-refts, as was afterwards practifed on the cuiraf.. A lance-reft was a kind of moveable iron bracket, fixed to the right fide of the cuirafs, for the purpofe of fupporting the lance. It does not appear that there was any eftablified ftandard for the length or thicknefs of the ancient lances, or the fize or form of their heads; but it rather feems, that every military man had his lence, as well as his other arms, conftructed of the dimenfions that beft accorded with his ftrength and ftature. It is certain, however, that the heads of lances and feears were always made of the beft tempered fteel, and their ftaves of the foundeft afll, whence the writers of Latin verfe ufed the word fraxinus (Latin for afh ) to exprefs a lance or feear. Although lances and fpears were chiefly the weapons of horfemen, they were alfo ufed by the infantry and difmounted knights, to keep off the cavalry; for this purpofe they fixed the butts in the ground, their points floping towards the breafts of the enemy's horfes. In tournaments, the knights fometimes fought on foot with their lances, in which cafe it was cuftomary to fhorten them, by cutting off part of the flaff. Tilting lances differed from thofe ufed in war, both in their heads and ftaves; the heads of tilting being blunt, or occafionally fitted with a contrivance to prevent penetration, called a coronel or cronel, from its refemblance to a crown. The faves were thick at the butt end, tapering off gradually to the point, and generally fluted; near the butt end they had a eavity for the reception of the hand. The front of it was defended by an iron-plate, called a vam-plat, that is, an avant-plate, and behind it was a broad iron ring, called a burr. Thefe handles were not confined to the tilting lance, but were made alfo on thofe defigned for war. Fauchet §ays, they were not in ufe before the year 1300 . Lances were ornamented with a banderole near the point, which gave them a handfome appearance; thefe were alfo called pencells. Grofe on Ancient Armour, vol. ii.

Lance, Holy, the lance which, in legendary ftory, is faid to have pierced the fide of our Redeemer. In the time of the Crufades, when Antioch was befieged, a prieft of the diocefe of Marfeilles, called Peter Bartholemy, pretended to have received from St. Andrew, during his lleep, the Following inftrution. "At Antioch," faid the apoltle, "ir the church of my brother St. Peter, near the high altar, is
concealed the fleel-head of the lance that pierced the fide of our Redeemer. In three days that inftrument of eternal, and now of temporal falvation, will be manifefted to his difciples. Search, and ye fhall find; bear it aloft in battle; and that myflic weapon fhall penetrate the fouls of the mifcreants." This revelation was refpectfully received by count Raymond, whom his faithful fubject, in the name of the apoifte, bad chofen for the guardian of the holy lance. After fome previous ceremonies, the ground was opened at the appointed place; and fearch was unfuccefffully made for the lance. After the count and his companions had withdrawn, the artful prief defcended into the pit; and, availing himelf of darknefs and folitude, contrived to fecrete and depofit the head of a Saracen lance; and the firft gleam of the fted was faluted with a devout rapture. Thic holy lance was drawn from its recefs, and expofed to the veneration of the crufaders, and we may well imagine that the defponding troops would again be inflamed with the enthufiafm of valour. Preparation was made for a conflict, and it may be fuppofed that the potent energy of this relic or trophy, aided by another miraculous delufion, would enfure victory. In the feafon of danger and triumph, the revelation of Bartholemy of Marfeilles was unanimoufly afferted; but as foon as the temporary fervice was accomplifhed, the perfonal dignity and liberal alms which the count of Tholoufe derived from the cuftody of the holy lance, provoked the envy, and awakened the reafon of his rivals. Incredulity, with regard to the truth of the legend, fucceeded fufpicion and examination, and the author was obliged to fubmit his life and veracity to the judgment of God. A pile of dry faggots, 4 feet high and 14 long, was erected in the midat of the camp; the flames burnt fiercely to the height of 30 cubits, and a narrow path of 12 inches was left for the perilous trial. The unfortunate prieft of Marfeilles traverfed the fire with dexterity and fpeed; but his thighs and belly were fcorched by the intenfe heat ; he expired the next day, protelting his truth and innocence. Such were the origin, influence, and termination of the legend of the holy lance. Gibbon's Hift. rol. xi.

Lance la Grace, in Geograpby, a town of Louifiana; 75 miles S.S.W. of New Madrid. N. lat. $35^{2} 25^{\prime}$. W. long $90^{\circ} 27^{\prime}$.

Lance's Bay, a bay on the N.W. coaft of Jamaica. N. lat. IS $27^{\prime}$.' W. long. $78^{\circ} 14^{\prime}$.

LANCEA Christi, in Botany, a name given by fome authors to the ophioglof $\sqrt{k}, m$, or adder's tongue, a fmall herb found in moift places, with a fingle ftem of feeds.

LANCEARII, in Middle Age Writers, Soldiers whofe chief weapon was the lance. They were in great efteem formerls.

LANCEBEARERS, I/and of, or Ifle des Lanciers, in Geography, a fmall ifland in the S. Pacific ocean, fo named by M. Bougainville, in 1768. S. lat. $18^{\circ} 28^{\circ}$. W. long. $1^{3} 8^{\prime} 0^{\prime}$.
LanCellotti, Gianpano, in Biograpby, an eminent jurift, was born at Perugia about the year 1510. He was firft noticed as a teacher of the law at his native place, and was engaged by pope Paul IV. to draw up an intitute of canon law, in imitation of Juftinian's Inftitutes of civil law. This was publifhed in 1563 , and went very quickly through feveral editions. It was annexed to the body of canon law, and ftill retains its place in the modern editions of that compilation. He was author of other treatifes on legal fubjects, and of a life of Bartolus. He died at Perugia in 159 x . Moreri.
lancelot, Claude, was born at Paris in 1615 ; at a fit age he was perfuaded to join the devout folitaries of
the Port-Royal, by whom he was employed in teaching mathematics, and the languages in their fchools, till government thought proper to fupprefs them. He was afterwards appointed tutor to the young princes of Conti, but upon the death of their mother, he took the habit of St. Benedict, in the abbey of St. Cyran. In 1680, he was exiled to Quimperlé, in Lower Brittany, where he continued the fame afcetic courfe which he had been ufed to in the feminary. He died in 1695. He was author of many excellent works, among which may be noticed "Nouvelic Methode pour apprendre la Langue Latine;"," Nonvelle Methode pour apprendre la Langue Grecque." Thefe have been frequently reprinted, and abridgments have been made of both. His "Grammaire generale et raifonnèe," is faid to be a very excellent work, and has been tranflated into feveral languages.

LANCEOLA, in Botany, a name given by fome authors to that fpecies of plantain called rib-zwort, or plantugo quinquenervia, by moit authors.

Lanceolated Leaf. Sce Leaf.
LANCEROTTA, in Geography, one of the Canary inlands, about 30 miles in length, and eight in its greatelt breadth, containing 800 inhabitants. It is divided by a ridge of mountains, which afford nothing but pafture for cattle, though the vallies are fruitful, but fandy and thin in foil. A principal article of trade is goat's flefh, which the inhabitants fell to the neighbouring iflands, under the name of Tufinetta. In 1730, a volcano broke out in this inland. Cayas, called alfo Rubicon, and Lancerotta, the principal town, contains about 200 houfes. The ifland has feveral havens or roads; and at the N.E. extremity is one, where thips may come in from the northward, and lie land-locked from all winds in 10,15 , and 20 fathoms. The E. point of the ifland is in N. lat. $29^{\circ} 8^{\prime}$. W. long. $13^{\prime \prime} 26^{\circ}$.

LANCET, a well known furgical inflrument, the common form of which is reprefented in the plates of this work. See the Surgical Plates.

Lancet Arch, in Architecuure, the fame as the pointed arch.

Lancet Windowes, thofe with lancet arches; but the term is more generally applied to windows which are long and narrow, than to thofe which are wide and low.

LANCETI, a name given by the ancient laws of England to a kind of valfals, who were obliged to work for the lord one day in a week, from Michaelmas to autumn, either with fork, fpade, or flail, at the option of the lord.

LANCH is a fort of long boat belonging to flips; it is not built upon failing principles, it being flat-bottomed and broader, and is more ufeful for weighing fmall anchors than the long boat, and watering and carrying the fhipftores.

Lanch of a Sbip. See Launcir.
LANCHE, in Geography, a town of Anterior Pomerania; 11 miles S. of Bergen.

LANCIANO, a town of Naples, in Abruzzo Citra, of which it is the capital; the Iee of an archbifhop; $\$_{4}$ miles N. of Naples. N. lat. $42^{\circ} 12^{\prime}$. E. long. $14^{\circ} 20^{\prime}$.

LANCIEGO, a town of Spain, in the province of Alava; 18 miles S.S.E. of Vittoria.

LANCISI, John-Maria, in Biography, a celebrated phyfician, was born at Rome in October 1654. His parents were rather low in rank, but cherifhed the difpolition for learning which he early difplayed; and having finifhed his claffical ftudies, he went through the courfe of philofophy in the Roman college, and then commenced the ftudy of divinity. He had always evinced a great tafte for natural hiftory, which was fo Itrongly awakened during his theolo-
gical refearches, that it induced him to abandon the fludy, and apply himfelf entirely to that of medicine. He purfued the fundamental branches, anatomy, chemiftry, and botany with great ardour, as well is the more important object, the obfervation of difeafes; and was created doctor in philofophy and medicine in $16 \%$. In 1675 , he was appointed phyfician to the hofpital of the Holy Ghoft, in Saffia, where he purfued his clinical enquiries with great accuracy and acutenefs : but he quitted this fituation in 1678 , when he was received a member of the college of St. Saviour, in Lauro, where he read with zeal all the beft authors from Hippocrates downwards. His talents and acquirements were now known and ackowledged, and he was appointed profefo for of anatomy in the college de la Sapienza, in 1684, and continued his duties as a teacher for thirteen years with great reputation. In 1688, pope Innocent XI. chofe Lancifi for his phyfician and private chamberlain ; and forne time afterwards gave him a canon's ftall in the church of St. Lawrence: but on the death of the pope, in 1689 , he refigned it. He was now in high public eftimation, and when Innocent XII. fell fick in 1699 , Lancifi was called apon, and was never abfent from him during his whole illnefs. He was elected phyfician to the conclave, and was immediately appointed firlt phyfician and private chancellor to the perfon of the fucceeding pope Clement XI. He was indefatigable in the difcharge of all his duties, as well as in the purfuit of his ftudies, readirg and writing at every interval of Leifure, and in his attendance on the learned focietres of the time. He died in January, 1730, at the age of 65 . He was a man of fmall ftature, with a lively countenance, and cheerful difpofition; his manners were extremely engaging; and he was poffeffed of much knowledge of mankind. His ardour for the advancement of his art was extreme and uncealing. He collected a library of more than twenty thoufand yolumes, which he prefented in his life-time to the hofpital of the Holy Ghoit, for the ufe of the public, particularly the young phyficians and furgeons who attended the patients in that hofpital. This noble benefaction was opened in 1716 , in the prefence of the pope, and a great number of cardi。 nals.

Lancifi left a confiderable number of works, many of which have been printed, but feveral in MS., which he bequeathed to the hofpital, and which are depofited in its library. Among his leffer productions, were a fynopfis of anatomy ; an epitle to Fantoni on the fame fubject; an epiftle to Bianchi on the fecretion of the bile; an effay on the atmofphere and climate of Rome; on phyfiognomy and the feat of the foul; on the proper method of fludying in medicine; on the origin and ftructure of fungi, in a letter to count Marfigli; and fome others, in the Latin language; and alfo an addrefs to the acaderny of Sienna, "Del modo di filofofar nell' Arte Medica." His more important works are his treatife "De fubitaneis mortibus, Libri duo," Romæ 1707. -" Tabulx Anatomicx Clariff, viri Bartholomxi Euftachii, quas à tenebris tandem vindicatas, et fanctiff. Dom. Clementis XI. Pontif. Max. munificentiâ dono acceptas, prefatione notifque illuftravit," ibid. 1714 , folio.-"Differtatio Hiftorica de Bovillâ Pefte ex Campinix finibus, anno 1713, Latio importatâ. Accedit Conflium de Equorum Epidemiâ,", ibid. 1715 .-"De noxiis Paludum Effluviis, Libri duo," ibid. 1717.-He likewife edited, in the fame year, under the patronage of the pope, a pofthumous work of Michael Mercati, entitled Metallotheca, with plates; and afterwards publifhed, " Appendix ad Metallothecam Vaticanam Michaélis Mercati," 1719. After his death, a treatife, " De motu cordis et aneuryfmatibus," was printed in folio at Rome, 1728 :-and a collection of cafes from his MSS.

## L $A-N$

MSS. in the library of the hofpital, entitled "Confilia XLIX pollhuma," Venice, 1747 . All his works, with the exception of the two laft, were collected in his life-time, and printed at Geneva, with the title of "Joannis Maria Lancifi Opera qux hâtenus prodierunt omnia, Differtationibus nonnullis adhucdum iueditis locupletata," 1718 ; which, as well as moft of the feparate treatifes, have palfed through feveral editions. Eloy DiA. Hitt.

LANCISIA, in Botany, fo named by Pontedera, in honour of John Maria Lancifi, phyfician to pope Clement XI. Ponted. Diff. 203. Lamarck. Illuftr. t , ;or. See Limbeckia.

LANCKAW, in Geography, a town of Pruflia, in the palatinate of Culm; 10 miles E.N.E. of Thorn.

LANCPOU, a lake of Thibet, about 30 miles long and nine wide. N. lat. $32^{\circ} 36^{\prime}$. E. long. $84^{\circ} 32^{\prime}-$ Alfo, a mountain of Thibet. N. lat. $32^{\circ} 55^{t}$. E. long. S+ $34^{\prime}$.

LANCTAN, a mountain of Thibet. N. lat. $31^{\circ} 5^{2}$ '。 E. long. $85^{\prime} 54^{\prime}$.

LAND, in a general fenfe. See Eabth, Soil, \&c.
Dr. Davenant, from a fcheme of Mr. King, ftates the quantity of land in England and Wales to be thirty-nine millions of acres; which, reckoning the number of inhabitants, as he does, to be $5,500,000$, will at an average be $7 \frac{x}{s}$ acres per head. Davenant's Works, vol. vio § 3. See Acre, and Expectation of $I$ ife.
Land, in a legal fenfe, includes not only the face of the earth, but every thing under or over it ; fo that if a man grants all his lands, he grants thereby all his mines of metai and other foffils, his woods, his waters, and his houfes, as well as his fields and meadows.

Land, in Agriculture, the earth or foil in which plants fix themfelves and grow, or which produces crops of different kinds.

It is ftated in an able work on the landed property of England, that " land, viewed in the light of agriculture, is the foundation on which it refts, the materials on which it operates, and the vifible fource of its productions. And that it may generally be confidered as being compofed of three diftinct parts; the foil, the fub-foil, and the bafe, or fubfructure, on which they relt." It is added, that "the foil, or plant-feeding flratum, is not more various in quality than it is in depth. The foils of cultivated lands, however, have their limits as to depth. Thefe limits may, it is conceived, be fixed at three and fifteen inches. For although, in many inttances, the component parts of land are pretty uniform, to a greater depth than fifteen inches, a uniformity of colour and vegetative quality feldom reaches to that depth. The influence of the atmofphere, the fibres of vegetables living and decayed, the operations of animalculw, and larger animals, that inhabit foils, and, above all, the powerful effects of manures, tend to furnifl the furface mould with qualities which the fubftrata have not the means of acquiring. The medium depth of cultivated foils, in England, may, it is imagined, be fet down, with fufficient accuracy for this purpofe, at nine inches. For although a majority of the cultivated foils of the kingdom may not reach that depth, the writer is of opinion that the major part of them might, under proper management, be funk to nine inches deep, with advantage in many refpeets." See Solt.

And it is further ftated, that " the fubfcill, or intervening flratum of land, is till lefs definite with regard to depth. In fome initances, as where the cultivated foil refts upon rock, it may be faid to be wanting ; though, in moft cafes of this kind, a Atratum of a gravelly nature, compofed of broken
rock and earth, is found between them. And in many cafes, a regular bed of gravel, fand, or other earth, intervenes between the foil and the fubltructure. While in others, an uniform mafs of earthy materials reaches to a great depth. If, therefore, a definite thicknefs, or depth, may be affigned to the fubfoil, it mult be, in a degree, arbitrary," or without any degree of accuracy or correctnefs.

It feems evident, that "the foil affords nourithment and flability to agricultural plants, and that the fubfoil affigns them temperature, with refpect to moilture and internal warmth. If the fubfoil is of fuch a nature, or is fo fituated as to receive and retain more moifture than is requifite for the naturaj growth of plants, their health is injured. If it not only holds water in its own pores, but freely communicates it to thofe of the foil, the more valuable plants in agriculture give place to ranker herbage, let the furface foil be what it may. On the contrary, if an open ftratum of fuffio cient depth intervenes between the cultivated foil and the bafe, to permit the fuperfluous moillure which filters through the foil, or which is communicated fubterraneoully, to pafs off, the flants in cultivation will be relieved from collected moifture, in the immediate region of their feeding fibres; though the fubftructure may be charged to the fill with water. Hence, where nature has sot furnihed land with this valuable interttratum, it is the bufnefs of art to remedy the defect," in fome way or other, and which in general " is to be done by draining off the fuperfluous moilture to a fufficient depth to prevent its evil effectis on the foil, and thereby fupplying the required Itratum." It is however well obferved, that " in doing this, the artift mult be led by the given properties of the bafe, and can feldom lower it to any determinate or arbitrary depth. Neverthelefs, it will be right, before he proceeds further, to endeavour to form an adequate idea of the medium depth required;" in doing which, much, he fays, depends on the fpecific quality of the fubfoil. Sand will hold up water that is lodged at its bafe to 2 much greater height than gravel. A flratum of gravel of one foot in depth forms a drier fubfoil, than a bed of fand of twice or three times that thicknefs. But clean fand or gravel is rarely found in land; fand and gravelly loams being the more ordinary materials of abforbent fubfoils: and thefe are capable of railing and holding up water to a confiderable height. "Let us, therefore, admit that effective fubfoils may vary from one to two feet, and fix the medium depth at eighteen inches." And " by thus fixing the mean depth of foils at nine inches, and that of fubfoils at eighteen inches, place the bafe or fubitructure of the land at twenty-feven inches beneath its furface; which is a depth of land that is equally conformable with theory and with practice. To this depth drains may be funk, at a moderate expence: and covered fone drains of this depth may be rendered effectual, yet free from injury by the operations of tillage. In the practice of Riilful workmen, the depth of ordinary fubfoildrains waries from eighteen inches to three feet, according to the circumitances of the given cafe, and the method of draining employed."

After this general view of the component parts of land, and of their due arrangement, the common varieties of it, as they are given by foil, fubfoil, and bafe, may be enumerated and confidered. In the execution of which it may be proper to divide lands into claffes, and mark the varieties of each.
Firf Clafs. - This comprehends, according to the above writer, fuch lands as are liable to furface water only with their abforbent ftrata (if any) open, fo as freely to difcharge the fuperfluous water they receive upon them: the varieties

## LAND.

of which are firft, where "the foil, the fubfoil, and the bafe are repellent, or in a flate of moiftnefs, impenetrable by water, as clay and firong deep clayey loam." The fecond, where "the foil is repellent, the fubfoil abforbent, the bafe repellent." The third, where "the foil is repellent, the fubfoil and bafe abforbent, or in a flate of moiltnefs, conducting water; as fand, gravel, open rock, and the lighter more open loams." The fourth, where "the foil, the fubfoil, and the bafe are ablorbent." The fifth, where " the foil and the fubloil are abforbent, but the bafe repellent." And the fixth, where "the foil is abforbent, the fubfoil repellent, and the bafe abferbent or repellent."
ad Clafs. -This includes fuch lands as are liable to furfaceawater only, with their abforbent ftrata clofed, or permitting an imperfect difcharge, either for want of fufficient defcent, or by reafon of impervious ftrata, or beds of impenetrable materials. The varieties of which are, firft, where "the foil is repellent, the fub-foil abforbent, and the bafe repellent or abforbent." The fecond, where "the foil and the fub-foil are abforbent, but the bafe repellent, or abforbent." The thir\&, where "the abforbent and repellent ftrata, or maffes, are thrown together irregularly ; or not difpofed in regular ftrata, which correfpond with the furface," or upper part.
${ }_{3}$ d Clafs. - This comprifes fuch lands as are liable, not only to furface-waters, but to thofe which are fubterrene, and which either defcend from higher grounds in their refpective neighbourhoods, or rife beneath them from fubjacent refervoirs; the abforbent ftrata of this clafs being clofed, and thereby rendered retentive, as in the fecond clafs, or kind of land. The varieties of which are, firtt, where "the foil is abforbent or repellent; the fub-ftrata abforbent and clofed, and uniformly charged with defcend,ing waters, by an even ttratum of gravel, free-fand," or fome other fimilar material. The fecond, where "t the fame foil and fub-ftrata are partially charged with defcending waters, through veins of fand or gravel, or fiffures of rock, \&c." The third, where "the foil is repellent or abforbent, the fub-foil abforbent and clofed, and uniformly charged with defcending waters; the bafe repellent, with a fub-bafe freely abforbent and open." The fourth, where "the foil is abforbent or repellent, the fubftrata uniformly abforbent and clofed, and charged with rifing waters." And the fifth, where "the foil is repellent or abforbent, the fub-ftrata complex and clofed, and charged with rifing and defcending waters.'

It may be obferved, that the nature of thefe different kinds, or claffes of lands and their varieties, with that of their different conftructions, the effects to which they are each particularly expofed from a fuperabundance of water, the methods of removing fuch wetnefs, both with the view of ameliorating the lands for the purpofes of cultivation, and that of providing fupplies of water for economical ufes, as the working of light machinery, the confumption of palturingfock, and in particular cafes, where a fufficient quantity can be procured, for the watering of land, will be fully confidered in their proper places; and many ufeful obfervations may be found in the work here alluded to, efpecially in what relates to draining. The two objects of applying water to the ufe of live-flock, and that of irrigation, fhould conltantly be kept in the mind of the improver of the foil. See Soin, Watering of Laid, and Draining of Land.

It is fufficiently evident, from various circumftances in the management of lands, that fome forts are much better calculated for the production of grain crops than thofe of the grafs kind; while, on the contrary, others are much more fuitable and better adapted to the raifing of grafs than thofe of the corn kiad; and that there are ftill others that may Vol. XX.
be cultivated under a convertible fytem of corn and grafe, with more fuccefs than cither of the methods feparately.
It may be remarked, that all thofe lands which pulferfs a fufficient degree of drynels, whether they have much depth of mould or not, and which, in their natural itate, have but Iittle tendency to produce good herbage, fuch as thofe covered with different forts of coarle plants and vegctable productions, whether in an open or inclofed ftate, ate proper for tillage. And it las been well obferved by Mr. Davis. that grouds of this nature are of confiderably more value when in a fate of tillage than in patture; as they are particularly adapted to the improved methods of cultivation, and in addition to the quantity of grain to be produced from them, will afford a greater quantity of vegetable fuod for animal itock, when in a tillage thate, than they did when kept entirely in that of pafture or fward. The fame writer likewife ftates, that there are various other defcriptions of light lands that may be kept in a ftate of tillage with more advantage than in that of grafs, as they are peculiarly fuited to thote improved modes of cultivation that are neceffary for raifing large fupplies of green-food for the fupport of live-ftock of different kinds. That the poorer forts of fandlands, where marle, clay, chalk, or other fimilar fubitances, can be readily procured, are much more proper for the phirpofes of tillage than thofe of grafs, is fufficiently fhewn by the improvements that have been made in many of the more fouthern diftricts of the kingdom. And that lands of the chalky kind, whether of the more fuperficial or deep defcriptions, are, in molt cafes, better fuited for tillage thati grals, is proved from their wetnefs in the winter fealon, and their opennefs and friability in the fummer, rendering it almoft impoffible to eftablifh good herbage upon them. Befide thefe, there is another fort of land that is better for the parpofes of tillage than thofe of grafs, which is that which, in the ftate of grafs, is conitantly fo difpofed to the production of mofs, as to afford but a very fcanty fhare of good herbage in any circumftances.
It has been ftated by the author of "Practical Agriculture," that "moft of the clayey and more heavy defcriptions of land, efpecially when fituated in vallies, or other low confined expofures, though they may be capable of affording good crops of particular kinds when under the plough, as thofe of the wheat and bean kind, are, on account of their retention of moilture, the increafed expences of labour, and the uncertainty of feafon for tilling them, as well as their inaptitude for moft other forts of crops, and their fitnefs for the production of good herbage, much more beneficial in the itate of grafs than irr that of tillage. When there is an opportunity of procuring fea-fand, and of applying it at an ealy expence, they may, however, it is oblerved, be converted to the purpofes of tillage in a profitable manner. Moft of thofe ftrong cold grafs-lands which, in a ftate of tillage, would be improper for the growth of turnips, and other applications of improved cultivation, fhould alfo conftantly remain in a ftate of grafs. And likewife thofe lands that are fituated near large towns, where manure is plentiful, and, of courfe, capable of being procured at a reafonable rate; and where the produce of fuch lands is olways in great demand, and therefore capable of being difpofed of to great advantage. Such lands as are fituated on the banks of large rivers or brooks, which are capable of being improved by means of watering, are likewife more beneficial when kept conftantly under the grafs fyftem than any other mode of cultivation that can be practifed. The lands of a calcareous nature, which are diftributed in the vallies of the more mountainous diftricts, where old grafs-land is fcarce, and of much importance, and moft part of that in the ftate of tillage incapable of being converted to the coindition

## I. A N

of good grafs, may alfo, it is believed, be the molt advantageous when continued in a permanent itate of herbage."

But that "the forts of lands that are the moft adapted to the practice of convertible hubbandry are thofe of the loamy kinds, which are not too ftrong for the growth of turnips. Thefe, in all their different varieties, are capable of being changed from the ftate of tillage to that of grafs, and the contrary, not only without fultaining any injury, but frequently with the moft evident advantage, as the practice of fome of the weltern and midland diftricts has fully proved." And "the richer kiads of fandy lands are, in moft cafes, allo well fuited to this fort of hufbandry; efpecially where marle is at band, to be applied at the time of laying them down to grafs Grounds of the peaty fort may likewife, in many cafes, be the moft beneficially employed in chis mode of culture, ace, from their producing little elfe than plants of the aquatic id. it is obvious that they mult be completely deftroyed, and thofe of the proper grafs kind be introduced, before any ufeful herbage can be produced. And this is capable of being accomplifhed in by much the moft perfect manner under the flate of tillage. But as they are, in moft inftances, much too tender and moift for the purpofe of remaining long in the ftate of tillage, as foon as the above intention has been fully effected, they fhould be reftored to the flate of permanent grafs," either as meadows or pallurelands. Sec Ground and Sorl.

Land Carriage, in Rural Economy, that fort of conveyance which is performed on land, which, in many cafes, is highly inconvenient, and always greatly expenfive and troublefome to the farmer. It fhould, of courfe, be leffened as much as poffible, in fituations that will admit of it, by the fublituting of water-conveyance, by the forming of fmall narrow canals, which may, in many intances, be done at a trifling expence, and thus much leffen the extent or diftance of land-carriage. Much has been done in this way, with confiderable effect, within the laft twenty-five years, in different parts of the country. See Caxal and Inland Navigation.

LaNd-Guard, a furt of fence or embankment conftructed of fones, wood, or other materials, on the borders of rivers and brooks, in order to prevent their overflowing and carrying away the land. The cafes in which they beconse more particularly neceflary, are where they are confined in the parts where they are required to bend, by rocks or other means, to an unaltered charnel; it often takes place in hilly fituations, and where deep poois occur in fuch parts at low water, fo as to render it difficult or impofiribie to provide a good foundation for a pier. The mode of applying and forming the e forts of guards, will be explained in confidering the nature and manner of guarding river-banks, and confining ftreams of other kinds. See Embankifest, and RiverBanks, Guarding of.

Land Mark, in Agriculture, any thing placed as the divifion of land. Thefe marks were formerly chiefly ufed for thewing the different lots or divifions in common field-lands, and other forts of commonable land.

Land-Reeve, in Rural Economy, a perfon whofe bufinefs it is to overlook certain parts of a farm or eftate; to attend, not only to the woods and hedge-timber, but alfo to the fate of the fences, gates, buildings, private roads, drift-ways, and water-courfes: and likewife to the focking of commons (where there are any), and encroachments of every kind; as well as to prevent, or detect wafte and fpoil in general, whether by the tenants of the eftate, or others; and to report the fame to the manager or land-lteward. It has been obferved, that "the utility accruing from thefe inferior officers of an eftate occurred to the writer in the Highlands of Scotland; where they ha , e been commonly appointed on every eftate, it is believed, from time immenorial, under the name of
ground-officers." And he has "fince experienced"their utility fo fully in England, as to induce him to recommend their appointment on crery large eftate ; not merely as helpmates to the acting-manager, but as authentic evidences in matters of difpute, and as intelligent informants to a proprictor in going over, or inquiring after, the affairs of his cltate. Active inteliligent tenants, of known integrity, are generally the moft fuitable perfons for having the management of this fort of truit confided in them."

Land Springs, fuch as rife, or are produced in lands, at fome confiderable depth, from the water being obftructed in its defcent by fome fort of impenetrable material, fuch as clay, \&c., and thus forced up to the furface, where it breaks or oozes out, having different appearances, according to the nature of the foil and fituation in which it occurs. See Spring, and Draining of Land.

Lavd Stequard, the common name of a perfon who overlooks, or has the management of a farm or eftate. The number, defcription, and qualities of-land ftewards muft be regulated according to the nature and extent of the property, and the particular circumftances of the proprietor. In order to be fully qualified, according to the author of "The Modern Land Steward," for the proper management of large effates, the ftewards fhould have attained that thorough and correct knowledge of the bufinefs of life, that full-tried experience in men and things, which ought not to be expected earlier than the middle age. No material part of their time or attention flould be engroffed by their own private concerns, as, in fuch cafes, they muft evidently neglect their own, or the bufinefs of their employers ; and it would be paying human nature too great a compliment to fuppofe the former. To an ample fhare of agricultural knowledge, they ought to have a thorough infight into the nature of every improvement of which eltates may be capable, whether upon or beneath the furface; or from its local fituation, whether inland or upon the fea-coaft. Their attention fhould be alfo directed to the ufeful fciences of political economy and political arithmetic, as there is a ftrict and happy coincidence between public and private wealth. They fhould be well verfed in, and qualified to fuperintend, the culture of wafte lands, the difpofal of timber, the eradication or planting of woods, irrigation and warping, drainage, embankment, and the recovery of land from the fea, the cutting of canals, the laying out and repairing of roads; the conitruction of bridges, mills, and engines; and be poffeffed of a confiderable fkill in rural architecture of every kind. Nor is it lefs neceffary that they thoroughly comprehend the nature of all the various methods in which money bufine $\sqrt{s}$ is tranfacted; together with the advantage of bargaining in the purchafe or fales of eftates. Their intelligence ought allo to extend to the valuable inventions and improvements of other countries, as well as thofe of their own; which, whether in the mechanic or agricultural relation, they fhould ufe their beft means to introduce, and fairly experiment upon the eflates under their care, with the honourable and patriotic views both of private and national benefit. In fhort, with fufficient honefty, a mind amply replenifhed, a cool, deliberate, and calculating head, a quick difcernment, they fhould lay hold of every occafion, as it fprings, to enhance the worth, the reputation, and the embellifiment of the property committed to their charge.
For thele qualifications and endowments they fhould have full and adequate allowances, in the way of falaries or wages, according to the fervice to be performed. Their pract cal fkill in agriculture fhould particularly extend to the r anagment of cattle, and the common outlines, at leatt, of rural architeCture, as far as regards repairs, or ordinary new erections; and they fhould be thoroughly malters of common

## LAN

accounts, and able to deferibe or correfpond by letter intelfigibly, and with prapriety. When thus qualified, they may make very capable and refpectable ftewards; but they would not be the lefs eligible for a fufficient portion of mathematical and mechanical knowledge, and the practical habits of menfuration both of timber and land: though a defect of thefe branches of fcience ought not to operate to the rejection of thofe otherwife well qualified; fince they are acquired by a very moderate application and practice; and fince there are always at hand profeffional men in thefe fciences, whofe fervices are perhaps, after all, the molt eligible and proper. Land ftewards fhould have the care and management of every thing that relates to the farm or eftate, of which they have the fuperintendence. It is alfo'further adyifed, that " every eftate fhould be accurately furveyed, and correctly defcribed in a map, of which the tenant alfo Mould have one. It is fuppofed particularly neceffary, both to fteward and tenant, to keep an exact terrier of all common fieldlands; and where the bounds and abutments of any fingle parcel of land are dubious, to have them defined and afcertained with durable land-marks, by a jury purpofely impannelled at the manor-court: and in order to preferve the bounds and precincts of a parih, with the particular property of the lord, entire, and free from encroachment, and to preclude the neceffity of quarrels and fuits at law, it is good to keep the ancient cuftom of annual perambulation." And it is conlidered as " the duty of thewards to ride over, and make actual perfonal furveys of the eftates in their truft, fufficiently often to offer timely advice, to obviate any dangers, and nip any irregularities or encroachments in the bud: to have in their poffeffion duplicates of all leafes, covenants, deeds, \&c." And that, "where the cafe of default or danger does not admit of immediate remedy through their own means," to exonerate themfelves by inftant application to their employers.

And it is likewife their bufinefs "to infpect all repairs, that they be duly and fubftantially performed; fencing regularly kept up, ancording to covenant ; ditches caft and fooured, water-courfes frce, and common rights fairly enjoyed, according to the cuftom of the manor; the larger tenants not overflocking, to the prejudice of the inferior: in which cafe, the flewards are bound to interfere.-To ob-- ferve that the cutting of underwood be at the regular, cuftomary, or covenanted periods; that the lopping of pollards be fair, and no damage done, in any wife, to the proprietor's timber or woods; to mark the fpots where new plantations may be necefflary or advifable; woodwards to be admonifhed of their duty,-that they report all perfons who trefpafs, either with their cattle, under colour of cutting up handflicks, faggot-bands, or fimilar pretences." And "to difcourage poaching and deftruction of the game, rather by rational and moderate indulgences, than either by the threat or exertion of the exceffive rigour of the law, which, according to the complexion of the prefent times, can have no other poffible effect than to detract from the popular character of the proprietor, and from the fafety of that which fuch meafures are intended to enfure." Further: "to caution the tenants that they do not fuffer the land to be overrun and rooted up by moles, or the commons or woodlands by unrung fwine." And that "the ftricteft caution be obferved, that all materials produced by the farm or eftate, in any refpect fit for manure, or other ufeful purpofe, fuch as marle, lime-itone, coal, or kelp-a hhes, weeds, fhells, fand, clay, virgin-earth, \&c. be difpofed of and ufed among the tenants of the eftate only, and by no means alienated from it ; fince fuch practice would be to rob the foil of a natural and moft valuable mean of improvement.".

## LAN

It is, on the whole, concluded, that "there is great convenience in land ttewards being furveyors of the highways for the parifies in which they refide; in which cafe, it lies in their own power to preferve them in a condition ercditable to the county and the proprictors for whom they act. Nor ought they ever to be indtientive to the cond uce of the furveyors of other parifhes, in which they are concerned; never permitting the lealt neglect, nuifance, decaycd bridge, or dangerous way ; but occafionally, and according to the neceflity of the cafe, making a few examples in a gentecl and temperate, but firm tone, always pleading for their punctilioufnefs, the ftrict and peremptory orders of their employers, which they dare not difobey." And "the like frictnefs is, it is fuppofed, neceflary with refpeet to trefpaffes from neighbouring cattle; for fome farmers are fo exceffively dilatory in this refpect, that they will take no kind of pains either for the fecurity of their own or their neighbour's crops."

It is remarked by the writer of the work on "Landed Property," that on a large eltate a refident manager is generally found,-" a land fteward, a man who has fome knowledge of what is termed country bulinefs, and who acts under the controul of his employer, or of a confidential friend who is more converfant in rural concerns, or perhaps of a law-agent who knows lefs of them:" and that fuch refiding fleward, efpecially of a detached eftate, which lies at fome dittance from the refidence of its proprietor, acts without controul. In this cafe, if he is a man of judgment and integrity, he becomes, at leaft in the eyes of the tenantry, a fuperior being ; frequently, in their minds, a more exalted character than their landlord,--than the proprietor himfelf, who, perhaps, never deigned to glance his eye upor them or their lands." But that, "on the contrary, if fuch poffeffory manager wants thofe requifite qualifications, the confequence becomes mifchievous to the lands, their occupiers, their proprictor, and the community. If this unprincipled agent has an intereft in the derangement of the citate, and the ruin which will follow, and is fuffered to make ufe of it,--the crime of neglect, on the part of the proprietor, might well be cognizable as a crime againf the public." And further, that "fimilar evils are liable to befal an eftate which lies round the refidence of its proprietor, if he is equally inattentive" to its proper management and regulation.
Agriculture is confidered as the only firm foundation on which the other acquired attainments can be fecurely repofed. It is not more effentially valuable in the fuperintendence, than in the improvement of an eftate. "It is difficult to become an accurate judge of the value of lands, without a practical knowledge of their ufes: nor can any man, without it, properly appreciate the management of occupiers; much lefs affilt them in correcting their errors, and improving their practice." And that "land furveying is another requifite qualification: not fo much, however, for the purpofe of mapping and meafuring an eftate at large, as for checking and correcting the works of profeffional men; as well as to affit in laying out its lands to the moft advantage," and with the greatelt propricty. Further: that " fome knowledge of mechanics, and the other fciences that are requifite to the bufinefs of an engineer, may be highly ufeful in profecutivg the improvements incidental to landed property, in various ways; as well as a competent knowledge of rural architecture, and the fuperintendence of artificers, as they may be faid to be of daily ufe. The nature of planting, and the management of woodlands, are acquirements that cannot be difpenfed with. Nor flhould his knowledge and attention be confined to the furface of the

## LAN

pafturage by confequence. The ordinance was, that all houfes of hubandry, with twenty acres of ground to them, thould be kept up for ever, together with a competent proportion of land to be occupied with them, and in no wife to be fevered from them. liy thefe means, the houfes being kept up, did, of neceffity, enforce a dweiler; and the proportion of land for occupation being allo kept up, did, of neceffity, enforce that dweller not to be a beggar. This flatute was renewed in king Henry the Eighth's time ; and every perfon who converted tillage into palture fubjected to a forfeiture of half the land, till the offence was removed. In a law of the 25 th of the fame reign, it is fet forth, that many farms, and great plenty of cattle, particularly 'heep, had been gathered into few hands, whereby the rents of lands had been increafed, and tillage very much decayed; churches and towns pulled down; the price of provifions greatly enhanced, and a marvellous number of people rendered incapable of maintaining themfelves and families; and, therefore, it was enacted, that no perfon fhould keep above two thoufand fheep, nor hold more than two farms. In the third of Edw. V1. a bill was brought in for the benefit of the poor, for re-building decayed farmhoufes, and maintaining tillage againt too much inclofing. In the year 1638 , there was a fpecial commiffion from Charles 1. for enforcing the ftatute of the 3oth of Elizabeth, by which no cottage was allowed in any country place, without at lealt four acres of land to it, to prevent the increafe of the poor, by fecuring to them a maintenance; nor were any inmates allowed in any cottage, to fecure the full cultivation of the land, by diffufing the pcople more over it. And by an act in Cromwell's time, no new houfe was to be built within ten mules of London, unlefs there were four acres of land occupied by the tenant. Thus did the policy of our anceftors difcourage inclofing and engroffing, upon the fame general view of their depopulating tendency; and though the increafe of trade and manufactures in more modern times has produced a confiderable alteration in the fate of our country, and may require fome change in our internal policy, yet it is ealy to forefee, becaufe facts juftify the apprehenfion, that inclofing and engroffing, to the degree in which they have lately prevailed, will annihilate the fmall occupiers of land, and reduce the inhabitants of the kingdom to two claffes, viz. gentry and beggars, or grandees and flaves. See this fubject more amply difcuffed, and the arguments for and againft inclofnres and large farms, flated under Farm, and Inclosing of Land.

As in former times the number of the occupiers of land was greater, and all had more opportunities of working for themfelves, it is reafonable to conclude, that the number of people willing to work for others muft have been fmaller, and the price of day-labour higher. The nominal price of daylabour, fays an author who wrote a few years ago, is at prefent no more than about four times, or at moft five times, higher than it was in the year 1514. But the price of corn is feven times, and of flefh-meat and raiment about fifteen times highcr; therefore the price of labour has been fo far from advancing in proportion to the increafe in the expences of living, that it does not appear to bear now half the proportion to thefe expences that it did formerly. What alteration has taken place lince thefe obfervations were made, we leave others to determine. See on this fubject Price's Obfervations on Reverfionary Payments, Supplement, p. 388, Scc. Appeal to the Public on the Subject of the National Debt, p. 93 , \&c. See Labour, and Labourers.

Landaff, a townfhip of America, in Grafton county, New Hampfhire ; incorporated in 1774, and containing 461 inhabitants.

LANDAU, a town of France, in the department of the Lower Rhine, and chief place of a canton, in the diftrict of Wiffembourg, fituated on the river Queich, which runs into the Rhine; containing four churches; formerly imperial. The place contains 5123 , and the canton 15,246 inhabitants, on a territory of $487 \frac{1}{2}$ kiliometres, in 18 communes: N . lat. $49^{\circ} 13^{\prime}$. E. long. $8^{\circ} 10^{\prime}$--Alio, a town of the county of Waldeck; 12 miles N . of Waldeck.-Alfo, a town of Bavaria, on the Ifer; $3^{2}$ miles W. of Paffau. N. lat. $48^{\circ}$ $3^{6}$. E. long. $12^{\circ} 37^{\prime}$.

LAND-CHEAP, an ancient cuftomary fine, paid either in cattle or money, upon the alienating or felling of land in certain manors, or within the liberty of certain boroughs.

At Malden in Effex , a payment is fill made of 13 d. in every mark of the purchafe-money for lands and houfes fold in that town; which is called land-cheap.

LANDE, in Geography, a town of Norway; 36 miles N. of Chriftiania.

LANDECK, a town of the duchy of Warfaw ; 48 miles N. of Gnefna.-Alfo, a town of the county of Tyrol, on the Inn; 39 miles W.S.W. of Infpruck.-Alfo, a town of Pruflian Pomerelia; 64 miles S.W. of Dantzic-Alfo, a town of Silefia, in the county of Glatz, on the Biela; 8 miles S.E. of Glatz. N. lat. $50^{\circ} 15^{\prime}$. E. long. $16^{\circ} 40^{\prime}$.

LANDED Interest, a term oppofed to monied intereft, in political confiderations; though there is a near connection between them : for the landed intereft is affected by foreign trade. See Monied Interef.

The foreign trade of every country mult decline, that, 1. Lays unequal taxes in general on its people. 2. That cramps its commerce, the fountain of riches, by high duties, and impolitic prohibitions. 3. That fuffers many monopolies. 4. That opprefles its people by prohibiting the importation of victuals, under the pretence of railing the value of its lands. 5. That encourages idlenefs, by bad laws relating to its poor. 6. That tempts foreigners to carry away its coin for lefs than its intrinfic value. 7. That makes the obtaining juftice chargeable. 8. That fuffers a heavy national debt, contracted in time of war, to continue unpaid in time of peace.

The reafon why the decline of foreign trade finks the value of land is, I. Becaufe it finks the markets at home. For, the produce of land being rendered exceffively dear from the caufes above enumerated, foreigners will not take its fuperfluities; and labour being by the fame caufes rendered exceffively dear, we cannot manufacture or improve that produce, becaufe nations which can afford cheaper fupply the markets abroad; fo that the produce of the lands, not being carried off as ufual, mult become a dead ftock on the farmer's hands, and caufe great quantities to be crowded into markets, where, being encouragement but for few buyers, the price naturally falls; as, for inflance, the declining demand of our woollen goods abroad falls the price of wool at home.
2. Becaufe it increafes the number of poor, to burden the land.
3. Becaufe it diminifhes the number of people: for, as employment leffens, the molt induftrious, rather than ftarve here, will fly to other countries, where trade can maintain
them. So the confumption of thefe being taken away, the demand at market mutt grow lefs, and of courfe rents muft fall, yet the farmer's charges mult grow greater; for the fewer the hands, the higher wages are: this mult break him in the end, and produce all the confequences following that misfortunc. Befides, men who trade bring in money; therefore the fewer they are, the lefs moncy will be brought; and the lefs money, the lefs rent can be given for land.
4. Becaufe the decline of trade diminithes our riches. This is a confequence of the above remarks; for having fewer goods capable of being exported by reafon of their dear price, and our manufactures declining, muft in time be loit: therefore the importation of foreign goods muft naturally increafe, and more money go out to pay for them.

Nations that have no mines of gold and filver, have no means to get them but by foreign trade; and according to the quantity of thefe metals they poffefs, the price of their commodities, and therewith the value of their lands, rife and fall in proportion, which fhall now be proved.

According to Dr. Davenant, the whole rental of England, in 1600 , did not exceed fix millions per annum, and the price of land was twelve years purchafe; in 1688 , the rental was fourteen millions, and the price of land was eighteen years purchafe: fo that, within this period, the landed intereft rofe from feventy-two to two hundred and fifty-two millions; and this advance was owing to an increafe of trade.

The Britannia Languens, page 12, fays, if there were but five hưdred pounds in England, an ox could hardly be worth a penny ; therefore the rent mult bear its proportion to the riches. This appears by Maitland's Hiftory of London ; for he fays that, in the year 961 , land fold at one fhilling per acre. The reafon that land then bore fo low a price, was the low price the produce fold at ; for he fays, that, in the year 1000, an ox fold for 25.6 d , a cow for $2 s$, a theep for $1 s$., and a fwine for $8 d$. In 1445 , wheat was at $4 s .6 \mathrm{~d}$. per quarter ; in 1447, at Ss. ; in 1448, at 6 s .8 d ; in $14+9$, at 5 s . A bullock, in 1445 , was 5 s ; a Theep $25.5 \frac{1}{\frac{1}{2} d . ;}$ a hog $1 s .11 \frac{1}{2} d$. ; clothing for a ycar, at the fame period, of a common fervant of hufbandry, 3 s. 4 d. ; of a chief carter and fhepherd, 48 ; of a bailiff of hufbandry, 5s. In 1512, the mean price of wheat in Yorkhire was $6 \mathrm{s}$.2 d ; the price of malt was $\frac{s . \text {, and of oats } 2 \mathrm{~s} \text {. ; fo that }}{}$ the nominal price of grain at this time was about a feventh of its nominal price for the laft twenty ycars; reckoning from the time when the author below cited wrote. The price of a fat ox, at the fame time and in the fame county, wis 13 s. 4d.; of a lean ox, 8 s .; of a wether, $\mathrm{Js}$.Sd .; of a calf, is. $8 d$. ; of a hog, $2 s$.; fo that the nominal price of meat was no more than about a fifteenth of its prefent price, and bore the fame proportion to the price of corn that it would now bear, were it at half its prefent price. In an act of parliament of the $25^{\text {th }}$ of Henry VIII. heef, veai, pork, and mutton, are mentioned as the food of the poor, and their price limited to about a halfpenny a pound. Beef and pork in particular were fold in London at $2 \frac{1}{2} \mathrm{lb}$. and 3 lb . for a penny; at the fame time that wheat was at 7 s . and 8 s . a quarter, and bore the fame proportion to the price of fleth as it would bear now, were it about $4 \%$ a quarter. In 1549, wheat was in London 12s. per quarter, malt 10s., bariey 9s., rye $6 s 6 l_{\text {s }}$, oats $45 .$, a middling ox $1 \% 18 s .$, a wether 3s., butter $\frac{3}{4}$ d. and a penny a pound, and cheefe a halfpenny a pound. See the citations in the Supplement to Brice's Obf. on Reverfionary Payments, \&ce. p. 385 , \&c. This could be only owing to the little foreign isade the nation

## ${ }^{\circ} \mathrm{A} \mathrm{N}$

## LAN

haid at thefe refpective periods, and confequently, to the little quantity of gold and filver which trade had then brought in.

But if it flould be afled, What is the reafon that, at prefent, all things are naturally fo much advanced in price, to what they were in thofe days? the anfwer is, that the quantitics of gold and filver brought to Europe fince the progrefs made by the Spaniards and Portuguefe in America, have made thofe metals more common, and of lefs value than formerly; fo that 20s. will hardly purchafe what 1 s . would before the difcovery of the Weft Indies. On this fubject, fee the article Interest. To which may be added, the great increafe of our national debt and taxes, together with the circulation of the intereft of the principal money of the public funds; and likewife that great circulation of paper credit in trade occafioned by notes and bills, which, by promoting an artificial circulation of property, raife the price of commodities, and give the appearance of weath to the nation ; though they are really the characteriftics of a declining ftate. Poft. Dict. Com.

The dearnefs of commodities and the cheapnefs of money are the fame things.

LANDEGODE, in Geography, a fmall ifland in the North fea, near the coaft of Norway. N. lat. $67^{\circ} 25^{\prime}$.

LANDEN, John, in Biograpby, a celebrated mathematician, was born at Peakirk, near Peterborough, in Northamptonhire, in January 1719. He became an early proficient in mathematical fcience, was a contributor to the Ladies Diary in the year 1744, and was one of the molt ardent friends to that very ufeful publication. He contributed to this annual work till within a few years of his death. The life of Mr. Landen was far from an eventful one. He pafted the earlier part of his life, as a farmer, at Walton, near Peterborough, at the fame time he gave mathematical inftructio:s to feveral young perfons in the neighbourhood. From Walton, Mr. Landen, in 1762, removed to Milton, the feat of earl Fitzwilliam, to undertake the bufinefs of land fteward to his lordflip: and in this fituation he remained till within a year or two of his death. To return to the mathematical labours of our author.-He publifhed, in the Philofophical Tranfactions for the year $\mathbf{1 7 5 4}$, "An Inveltigation of fome Theorems, which fuggelt feveral very remarkable Properties of the Circle, \&c. "" and in the following year he publifhed a volume, intitled "Mathematical Lucubrations." This title was intended to inform his friends and the public, that the fludy of mathematics was at that time rather the purfuit of his leifure hours, than his principal employment. They contain a variety of tracts relating to the rectification of curve lines, the fummation of feries, the finding of fluents, and many other points in the higher parts of mathematics. From this time to the year 1706 he gave the world feveral valuable works; and on the 16 th of January of this year, he was elected a fellow of the Royal Society: focn after which he inferted in the Philofophical Tranfactions, "A Specimen of a new Mothod of comparing curvilineal Areas;" by means of which, many areas are compared, that did not appear to admit of compatifon by any other method, a circumftance of confiderable importance in that part of ratural philofophy which relates to the doctrine of motion. Thefe are but a fmall part of the works which he produced, and which have given celebrity to his neme. In the years $1781,1782,1783$, he publifthed three fmall tracts "On the Summation of converging Series," in which he explained and thewed the extent of fome theorems which had been given for that purpofe by De Moiyre, Sterling, and Thomas Simpfon, is
anfwer to what he conceived to have been written in difparagement of thofe excellent mathematicians. Mr. Landen was author of a work publifhed in two volumes, and at difo ferent times, intitled "Memoirs." The fecond volume contains his laft labours on the folution of the general problem concerning rotatory motion. It comprifes alfo a refolution of the problem relating to the motion of a top; with an inveftigation of the motion of the equinoxes, in which Mr. Landen has, firft of any one, pointed out the caufe of fir Ifaac Newton's miltake in his folution of this celebrated problem. He lived to fee the volume completed, and received a copy of it the day before his death, which happened January 15, 1790, at Mitton, in the 7 IIt year of his age. Mr. Landen was not only diftinguifhed by his eminent talents as a mathematician, but by the excellence of his moral character. His temper, however, was, not a good one; and he was too apt to look with contempt on thofe whom he deemed lis inferiors. His MSS, were fold for wafte paper; a circumftance that did not reflect much credit on thofe perfons who came in poffeffion of them.

Landen, in Geography, a town of France, in the department of the Ourte, and chief place of a canton, in the diftrict of Huy, feated on the river Becke; 17 miles W.S.W. of Liege. The place contains 642, and the canton 9265 inhabitants, on a territory of $82 \frac{1}{2}$ kiliometres, in 25 communes.

LANDERNEAU, a town of France, in the department of Finitterre, and chief place of a canton, in the diftrict of Breft. The place contains 3577 , and the canton 13,804 inhabitants, on a territory of 180 kiliometres, in 9 communes. N. lat. $48^{\circ} 27^{\prime}$. W. long. $+10^{\prime}$.

LANDERON, a town of Switzerland, in the principality of Neufchatel, fituated at the S.IV. extremity of the lake of Bienne, and inhabited by Roman Catholics ; 7 miles N.E. of Neufchatel.

LANDES, Les, a department of the S.W. region of France, formed of Landes and Chaloffe, diftricts of Gafcogne, in N. lat. $44^{\circ}$, a maritime territory between Lower Pyrenées and Gironde; bounded on the N. by the department of the Gironde, on the E. by that of Lot and Garonne, and Gers, on the S . by the Lower Pyrenées, and on the W. by the fea, containing 468 fquare leagues, and 228,589 inhabitants, and divided into three circles or diltricts, viz. Mont-de-Marfan, which has 72,96 inhabitants. St. Sever, including 78,125 , and Dax, with 77,796 inhabitants, 28 cantons, and 368 communes. Its contributions amount to $145,376 \mathrm{fr}$. and its expences charged on the departments are $203,769 \mathrm{fr} .62$ cents. The foil of this department is for the moft part fandy and unfruitful, the N. and W. parts confifing of heath and marfhes, and poorly cultivated. Some parts, however, towards the S.E. are more fertile; and this department yields fome grain, fruits, and excellent paftures. It has alfo forefts of pines, quarries, and mineral fprings. Its chief town is Mont-de-Marfan.
LANDESHUT, a town of Silefia, in the principality of Schweidnitz, on the Bober. The town was founded in 1292, and it has a Latin fchool, a Roman Catholic church, and by permifion and purchafe a Lutheran church. Its linen trade is flourihhing ; 18 miles W.S.W. of Schweidnitz. N. lat. $50^{\circ} 30^{\prime}$. E. long. $15^{\circ} 55^{\prime}$.

LAND-FALL, is a fea-term, fignifying to fall in with the land, or the firtt land difcovered after a fea-voyage.

Land-fall, Good, is when a thip makes or fees the land, as the expected, according to her reckoning. The contrary is called a bad land-fall.

LAND-GABLE, an ancient term for a tas or rent,
ifluing
ifluing out ni : land ; anfwering to what we now call groundrent.

LANDCRAVE, formed of the German land, earth, and graff, (1, srave, judge, or count, a name formerly given to thofe who scuted jutice on behalf of the emperors, with regard to the internal policy of the country. The title docs not feer. ${ }^{\prime}$, have been ufed before the eleventh century. Thefe jud, 's were firlt appointed within a certain diftrict of Germany; a procefs of time the title became hereditary, and thefe juJges affumed the fovereignty of the feveral diftricts or cometries over which they prefided. Landgrave is now applices, by way of eminence, to thofe fovereign princes of the cinp:: - who poffefs by inheritance certain eftates, called landgravati: and of which they receive the inveltiture of the emperor. There are four princes who have this title, viz. thofe of Tiuringia, Heffia, Alface, and Leuchtenberg. There are affo other landgraves who are not princes, but counts of the empire. See Count.

LANDCUARD Fort, in Geography, an Englifh fort, fituated on : point of land at the S.E. extremity of the county of Sufi $3 k$, at the mouth of the rivers Orwell and Stour, oppofite to Harwich ; furnifhed with a garrifon, under the command of a governor, and a platform of guns to defend the coalt.

Landguard, a point on lake Erie, in Upper Canada; formerly called Point aux Pins, fituated in N. lat. $42^{\circ} 7^{\prime} 15^{\prime \prime}$. To this place there is a great refort of Indians in the fpring, on account of the abundance of finh and fowl, which may be then taken. This point is about twenty miles E. of the South Foreland, and bears the only pine-timber on this coaft.

LANDI, Ortevsio, in Biography, was born at Milan about the middle of the fixteenth century : he was educated at his native place, and at Bologna. Being in neceffitous circumftances, he attempted to gain a maintenance by the practice of phyfic, which he exchanged, in a very fhort time, for theology, and entered into the order of St. Auguftine. It has been faid by fome writers that he apoftatized from the church, but others fay that in this particular he has been miftaken for a different perfon. While at Milan, he publifhed two dialogues, entitled "Cicero relegatus," and "Cicero revocatus," which he feigns to have been held by a company of learned men in 1533. His next work was entitled "Forcianx Qureltiones," in which, under the feigned name of Philalethes, he treats, in an entertaining manner, on the cuftoms, drefs, diverfions, and inhabitants of the different cities of Italy. It was publifhed at Naples in 1536 . He now travelled into France, and contracted a clofe friendifip with Stephen Dolet, who was afterwards burnt as an atheilt. Upon his return to Italy, he entered fucceffively into the fervice of the bifhops of Trent and Catania. In 1540, he publifhed a dialogue againft Erafmus, who had been dead four years, and on account of which he was feverely handled by an able antagonift. While he was at the court of Francis I. in 1543, he publifhed his two books of "Paradoxes :'" thefe he foon found had been written with too great freedom, and as they began to excite confiderable attention, he thought proper to anfwer them himfelf anonymoufly, and in his reply he is faid to have treated himfelf with as little ceremony as any real opponent would have dorie. In 1544, he travelled through Germany, and afterwards through the different provinces of Italy, which he defcribed in a work entitled "Commentario delli piu notibili et moftruofe cofe d'Italia et altri luoghi." He is fuppofed to have died foon after the year 1560 , leaving behind him many other works befides thofe which have been enumesated. He lived in friendhip with feveral of the learned VoL. XX.
men of that age, by whom he has been mueh praifed. Gen. Biog.
LANDINGS, in Arcbitecture, the firft part of the foor at the head of a pair of ftairs.

LANDINO, Cmeistorimer, in Bingrafoys, an Italian feholar, was born at Florence in 1434 . He itudiet firth at Volterra, under Angiola da Todi, by whom he was fo much beloved, that he not only maintained him a long time at his own expence, but at his death bound his heirs to fupport him three years longer. He was intended by his father for the law, and was by him obliged to purfue it till he obtained the liberal patronage of Cofino and Peter de Medici, by which be was enabled to return to his favourite purfuits, and indu!ge himfelf in the fudy of the Platonic philofophy. He became one of the chicf ornaments of the Platonic academy at Florence, and lived in Arict friendhip with Poliziano, IFiciru, and others of its members. In 1457, he gave public lecturey in polite literature at Florence, which contributed to the prozrefs of learning in that period. At an advanced age he cbtained an office in the ftate, and was prefented with a paa lace for his refidence. He died in 1504, at Prato Vecchio. His "Latin Poems" will bear a comparifon with the mott able compofitions of that age. He wrote commentaries on Virgil and Horace, and Dante, which went through feveral editions. He tranfated Pliny's "Natural Hiftory" into Italian, and was author of "Dialogues on the, Nobility of the Mind," and other pieces connected with moral phi'ofophy. He compofed fome Latin and Italian orations, which were printed.

LANDIVISIAN, in Geography, a town of France, in the department of Finifterre, and chicf place of a canton, in the diltrict of Morlaix; 10 miles W.S.W of Morlaix. The place contains 2124 , and the canton 11,460 , on a territory of 150 kiliometres, in 7 communes.

LANDIVY, a town of France, in the department of the Mayenne, and chief place of a canton, in the diftrict of Mayenne; i8 miles N.W. of Mayennc. The place contains 1872, and the canton 11,223 inhabitants, on a territory of $187 \frac{1}{\frac{1}{n}}$ kiliometres, in 8 communes.

LAND-LOCKED : a flip is faid to ride land-locked, when fhe is furrounded with land, that is, is at anchor in a place where there is no point open to the fea, fo that fhe is fafe from the violence of winds and tides.
LANDO, pope, in Biography, a Sabine by birth, fucceeded to the pontifical throne on the death of Anaftafius III. in the year 913. He was indebted for his elevation to Theodora, and her daughters Marozia and Theodora, all of them no lefs famous for their beauty, their wit, and addrefs, than infamous for the fcandalous lives which they led. Lando died within about fix months of the time that he was elcvated to the papal fee, and during that fhort reign he did nothing worthy of note, or that need be recorded in this work. Moreri. Bower.

LANDRECIES, in Georraphy, a town of France, in the department of the North, and clitef place of a canton, in the diftrict of Avefnes, feated on the Sambre. It was taken from the Spaniards by the French in 16 ;5, and continued in their poffeflion by the peace of the Pyrenés, where they enlarged its fortifications. and made it one of the ftrongeft places in the country. It has only two gates, one towards the eaft, called the "Gate of France," and the other towards the weft, called the "Gate of Quefnay." It fuffered feverely by the fiege of 1594 , and furrendered to the allies; but in the fame year the garrifon, confifting of 20,000 men, furrendered to the French. The place contains 2867 , and the canton 8865 inhabitants, on a territory of po kiliometres, in 9 communes. N. lat. $50^{\circ} 3^{\prime}$. F. long. $3^{\circ}+5^{\prime}$. K k

LANDRIANO, a town of Italy; it miles S.S.E. of Milan.

LANDROAL, a town of Portugal, in Alanteijo ; 13 niles N. of Mouran. N. lat. $3^{8^{\prime}} 35^{\prime}$ E. long. $7^{\prime} 12^{\prime}$.

LANDSBERG, a town of Pruffin, in the province of Natangen; 26 miles S. of Konigiberg. N. lat. $54^{\circ} 14^{\circ}$. E. long. $20^{\circ}$ 30'.-Alfo, a town of the duchy of Stiria; 24 miles S.W. of Gratz- Alfo, a town of Germany, in the county of Hoya, on the Wefer; 6 miles S.S.IV. of Nieu-burg.-Alfo, a town of Silefia, otherwife called Gorzozv, in the circle of Oppeln, on the borders of Poland ; 30 miles N.E. of Oppeln. N. lat. $51^{\circ} 3^{\prime}$. E. long. $18^{\circ} 29^{\prime}$.—Alfo, a town of Bavaria, on the Lech; 18 miles S. of Augfurg. N. lat. $48^{\circ}$. E. long. 10 51'- - Alfo, a town of Saxony, in the circle of Leipzig; If miles N.W. of Leipzig. N. lat. $51^{\circ} 34^{\prime}$. E. long. $12^{\prime} 11^{\prime}$. - Alfo, a town of Brandenburg, in the New Mark, on the Warta; containing three churches, a royal mayzzine, and feveral manufactures of ftuff and cloth, with a confiderable trade in wool; 20 miles E.N.E. of Cuftrin. N. lat. $52^{\circ} 4^{\prime}$. E. long. $15^{\circ} 20^{\prime}$. - Alfo, a town of I3randenburg, in the Middle Mark; 14 miles E.N.E. of Eerlin. N. lat. $2^{\prime} 35^{\prime}$. E. long. $13^{\prime} 4^{8}$.

LANDSCAPE, or LANDSKIP, the vien or profpect of a country, extended as far as the eye will reach.

Lavdscape Painting, is that peculiar application of the art of painting, which reprefents extended views of whatever is attached to the furface of the earth; as mountains, rocks, woods, buildings, \&c. It is even applied to views of the fea, particulady when any portion of the land is feen: and, in the general divifion of the practice of the art into four principal branches, landfcape-painting inciudes all reprefentations of the fea alone; although, in common difcourfe, they are generally termed according to their character: as a calm at fea, a ftorm, a fea-light, \&ec. \&c.

The great points which the artilt ought to aim at, who practifes landfcape-painting, are, to mark jult proportion and true perfpective; to obtain a free and varying touch, which may fully characterize the various objects he mu't of neceffity be called upon to imitate; and to produce the effect of fpace, or what is technically termed diftance.

There are two kinds of proportion which require attention in order to produce a pleafing landfcape. One is, between the quantum of the furface of the picture appropriated to the fiy, and that allotted to the earth or the figures intended to be introduced, be they mountains, houfes, rocks, or trees: and the other is that of the various parts of the picture, reciprocally, according to their various diftances in the fcene. Of the latter, after the fize of the objects on the fure-ground is determined, perfpective is the fole regulator: therefore a knowledge of the principal rules of that fcience is here abfolutely requifite.

With regard to the former of thefe proportions, the fubject of the picture will undoubtedly furninh the belt means of deciding juilly. If the fcene be mountainous, viewed from below, and at a fhort diftance; the face allotted to the iky muft be fmall and near the top of the picture. If, on the contrary, the view be of an open champaign country, the reverfe will be the juft characteritic of the picture ; and the fky will occupy by far the larger part. It is by no means afferted that this will always be the cafe, as for inftance, if the view of a plain be taken from a great height, then of courfe the horizon will rife very high; but this would have more the character of a plan, than a picturefque or natural view. Common fenfe poiuts out the rule in the two prefuppofed cafes ; but it is not eafy to regulate this matter in ordinary compofitions, whereas, to make the work captivating, it is of ruch mone importance than is generally imagined,
and a large demand is made upon tafte to regulate it. In general, much more grandeur is acquired by a low horizon, and an ample fpace of fky , than by any other proportion; and next in effect to that, is the direet reverfe. In both, it is the quantity doubtlefs that produces the impreffion; and this principle holds good, not only in landfcape, but in all other fubjects on which the art is employed. In fact, the general principles of the art of painting are alike applicable in all its different branches. The fame felcction in tyle of defign, or rather choice of nature; the fame aims in compofition; the fame contralts in arrangements of colour, except that they can never, or very rarely, be fo powerful in landicape, as where the picture reprefents animated or artificial objects. In landicape not only are the objects fit to be introduced, of a clafs which are not fraught with ftrong colours, particularly of red or blue, but being furrounded by open sir, and receiving reflections of light and colour in every direstion, their natural vividnefs is diminifhed; and as they recede from the eye, the denlity of the atmofphere intervening between them and the fpectator, envelopes them in a milt, and renders them indiftinct in various degrees; till in the extreme diftance it reduces all colours to one hue of a light greyifh blue, almoft intermingling them with the fiky.
It is by the intervention of this grey hue in the atmofphere, which arifes from reflections of light thrown off by particles floating in the vapours which hover upon the furface of the earth, (aided by diminution of form,) that the effect of diflance is-produced ; and to imitate this with truth, and in a tone correfpondent to the kind of day or feafon which. is felected for reprefentation, is one of the principal difficulties of landfcape painting.

It is vain to attempt to give rules for overcoming this difficulty. Different malters have proceeded by different ways to gain poffefion of this defideratum. Ciaude in oae ftyle, and Wiffon in another, have both admirably effected it. One. by fcumbling a grey, or air teint, over the dittant parts; the other by working the teint in the body of colours. Obfervation of their pictures, with tafte cultivated by a long continued obfervance of nature, is the only means of acquiring a juft feeling of the fimplicity and purity exhibited in her works, and the confequent power of reprefenting them in all the varied effects fhe exhibits; either in her more gay, or fombrous momerts; when the face of the earth is illumined with funfhine, and fparkling with luttre; or when clouds bedim and envelope its beautios in fhade, and the forms of diftant objects are lott in the whirlwind and the form.

Though landfcape-painting has not the fame powerful means to work with as hittoric painting, which enjoys the great hdvantage of animation and expreffion in its fubjects, and likewife prefents the greateft difficulty to overcome; yetno true and enthuliaftic lover and obferver of nature, can avoid acknowledging, that it poffeffes the power of exciting great intereft in the mind. A form reprefented by the pencil of Gafpar Pouffin, or a calm by that of Claude, will not fail to imprefs the obferver with ideas of terror, or gentlenefs. The one, who Acilfully traced the paths of the wind in its ravages, and the deformity produced by the falling fhower ; and the other, who loved to dwell upon the beauties of the earth, in moments of undifturbed tranquillity, equally intereft our feelings, and excite thofe emotions which fuch varied circumltances in nature are calculated to infpire. Compared with fuch views of the higher objects and airs of art, the practitioner in landfrape portrait painting, or one who paints views of particular fpots, finks into about the fame ratio, as the portrait painter of mankind holds to him who engages his talents in the reprefentations of hiltory. Yet fill his tals is not desoid either of pleafure or intereft.

The fame principles are required for practice, but they are unfortunately often obliged to yield to peculiarities which deftroy their fimplicity and prevent their cffect; unlefs the artift has obtained that extraordinary talent of introducing cafual circumitances, fuch as ideal thadows, accidental reflections, and agrecable figures, in fuch a manner as to unite or improve imperfect forms, and guide or attract the eye From difagrecable parts. As is the aim of the inprover of grounds, or, as he is now termed, the landfcape fardener, fuch ought to be that of the landfcape painter. Wherever bleminhes in form occur, they fhould be hidden, and where natural beauties are beftowed, they fhould be exhibited to view; and adorned with proper adjuncts of trees, water, clouds, or figures. A perfon not converfant with the powers of combination and contraft in defign, can have no conception of their extraordinary power to heighten the effect of the dulleft fcenes, and the meaneft objects. It fhould therefore be the principal talk of the artilt to obferve thofe which are conftantly occurring among natural objects, their effects, and the different fentiments they excite; fo that he may poffefs a ftore to recur to, in time of need.

The beauty of landfcape-painting depends very much upor fimplicity of felection, and clearnefs and frefhnefs of colour. The former fhould not only govern the choice of objects or fcenery, but alfo the manner of reprefenting them, i. e. the artilt mult not attempt to delineate all the forms he fees in a tree or a rock ; that would not only be an almoft endlefs labour, but an imperfect one, even when the greatelt fkill was exhibited; his duty is rather to felect thofe forms which more immediately characterize the object, and mark them only; taking care to avoid heavinefs.

Of this kind was the practice of Titian, Claude, Domenichino, Pouffin, Mola, and all the beft landfcape-painters of the Italian fchool, and Rubens and Rembrandt adopted it : whilt Hobbima, Ruyfdael, Both, Wynants, and almolt ail the Flemifh fchool, by attempting too minute an imitation in finaller matters, lof dignity and even interef.

Among thofe who have praftifed with fuccefs this delightful branch of the art of painting, the name of Claude Gelee, ufually known by that of Claude de Lorraine, defervedly flands pre-eminent. He may have been furpalfed by Titian in wild and romantic fcenery, and grandeur of fyle in detign, but neither he nor any other has ever equalled Claude's truth and purity of colour and effect. Hitherto the perfection with which he has reprefented the effect of the atmofphere is unrivalied. Even Cuyp and our own Wilfon, who have arrived the nearelt to him, Utill lack his completion of effect. Their art is more apparent than his in his beft works; and great chaflity and fwee!nefs of tafte appear generally to have governed his choice of fcene and of parts. Nicolo Pouffin has left a great number of highly interefting landfcapes, in a ftyle peculiarly his own. He appears to have delighted in the hues of the earth and trees after wet, and without fun; and in the tones of twilight; which admirably coincides with his choice of fcenery and the claffic objects he introduced into it. His nephew Gafpar proceeded in another track, and made pictures from the fcenes which the Apennine mountains afforded him; which, while they are wrought with great freedom, fill bear too much the air of portraiture, and too often lack atmofphere. The fame may be faid in a greater degree of the works of Salvatur Rofa, who delighted to reprefent the molt wild and defert fcenes of nature; which he executed with a touch in perfect confonance with their character. It was with Wilfon, as we have above mentioned, that the tafte and talent of Claude for producing the air-teint, (as that which produces the effect of
the atmofphere is technically termed,) was moft powerfulty revived : and of him it may truly be faid, that had his patience in completing hus pietures been equal to his tafte in colour, compolition, and effect, the ancient maiker might have fallen under the modern one; and we fhould have had to boalt, that the greatelt painter of landfcapes the world ever produced, was an Englifhman.

LANDSCRON, in Geography, a town of Bohemia, in the circle of Chrudim; 27 miles E: of Chrudim. N. lat. 49' $50^{\prime}$. E. long 16' $23^{\prime}$.

Landscron, a town of Pruffia, in Natangen; 18 miles N.E. of Heilfperg.

LANDSCRONA, a fortified fea-port town of Sweden, on the W. coalt of the province of Skonc, on an ifland near the Sound: a flaple town, with a good harbour. The harbour lies between the continent and a frall iffand, and is 20 feet deep; 12 miles S. of Helfingborr. N. lat. 55 52'. E. long. $123^{6}$.

LANDSELE, a fmall ifland in the Eaft Indian fea, neat the N. coalt of the great Andaman. N. lat. $13^{3} 3^{8 \prime}$. E. long. $93^{\prime \prime} 7^{\prime}$.
Land'S-END. See Corswall.
Land's-End, a cape on the N. coait of the ifland of Sheppey ; 4 miles N . of Sheernefs.
LANDSER, a town of France, in the department of the Upper Rhine, and chief place of a canton, in the diftrict of Altkirch. The place contains $6 ; 1$, and the canton 10,629 inhabitants, on a territory of 150 xiliometres, in 22 communes.
L ANDSHAAG, a town of Aufria, on the Danube; 19 miles S.W. of Freuftadt.
LAND'S-HEIGHT, or the high ground, in Noth America, that which lies on the chain of lakes between lake La Pluie and lake Superior, where is a portage of 7 miles: Bo miles E. of the grand portage from the W. end of lake Superior.
LANDSHUT, or Landznit, a town of Moravia, in the circle of Brunn ; 16 miles s.E. of Aufpitz.

Landshut, a town of Baaria, on the river Ifer ; an open well-built town, and the capital of a government ; containing two palaces and a college with a church in it, the fteeple of which is reckoned the highelt in Germany; 32 miles N.E. of Munich. N. lat. $48^{8} 29^{\prime}$. E. long. $12^{\circ} 5^{\prime}-$ Alfo, a town of Auftrian Poland, in Galicia; 72 miles W. of Lemberg.

LANDSKIP. See Landscape.
LANDSORT, in Geography, a fmall illand in the Baltic, near the coaft of Sweden. N. lat. $58^{\circ} 52^{\circ}$. E. long. ${ }^{1} 7^{\circ} 10^{\prime}$.
LANDSTHUL, a town of France, in the department of Mont Tonnerre, and chief place of a canton, in the diftrict of Deux Ponts. The place contains 705 , and the canton 7910 inhabitants, in 32 communcs.

LANDSTRASS, or Landstrost, a town of Carniola, fituated on an ifland in the river Gurek, with a cathedral; 18 miles S. of Cilley.

LAND-TAX, is one of the ufual annual taxes, which has fuperfeded all the former methods of rating either property, or perfons in refpect of their property, whether by tenths, fifteenths, fublidies on land, hydage or hidage, fcutage or efcuage, or talliage. Tenths and fifteenths were temporary aids iffuing out of perfonal property, and granted to the king by parliament, being the real tenth or fifteenth part of ail the moveables belonging to the fubject. We meet with the payment of fifteenths as far back as the fatute of Magna Charta; in the conclufion of which, the parliament grants to the king, for the concefions made by him, a fiit enth part

## LAND.TAX

of all their morcable goods. This taxation was orignally charged upon the feveral individuals, but in the eighth year of Edward III. a certain fum was rated in every town, \&c. In procefs of time this fifteenth being infufficient for the public exigence, the number of fifteenths was augmented to two or three fifteenths. Whenever, in later years, the commons granted the king a fifteenth, every parifh in England knew their proportion of it ; i. e. the fame identical fum that was affefed by the fame aid in the cighth of Edward III., and then raifed it by a rate among themfelves, and returned it into the royal exchequer. (See Fifteentie. See alfo T'extio) The other ancient levies were in the nature of a modern land-tas: for we may trace the original of that charge as high as to the introduction of our military tenures; whon every tenant of a knight's fee was bound, if called upon, to attend the king in his army for forty days in e:ery vear. In lieu of this perfonal attendance, a pecuniary fatisfaction came to be levied by affefments, at fo much for erery knight's fee, under the name of fcutages. (See Escrice.) Of the fame nature with thefe were the afferfments of hydage or hidage upon all other lands, and of talliage upon cities and boroaghs. But thev all gradually fell into difufe, upon the introduction of fublidies, about the time of king Richard II. and king Henry IV. (See Sumsmy.) In lien of fubfidies, which were ufually raifed by commiffioners appointed by the crown, or the great officers of tate, the parliament, in the beginning of the civil wars, introduced the practice of laying weekly and monthly affeffents of a fpecific fum upon the feveral countics of the kingdom, to be levied by a pound rate on lands and perfonal eltates; which were occafionally continued during the whole ufurpation, fometimes at the rate of 120,000 . a month, fometimes at inferior rates. After the relloration the ancient method of granting fubfidies, inftead of thefe monthly affelfments, was twice, and twice only reacwed, wiz. in 1663 , when four fubfidies were granted by the laity and four by the clergy; and in 1670, when 800,000 l. was raifed by way of fubfidy, which was the lait time of raifing fupplies in this manner. The monthly affeffments beirg eltablifhed by cuftom, raifed by commiffioners named by parliament, and producing a more certain revenue, fubfidies rere difcontinued, and occafional affeffments granted as emergencies required. Thefe periodical affeffments, the fublidies which preceded them, and the more ancient fcutage, hydaye, and talliage, fays judge Blackftonc, were to all intents and purpufes a land-tax; and the affefments were fometimes expreflly called fo. However, in the year 1 (f)?, a new affefment or valuation of eftates was made throughout the kingdom, which, though by no means a perfect one, had this effect, that a fupply of $500.000 \%$. was equal to Iso in the pound of the value of the eftates given in. And, according to this enhanced valuation, from the year 1693 to the prifeat, the land-tax las continued an annual charge upon the fuhect; above half the time at $4 s$ o in the pound, fometimes at 3 s., fometines at $2 s$, twice, ciz. in 1732 and 1733, at is but without any total intermiffion. The medium l:s been $35.3 \%$. in the pound, being equivalent to twenty-three ancient fubfidies, and amounting annually to more than a million and a half of money. The method of railing it is by charging a particular fum upon each county, acerrding to the valuation of 1692 ; and this fum is affeffed and raifed upon the perional as well as the real eltates of individuals by commifioners appointed in the att, being the principal landholders of the county, and their officers.

It is obferved by Dr. Smith, in his " Nature and Caufes of the Wealth of Nations," (vol. iii.) that a land-tax, like that of Great Britain, affeffed upon each diftrit according
to a certain invariable canon, though it fhould be equal a its firft eftablifhment, neceflarily becomes unequal in procels of time, according to the unequal degrees of improvement, or neglect in the rultivation of the different parts of the country. In England, the valuation according to which the different counties and parifhes were affefied to the landtax by the $4^{\text {th }}$ of William and Mary, was very unequal even at firft eftablifhment. This tax, therefore, offends againk the firlt of thofe four maxims which this ingenious writer propofes, with regard to taxes in general. (See Tax.) This maxim is, that the fubjects of every ftate ought to contribute towards the fupport of the government, as nearly as poffible, in proportion to their refpective abilities; that is, in proportion to the revenue which they refpectively enjoy under the protection of the itate. However, it is perfectly agrecable to the orher three. It is perfectly certain, and not arbitrary. The time of payme:at for the tax; being the fame as that for the rent, is as convenient as it can be to the contributor. Although the landlord is in all cafes the real contributor, the tax is commonly adranced by the tenant, to whom the landlord is obliged to allow it in the payment of the rent. Moreover, this tax is levied by a much fmaller number of officers than any other which affords nearly the fame revenue. As the tax upon each diftrict does not rife with the rife of the rent, the fovereign does not flare in the profirs of the landlord's improvements. It does not therefore obitruct the induftry of the people; nor fubject the landlord to ary other inconveniency befides the unavoidable one of paying the tax. The adrantage, however, which the landlord has derived from the invariable conitancy of the valuation by which all the lands of Great Britain are rated to the land-tax, has been principally owing to fome circumitances altogether extraneous to the nature of the tax. It has been owing in part to the great profperity of almoit every part of the country: the rents of almoft all the eftates of Great Britain, having, fince the time when this valuation was firit eftablifhed, been continually rifing, and fcarcely any of them having fallen. The landlords, therefore, have almoit all gained the difference between the tax which they would have paid, according to the prefent rent of their eftates, and that which they actually pay according to the ancient valuation. But if the flate of the country had been different, and rents had been gradually falling in confequence of the declenfion of cultivation, the landlords would almolt all have loft this difference. As the tax is made payable in money, fo the valuation of land is expreffed in money. Since the eftablifhment of this valuation, the value of tilver has been pretty uniform, and there has been no alleration in the ftandard of the coin, either as to weight or finenefs. : But if filver had rifen confiderably in its value, the conflancy of the valuation raight have proved very oppreffive to the landlord. In circumiltances, fomewhat different from thofe which have actually taken place, this conftancy of valuation might have been a great inconveniency, either to the contributors, or to the commonwealth. A tax upon the rent of land which varies with every variation of the rent, or which rifes and falls accord:ing to the improvement or neglect of cultivation, has been: recommended by thofe philofophers called economits in France, as the moft equitable of all taxes. In the Venetian territory, all the arable lands leafed to farmers are taxed at a tenth of the rent. The leafes are recorded in a publifregifter, kept by the officers of the revenue in each province or diftrict. A proprietor cultivating his own lands is allowed a deduction of one fifth of the tax, and pays on' $y$ 8 inftead of 10 per cent. of the fuppofed rent. A landtax. of this kind, fays Dr. Smith, is certainly more equal

## I. $\triangle \mathrm{ND}-\mathrm{T} \Lambda \mathrm{X}$.

than the land-tax of England, but it mbght not, perhaps, be altogether fo certain, and the affelfinent of the tax might fremuently occafion more trouble to the landlord, and the levying of it might be more expenfive. In the ancient dominions of the king of Pruffia, the land-tax is affefled according to an actual furvey and valuation, which is reviewed and altered from time to time. According to that valuation, the lay proprietors pay from 20 to 25 por cent. of their revenue. Ecclefiatics from 40 to 45 per cent. In fome other countrics the fame method is purfued. A land-tax affeffed according to a general furvey and valuation, how equal foever it may be at lirft, mult, in the courfe of a very moderate period of time, become unequal; and to prevent its becoming fo would require the continual and painful attention of government to all the variations in the flate and produce of every different farm in the country.

The fum lixed by $3^{8}$ Geo. III. c. 5. f. Io to be paid for the land-tax in Great Britain is $2,037,627 \%$ 9s. $\frac{1}{4}$ d., which is now made perpetual. To this time the land-tax acts had been amual; but by 38 Geo. III. c. 60 . after reciting, that it may materially conduce to ftrengthen public credit, that the duty now payable for one year on land fhould be made perpetual, fubject to redemption by purchafe on conditions herein fet forth; it was enacted, that the feveral fums charged by virtue of an act ( 38 Geo. III. c. 5.) granting an aid for the fervice of the year 1799 , on the refpective counties, \&cc. in refpect of the manors, meffuages, \&c. to be raifed and paid within one year, from the 25 th of March, ${ }_{179} 9$, fhall, after the expiration of the faid term (allowing for certain fpecified exceptions) continue, and be raifed and paid after the 25 th of March in every ycar for ever. And all powers and provilions contained in the faid act thall be in full force, and be duly executed ; fubject to the regulations and conditions of redemption or purchafe mentioned in it. Provided always, that none of the provifions herein contained fhall extend to any fums charged by the faid act upon perfonal eftates and perquilites of office; which fums fhall, after the $25^{\text {th }}$ of March, 5799 , be afcertained, raifed, collected, and paid, according to the directions of an act to be paffed for that purpofe. (39 Geo. III. c. 3.) It is allo enacted, that the land-tas not parchafed by proprietors fhall be fold to othe: perfons, fubject to redemption by the perfon in poffeffion, or having any beneficial or future intereft in the lands : provided that in fuch cafes, all fuch lands wheron the land-tax fo purchafed fhall be charged, fhall, until fuch redemption take place, be fubject to a new affeffrent of the faid land-tax from year to year, by an equal rate, according to the value thereof, in common with each other, without any power in fuch purchafer to exonerate the fame from fuch land-tax, or to fix the rate of land-tax to be charged thereon. Alfo, where the whole tax in any place fhall not be fold, fuch lands as are not exonerated by this act from fuch land-tax, thall continue fubject to a new affeffment yearly, and from year to ycar, by an equal rate, according to the value thereof, not exceeding in any year $4^{\text {s. }}$ in the pound on fuch annual value. It is alfo enacted, that in cafe perfons entering into any contract for the redemption or purchafe of any land-tax, fhall neglect to complete their contract, fuch contract flall be void, and the tax be revived, and again affeffed and collected; and the perfons thus making default fall forfeit not exceeding one-fixteenth part of the confideration. Where land-tax, remaining unfold, fhall exceed 4 . is the pound on the annual value, the fame fall be fabject to an abatement in the manner directed by the faid act. (38. Geo. III. c. 60. f. 103. 42 Geo. SII. c- I16. f. 181.) By this lalt act, the provilions of the feveral acts for the
veitemption of the lum d. Aarare repealed from the 2 thi of Junc, ${ }_{2} \mathrm{Sc} 2$, from which date all contracts are to be eatered into and made according to that act, and the 43 Cco. III. c. 5 . to render the fame more effectual. As the land-tax not purchafed will remain to be collsected as hefore, it may not be improper or unufeful to detail the following particulars relating to it. By 35 Gco . III. c. 5. the gencral qualification of commilfioners in countics, with fome few exceptions, is socl. a-year of landed, property: thefc commiffioners, befure they can aft, are required to take the oaths of allegiance, fupremacy, and abjuration, under a penally of 200\%. to the king: and by 28 Gco . III. c. 2. f. 49 . an oath, if required, Ipccifying in writing the parifh, lituation, quantity of land, whether frechold or copyhold, of the premifes which entitle them to act as commiffoners. When they firlt meet, they direct the return and appointment of proper affeffors: and by 20 Geo. III. c. 17 . they thall caufe to be delivered to cach affeffor at printed form of affelfo ment, according to which they fhail make their affefiments. At their fecond meeting they direct the affeffors how to proceed in fettling the feveral rates and charges. By 39 Gco. III. c. 3. the feveral fums charged upon eftates in ready money, debts, goods, wares, merchandifes, chattels, or other perfonal eitate, by the act of 38 Geo. III. c. 5 . and which were not authorized to be fold by the faid act of $3^{8}$ Gee. III. c. 60 ; and alfo the feveral fums hereby charged in refpect of any public office or employment, or any annuity, penfon, flipend, or other annual payment, fhali be affeffed and paid in the following manner. That is to fay, the-feveral fums charged by virtue of the faid act on perfonak. eltates as aforefaid, fhall be, and are hereby fet and impofed on the refpective parifhes, conttablewicks, divifions, allotments, ard places, wherein the fame have been, or flall be fo charged by virtue of the faid act, and towards raifing the feveral fums hereby charged on the fame refpectively, all perfons, bodies politic and corporate, guilds and fraternities within fuch places refpectively, having any eftate in ready money, or in debts owing to them, or having any eftate in goods, wares, merchandize, chattels, or other perfonal eftate belonging to, or in trutt for them, (except fuch fums as they may bona fole owe, and fuch debts owing to them as fhall be by the commiffioners adjudged defperate, and alfo except flock upon lands, and fuch goods as are ufed for houfhold ftuff; and allo except fuch loans and debts as are owing from his majelty, fhall be charged with as much equality and indifference as is poflible by a pound rate, viz. for every $100 \%$ of fuch ready money and debts, and for every 1001 . worth of fuch goods, wares, and merchandize, or other perfonal eftate, and fo in proportion for more or lefs, towards the faid refpective fums by this act impofed upons every fuch parifh or place charged therewith as aforefaid, fo that by the faid rates io to be affefled as aforefaid, upon fuch perfonal eltates as aforefaid, the full fum hereby fet upon the fame, fhall be completely affefied, collected, and paid. f. 2.

And towards raifing the fums charged on perfons in refpect of public offices, or employments of profit, all perfons, having, v ing, or exercifing the fame, which are affeffed: by virtue of the faid act of 38 Geo . III. c. 5 ; 5 and all clerks, agents, fecondaries, fubflitutes, and other inferior nimifterswhatfoever, (fuch military officers as are muffered by the mufter-mafler general of the army, or in pay of the army or navy in refpect of fuch offices, only excepted ${ }^{\text {s }}$ ) fhall pay any fum not exceeding what fuch office or employment thall be affeffed in the year commencing 25th March, 179 S , by virtue of the faid akt of 38 Geo . I11. c. 5. And all perfons, guilds, fraternitics, bodies politic and corporate, having any
anauity, penfion, or other yearly payment, eifher out of the exchequer, or any branch of the revenue, or payable, or fecured to be paid by any perfon whatfoever, (not iffuing out of any lands, tenements, or hereditaments, or charged upon the fame, nor included in any affeffment made thereon by the faid act of 38 Gco . III. c. 5 . and not being annuties or ycarly payments which by any act of parliament fhall be exempted from the payment of taxes, ) fhall pay 4 s . for every 20 s . by the year for the fame, to be levied and collected in like manner, and by the fame perfons as the land-tax. f. $3,4$.

It is provided that nothing in this act fhall extend to the queen or royal family; nor to charge the penfions of fuperannuated fea-officers or their widows, poor knights of Windfor, or poor clergy of the Infe of Man, or tolls on turnpike roads. By 38 Geo. III. c. 5. the charge upon real eftates thall be as follows: That the entire fum may be raifed, all manors, meffuages, lands, and tenements; all quarries, mines of coal, tin and lead, copper, mundick, iron, and other mines, iron-mills, furnaces, and other iron-works; falt-fprings, and falt-works; all alum mines and works; all parks, chafes, warrens, woods, underwoods, coppices; all fifhings, tithes, tolls, annuities, and all other yearly profits; and all hereditaments whatfoever-fhall be charged with as much equality and indifference as poffible, by a pourd rate, to make up the feveral fums charged by the act on each county or place.

A parion who lets to each parifhioner his own tithes is properly the occupier, and ought to be rated. 16 Viner, 427.

But if a parion makes a leafe of his tithes to one perfon, and that perfon afterwards lets to each parifioner his own tithes, in that cafe the leffee is the occupier, and ought to be rated. 8 Mod. 6 r

Colleges and hofpitals are exempted, together with the buildings that are within the walls or limits of the fame. The act ${ }_{3}$ S Geo. IlI. c. 5. f. 25 .alfo exempts any mafter, fellow, or fcholar, or exhibitioner of any fuch college, or hall, or any reader, officer, or matter of the faid univerfities, colleges, or hall's, or any mathers or ufhers of any fchools; for or in refpect of any ytipends, wages, rents, jprofits, or exhibitions whatfoever, arifing, or growing due to them in refpect to the faid feveral places or employments: or any of the lands which before March 25, 1693, did belong to the fcites of any college or hall, or to Chritt's hofpital, St. Bartholomew, Bridewell, St. Thomas and Bethlehem hofpitals in London and Southwark ; or any other hofpitals or alms-houfes, in refpećt of any rents, or revenues, which, before March 25 th, 5693 , were payable to them, being to be received and difburfed for the immediate ufe and relief of the poor of the faid hofpitals and alms-houfes only. Id. f. 25 .

But this fhall not difcharge any tenants of any houfes or lands belonging to the faid cqlleges, halls or hofpitals, alms. houfes, or fchools, who, by their leafes, or other contracts, are obliged to pay and difcharge all rates, taxes, and impofitions. Id. f. 26.

All fuch lands, revenues, or rents belonging to any hofpital or alms-houfe, or fettled to any charitable or pious ufe as were affeffed in $4 \mathrm{~W} . \&$ M. fhall be liable; and no other lands, revenues, or rents, then belonging to any hofpital, or alms-houfe, or fettled to any charitable or pious ufe, flall be charged or affeffed: but lands given to charities fince the 4 W. \& M. fhall not be exempted. No poor perfon fhall be charged, whote lands, \&ic. are not of the full yearly value of zos. in the whole. The afficfors themfelves are affeffed by the comnifioners. The land-tax fhall be paid by the tepant, who fhall deduct it out of his rent. Papits
and reputed papifts, being 18 years of age, who fhall not have taken the oaths of allegiance and fupremacy, flall pay double land-tax. By 10 Geo. III. c. 6. f. 113. eftates doubly taxed, coming to Proteftants, are to be discharged. At the third meeting of the commiffioners, the affeffors fhall deliver duplicates of the afferfment in writing, figned by them, to the commiffioners, with the names of proper collectors, for whom the parifh or place frall be anfwerable. One of the duplicates, figned by three or more commiffioners, Shall be delivered to the collectors, with warrant for collecting ; and the time and place of appeals fhall then be appointed. The fourth meeting is that of appeal, notice of which fhall be given in the church; and every perfon in. tending to appeal fhall give a written notice to one or more affellors, that they may attend to jultify the affeffment. The commiffioners are empowered to give relief in cafe of overcharge, and caufe the fum abated to be re-affeffed: and when the appeal is determined, it is abfolutely fnal. If any perfon refufe or neglect to pay to the collector on demand, he may levy the fum affefted by diltreis and fale of the goods of the perfon neglecting or refuling to pay; and for want of diftrefs he may be committed by warrant of two commifo fioners to the commor gaol, until payment of the money afeffed and of the charges. The collector is required to pay the money received to the receiver.gencral, or his deputy, quarterly, on or before June 24th, Sept. 29th, Dec. 25 th, and March 25th ; who fhall give a receipt gratis: the collectors are allowed $3 d$. in the pound, which they may detain out of the laft payment ; but if any collector detains the money longer than the time appointed, or fays it otherwife than directed, he fhall forfeit ret exceeding $40 \%$ nor lefs than 5\%. to be levied by diftrefs; and if he refule to pay it, two commiffioners may imprifon him, feize his eftates real and perfonal, and fell them for payment. The receiver-general is appointed by the king, or in purfuance of his directions, and has a falary allowed him by the lords of the treafury, not exceeding 2d. a pound : notice of his appointment is to be given to the commifioners, before the time of the firft quarterly payment. The receiver, within twenty days after the receipt, fhall pay the money into the exchequer, or forfeit $500 \%$ to him who thall fue. The clerks of the commificners are allowed $\mathrm{s} \frac{1}{2} d$. in the pound for writing the affefments, duplicates, \&c. to be paid by the receiver-general, according to the warrant of two commiffioners. Affefors, colletors, \&c. not doing their duty may be fined by three or more commiflioners, in any fum not exceeding 40\% $3^{8}$ Geo. III. c. 5. Blackit. Com. ${ }^{\text {vol. i. Burn's Juttice, art. Land- }}$ Tax.
LANDVELLER, in Geograpby, a town of Sweden, in Wert Gothland; 9 miles E . of Göhenborg.

LAND-WAITER, an officer of the cuftom-houfe, whofe duty is, upon landing any merchandize, to examine, tafte, weigh, meafure them, \&c. and to take an account thereof. In fome ports they alfo execute the office of a coalt-waiter. They are likewife occafionally fyled fearchers, and are to attend and join with the patent fearcher, in the execution of all cockets for the fhipping of goods to be exported to foreign parts; and in cafes where drawbacks or bounties are to be paid to the merchant on the exporiation of any goods, they, as well as the patent fearchers, are to certify the flhipping thereof on the debentures.
LANE, in the Military Art, is ufed when men are drawn up in two rarks facing one another. This is called making a lane, and is generalij done in the ftreets through which a great perfon is to pafs, as a mark of honour. Bu: foldiers are often drawn up in this manner, when an offender is to run the gantlope. See Milifary Execution.

Lane, in Geography, an ifland in the Atlantic, rear the coant of America, a little to the ealt of Scuttock Point. N. lat. $44^{\circ}$ 18'. W. long. $67^{\circ} 56^{\prime}$.

Lane, a river of Ireland, in the comnty of Kerry, which rifes in Magillicuddy's reeks, and receiving feveral freams from Mangerton, and other adjoining mountains, and the river Filefk from the weftward, flows nerth-weftward to Caflemain harbour. The expanfe of the waters of this river, confined by a great lelge of rocks, forms the two lakes, fo well known and fo juflly celebrated as the upper and lower lakes of Killarney, from the town of that name being near them. See Killatinei.

LANEL, a town of Africa, and capital of the king. dom of Galam, on the S. fide of the Senegal.

LaNERK. See Lavank.
LANES, a town of Sweden, in the province of An. germanrland; 30 miles N . of Hernofand.

LANESBOROUGH, a poit-town of America, in Berkihire county, Maflachufetts, N. of Pittsficld fix miles. It has two quarries of marl and contains $144^{\mathrm{S}}$ inhabitants.
Lanesborougit, a fmall town of Ireland, in the county of Longford, on the bank of the Shannon, over which there is a bridge into the county of Rofcommon, in which it has a fuburb, This is a borough town, which was disfranchifed thy the Union, and is $62 \frac{1}{2}$ miles W.N. W. from Dublin.
LANFRANC, in Biograpby, archbifhop of Canterbury in the eleventh century, was a native of Italy, and born at Pavia, at which place his father was keeper of the public archives; he purfued his academical ftudies at Bologna, paid particular attention to rhetoric and civil law, and on his return to his native city, he commenced advocate in the courts. He removed to France, under the reign of Heary I., taught publicly in the fchool of Avranches, and was attended by a crowd of ftudents of high rank. In a journey from that place to Rouen he was befet by robbers, who plundered him, and left him bound in a foreft near the abbey of Bec. Here he remained, in a mot deplorable ftate, till next day, when he was releafed, carried to the abbey, and foon after he took the monk's habit. While he refided in this place, his literary fame and excellent character recommended him to the efteem of William I., duke of Normandy, who made him one of the counfellors of ftate. Under the pontificate of Leo IX. he went twice to Rome; the principal object of his fecond journey was to folicit a difpenfation for the marriage of William with the daughter of the earl of Flanders, his firt coufin, which was granted upon the condition that the duke and his lady fhould build a monaltery. They accordingly gave directions for the building of that named St. Stephen, at Caen, of which Lanfranc was appointed abbot in the year ro63. Soon after William was feated on the throne of England, he fent Lanfranc to Rome, to negociate with Alexander II. about the miffion of legates to England, to crown him, and to regulate the affairs of the church. After the coronation of William, he formed the defign of depriving many of the Englifh clergy of their dignities, in order that he might beftow them on his countrymen, or on others, on whofe attachment he could depend: in conformity with this principle, Stigand, archbifhop of Canterbury, was depofed, and Lanfranc raifed to the high wffice in his ftead : he would gladly have declined the honour, but an exprefs order from pope Alexander II. obliged him to accept it. He was accordingly confecrated archbihop of Canterbury in 107:, and in the following year he went to Rome, in company with the archbifhop of York, and was received with uncommon refpect by his holinefs, who had formerly been his pupil at the abbey of Bec. Lan-
frane defended before the pope the claims of his fee 10 fupcriority over that of York. Alexander, however, unwilling to offend either of thefe prebates, or to difoblige the king of England, refured to give judgment in the matter, and declared that it ought to be determined by an Englift fynod. Two councils were held for this purpofe in 1072 , in which the queftion was debated with much warmth, in the prifence of the king, queen, and the whole court, and at length determined in favour of Canterbury. After this, Lanfranc prefided at different councils, in which feveral ecclafialtical canons were made, by fome of which a change was produced in the condition of the clergy, as well as in the creed of the church of England. By one, the fecular clergy who had wives were allowed to keep them; but thofe who had not wives were forbidden to marry, and bihops were prohibited in future to ordain any man who had a wife. By another, the doctrine of tranfubltantiation was promulgated, which before this period was but little known in our ifland: Lanfranc was, however, one of its molt zealous champions, and employed the weapons of dialectics, with great ingenuity and addrefs, in defence of it, both before and after hiselevation to the fee of Canterbury. Having prefided over the diocefe nineteen years, he died in 1089, leaving behind him a high character for wifdom, learning, munificence, and other virtues. His munificence in the way of alms-giving has been very highly extolled; he is faid to have given away upwards of five hundred pounds a year, a fum which mult have becn equal to eight or nine thoufand pounds at prefent. As an author, the archbihhop maintained a high rank for the age in which he lived, and his works are written in good Latin : thefe are "Commentaries upon the Epitlles of St. Paul:" " A Commentary on the Pfalms:" "A Treatife on Confeffon:" "A Differtation concerning the Body and Blood of Chritt in the Eucharilt :" and a collection of letters to pope Alexander II.; to Hildebrand, while archdeacon of Rome, and to feveral bifhops in England and Ncrmandy. They were collected, and publifhed in 1648 , in a folio volume. Moreri. Mofheim. Henry's Hift.

Lanfranc, a phyfician and furgeon of Milan in the thirteeifth century. He left his native country, in confequence of fome perfecutions that he had fuffered during the troubles of the times, and went to France; ;and in the year 1295, having already obtained confiderable reputation, he was invited to Paris by many members of the faculty. His dexterity as an operator, his candour, and the energy with which he communicated his knowledge to nthers in his lectures, gained him the refpect and efteem of his profefo fional brethren; and he certainly contributed to the advancement of furgery, which was at that time at a very low ebb in France. Neverthelefs he held fome opinions adverfe to the progrefs of the art ; he condemned the ufe of the trepan, and abfolutely forbade the operation of lithotomy, alleging that the extraction of a calculus rendered the patient impotent. He pointed out in Atrong terms the impropriety. and danger of tents, which were generally employed at that time ; the practice, however, continued to be reforted to long after his animadverfions were made.

He left two works in MS., which were depofited in the king's library at Paris ; the one entitled, "Chirurgia parva," the other, "Ars completa totius Chirurgix, five Practica major.' They were printed at Venice in 1490 , with the title of "Chirurgia magna et parva," in folio; and have undergone feveral fublequent editions, and have been tranIlated into the Frensh and German languages. Eloy. Dict. Hit.-Hutchinfon Biog. Med.
LANFRANCO, GIov. Maria da Terentio, in 1538. publifhed his Scintills di Muufica, or "Sparks of Mufic."
a' work which, notwithfanding its quaint tifle, is often guoted with great praife by fubfequent writers. It is now fo fcarce, that it would be difficult to find a copy of it throughout Italy.

Lanerance Giovanni, a painter of hitory, whofe principal merit was the freedom and eafe with which he managed large compofitions in their colour and execution, but to the great lors of character and expreflion. He was born at Parma in 158x, and was at firft a difciple of A gollino Caracci, but alterwards itudied under Annibale, and having obtained a great proficiency of handling, was employed by that mafter in his great work in the Farnefe palace at Rome, part of which he executed fo well, that the difference between his painting and that done by Annibale himfelf is fcarcely to be difcerned.

Endowed by nature with a lively imagination, and having, after he left the Caracci, (under whom he had learnt the art of compoition, ) paid great attention to the artificial Atyle of Corregio, particularly in the Duomo at Parma, and in the cupola there, he obtained a fondnefs for fore-fhortening, loting fight of the fimplicity of nature, and indulging his fancy in ideal furms and groups, which, while they exhibit his fkill, deprive him of a reputation for judgment or true tatte. He was, as M. Fufeli has obferved, "a machinitt in art of the firlt order, and taught his fucceffors the means of filling the eye at a great diflance, by partly painting and .partly leaving it to the air to paint."

His colour was powerful and rich, but not pure. He moit frequently employed very dark fladows, which give his pictures a heavy and fombrous appearance; and not being well verfed in chaiaro-fcuro, the lights in them are not unfrequently ill comnected, or rather lack connection, and are too much in detached fpots. With thofe who prefer fpirit and dafl to more ftudied perfections, Lanfranco will, notwithttanding his deficiencies, be always a favourite.

He was engaged by Urban VIII. to paint the miracle of St. Peter walking on the water for the grand cathedral, dedicated to that faint in Rome, and he afforded his patron fo much pleafure by his labour, that his holineis conferped the honour of knighthood upon him.

His pencil being exceedingly rapid, and his life prolonged to the age of 60 , his works are by no means fcarce, but are to be met with in molt collections. He died in $\mathbf{1 6 4 7}$.

LANG, Join Michael, a German Proteftant divine, was born at Ezelwangen, in the duchy of Sulzbach, in the year 1654 . Having received a gond claffical education, he was fent to the univerlity of Altdorf, in 1682, and there applied himfelf with great ardour to thofe itudies which were to lit him for his future profeffion. He excelled particularly as an oriental fcholar, and was admitted to the degree of M.A. in ${ }_{168}$, and then went to the univerfity of Jena, where he delivered public lectures on ethics and natural theology. He officiated feveral years as paftor to a country church in the palatinate, but becoming diffatisfied with a country life he removed to Altdorf, where he was created doctor, and admitted into the academical fenate in 1697. Here he was elected to the profefforfhip of divinity, and appointed pattor of one of the churches. After fome years he was involved in theological difputes, which ended in his quitting Altdorf, and removing to Prentzlow, in the year Iy 10 , where he obtained an appointment, in which he yemained till 1737, when he died, at the age of fixty-feven. He was author of the following among, other works then held in high eftimation: "Differtationes Botanico-Theologica;" "Plilologia Barbaro-Greca;" "De Fabulis Mohammedicis." Moreri.

Lang, in Geograply, a narrow illand of Denmark, fome-
what more than two miles in length, fituated in the Baltic, near the S. coaft of Laaland. N. Lat. $54^{\circ} 43^{\prime}$. E. long. $11^{\circ} 20^{\prime}$.

LANGANICO, or SUNRI, anciently Olympia, a town of the Morea, on a fmall river called Carbon, the ancient Alpheus, once a city of great note, near which were celclebrated the "Olympian grames," which fee. See alfo Olvipia. It is now an inconliderable place; 60 miles S.W. of Corinth.

LANGAROOD, a town of Perfia, in the province of Ghilan, near the S. coaft of the Cafpian fea, which gives name to a road for thips. The cove has 10 feet water, but the entrance is narrow. The filk manufacture is here in high eftimation; 20 miles S.E. of Refhd. N. lat. 27'。 E. long. $5^{\circ} 15^{\prime \prime}$.

LANGASCHANTZ, a town of Sweden, in the province of Harjedalen ; 110 miles S.W. of iSundfwall.

LANGBAINE, Gerard; in Biography, was born at Barton-kirk, in Weftmoreland, about the year 1608 . In 1626, he was admitt a fervitor of Queen's college, Oxford, of which he became a fcholar and afterwards a fellow. He took his degree of M.A. in 1633, and of D.D. in 1646. He had, however, fome years previoully to his taking the laft degree, made himfelf known as a man of erudition, by an edition of Longinus, Greek and Latin, with notes, printed at Oxford in 1636 . This work was followed by others of an hiltorical and critical kind, difplaying much found learning, and an ardent attachment to the exifting order of things in church and ftate. He was in habits of correfpondence with the learned Ufher and Selden, and is referred to by bifhop Nicholfon as a perfon admirably akilled in the antiquities and laws of England. In 1644; the univerfity, of which he was a member, appointed him keeper of its archives, and in the following year he was made provolt of his college. He readily fubmitted to the changes which took place at this period, and was accordingly allowed to remain in peace, employing his time and talents in the promotion of learning, and the maintenance of academical difcipline. He died in the enjoyment of both his offices, in the year 1658 . He had a fon of the fame name, who is known by his "Appendix to a Catalogue of Oxford Graduates;" and "A New Catalogue of Euglith Plays.".
LANGDON, in Geography, a towfhip of America, in Chefhire county, New Hampfhire, incorporated in 1787, and containing 484 inhabitants.

LANGE, or Langius, Join, in Biography, a phyfician of reputation, was born at Loewenburg, in Silefia, in the year 1485. He purfued his ftudies with fingular zeal at Leipfic, Bologna, and Pifa, in the latter of which univerfities he was honoured with the degree of M.D. He then fettled in the practice of his profefion at Heidelberg, where he foon acquired the efteem of the public, and was nominated firt phyfician to four fucceffive electors palatine; one of whom, Frederic II., he accompanied in his travels through the greater part of Europe. He attained the age of eighty, notwithftanding his exceffive ufe of cheefe, which made a part of all his meals, afferting that phyficians were miltaken in decrying, as indigettible, this his favourite nutriment. He died at Heidelberg in June, 1565 .

The molt efteemed of his works is entitled "Medicinalium Epifolarum Mifcellanea," firft publifhed at Bafle, in 1554 , 4to. This edition contains but eighty-three epittles; but thele were greatly multiplied in the fubfequent editions. The work was full of the various learning of the times; and he in a great meafure anticipated Sydenham in recommending the cool reginen in inflammatory difeafes. He likewife publifhed the following works: "De Syrmaimo et ratione

Lanoholm, a market-town and burgh of barony under the duke of Buccleugh, is fituated in a parifh of the fame name, in the diffrict of Efledale and county of Dumfries, Scotland. The population of this town is ftated, in the parliamentary reports of 1 SoI, at 2039 perfons, but it is prefumed, this number includes the whole parifh. A market is held here every week, and four fairs annually ; that helơ on the 26 th of July is confidered as the greatelt in Scotland for lambs. At a flort diftance from the town is the village of New Langholm, which has been erected by the duke of Buccleugh for the eftablifhment of an extenfive cotton manufactory. The country along the banks of the Enk is generally flat, well fheltered with woods, and yield luxuriant crops, particularly of oats and barley. The other parts of the parifh confilt chiefly of fmall hills, covered with werdure, and affords excellent pafture for theep. The duke of Buc. cleugh has built in this neighbourhood a very handfome manlion called Langholm-lodge, which ftands in a delightful valley.

LANGHORNE, Joun, in Biography, an excellent Englifh poet, was born at Kirkby-Stephen, in Wefmoreland, in ${ }^{7} 735^{\circ}$. By the death of his father, the education of John and three other children devolved upon his mother, who fulfilled the talk with great affiduity and affection. He received his fchool-learning at Appleby under Mr. Yates, who joined elegance of tafte to the acquirements of a claffical fcholar. Langhorne continued under his tuition till the age of eighteen; when the narrownefs of his circumftances obliged him to engage himfelf as dameftic tutor in a family, near Ripon. He nlade himfelf known as a poet, by a poem entitled "Audley-park," defcriptive, as its title imports, of the beauties of that place. He foon after became an affittant at the free-fchool of Wakefield, and taking orders, acquired popularity as a preacher. In 1759, he undertool the tuition of the fons of Robert Cracroft, efq, of Hackthorn, near Lincoln, and while in this fituation he made a collection of fuch mifcellaneous poems as he had written, and publifhed them in a volume for the benefit of a friend in diftrefs. In the year ${ }^{2} 760$, he entered himfelf at Clare hall, Cambridge, for the purpofe of taking a degree, and dated from that place a poem on the king's acceffion, printed in the Univerfity colfection of verfes on that occafion. In 1761, he officiated as curate to the clergyman of Dagenham, in Eflex, and at the fame period he publifhed feveral poens, which made him generally known among the votaries to the Mufes, and in 1762 , he appeared as a profe writer by his. "Letters on relig:ous Retirement, Mcłanckoly, and Enthu*

## LAN

fiafm," and by his caftern tale of "Solyman and Almena." He was, at this time, likewife a writer in the Monthly Review. His next work, publihhed in $1_{7} \sigma_{3}$, entitled "Letters fuppofed to have paffed between Theodofins and Conltantia," founded on a ttory in the Spectator, hecane popular, and obtained for the author much applaufe. Mr. Langhorne, in the following year, rewoved to the metropolis, where he was appointed curate and lecturer of St. John's, Clerkenwell, and in the fame year he publifhed two volumes of fermons, which he entitled "'Iracts of religious Philofophy:" Dr. Hurd now appointed him affitant preacher at Lincoln's-Imn, and Mr. Langhorne fuon after gave the public his " Letters on the Eloquence of the Pulpit:" and "Letters to and from felect Friends, or Effufions of Friendihip and Fancy." He is faid to have publifhed a dcfence of lord Bate; but a paltoral poem, entitled "Genius and Valour," he avowed, the object of which was to vindicate the natives of Scothand from the rancorous abufe thrown upon them by Churchill. This obtained for the author a complimentary letter from the univerfity of Edinburgh, with a diploma of doctor of divinity. He had, in the year 1760 or 1751 , quirted the family of Hackthorn, on account of beins refufed the hand of one of Mis. Cracroft's daughters ; in 1767, when he bad obtained a ftation of much greater refpectability, and when he was looked up to as an author and c'ergyman, he renewed his fuite, and was fuccefsful. The living of Blagdou, in Somerfethire, was purchafed, which afforded the newly-married couple a defirable refidence, but this happy union was fatally duriolved by the death of Mrs. Langhome in child-bed, in the enfuing year. Life now feened to have lott its charms on the furvivor, he quitted a place which ferved only to remind him of his heavy affliction, and retired to the houfe of his brother William, a clergyman at Folkettone, in Kent. In this retreat, inftead of giving himfelf up to melancholy, he very wifely sccupied his mind with a literary talk of fome labonr and extent, and the two brothers jointly produced a new verfion of Plutarch's Lives, with notes critical and explanatory, and a life of the author, which was publifhed in 177 I , and met with a favourable reception. He had publihed, previounly to this, "Letters fuppofed to have pafled between St. Evremond and Waller," two vols.; and "Frederic and Pharamond, or the Confolations of Human Life," a philwfophical difcourfe. His "Fables of Flora"" were publifhed in 1771, as was another poem, entitled "The Origin of the Veil." In 1772 , he paid a vifit to his native country, which produced a fecond matrimonial connection, and having induiged himfelf and his lady with a continental tour, he fat down again at his living of Blagdon. To the duties of the church he added thofe of a magitrate, and at the defire of his friend Dr. Burn, he gave the world accurate ideas of this important office in a poem, entitled "The Country Jultice." The firl part appeared in IFIt, and was greatly admired for the manly itrain of its fentiments, and the beauty of its defcriptions. The two other parts were of inferior merit, and publifhed at different periods. In 1776, he loft his fecond wife in child-bed, which mult, to a man of feeling, have been an unufually fevere calamity, and from the efiects of which he probably never wholly recovered. His affiction was in a degree alleviated by the connexions that he had acquired in the great. world, one of the fruits of which was, the prefentation to a prebend in the cathedral of Wells, in 1777 , by the bifhop of that fee. His health was, however, declining, yet he continned to amufe himfelf and the public with writings of different kinds, the laft of thefe was a romiantic tale, entitled "Owen of Carron," He died at Blagdon, in April 1779, in the
forty-fifth year of his age. He was amiable in his manners, but is faid to have been rather too much addicted to convivial indulgences: if this lazbit was incurred by domellic misfortuncs, though not to be juttified, it mas, in a meafure, be palliated, and the fubject of it is to be truly piticed. "His poetry," fays an able critic, " is generally harmonious, abounding in plealing imayery, but over-loaded with ornament, and not frec from obf, urity and affectation. His profe writings are rather light and flowery than folid and natural. His fermons have been cenfured for the loofe foft texture of their tyle, and the falle pathos of their fentiment. In religion he was inclined to enthufiafm, but the morality of all his works is pure and rational "

LANGIN, in Gcograpby, a town of France, in the department of Mont Blanc; 6 miles N. of Bonne.

LANGINES, a fmall ifland of Denmark, in the North fea, near the welt coalt of South Jutland; 2 miles N.W. from the inand of Norditrand.

LANGPORT, a market-town and parilh in the hundred of Pitney, and county of Somerfet, England, is fituated upon the banks of the river Parrot, near its confluence with the Irvell. It was formerly a royal borough; and the inhabitants, by immemorial cultom, still claim feveral boroughprivileges. This town confilts chiefly of two ltreets, and is divided into two parts, called Langport-Eaftover and Lang-port-Weltover. The government is vefted in a portreve, a recorder, two capital bailiffs, and nine common-council men. The river Parrot being navigable by lighters, a confiderable trade is carried on, between this place and Bridge.water, in timber, flone, coal, iron, and falt. The church, dedicated to All-Saints, is adorned with a very fine tower, which has feveral niches on the weft fide, formerly ornamented with handfome ftatues. Adjoining to the town are two large commons, called Common-Moor and Ragg-Common; ; the former confifing of 150 , and the latter of 70 acres of good meadow ground, upon which all the inhabitants not only affume the right of feeding cattle, but even of building
as they deem moft convenient for themfelves. The houfes in Langport, according to the parlamentary returns of 1800, amounted to $126^{\circ}$ in number, and were ocengied lis. $75+$ inhabitants. Here are a weekly market and there annual fairs. Collufon's Hitory, \&ec. of Sonserfithite, 3 vols. 4 to.

LINGRAVA, a town of Portugal, in the province of 13eira, having a medicinal fpring; 12 milcs $\mathbb{N}$. IV. of Pinhel.
LANGREL-SIOT, is a fort of fhot fometimes ufed at fea, made of two bars of iron, with a juin, or fiackle, in the middle; by which means it can be ihortench, and io put the better into the gun; and at each end there is a hale bullet, cither of lead or iron.

This fhot, when difcharged, flies out expanded, and fo does more execuion among the enemies rigging, \&ic. It is never ufed in royal fhips, but very often by privateers and merchantmen.

LANGRES, in Geozraphy, a town of France, and chief place of a ditrict, in the department of the Upper Marne. In the time of Julius Cxfar, this was the captal of the Lingones. On the irruption of Attila, it was taken and burnt; and after having been rebuilt, the Vandals dettroyed it. It was, at an early period, erečed into a bifhopric; and from the reign of Philip) Auguftus to the revolution, the prelates were peers of France. It afterwards belonged to Burgundy, and fell with the reil of that kiugdom to France. N. lat. $47^{\circ} 52^{\prime}$. E. long. $4^{\circ} 25^{\prime}$.

LANGRISH, BRowye, in Biograply, a phyfician of the latt century, who diftinguifhed himfelf as an adrocate for the mechanical theories of phyfiology and medicine, and by the numerous experiments with which he fupported thofe doctrincs. A mose accurate inveltigation of the nature of the animal economy has exploded them; but Dr. Langrifh had the merit of afcerraining feveral interelling fact in refpect to the nature of the circulating powers. He died in London, on the 29th of November 1759, and left the folIowing works: "A new Efliay on Mufcular Motion, founded on Experiments, Scc." ${ }_{1733}$, Svo.; " Modern Theory of Phylic," 1738, Svo.; "Phylical Experiments upon Brites,", 1745, Svo.; "Croonian Leciures on Mufcular Motion," ${ }^{17+7}$. Eloy. Dic. Hitt.

LANGSELE, in Geography a town of Sweden, in Angermannland, on a river of the fame name; 45 miles N.N.W. of Hernofand. N. lat. 63 14'. E. long. $16^{3} 49$ '.
LANGSKAR, a fmaillifland on the ealt fide of the gulf of Bothnia. N. lat. $63^{\circ}$. E. long. $21^{\circ} 9^{\prime}$.

LANGTON, STEPien, in Biography, archbifhop of Carterbury in the 13 th century, was a native of England, but was educated at the univerlity of Paris, where he afterwards taught divinity, and explained the Scriptures with much reputation. His character flood fo high, that he was chofen chancellor of that univerfity, canon of Paris, and dean of Rheims.. He was afterwards fent for to Rome by pope Innocent III., where he was created a cardinal. In the year 1207, the monks of Canterbury having, upon a, vacancy taking place in that fee, made a double return, both parties appealed to the pope, and fent agents to Rome to fupport their refpective claims. His holinefs not only determined againft both the contending candidates, but ordered the monks of Canterbury, then at Rome, immediately to proceed to the election of an archbifhop, and, at the fame time, commanded them to choofe cardinal Stephen Langton. After various excufes, which the pope knew how to get over, by abfolving the agents in the bufinefs from all lorts of promifes, oaths, \&c. and by threatening them with the higheft penalties of the church, they complied, and

Langton was confecrated by the pope at Vitcrbo. As foon as the news arrived in England, king Johm was incenfed in the higheft degree both againd the pope and monks of Canteringy. The latt, being within the reach of his power, csperienced the cffects of his maignation. He fent two wficers wath a company of amed men to Canmbury, touk poti.ficu of the mematery, banithed the monks out of the longdom, and fizad ali their property. He wrote a finited leter to the pope, whom he accufded of iagstlice and preflam,tion, in sathg a Aratger to the highent dignity in his kntrom, withont cren his knowted, ; and he added, that if this holinefs did not irflantly repair the injury, he would break off all commnnication with Kome, Then, unfortunately for himfelf and his tingedom, was unlit for fo arduous a contelt ; and he, in the end, fubmitted to the mott difgraceful terms. (Sce Jons, and Innocert Ill.) In 1213, cardinal Langton arrived in Eugland, and took porfeflion of the fee; and though he owed all his advancement to the pope, yet the mument he became an Englifh baron, he was in!pired with a zealous altachment to the liberties and independence of his country. In the very year in which he came over, he and fix other bifhops joined the party of the barons, who affociated to refift the tyranny of the king; and at length they were fucceffful in procuring the great charter. Langton was equally zealous in oppofing the claims of the papal agents, particularly of the pope's lecrate, who aflumed the right of regulating all ecclefiallical affairs in the moft arbitrary manner. In the grand comelt which took place between king John and the barons about the charter, the archbifhop's patriotic conduct gave fuch offence to the pope, that, in 1215 , he laid him under a fentence of fufpenfion. Neverthelefs, in the following year, we find Langton affilting at a general council held at Rome; and during his abfence from England at this time, king John died. In 1222, he held a fynod at Oxtord, in which a remarkable canon was made, prohibiting clergymen from kecping concubines publicly in their houjes, or from going to them in other places fo openly as to occafion feandal. In the following year, he, at the head of the principal nobility, demanded an audience of king Henry III., and demanded of him a confirmation of the charter of their liberties. Their determined manner convinced the king that their demand was not to be refufed, and he initantly gave orders for the affembling of parliament. 'The archbifhop itewed, in feveral inftances, that he was friendly to the legal prerogatives of the crown; and by a firm and impreffive conduct, in a cafe of great difficulty, he prevented the calanity of a civil war. He died in the year 1328 , leaving behind him many works, which prove that he was deferving the character of being as learned and polite an author as any of the age in which he flourifled. He wrote "Commentaries" upon the greateft part of the books of the Old and New Teftament. He was deeply fkilled in Ariftotelian dialectics, and the application of them to the doctrines of Scripture. The firt divifion of the books of the Bible into chapters is afcribed to this prelate. The hiltory of the tranflation of the body of Thomas a Becket was printed at the end of that archbifhop's letters, at Brufels, 1682 . His letter to king John, with the Ling's anfwer, may be feen in d'Archery's Spicilegium. Motheim's Eccl. Hift. Henry's Hitt, of Eng.

Langton, in Geography, a town of Scotland, in the county of Berwick; 2 miles S.IV. of Greenlaw.
LANGUAGE, a fet of words which any people have agreed upon, whercby to communicate their thoughts to each other. Or, language, in gencral, fignilies the expreffion of our ideas by certain articulate founds, which are ufed as the figns of thefe ideas. See Arriculation.

Whatever

## LANGUAGE.

सhatever be our opinion relpecting the progreflive amelioration of brutes, if the capacity of language were communicated to them, there can be no hefitation in admitting the progrelfive detcrioration of the human 〔pecies, if they were deprived of it. If man had not poffefed this, er fome other extenfive power of communication, that alfonifhing fyllem, which we call the human mind, would have remained in inactivity, its facultics torpid, its energies unexcited, and that capacity of progreflive improvement, which furms fo important a part of the mental conflitution of man, would have been given in yain, would have been unknown, except to him who gave it. But in cyery part of the creation we difcerna unity of defign, which equally proves the wifdom and benevolence of the great Tirft Caufe. The means of brinzing his powers into activity are bettowed upon man, as well as the powers themfelves; and it is a polition which will bear a vigorous examination, that the accuracy of human thought and the extent of human intellect gencrally procced in equal Reps with the accuracy and extent of languace. "This ineitimable prerogative," fays Smellie, " is perhaps one of the greatell fecondary bonds of fociety, and the greate? improvement to the human intellect. Without artificial language, though nature has beftowed upon every animal a mode of exprelling its wants and defires, its pleafires and its pains,-what a humiliating figure would the human fpecies exhibit, even upon the fuppolition that they did aflociate. But when language and fociety are conjoined, the human intellect, in the progrefs of time, arrives at a high degree of perfection. Society gives rife to virtue, honour, government, fubordination, arts, fciences, order, happinefs. All the individuals of a community conduct themfelves upion a regulated fyltem. Under the influence of eftablifhed laws, kings and magiftrates, by the exercife of legal authority, enconrage virtue, reprefs vice, and diffufe through the extent of their jurifdiction the happy effects of their adminiftrations. In fociety, as in a fertile climate, human talents germinate and are expanded; the mechanical and liberal arts flourifh; poets, orators, hiltorians, philofophers, lawyers, phyficians, and theologians, are produced. Thefe truths are pleafant, and it were to be wifhed that no evils accompanied them : but through the whole extent of nature it appears to our limited views, that good and evil, pleafure and pain, are neceffary and perpetual concomitants." It will not appear too much to affirm, when we confider the influence of language on the intellect, that if that genius, which has dazzled the world with its fplendour and extent, had been originally deftitute of the power of communication, he would not have rifen above the level of the lealt cultivated of his fellow-mortals. Conceive him (to ufe the ideas of Condillac) bereft of the ufe of vifible figns, how much knowledge would be concealed from him, attainable even by an ordinary capacity! Take away from him the ufe of Epecch,-the lot of the dumb teaches you in what narrow bounds you enclofe him. Finally, deprive him of the ufe of all kirds of figns; let him not know how to make with propricty any gellure;-you would have in him a mere ideot.

We are far, however, from believing, with lord Monboddo, that the human race have actually rifen from the very lowelt fage, -that of mere brutality. His lordhip's -pinion is too lingular to be omitted here. He fuppofes, on the authority of feveral travellers whom he quotes, (and of whofe paffion for the marvellous his quotations leave no room to doubt,) that there are nations without laws, or any of the arts of civilized life, without even language ; and that. - me of them, to complete their relationfhip to the monkey tribe, Had actually tails. This, with other opinions, which
difplay rather the credulity of the man of fyftem than the fober and cool judgment of the philofopher, has been expofed to the lively ridicule of Horne Trooke: and though we wifh never to countenance the idea, that ridicule is a proper telt of truth,-we are willing to admit, that there are forme opinions which it is below the dignity of reafon to refute.

We fee in language a complicated whole, which we have been accultomed to confider as it is, without attempting to afcertain what it has been. We fee all regularity and beauty; and we do not afk ourfelves the queftion, has language always been thus regular and beautiful? When we look back into the earlier periods of human nature, we find that that which now wears the appearance of art was early the inveution of neceffity, gradually perfected and brought to a fyltematic form, by caufes which have operated generally, but have received modification from the influence of local or temporary circumftances. A complete fyitem of the origin and progrefs of language would be a hiltory of the progrefs of human intellect. This we fhall not aitcmpt : perhaps our refources of knowledge are not fufficient to render the attempt in any degree fuccefsful; but a fhort outline of the early hiftory of language, particularly of written language, will be neither uninterefting nor ufelefs.

Our direct evidence is not extenfive, and we are too much obliged to have recourfe to hypothefis, in tracing the progrefs of improrement in any department of fcience. We are unable always to afcertain (as Mr. Stewart oblerves) how men have actually conducted themfelves on particular oceafions; and we are then ted to inquire in what manner they are likely to have proceeded from the principles of their nature, and the circumftances of their external fituation. In fuch inquiries, the detached facts which the remains of antiquity, or the narration of travellers, afford us, or the actual appearances of language at prefent, ferve as landmarks for our fecculations. "In examining the hiftory of the human mind, as well as in examining the phenomena of the natural world, we cannot always trace the progrefs by which an event bas been produced; and it is frequently of importance to difcover how it may bave becn produced, by caufes known to exilt. The fleps in the formation of language cannot probably be determined with certainty; yet if we can thew the known principles of human nature, how the various parts may naturally have arifen, the mind is not only to a certain degree fatisfied, but a check is given to that indolent philofophy which refers to a miracle whatever appearances, either in the natural or moral world, it is unable to explain."

Diodorus Siculus (lib. i.) and Vitruvius (A rchit. lib. ii, c. 21.) fuppofed that the firlt men lived for fome time in the woods and caves, like the beafts, uttering only confufed and inarticulate founds; till affociating for mutual afiitance, they came by degrees to ufe articulate founds, mutually agreed upon for the arbitrary figns or marks of thofe ideas in the mind of the feaker, which he wanted to communicate to the hearer. By what degrees they proceeded from inaticulate to articulate founds, thefe writers do not attempt to point out; and unlefs we admit that thefe articulate founds were connected with certain feelings, in the fame manner as what are called the natural ligns, or that they were cafly produced, which will not be allowed by thofe who have attended to the ftructure of the organs of fpeech, the account we have received from a better informed hittorian will not lofe ground.

Plato, in Cratyl. p. 383. p. 425. ed. Scrrani, feems to maintain, that the firll language was of diviee formation; for he fuppofes that the names of things had-originaily fome matural comection or congruity with the things themfelves,

## LANGUAGE.

and that the firt names muit have been juftly impoled, be taufe they were impofed by the gods.

Mofes, however, on whofe authority we may more confidently depend, gives us to underitand that the rudiments of language were begun by man, under the fuperintendence of his Maker. The Supreme Being caufed all the mimal credtion to pafs before their lord, to receive from limn their names. If we conlider that the numerous varieties which we obferve in the fubordinate clafles of the brute creation probably originated in a comparatively finall number of individuals, as the almont equally numerous varictes of men fprang from our great progenitor, this alnott endlefs tak, as it at firt fight appears, is very much reduced in its magnitude. Here is the lirft flep. Miracles are never ufed exsept when they are neceffary, that is, when the fame effect cannot be produced by the common laws of nature: and hence we feel inclined to believe, that here the divine communication ceafed; and that what man had been inftrucked to begin, he was left to complete for himfelf. Indeed, if we fuppofe that more than the application of names to natural objects had been divinely taught, yet we mut admit that thefe communications would be bounded by the wants of the being to whom they were made. It is not probab!c that the divine initructor would lead man to fix upon words, to denote things then unknown, or to denote ideas which were not then acquired. "It is not neceffary to fuppole," fays Liett, "that the Creator infpired the firlt parats of mankind with any particular original or primitive language; but that he made them fully fentible of the power with which they were endued of forming articulate founds, gave them an impulfe to exert it, and left the arbitrary impofition of words to their own choice." This"feems to be intimated Gen. ii. 19. See Shuckford's Connection, vol. i. book ii. p. 111 .

Let us then fuppofe the ufe of articulation given, and its application in fome inflances pointed out, in the invention of the names of animals ; which, we may obferve, is, in fact, the firlt ftep that would probably have been taken, prefuppofing the power of articulation, if ne divine direction had been given. Words would originally be fimply the figns of things, and farther of individuals. Every new object, for which neceflity required a name, would receive a different name from others: but if there were a flriking fimilarity between this new object and one which had already received a name, the old one would be transferred. One of the principles of affociation is fimilarity; and this new impreffion would recal the idea of the former object which it refembled, and confequently the word with which it vas connected: and thus what originally was a name only for an individual, would gradually become the name of a multitude. 'Thus Lee. Boo, who had been taught by his fellowvoyagers to call a great Newfoundland dog by the name of Sailor, ufed to call every dog he faw Sailor. There is little or so difficulty attending the application and claffification of fenfible objects: it feems to be an operation fimple and eafy, if we prefuppofe (as we have done) that fome articulate founds were known.

When feveral objects had received the fame natne, it wou'd be fometimes neceliary to diftinguifh them. Our procedure in fuch cafes is to connect with the name of the object, the name of a diftinguihing quality, or to fpecify fome relation it has with other objects; but this fuppofes that to be already done, which we mult confider as yet to be done. Now we muft bear is mind that fimilarity, (fenfible external femilarity,) and local connection, are thofe principles of affociation, which are known to be moll active at prefent in the minds of the illiterate and unculkirated; they muft alfo have
been moftactive in the minde of all men in the rude flates of fociety. A peculiar colour, (which would furning one pris ciple of diilinction,) would naturally be denoted by the name of an object remarkable fur that colour, and this that e, joised with the general term, would conli.e it to the parthcular object it was meant to \{pecify. This is a procedure fo fimph, that one may expect to find fone traces of it Rill remaining, and it is what we actually do in comron language. An orange villon will precifely explain our nestanis. We wilh to ditinguifh a ribbon from cthers by its culour ; in this inllance we are able, agreeably to the cutom of our language, to employ the name of an object remarkable for that colour, to denote the colour itfelf; and it is to be co. furved, that fenfible qualties were thofe, and thofe orify, which would be firlt noticed, and moll requilite to be noticed.
Local fituation, or vicinity to fome object, would furninh another ground for diftinction ; the founthin ncar the cave, fur inllance. Now in order to exprefs this, the prozedure woud be finple and intelligible, if immediately preceding or following the term employed to denote fountain, the term denoting cave were added. As we thonid at prefent ufe che exprcfiion, the barn-yard, for the yard near to, or adjoining the baru; the bermibase-walk, for the walk leading to the hermitage. 'i'his juxtapofition of the ligns, to fignify' the congruity or funilarity of the objects they denote, is the molt natural, and in a language little extended, fufccient'y adequare for all the purpofes of common lifc ; but it is obvious that it would allow very great latitude of interpretation; and hence, as language became more copious, contrivances were ufed to denote the nature of the cornection which fubfifted between the objects denoted by the figns employed. The chief of the fe is the employment of prepolitions, at firt feparately, and afterwards, in fome cafes, coalefcing with, and forming a part of the word; and the origin of thefe furnithes additional proof that the procedures we have frozen of were in reality thofe of the early framers of langt: je (fee Grammar); but thefe were centrivances of a luje: date than thofe of which we here fpeak.

By degrees it was found converient, at leaft by fome tribes, to defignate thofe rames which were employed, in c -nneftion with cther rames with a tiew to point fome diality or reitr:cting circumfance of the thing fignified, ty fome note that they were fo employed. The Tpeaker migtt cettainly bave left the inference to fimple juxtapofition; but this appears to have been done in few languages, after improvements brgan to take place; and to effect fuch defignation words (in fome cafes denoting add, join, like, \&c.) were fubjoined to the particularizing names, and they then were ufed only as adjectives, (or, to ufe a more general. term, as admouns.) The Chinefe, however, Aill nake no dintinction in form, between words when employed as nouns and as adrouns; the fame word when placed firlt being an adjective, and when placed laft a fubttantive; thus bao gin is a good man; and gin te hao is the goodnefs of a mau. We ufe the fame word in many inttances both as a noun and an adnoun; but a large propertion of our fimple adje ctives are formed as above, and are never employed as fubflantives; the Chinefe, on the other hand, when a fubflantive is sot to be ufed as an adjettive, add the defignating fyllable $c$ a to it.

As far as the proceffes we have defcribed regard fenfible objects and their connections, all feems very plain; and we find fo many tracts of fimiar modes of proceeding in languages at prefent in ufe, that we can fcarcely doubt that at leafli: Itromgly refembles the aEtual procedure in the early flages of language. Bind we may renark, as we go on, thats.

## LANGUAGE.

that every procedure, in order to be probable, fhould be fimple, and fuch as might calily be adopted. It would not be long before art was applied to perfect and correct that which neceffity began; but even this mult have had the features of fimplicity, mult have been direeted by circumifances which would not lee under the controul of man. It is not probable that any variations would be formed by regular analogres, except fuch as really exilted in the fituation or comection of the object; nor that they would form any combinations of words, excepting when the objects they figsilfied had fome reat or appretiended connection.

In order to exprefs objects which were not fenfible, fo as to convey to others notions or feelings which exitted in the mind of the fpeaker, words would be ufed which had previoufly been appropriated to objects to which thofe objects of the mind's cye appeared to have fome refemblance, or other connetrion. This refemblance or conncetion was frequently forced, and to thofe whofe fituation was different would not be at all ftriking; in other cafes it was correct, and the jultnefs of application is proved by a fimilar procedure of uncomected inventors. We may derive great light here from the hieroglyphics; for there cannot be a doubt that where the vifible fign which originally reprefented only a fenfible object, was applied to denote fome quality difcovered by reafoning and obfervation, or fome internal feeling, the audible fizn or word was applied in a fimilar manner. The writing would, of courfe, as Warburton very juflly obferves, be that very picture which was before painted by the fancy, and thence delineated in words. Some inttances will be adduced, when we come to confider the hieroglyphical mode of communication; at prefent we will add one or two as illuftrations of the principles we have laid down. The term ufed to denote the mouth, denoted alfo /peces ; this, connected with the dor, fignified the dog's voice. They proceeded further, and ufed this compound, at leaft the hieroglyphic denoting it, to fignify lamentation and the forrozw which produced it. At firlt view this procedure appears extraordinary; to enter fully into the refemblance, we muft remember that in uncultivated minds grief is loud and clamorous; and it is to a fimilar refemblance, that the fame cerm has; in our own language, been applied to the cry of a dog in pain, and to the expreffion of lamentation among the lower claffes of the Irih. It was a procedure much more naturai when the term dog joined with the word denoting a field was made to fignify bioting. Our readers will be able, even in the prefent refined period of our language, to trace numerous intances, in which the names of intellectual things have been obvioufly transferred from fenfible things; and to thofe who have attended much to the fubject, it will not appear too much to affirm, that in every inftance where a word is not the name of a fenfible object, it has acquired its prefent force by a gradual tranfition from its primary application to fenfible objeets. Mungo Park has furnifhed us with fome grod fpecimens of the commencement of this tranfition in the Mandingo language : thus telin-
 terally the beart c mes out, fignifies angry; a beagee, literally is bere, fignifies alive; Sc. In every known language the trantition has been begun ; but it is only among the more refined that it has been complete. In our own, we find abundance of inflances in almott every intermediate ftage of the progrefs, as weil as in its termination.

Language would pröceed but awkwardly without thofe wheels which have been gradually made for it ; but all which $c$ an be thought neceffary for communication are the noun and the verb; and even of the latter, as a ditinct clafs of words, the necelfity may juitly be doubted. We regard it as nest to
certain that the whole of what is now (by affociation) ime plisd or denoted by the verb, beyond what is denoted by the acknowledged noun, was originally mere inference from the juxtapofition of the verb-nom with another noun. We cannot indecdacyance one flep in oral communication, without leading our hearers to the inference that certain ideas are sonnected in our minds, or that we believe certain objects, properties, or events, to be connected. The comnecting link, however, weed not always be itated; in the firlt flage of language it would not exit, becaure the firft words could only be names without the idea of affirmation being appropriated to any of them; and in the language of childhood it does not exill. Words are placed together ; and it is cafily underflood that the correfponding ideas arc connccted in the mind. "Mamma, milk-good," would furely be underftood by any one; and depending upori the cafe of inference, the ancient writers (long after words had been appropriated to exprefs affirmation) continually left their readers to make it for themfelves. But how flowly, and how ambiguoufly, communication would, in many: cafes, proceed, without fome appropriated link of conuection, any one may be convinced by attempting to exprefs a train of thoughts without thofe words which have the idea of affrmation aflociated with them, in the forms fo expreffing affirmation.
The chief diffeculty oppofing the admiffion of the opinion that verbs were originally nouns, arifes from the peculiarities exitting in the external character of verbs, the notion of time and of modes of exiftence and action having become affociated with them, and the fubject in numerous intlances, and occafionally the object, having coalefced with the verb; but thefe are all accidental circumftances; and the mere Enslim fuholar has here advantages which the learned do not poffefs, becaufe he continually meets with verbs in his own language the fame in every external character as the noun, and frequently ufed as nouns. The point, however, to be carefully kept in view, and what muft gradually remove: every dificulty, is, that the only effential difference between the noun and the verb is, that the latter (of courfe by affociation) expreffes affrmation; all the fuperadded circumftances may be convenient for communication, but are in no way neceffary; and in our own language, thofe fuperadded circumftances are in moft cales expreffed by adjuncts and not by the verb itfelf. If, in any form, a word employed to exprefs affirmation, does not exprefs it, it ceafes to be a verb. For grammatical convenience we may arrange fuch forms with thofe which exprefs affirmation, but it is merely

 vent much mifake as to the nature of the verb, if the infinitive and imperative moods were always arranged together under the clafs of the noun-fate of the verbs. The infinitive is the verb-noun with a termination (originally, without a doubt, exprefivc by itfelf, as all terminations milt have been,) denoting that it is to be employed as a verb; thus in the Anglo-Saxon verb cean, če is the verb-noun, and an is the verbalizing adjection; fo тvสт, ama, \&c. are the verb-nouns,
 zustev, \&c.) and amare, have the refpective verbalizing ad. jections joined to them. In fhort, in our opinion, the imperative is the verb-noun it[elf; and the notion of command, entreaty, \&ic. conveyed by it, is merely the inference of cuftom; whether we fay to a fervant bread, or, bring fome bread, we merely fecify, in the latter cafe, the action and the object of the action, and, in the former, the object alonel, the relt is inforred from tone, manner, \&c. The fact indifputably is, that in every department of language, fully as much is done by inference as by actual expreflion; and even

## $\mathrm{L} \wedge \mathrm{NG}_{\mathrm{G}} \mathrm{U} \wedge \mathrm{GE}$.

as it is, thought is by far too quick for words. Though we are now encroaching on the department of grammar, we muft add as fome confirmation of our ideas, that the Hebrew imperative is the fame with what is called the radical form of the verb, in its feveral conjugations, except in niphal, where it is the fame as the infinitive. But to proceed;

Men, fisht, are names, and are thll acknowledged as fuch; when they are placed together, efpecially if accompanied by ditinguifhing tones of voice, it would be naturally inferred that the fpeaker intended to raife in his hearer's mind that belief which exilts in his own; or at leait, to inform his hearer of a connection which circumflances had formed in his mind. By degrees, at lealt in molt nations, fome of thofe names xhich were frequently thus employed with the inference of affirmation, became appropriated to convey this inference, and it would then be made whenever the word was employed; but in the more fimple languages, a large pro. portion of thofe verbs which are cmployed as verbs, (i.e e conveying the inference of affirmation,) are thill immediately recognized as nouns. In the Chinefe, very few names are ap-p-opriated as verbs, but are ufed indifcriminately, and without any variation of form, either as nouns or verbs; in the Hebrew, the ront, (which does not, like every part of the indicative in the Greek and Latin verbs, include a pronouri, is a fimple name, and is ufed, in many cafes, as a noun; and in our own language, many names are ufed either as nouns or as verbs. When we have adranced to the frequent ufe, and gradual appropriation of fome names to convey the inference of affirmation, the reft is cafy and almoft certain. With refpect to the fimple affirmation, the fubject of it would, in the cafe of the frit and fecond perfons, always be a pronoun, and, in the fame diftrict, the fame pronoun. This, where $\sqrt[\beta]{ }$ oken language made material progrefs, would gradually coalefce with the verb; and the word fo formed would be completcly invelted with the rerbal character, and never be employed but with the inference of affirmation. The Hebrew prefents us with this coalefcence in its incipient and obvious ftate; the Greek and Latin fhew it in a much more complete ftate, and the component parts cannot always be detected ; no reafonable doubt can however exift but that the procedure has been the fame in all. The fame might alfo be the cafe refpecting the third perfon, but the coalefcence would, in this inftance, be more nowly formed; and in fome languages where the coalefcence took place in the other perfons it did not in this; it mult, however, be admitted that, in others, the contrary is the fact.

Refpefting the changes of the verb, to make it exprefs other circumftances belides thofe of affirmation, we mult refer to Grammar and the connected articles, and thall content ourfelves with the following general remarks. There appears to us to be little or no reafon to doubt, but, that all the common changes, which have taken place in the verbs of all languages, to denote the time or mode of exiftence and action, (as well as thofe of number and perfon,) have been formed in confequence of the coalefcence of words of appropriate fignification ; and though the gradual refinement of language may have greatly varied the affociations of words, from what they originally poffeffed, yet that thofe changes were originally found fufficient to anfwer their refpective purpofes. In fome cafes the contrivances adopted can be fill traced; and from the new turn which has lately been given to philological fpeculation, we may expect other difcoveries refpecting the caufes or origin of particular flexions. We fhall only mention two inttances, which will ferve to fhew how fimple thofe contrivances originally vere. The future of the French verb is nothing more than the infinitive of the verb, with the prefent tenfe of avoir;
thus aimerai is ai aimer: and $j^{\prime}$ amerai, means, I bave to love, which mode of expreflion is, in our own langraage, ufed with a future force. This leading diflinction between the paft and the future tenfe of the Hebrew verts is. that ine the pait tenfe the verb, is placed lafore the fragment of the pronoun forming the perfon, and in the future offer it ; to intimate (as may be reafonably fuppofed, that abe action. has paffed the fulyect in the lirft cale ; in the fecond, that it is yct to come.

The force of the prenouns (the legritimate fubltantive pronouns) is very clear. I means the ferfon forathing ; tho:t, the perfon Spoken to ; lin, fiee, it, the fail pertun or thing, the perfon or thing lefore mentianed or refericed to; and fo on in the plural. When this limple view of the fuljict is taken, no one can fecl any mytlery in the origin of pronouns. The firit plan would undoubtedly be, to ufe the names themfelves; and fuch is the firtt prosedure in childhood: "Mamma loves Mary, and hopes Mary will be a good girl." Children ufe pronouns by degrees only ; and thofe of the firit and fecond perfons much later than thofe of the third, for the obvious reafon that the fe latter are whe moft convenient in their limited intercourfe. The pronouns of the third perfon identify the object now fpoken of, with that befare fpoken of, and fave much circumlocation, and Itill more ambiguity; the pronouns of the firlt perion are of great convenience, in cafes where the name of the Speaker or hearer is unknown, where there are others of the fame name, and in the plural efpecially where feveral names muft ctherwife be often repeated. -The pronoun is then a very valuible, but not a neceffary part of fpeech. How it might be formed, the very pro bable procedure in a few inttances will fufficiently fhew. Horne Tooke thews that it, formerly written bit, is the palt participle of the verb $7 \lambda, r \lambda \lambda$, to name, and therefore means the perfon or perfons, thing or things named or aforefaid; and accordingly it was applied by all our old writers indifferently to plural and to lingular nouns. We do not know whether a fimilar opinion as to the origin of pronouns had been previoully laid before the public, but the philofophical Greek profeffor of Glafgow (who in his very interefting and important inveftigations, has often anticipated Horne Tooke) long ago delivered it as his opinion, that fome, at leaft, of the pronouns, are participles, and, if we miftake not, traced the origin of syow and iple as follows: Eう八, in one of its earlier forms, was kysy, which is an obvious abbreviation or corruption of $\lambda_{E \gamma} \omega^{2}$, fo that $\varepsilon \gamma \omega$ (whence the Latin and other languages have their firf pronoun) fignifies the perfon fpeaking. Iple is the Latin paft participle from $\varepsilon \pi \pm ;$ and though this verb is not to be found in Latin writers, thofewho know how much the Latin is a dialect of the Greek, will not feel this to be a material difficulty: on this derivation ipfe fignifies the faid perfon, \&c. Whatever be the origin of ille, it is obvious that it is in itfelf merelfy an adnoun, (exactly correfponding to our that,) employed to point out, and probably accompanied in the firit inflance by the ation of pointing out: now from this demonttrative adnoun, ( 3 pronoun only by a fubauditur,) the French have taken not only their demonftrative $l \varepsilon$, but alfo their legitimate pronoun il. Ille is never employed without a fubftantive expreffed or underitood; il will not admit of a fub. ftantive ; and this fact, among many others which meet us at every ftep of our inveftigations, fhould prevent us from imagining that a procedure cannot have been, becaufe we can now find no traces of it: the origin of il was an adnoun it is itfelf a proncun. We fhall add one more example of the probable origin of pronouns. $T_{u}$ is found in the form tute; tute is the vocative of tuitus or tutus, from tueor, to fer, to obferve, and fignifies a fern gerfon: we look at the perfon
-we fpeak to, and, by dired inference, tute denotes the perfon $f_{R}$ oken io. It may be objected that $h$ is from $7 v$, a form of $\sigma^{\nu}$; it appears to us in no way unreafonable to fuppofe that the Latin has preferved a verb from the early Greek dialect which the common forms of the Greek have lolt.

We do not think it neceffary to enter any farther into the fubject of the origin of oral language. It can farcely be doubted, by thofe who have ftudied the nature of the otber parts of fpeech, by means of the light which the refearches of Horne Tooke and others have afforded, that all have been derived from the noun and the verb; and, admitting this, all that is incumbent upon thofe who profefs to fhew the original caufes of language, is to prefent a probable otigin of thofe claffes of words. In thofe procedures which have been here itated, there is nothing which fuppofes metaphylical refearch, or much obfervation ; and to rende: any procedue probable, it mult wear the marks of fimplicity. In the prefent period of the language, we fee the grammarian pointing out the analogies which are found to exilt in language, and thence proceeding to the formation of new words upon thefe analogies: this is art ; but the early formers of language, in their inventions, followed only the dicates of circumitances; and whatever regularity we may perceive in their inventions, mult be attributed to the fimilarity of thofecircumftances. We fee the philofopher inventing a new term, agreeably to prevailing analogies, to exprefs fome power of the mind, or fome emotion which had not received any denomination ; but thofe who originally gave names to mental Feelings, derived them fimply from fome analogy, fancied or real, between the internal and an external object, and thofe names which now fuggeft to us ideas the moft fubtle and refined, were originatly only the names of objects obvious to the fenfes. The reafoner, when he ufes a word whofe meaning has not been accurately afcertained, defines the ideas which he intends to attach to it, and ufes it accordingly ; in the early and even in the more refined periods of language, the ideas connected with words have been the refult of cafual affociations, produced by local circumftances, by the cuftoms of the age, or the appearances of nature in particular fituations.

In languages in which the coalefcence between the verb and its adjuncts has taken place, and alfo the coalefcence between nouns and their connective words, much greater liberty of inverfion is practicable than in thofe in which fuch coalefcence has not at all occurred, or but incompletely. In other words, where the noun, adnoun, and verb, admit of flexion, there the arrangement depends, in many inftances, more upon the found than upon the fenfe; and nearly in all cafes may be made fubfervient to the former. This gives fuch languages confiderable advantage over thofe whin admit of but few changes, fo far as relpects their modulation; and farther, the coalefcence renders them much more forcible, where emphafis or any of the fractional parts is not required. Whenever flexion increafes perfpicuity, the advantage is decifive and obvious; with refpect to modulation, though an object of fome confequence (fince we may fometimes find the way to the head and heart by plealing the ear), yet all cultivated languages will be found to poffefs fufficient power of pleafing the native ear ; and among thofe who made found fo much an object, fenfe was often facrificed to it : with refpect to force it may fairly be doubted whether the advantage of greater precifion by means of more accurate emphafis, does not counterbalance it. We ase willing to admit, on the whole, that the advantage is fomewhat in favour of thofe languages in which flexion is extenfively adopted; but we can by no means admit the opinions of thofe, who think it neceflary to a perfect lan-
guage. That language is not the mot perfect, whichenables us to exprefs our thoughts in a great variety of ways, but that which erables us to exprefs any thought with precifion and perficuity; and contemptible as our own uninflected language may appear to thofe, who can think nothing good, but what accords with the objects of their early tatte, we are difpofed to believe that in its real powers, it rifes beyond all the ancient languages and moit of the modern.

Before we leave the fubject of oral language, we mult pay fome attention to the following inquiries; whether words are originally imitative; whether they were long; and of what kind of articulations they were compofed. The latter are of importance in tracing the gradation from hicroglyphics to alphabetical writing.

Wiords in their prefent ftate are fimply arbitrary marks, ufed to dcwote ideas, or combinations of other words; the found of fome appears to be "an echo of the fenfe," but in the greater number of inflances in which there is fuppofed to be this refemblance, very much may be attributed to the fancy of the obferver. It is obvious, however, that there are fome words which are formed upon found, and are traly imitative; fuch, for intance, as denote the various founds of animals. When we carry our enquiries further back, we are led to fuppofe that this might be the cafe in the earlier flages of language; that the original words would be formed from fome refemblance, real or imagined, between the fousd and the thing fignificd. What elfe, at firlt, could induce them to fix upon one found rather than another? We have already feen that fenfible objects were the firt which obtained names; and of fenfible objects, the number is confiderable which either emit fome imitable found, or perform fuch motions as have generally fome connection with found. Of thefe latter the number is evidently fmall; waving and regular, rapid and flow motion, violent and fmooth motion, appear to be all the varieties which found would denote. With refpect to founds, whether produced by animate or by the motion of inanimate objects, thefe might and probably would be imitated; and the names of thofe objects which were connected with the founds would be derived from thofe imitative founds. The Otaheitans give to the gun the appellation of tick-tick-bow, evidently imitative of the cocking and report of the gun; and the Kamtfchatkans denominated the Ruffian clergyman bogbog, becaufe he often repeated the found bog, which in the Ruffian language fignifies God. With refpect to qualities totally unconnected with found, particularly mental qualities, this principle of imitation is not directly applicable. We immediately fee the incongruity of colour and lound, when, for example, we call to mind the idea of the blind man, that a fcarlet colour was very much like the found of a trumpet. A circumitance which appears to have milled feveral ingenious writers on this fubject, is, that obferving certain letters applied to denote a clais of ideas which have, among others, fome common features of refemblance, they have fuppofed that thofe letters were fignificant of that common feature; for example, that $c$ denotes cavity or hollownefs. Now fuppofing that there is that general idea, varioully modified, in every word in which the $c$ forms a principal part, does it follow from this that the $c$ figuified by its found cavity or hollownefs? We can difcover no fuch fimilarity. We apprehend that the coincidence may be better accounted for in a different way, that the original word denoting hollownefs, which has entered, varioufly modified, into the words in queftion, was $c$ with fome vocal found. That is the extent of the inference which may be juftly drawn from the coincidence ; that it was fo applied, but not that it was fignificant of the quality. We have been accuftomed to ufe founds in given comections

## I. ANGUAGE.

with fucli regularity and confancy, that they appear to us to have a connection of real fignification inftead of merely arbitrary inflitution. Frequently, from our acquaintance with the fenfe, we read a combination of words as the fenfe dictates, and fuppofe that imitation in the words, which in reality exifts only in our mode of enunciation ; but it is only with words feparately, confidered from their comeetion with other words, that we are here concerned; and with refpeet to them we cannot but confine the refemblance of their found to their fenfe, tr cafes in which they denote either found, or motion, ufually accompanied with found.

In tracing the tranfition from-hieroglyphics to alphabetical writing, the probability of the theory advanced will much depend upon the fhertnefs of the words of that language in which the tranfition was made. It is generally fuppofed that this was the Egyptian; but of the ancient Egyptian we have no remains, excepting fome words which the modern Esyptian or Coptic has preferved, many of which, hovever, are monofyliabic. It will be worth white, therefore, to ftate it as a general enquiry, whether the original words of original languages were. long or fhort. Lord Monboddo fuppofes that all human founds were originally inarticulate cries; and that the firf articulate founds were imitations of the cries of animals, and confequently were of great length. "For fuch cries of almoft all animals have a certain tract and extenfion (as his lord/hip exprefles himfelf) fuch as the lowing of an ox, the neighing of a horfe, the braying of an afs, the roar of a lion, $\& \in \cdot$. And that we may not think them an exception to this ruie, we need only attend to the dumb perfons among us who utter inarticulate cries, fometimes very loud, but always of a confiderable length." There are few loofer reafoners than his lordhip, at lea't among thefe' who poffefs fuch a fund of information as his lordfhip certainly did. To adduce dumb perfons as an example of what men poffeffed of the powers of articulation would do when they firft began to ufe thofe powers, feems a very incorrect mode of argument. We mult, however, remember that lord Monboddo fuppofes men to have arifen from the ftate of mere brutality. We fuppofe, and on far better authority than that on which he reffs his faith, that man was never a brute, and that the firft man was led by divine interpofition to ufe his powers of articulation. We have already feen that it is probable that the founds to denote objects emitting founds, would be fignificant ; and the cries of different animals would therefore furnifh names for thofe animals. If we confine imitation to this, great length of words is unneceffary and improbable: unneceflary becaufe one or two dittinct articulations would generaily be fufficient for diftinction; thus, bow roow would anfiver the purpofe to denote a dog, as well as a continuation of the found to a hundred fyllables. It is improbable, becaufe articulation is at firft very difficult, and it is therefore fcarcely fuppofeable that more articulations would be ufed, than were neceffary to exprefs dittinctly what object they were intended to denote. If we extend the priaciple of imitation further, and fuppofe that man imitated thofe cries in order to exprefs his feelings merely, his cries would have no claim to the higher title of words, and at any rate would throw no light on our inquiries.

At firt fight, the hypothefis that the original words of language were long, appears to draw confiderable confirmation from the vocabularies of the North American Indians. Of three that are given us by Mackenzie, two appear to be compofed of words, of from two to feven fyllables; with fcarcely any of one. - The third, on the other hand, is compofed folely of words of one or two fyllables.

Vol, XX.

With refpeet to the former, even where viordis aqually denote objects of ferfe, our inferences that they are uncompounded flould be carefully drawn. The moon is exprefied by two words, Tulifca-pefim, fignifying the nizh-fun; and feveral others appear clearly to be circumlocutions. In like manner the favages on the river St. Laurence, near Montreal (who are Catholics) give the French priefts thic appellation of the malter of life's man; and it is by far the molt probable fuppofition, that, in uncultivated nations, names of new obje:1s would, when pofiible, be formed rather by fignilicant combination of words in ufe, than by the formation of new words. Thus, as we learn from Mr. Park, the Mandingo nation ufe the following (among many) circumlocutions: fruit is eree-ding, child of the trees; noon, teeleekoniata, the fun over bead; finger, boullakonding, child of the band or arm; brother, ba-ding-kea, mother's male child; filler, ba-ding-moofa, mother's fomale child. Some others we have already noticed.
L.ord Monboddo is very unforturate in the choice of examples of his theory ; for not one is of that clafs of names, which, in all probability, were the original ones, names of fenfible objects. They are the following: wonnazuucktuckluit, fignifies much, and mikkeuawkrook, little, in the E\{quimaux language; and poellcrrarorincourac, is the name for three among fome South American Indians. With refpect to the two former, the examples above adduced, authorize us to conclude that they are circumlocutions, defcriptive of the fignilication. With refpect to the laft we may obferve, that the names of numbers were, probably, originally fignificant in all languages; and that the length of thofe names would depend upon the length of the original words, and the manner adopted in combining them. Thus fix is, by the Kamtichatkans, denoted by innen-milchin, i.e. one and five. Numbers are fo familiar to us, and fo dilkinctly arranged in groups, that perhaps in no inftance are our ideas more clear. Yet this clearnefs entirely depends upon the dilitinctnefs of the figns we ufe to denote them. We fpeak of ten and twenty, Sce. and all feems very clear; but it is evidert that if we attempt to form a conception of ten, twenty, \&c. we mult pafs over every one fingly, and endeavour to combine thera together by proceffes which will be varied by the habits of the individual. If we give a frefh name to every group of objects, and then confider thofe groups as units, and fo on, we are capable of extending our ideas of number indefinitely, and of fpeaking and thinking of them with accuracy ; but if the fmall extent of our intellect, or the circumitances of our fituation, prevents this grouping, and we conine our attention to individuals, cur arithmetic mult be very confined. Thofe nations which reckon only by a computation with their fingers, carry their ideas of numbers no farther than ten ; thofe who with the Kamtichatkans take in the toes, go as far as twenty; theie prople can reckon mo farther, and when they have adranced to this limit, they fay " where fhall we go now?" It is difficult to conceire what circumftances could bound the arithmetic of lord Monboddo's Indians to three, or rather what fhould induce thens to choofe fo troublefome a node of procedure; but it appears probable that they joined the names of three different men or other animals; and if they had proceeded further, would have joined four together, \&c.. Why they did not ufe fhorter words to form the combination, we cannot conjecture, unlefs it were that their tribe was originally very fmall, and that they mentioned the names of one, two, or three in ordet to denote thofe one, two, or three; and that thefe names, being proper names of perfons, would be fomewhat long. But this is entirely hypothetical. It feems a moren Mman natural

## LANGUAGE.

natural procedure to repeat the word as often as there were numbers to be denoted, but the ear would not readily follow this repetition.

If lord Monboddo had looked into the vocabulary of the Mexicans, he would have thought that his theory derived great confirmation from their words. Clavigero informs us, that they had words of fifteen or fixteen fyllables; but he - exprefsly fays that they are compounds. He gives us one fpecimen of their mode of combination. It is a title of addrefs, Notlazomalruitzteopizcatalzin, and fignifies my very worthy fatber, or, revered prief. It is compounded of tive words (taking away eight confonants and four vowels), prefixing no, which correfponds to my, and adding tzin, which is a particle expreffive of reverence ; fo that there are no fewer than feven words compounded together. Their language is very copious; and one caufe of the length of their words is probably the deficiency of confonants, which would render a combination of founds neceffary for diftinction. It is entirely deftitute of the $b, d, f, s, r, s$, but abounds with $l, a, t, z, t, t z$.

We have before remarked, that the importance of the enquiry to us refults principally from its connection with the origin of alphabetical writing. Now we may admit that the languages of thefe North American Indians favours the hypothefis of long words without any injury, for among them alphabetical writing never exitted; and we fhould have enlarged lefs on this point, if it had not led us to notice fome curious procedures of language. Yet it feems reafonable to admit, as au inference, that the original, or rather fecondary words of language, would have been long (though not to the degree lord Monboddo fuppofes), if the circumrftances of man had not required a varied vocabulary; for the more confined the number of articulations, the more extent mult be given to fome words to diftinguifh them from others. But when we advance further, and inquire of what kind the original words of man really were, we fhall fee fufficient reafon to conclude them to be fhort. Language was firit ufed in the Eaft, and there, too, writing was firtt invented. We have already mentioned, that of the ancient Egypti-n words which are preferved in the Coptic, a confiderable number are monofyllabic. The Chinefe, which, as far as original language is confidered, appears to have undergone little alteration, or combination, and is probably nearly an original language, is compofed entirely of monofyllables. Probably, indeed, this was the very caufe that the Chinefe never advanced into the alphabetical mode of writing. They had no compounds of founds; and they varied their words by inflection of voice inftead of additions of articulation. The original words of the Hebrew, Greek, \&c., that is, thofe which are not varied by the addition of other words, are flort, frequently only of one fyllable, feldom of more than two. And of the vocabularies which we have had an opportunity of confulting, of the uncivilized nations of the Ealt, the words are generally monofyllabic or diflyllabic.

Having now attended to the two former of the inquiries with which we propofed to finifl the fubject of oral language, we fhall proceed to the laft-Of what kind of artienlations the early languages were compofed. It appears that in the early languages conforant founds were at lealt generally accompanied by vowel founds; but though this is a material point in tracing the tranfition from hieroglyphic to alphabetical writing, it will not be neceflary to enlarge much upon it. We think this pofition proved, by the following, in fome meafure unconnected, confiderations. I. Vowel founds are by far the moft eafy ; and confequently they confirute the earlieft vocal founds of children, and a large pru-
portion of the rocal founds of uncivilized nations. Several words among the South Sea illanders are compofed entirely of vowel founds; and fo great is the difficulty which thefo people find in pronouncing confonants together, that they called fir Jofeph Banks, Opano. From this confideration we may fairly infer, that vowel founds would be frequent in the original words of the early languages, which were formed before articulation was become cafy. z. Yet as the fhades of diftinction between them, when employed alone or together, are too nice to furnifh, at leaft to the unpractifed ear, many obviouny different words $;$ and as man was not at firft in that low fate of intellect in which he has fometimes appeared, a vocabulary formed of fuch founds would be very inadequate to his wants; and, therefore, we mult fuppofe that in the early languages there would be very few words without confonant founds. 5. Some of the firft articulations of man were withour doubt employed in naming. thofe of the inferior animals with which he was concerned. Now their names would almolt certainly be given from their: diftinguifhing cries, and the cries of fuch animals confifit of confonant founds, each followed by a vowel found. 4. Its articulation would at firit be nearly as difficult as we now perceive it to be in children, the firft words would be compofed of fimple articulations, that is, of confonant founds, each followed by a vowel; and new words would be formed by the combination of fuch; fo that in the early languages all compounds would be formed by the combination of fimple articulations. 5. The greater part of confonant founds, cannot be founded fingly without vowels, nor together without vowels intervening. In many cafes this is evident to the ear; and when it is not perceived, it often is the fact, though the acquired rapidity of utterance may render it very little perceptible. 6. Some languages do not admit of any two confonant founds together. The Tartar language always requires a vowel between two confonants. The Ruffians, we believe, does the fame. The Chinefe never join two confonants, unlefs we mult except ng ; but this appears to be only a fimple found, though reprefented by two of our letters. With refpect to the Chinefe the point is of confequence, becaufe there is great reafon to belicve that they came from the Atock of the Egyptians, before there had been any confiderable addition to their vocabulary by combinations of founds, and before the tranfition had been made from hieroglyphical to alphabetical writing. It is true many of the Chinefe words end in confonants, which feems to render improbable the pofition advanced; but it is to be obferved, that in fuch cafes the words fhould be confidered as of two fyllables; for it is impofible, in continued fpeaking, to utter a complete confonant found at the end of a word, without emitting a vowel found. 7. That the Hebrew (which is to be confidered as a reprefentative of all the cognate eattern languages) never founded a corfonant without a vowel, may be inferred from this circumftance, that thofe who invented the denotements of vowel founds, while at leaft the leading features of the pronsnciation remained, thought it neceffary to add or fuppofe underfood a vowel found after every confonant.

Having gone over the principal topics relative to oral language, we proceed to written language. Writing has been juitly confidered as one of the moft noble and beneficial inventions which human ingenuity can boaft. We fhall not expatiate upon its advantages in embodying and perpetuating our thoughts, but fhall proceed to give a hiftory leds enveloped in obfcurity in molt of its ftages than that of oral language. Difficulties indeed attend it, as muft occur in every inveltigation into antiquity ; but we bave here data

## L. ANGUAGE.

on which to found our conclufions, which the flecting nature of oral language would not permit.

Vifible language firtt ufed marks as the figns of thinges ; and we can trace it through its various ftages from the limple picture to the arbitrary mark. The rudett fpecies of vifible communication with which we are acquainted, is that of the Peruvians; it was by means of knotted cords of various colours. We have reafon to believe, however, that this was not the only fpecies of vifible communication among them; and it was evidently very defective. The Quipos, as they are called, have been celebrated by authors fond of the marvellous, as if they had poffeffed regular annals of the empire; but it feems reafonable to hefitate here. They might have fome fignificancy by agreement, but without oral interpretation they could denote little more than that fomething was to be remembered, in the fame manner as perfons of weak memories fometimes adopt the contrivance of tying a piece of ftring round their finger to remind them that recollection is neceflary. According to the opinion of the beft informed judges, they feem to have been a device for rendering calculation more expeditious and accurate. By various colours, different objects were denoted, and by each Enot a diftinct number: fo that they might ferve as a kind of regitter of the number of inhabitants in each province, or of the quota they furnifhed to the general treafury of the nation. As they had picture-writing, though to no great extent, and numbers mult be denoted by arbitrary figns to render calculation at all extenfive, this account is by far more probable than that of thofe who fuppofe them defigned for hiltorical purpofes. In this view they could anfwer no. farther purpofe than the twelve flones which Jofhua fet up after the paffage of the Ifraelites over the Jordan.
The Mexican picture-writing was the firlt fep in the progrefs towards alphabetical writing. The effential difference which it will be defirable to keep. in mind between the latter and all the intermediate feeps, is, that in alphabetical writing we ufe figns for founds only; except with the deaf, they are in the firlt inftance fignificant of things or ideas only by an intermediate ftep: picture-writing, in all its various flages, prefents figns for things or ideas directly, and only for founds as being the denotement of them.

The fimpleft fpecies of picture-writing was that in which a mere delineation of the thing to be denoted was employed; thus, to exprefs man or dog, \&c. a drawing of the animal would be given. This we learn from fir William Johnfon is the procedure of the North American Indians: when they go to war they paint fome trees with the figures of warriors, often the exait number of the party, and if they go by water they delineate a canoe. When they gain a victory, they mark the handle of their tomahaws with human figures, to figaify prifoners; and draw the bodies without heads to exprefs the fcalps they have taken. To thefe fimple annals the warrior trults for renown; and pleafes himfelf with the belief, that by their means he fhall receive praife from the warriors of other times. Thus, too, the Mexicans, when the Spanifh invaders firft arrived on their coafts, fent large paintings on cloth as expreffes to their emperor Montezuma. But the Mexicans had made much greater advances than their favage countrymen ; except in fome few inflances they did not indeed go further than fimple delineation, but by a proper difpofition of their figures they could exhibit a more complex feries of events in hiftorical order. They could defcribe, for inftance, the occurrences of a king's reign from his acceffion to his death; the progrefs of an infant's education from its birth to the years of maturity ; the different recompences and marks of diltinction conferred upon war-
riors, in proportion to the exploits they had performed. Some very curious fpecimens of this peture-writing are preferved; the molt valuable one has been publihed, and may be found in l'urchas's l'ilgrim. It is divided into three parts. The firlt contains a hittory of the Mexican empire under its ten monarchs; the fecond is a tribute roll, reprefenting what each conquered town paid into the royal treafury; the third is a code of their inltitutions, domettic, political, and literary.

The defects of this mode of painting mult have been carly felt. It was, where applicable, a tedious operation; and no objects but thofe of fenfe could be denoted by it. The human intellect, flimulated by the neceflity of improveraent, would probably have gone through the fame courfe in the new world as it had done in the old, and have proceeded from the picture to the fimple hieroglyaldic, then to allegorical fymbols, and laftly, to arbitrary characters; but a lkop was early put to the progrefs of their improvement by thic deltruction of their molt cultivated empires. In the fimple hieroglyphic, a principal part or circumftance of the fubject is made to ftand for the whole; and to this the Mexicans had made approach. In the hiftorical painting before mentioned, the conquered towns are uniformly denoted by the rude delineation of a houfe, to which is added fome dittinguifling emblem. The kings themfelves, or the leaders of their armies, are in like manner denoted by heads of men with fome emblematic mark conjoined. Thefe emblematic mark: were denotements, not of their qualities, but of their names, as we learn from Clavigero, who farther informs us, that the names of places were formerly fignificant compounds. They advanced itill further, and made ufe of the mere figurative hieroglyphic. When they wihed to exprefs a monarch who had enlarged his dominion by force of arms, they placed the reprefentation of a target, ornamented with darts bet ween the figure of the king and that of the cowns which he had fubdued. To denote numbers, arbitrary figns were ufed. It will be feen from this account, that the Mexicans had actually in fome initances paffed through all the intermediate ftages of writing, though the fhort duration of their empire prevented them from extending thofe rudiments to a regular fyftem. Indeed Clavigero jufly complains, that injuftice is done his countrymen. They evidently made confiderable ufe of the fimple hieroglyphic ; their marks for months and other portions of time, for the air, the earth, \&c. were fymbolical, and their cyphers were arbitrary ; yet they are generally fuppofed to have made no advarices beyourd mere picture-writing. Their manner of denoting numerals was as follows. They painted as many points as there are units to twenty; this number had its proper character ; then they doubled it, \&c. for 20 times, that is, to 400 , which had a new character; this they doubled, \&c. in like manner, that is, to Sooo, which again had a new character, and which they doubled, \&c. as before. So that with thefe three characters, and the points, they expreffed numbers as far at leaft as 20 times 8000 , i.e. 160,000 . At leaft, however, it muft be acknowledged, that the annals of a nation, conveyed in the manner we have defcribed, mult be very fcanty and imperfect. And accordingly Clavigero admits, that their paintings ought not to be considered as a regular full hiltory, but only as monuments and aids of tradition. The parents and malters took the greatelt pains to inftruct the riling generation in the hiftory of the nation. They made them learn fpeeches and difcourfes which they could not exprefs by the pencil; they put the events of their anceltors into verfe, and taught them to fing them. This tradition difpelled the doubt and ambiguity wh ch painting alone would have occafioned ; and by the affilta ce of thele

## I. ANGUAGE.

monuments perpetuated the memory of their herose, their mythology, their laws, and their caltoms. Sce Robertfon's America, - vol. iii. p. 173-180, and Clavigero, vol. i. p. 4C0- ${ }^{11}$.

This fimple picture-writing would foon be contracted by neceffity ; parts of the object, or the principal circumfances of the action, would be delineated to denote the whole of the object or action which it was intended to reprefent. 'This woald correfpond to what we flould call in writints a plain Ityle; but it is obvious, that language, whether writien or fpoken, if confined to words denoting objects of fenfe merely, would be very meagre and imperfect. To enlarge the powers of vifible communication, the real or fuppofed inftrument of a thing was placed for the thing itfelf. And a ttill more refined fpecies of hieroglyphic is, where qualities, \&c. were reprefented by objects which had fome real or fuppofed analogy to them ; this correfponds to a figurative ftyle. We here fpeak of hieroglyphics as intended for the purpofe of communicating, not concealing knowledge. It was long fuppofed that the latter was their firft and only purpofe; but bifhon Warburton has fatisfacorily proved that this ufe was not made of them after the other was rendered unneceffary by the invention of alphabetical writing. It is for the purpofe of communication that we wifh to confider them. Warburton feems to confider thefe three kinds of hieroglyphics as in reality three dilfinct (pecies of communication; but as De Guignes juftly obferves, this difference regards the Atyle alone. And though probably the molt limple hieroglyphics were thofe firtt ufed, yet as language mult have made fome progrefs by the ufe of permament vilible communication, it was found neceffary, and confequently muft have given metaphorical meanings to the names of many fenfible objects, it is not to be fuppoled that the hieroglyphics tvould be confined thus even in their very earlieft flages. We mutt remember, too, that even the rudef kind is an improvement upon the picture-writing ; fo that we are not to confider them as the firft attempts of neen to embody their thoughts.

The moft fimple fpecies of hieroglyphics was when the delineation of part of the object or action reprefented the whole ; thus the ancient Egyptrans painted a man's two feet in water to reprefent a fuller: fmoke afcending, to denote fire; two hands, one of which held a buckler, the nther a bow, to denote a battle, \&c. Now if we direct our attention to oral langtage, we fhall perceive that it fill retains many of thefe contractions, particularly in poetry. The fail, for infance, to denote the whole flip ; the hand, to denote the whole man, \&c.; where, however, it mult be remarked, that thefe contractions are for the purpofe of denoting the part of the otject, \&c. which is moft to be attended to in the given circumfances, and therefore come under the fecond kind of hieroglyphics, where the real or fuppofed intrument is ufed to denote the performer or the thing performed. And indeed fo long as oral language denotes fenfible objects, there is no advan:age with refpect to brevity in placing the name of a part to denote the whole, fince, except in peculiar cafes, the name of the whole may be pronounced with as great facility as of the part. Examples of this fecond clafs of hieroglyphics, are the eye and the fceptre to denote a king; a fword to denote a bloody tyrant; the mouth for fpeech and voice; an eye placed in an eminent pofition, to denote the prefence of God; and the fun and moon in like manser were ufed to denote the fucceftion of time. Inftances of fimilar metaphors in common language are very numerous; to take the laft two initances, we lay the eye of God is upon us, meaning that the omnifcience of the Supreme Being extends to us; and though perhaps it would be too bold even for our poetry to ufe the expreflion
of fun for the time of his apparent revolution; yet we might employ moon to denote the time of a lunation. The lalt kind we mentioned, was that which employed, to reprefent one thing, another which had fome refemblance or analogy to it. Hence was the laft procefs in the invention of oral as well as pictured language, and it is perfectly fimilar to what at prefent we confider as an ornament, figurative language. For it muft be obferved, that what we conlider as a beauty, was originally the invention of neceflity. For inftance, among the Egyptians the dog's head, (as among the Chinefe the dog's vcice, was the fymbol for forrow; fcience was denoted by dew falling from heaven. This very metaphor is expreffed in the form of a fimile, in Deut. xxxii. 2. "My doctrine thall drop as the rain, my fipeech fhall dittil as the dew, as the fmall rain upon the tender herb, as the fhowers on the grafs." Thefe fymbolical hieroglyphics would be very frequently derived from very fanciful analogies, founded frequently on the popular prejudices of the times. As an inftance, may be mentioned the figure of an hyæna, which was ufed to denote a man who fupported his misfortumes with courage, and rofe fuperior to them. This took its rife inthe opinion that the flkin of the hymena rendered the wearer fearlefs and invincible. The laft we fhall mention, is the fanzous infcription at the temple of Minerva at Sais, where we find the figures of an infant, an old man, a hawk, a fifh, and a river horfe. The hawk and fifh were one chardeter; this kind deftroys fifh, and is therefore the fymbol for hatred. The river horfe was the fymbol for impudence, and the infant and the old man were intended to denote all men. The hieroglyphic therefore means "young and old hate impudence ;" or, more literally, "old man, infant, hatred, impudence." It has been more diffufely rendered; "all ye who enter into the world, and who go out of it, know that the gods hate impudence." We may remark, as we proceed, that this-tends to confirm the hypothefis, that originally all words, even verbs, were nouns. This hieroglyphic was a plain admonition, defigned for the inll ruction of the people; for it was engraved on the veltibule of a public temple ; and is therefore juftly confidered by Warburton, as one proof that the original hieroglyphics were for the purpofe of communication, not of concealment. If the Scythian king hadd been able to delineate objects, he would perhaps liave fent as painting to Darius inftead of the real objects. The pi\&ure of a moufe, a frog, a bird, a dart, and a plough would have anfwered the fame purpofe as the things themfelves, and have. been "lefs inconvenient. They would then have been reals hieroglyphics.

The firt object of thofe who invented hieroslyphics, was, to preferve the memory of events, and to make known laws; and regulations for the conduct of the citizen and the man.. Such fymbols therefore would firlt be employed as were of obvious interpretations. Figures founded on their language (which, as we have already obferved, mult have made confiderable advances towards improvement,) would be readily underttood, even if the analogies which gave birth to the: words were forgotten. By degrees they were employed:for. the more refined purpofes of philofophy ; and analogies and refemblances were the foundation of hieroglyphics, which would be intelligible only to thofe who were acquainted: with the fciences from which thofe analogies were deduced.: This progrefs, as we fhall afterwards fee, is the fame withthat of the Cbivefe language, which in all its flages is an object worthy of our curiofity. Still, however, there was. nothing done for concealment. The purpofe of communication was ftill kept in view, and knowledge of the theories of. the times alone was fufficient for their interpretation. But, by degrees fuperitition appropriated them for the purpofe of concealment,
eoncealment, and thofe whofe dominion oter the vulgar confilted in the poffeflion of mylleries, wfter the invention of alphabetical writing, which would otherwife have aumihilated the ufe of hiernglyphice, filll employed them to keep the fecrets of the pricthood from the eyes ot the profane vulgar. Their fymbols, which for the purpofes of commumeation Should have had an obvious analogy, were introduced from far-fetched refemblances. A cat was ufed to denote the moon, becaufe they perceived a difference in the fize of its pupil at the full moon, and in different periods of its apparent magnitude. Egypt (which in the common hieroglyphic was denoted by a crocodile,) was in the facred hicroglyphic denoted by a burning cenfer with a heart upon it. In the natural progrefs of hieroglyphics, qualities would be denoted by the objects which would be confidered ats poffeffing them in a great degree; as we have feen in the infeription at Sais. But to make the hieroglyphic a real myltery, one animal or fenlible object was made to denote a variety of contrary qualities; thus the hawk denoted fublimity, humility, victory, excellence, \&cc. And on the other hand, the fame idea was denoted by various hieroglyphics. It was this ufe, which was probably potterior to the invention of alphabetical writing, that has attached to the hicrogly phical fyitem the character of myitery.

It is obvious that the exact manner of delineation would be tedious, as well as voluminous. The more ufe was made of vifible communication, the more we may expect to lind the written charatters depart from the fimple picture, and become arbitrary marks. Not, indeed, arbitrary in their original invention, but perfectly arbitrary to thofe who afterwards ufed them. We fee, from the remains of the Egyptian hieroglyphics in their early flages, that they paid confiderable attention to the delineation of their figures: they filled up the outline of their pictures ; in procefs of time th, y ufed only the outline; and thefe, again, they changed, as the convenience of the writer dictated, till at lait it lolt every refemblance to the object which it originally reprefented. The changes that our written characters have undergone, and are continually undergoing, might be adduced as an exemplification of this procedure, from delineation to the curfive hieroglyphic. The mark for and, for example, was originally fignificant ; it did not, indeed, reprefent an object, but it was a correct picture of a word. Some of the forms yet fhew its derivation ; $\mathbb{U}$ is obvioully et ; but continual changes have been made upon it, till the $\mathbb{E}^{\circ}$ of the writer no longer bears marks of its origin. We ceafe now to confider the letters of which it is compofed ; it is the reprefentative of an idea, and, confequently, of the word dencting it in the refpective nations that ufe it. We ufe it tor and without confidering at all the meaning it originally had. The ufe of the curlive hieroglyphics would, in like manner, take off the attention from the fymbol, and fix it upon the thing lignificd; a progrefs which we equally obferve in oral language, where the words employed to denote mental affections were originally denotements of fenfible objects; then of mental affections bearing fome refemblance to them; and, laftly, in many inftances, of thofe mental objects, without any reference to the original meaning.
We have now advanced to the verge of alphabetical writing. So far has generally been regarded as fimple, and as the actual procedure; but it is imagined that flill there is a great gulf, whofe depth is unfathomable. Many of the preceding obfervations have been made with a view to this difcuflion ; and by their means it does not appear difficult to afcertzin the exact procedure. Perhaps we fhall not be able to trace all the minute fteps of the mind's march; but the general tract we hall find no difficulty in purfuing:

Truth, Horne Tuoke obferves, has generally been fuppofed to be at the bottom of a well ; he thinks it lies much vearer the furface. More has been fuppofed neceffary than conuld have been done, at lealt than is probable, at the periods of which we fpeak; and this has deterred thofe who faw the necefity of timplicity from attempting any thing. We fhall fee that much was not necelfary; certainly not fo much as to render requifite the exertions of genius, aided by the light of philofophical refearch. Signs, we have feen, become at laft arbitrary marks for ideas or words. From this flage we may confider written language as taking two different churfes; in one the fign became merely the fign of the found, and its combinations the figns of thole of found; in the other the fign was confidered as the fign of the idea, and its combinations did not correfpond with any combinations in oral language, but were reprefentative of combinations of ideas. The former we may expect to occur where oral language was copious, the latter where it was fcanty; the former where learning was confiderably diffufed, the latter where it was confined to a fmall proportion of the perions ufing the language. Where the vifible figus became merely figns for founds, alphabetical writing, as we fiall hereafter fee, catily followed; where they were arbitrary figns for ideas, every new combination not attended by a correfpondent combination in oral language, placed the introduction of alphabetical writing at a greater diftance than ever. This latter we fhall find to be the cafe with the Chinefe language, to which, as far as refpects the objects of the prefent dif, cuffion, we wih now to call the attention of our readers; as prefenting fome molt important features in the hillory of language.

We have feen that written language originally confitted of pictures of the things to be denoted; then of abbreviated forms of the fame; that thefe pitures and abbreviations were employed to denote, not only the objects they reprefented, but others which had fome real or fuppofed refemblance to them; and finally, that through gradial changes and abbreviations of the written character, it became at lat, inftead of a picture, a mere arbitrary character. Through all thefe tlages has the written language of China pafied: from caufes, fome of which we can trace, they here ftopped. Other nations procceded further, and ufed thefe marks as the figns of founds and of ideas through their intervention; the Chinefe employ them as the figns of ideas, without the intervention of founds, and their combinations and changes have no correfponding combinations and changes in their fpoken language.
Before the time of Fohi, the firlt Chinefe emperor, the Chinefe ufed knotted cords, limilar to thofe of the Peruvians. Fohi, in the place of thefe knots, employed two horizontal lines, the one whole, the other divided, and by their various combinations in threes, formed the text of the moft ancient work among the Chinefe, known under the name of Ye King, or the book of production. The Chinefe regard this work as a precious monument of the molt ancient plilofophy; but, notwithtanding the numerous commentaries which have been publifhed upon it, fome fo early as 1 roo years before Chrit, it is flill unintelligible. They are, however, fuppofed to contain, in a few lines, the moft fublime truths, and are ftill employed for the purpofes of divination. Subfequent to the trigrams of Fohi, Xin-nang, the next in fucceffion, is faid to have invented fixty-four hexagrams, which are fuppofed to exprefs the whole circle of haman knowledge, and, together with the trigrams, are to be confidered as the moft ancient written characters of the Chinefe. It is fuppofed that thefe characters were taken from the knotted cords; and it appears:
to us highily probable that they expreffed no more. It does not appear at ali likely that thefe marks fhould be intended to denote the myfleries of philofophy, whether we confiter the time of their invention, which is carried back to the age of Noah, or their inadequacy to expreis any thing but numbers. It is allowed that the earlieft writing of the Chinefe was the refult of the rotation of numbers by the knotted cords. In fact, the prefent numerals of the Chincfe appear to lave an equal right to be confidered as the myfterious denotements of my/teries. The prefent Chincfecharacters are not to be deduced from thefe combinations of lines, but from pictures and fymbols. Their prefent form $\begin{aligned} & \text { oes not }\end{aligned}$ prefent any objection to this fuppofition. Many of them, indced moit of them, bear little or no refemblance to their original form; but the progrefs can be traced in very many cafes, and hence it is a fair inference that they were deduced from pictures and fymbols, even where the connecting fleps are loit. Several examples of this are given in the Philofophical Tranfactions for $\$ 769$, vol. lix.

Before we proceed further in the conficicration of the written character of the Chinefe, we fhall find it expedient briefly to confider the fingular ftructure of their oral language. This, as we have before obferved, is entirely monofyllabic; and every word may be expreffed by an European confonant and a vowel, and about one-third of the words end with $n$, or the nafal found of $n$. We mult not expect to find a monofyllabic language very copious in founds; and we fhall expect a ftill fmaller variety of words awhen we find that their confonant founds are lefs numerous than our's, as they are deftitute of the $b, d, r$, and $x$; in fact, the number of their words is not more than 330 . This number is fo fmall, that we fhould fuppofe it inadequate to the purpofes of life, much more fo to thofe of fcience. The capabilities of their oral language are, however, very much increafed by the variation their words undergo by means of tones, or other inflections of the voice. For inflance, the word Fu , differently pronounced, denotes a hufband, to help, a town, a father, and to conceal. There are other modifications of found which the fame word undergoes, which enables them to extend its meaning without confufion, and this to things very oppofite, or at leaft very different in their nature. Thefe nice diftinctions certainly require a very difcriminating eye to perceive them, and very flexible organs to exprefs them ; but we know the power of habit. We have in our own language inftances of words approaching fo nearly in found, that many never pronounce them correctly, yet feldom leave any room for ambiguity; for intance, bair, air, lpeir, are, bare, are all different founds, Sbut their fimilarity is fo great, that many confound them in pronunciation. Staunton ebferves, that fynonymous words are very much ufed in converfa ion ; and this malt materially leffen the ambiguity. This, however, muft be only for the fake of thofe who have any difficulty; for it feerns to be the genius of the Chinefe language to exprefs the ideas of the !peaker in as few words as poffible. "The Chinefe," fays a writer in the Philofophical Tranfactions, vol. lix. P. 495. "fpeak as fatt as we do, fay more things in fewer words, and underttand each other." The laft refort to diminin the occationa? difficulty in conveying their ideas by oral language is to trace the written fign in the air, or in a more permanent manner.

A language in which we find not more than 1500 diftinct rounds camot be confidered as copious. It is probably fufficient for all the purpofes of life, but for the purpofes of feierce sery inadequate. Mof nations have improved their oral language ; the Chinefe have directed all their attention to the improvement of their witten language.

They have refrained from combinations of words to exprefs: combinations of ideas; and what appears ftill more fingular, the combinations which have been formed in their vifible, have not been carried into their oral language. In fact, the Chinefe writing may be confidered as totally dillinet from their oral language. One might have fuppofed, as Freret fays, that it was invented for thofe who do not paffefs the capacity of fpeech. The written not laving been founded. on the fpoken language, the improvements and changes of each are independent of the other. Their characters were originally figns of ideas; and as it is much more eafy to introduce changes in the language of fcience, than of the vulgar, the philofophers combined, and combined their combinations of characters, but did not, perhaps could not, carry their combinations into oral language. 'Thus, for inftance, the character for boufe named mien, and that for fire named $b o$, when combined denote calamity, expreffed in oral language not by mien-bo, but by tfai. On the other hand, as our writing is a denotement of found, every combination of written words will have a correfpondent combination of found: and no combinations will be formed except fuch as can be fpoken. We may compare the Clinefe characters to the arithmetical cypher, or to algebraic or aftronomical characters, which may be underitood by thofe who are unacquainted with the words we exprefs to denote them. Prefent an arithmetical calculation, or algebraic denronftration, to ten mathematicians of ten different countries, every one underftands it immediately. In the fame manner the Chinefe characters are intelligible not only in all the provinces of this valt empire, but farther in Japan and Cochinchina, whofe fpoken languages are totally different from that of the Chinefe. If thefe nations converfe they employ an interpreter, but the obftacles to communication vanifh, as foon as alley trace their written character. There appears, however, a confiderable difference between the common ufe of the arithmetical cypher, and the ufe the Chinefe philofophers make of their characters. We always think of one, two, \&c. if we ufe $1,2, \& c$.; at leaft this mult be the cafe with all who are not in the habit of calculation; and the vifible fign is fo ftrongly affociated with the audible, that we apprehend few perfons read to themfelves without the intervention of found, real or conceived. When we think in words (as we always do when we reafon, and frequently when we feel ), it is to the audible and not to the vifible fign that we attend: and we apprehend that it is generally the cafe where the habit of folitary ftudy and feclufion from the world has. not been formed. Our written words are more or lefs exact: reprefentatives of the found, and it is therefore difficult to feparate them even in imagination: but the Chinefe characters have no connection with found, except by their common connection with ideas. And as they have no vifible reprefentation of the found, its intermediate affociation cannot be fufficiently ftrong in the minds of their literati to render it neceflary in the train of reafoning to ufe the found at all.
All the Chinefe cha:acters are compofed of 214 clefs, keys, or tribunols (as the Chinefe themfelves call them). Thefe reprefent the moft fimple ideas, and by their combinations are produced, exprellions for the more complex ideas. In fact, thefe keys exprefs fire, zwater, earth, air, wood (which are the finer elements of the Chinefe), the fun, the moan, bird, man, different kinds of animals, mountains, wallies, \&c. fatber, mother, fon, life, death, the body, and. different parts of it, and fome veffels and inflruments, and many other things fimilarly fimple. All thefe can be traced ta fimple paintings or fymbols; and hence the whole written language may be juitly conlidered as deducible from the

## LANGU^GE.

more fimple writing of the Mexicans and the Egyptians. Indeed, the refemblance between the ancient Chinefe character and the Eyyptian hieroglyphics is fo ftriking, and this in cales where the analogy on which both are founded is not an obvious one, that De Guignes confiders them as derived from the fame fource. The actual number of the keys at prefent is 214; anciently they were more or lefs numerous, but this has been owing rather to the different opinions of the philologers of the time, than to any real change in their number. Thefe keys are formed at prefent from fix fimple Itrokes, a horizontal line, two perpendicular lines, the one pointed at the bottom, the other blunt, a point, a line curved to the right, and another to the left. We are not, however, to fuppofe, that the inventors of the Chinefe characters fixed upon thefe fix elements, and compofed all the characters from them methodically: this is the procedure of art. But as writing gradually paffed from painting, it loit its correctnefs of delineation, and then the -bject was to facilitate, as much as poffible, the labour of writing. It reduced all the characters by degrees; the more compounded, to others lefs fo; and thefe again to fimple ftrokes, fuch as have been mentioned. Thefe 214 keys are each employed alone, as a character ferving to exprefs an idea, or differently combined one with another when they are confidered only as part's of a group. The feveral parts of this group, or combination, form a kind of phrafe expreflive of the idea it is intended to communicate. Thus, the Chinefe character for night, is compofed of three characters, fisnifying darknefs, the ation of covering, and man, which rendered literally, fignifies darknefs covering man; a phrafe which perfectly expreffes the idea of night, and which is fimilar to the language of poetry. Both, in fact, iffue from "the cradle of the human race." This figurative kind of language (the offspring of neceflity) is what we admire fo much in the facred writings; it comes home to our feelings and our bofom; it points to our minds, and calls up their conception forcibly and correctly. Hence it is juntly deemed a beauty, and whenever the language of feeling is neceffary to excite the mind to activity, will generally be found a prevailing trait.

We might fuppofe that all the Chinefe characters, being compofed of fimple charatters, might be eafily underftood, when the meaning of the keys compofing them is known; as is the cafe in the two examples which have been given. If it were actually fo, the Chinefe would be the molt eafy of all languages, and might be adopted as a general or philofophical languare ; but the analogies and metaphors on which the compolition is founded, are often forced and often erroneous. Their principles of philofophy furnihed a wide field for combination; but frequently thefe are abfolutely falle : their ancient cultoms and their popular fuperftitions all afforded fcrpe for the invention of new characters; and to underitand the compound characters of the Chinefe, without the aid of oral inftruction, we mult underftand their ancient phyfical and religious dogmata, and join to this an acquaintance with the fleeting cultoms and opinions of the times in which they were formed. This is not peculiar to the Chinefe language; in order to trace the origin of words, the fame references are often neceflary, but we have more frequently the data requifite to enter into them. For inftance, candidus in Latin fignifies zwbite, candidatus, a candidate (a perfon who offers himfelf to fill a lucrative or honourable fituation), a perfon dreffed in white. We fhould lave been unable to folliow this analogy if we had not been informed by hitury, that among the Romans all candidates Eor places wore white robes. In a funilar manner the Chinefe character, pao, to rut, is compofed of two, that of
wrapping, and that of feet ; this is not an obvious proce. dure, and the Clinefe do not retain any esplanation of it; but we know that the favages of Louiliana, when about to undertake a long march, wrap up their feet in cloth to prevent their being torn; and it is highly probable that the combination of pao mult refer to a fimilar cultom.

We have now traced the various procedures which have been adopted to perpetuate the remembrance of actions or opinions. We have feen the artlefs contrivances of men in early ftages of cultivation; we have obferved the progrefs of the art of vifible communication from the rude quipos of the Peruvians to the curfive hieroglyphic of the philofophic Egyptians. We have found that when the vifible marks loit their original correCtnefs of delineation, they became mere arbitrary characters. From this flage two procedures have been purfued; fome nations have ceafed to conlider them as figns for things, and have retained them as figns for founds; others have continued to ufe them as figns for things without any immediate connection with found. The latter have combined, and combined thefe combinations to form expreffions for ideas without any regard to analogous combinations of found ; the former have combised them to exprefs combinations of found, and of ideas only by their intervention. In the one the written language is a picture of the fpoken, in the other it is a picture of thought. We now proceed to the object we have all along had in view-the inveltigation of the other procedure, where vifible marks became figns for elementary founds.

In tracing the origin of oral language, we derive fome affiftance from the Mofaic records; we afcertain the degree of divine inteference. In tracing the origin of alphabetical writing we muft expect no fuch alfiftance ; the art of writing is no where referred to a divine original, and while revelation is thus filent it becomes us to be filent too. Upon the principle that we ought not to fuppofe miraculous interpofition merely from the difficulty of accounting for a phenomenon, we fhould argue à priori, that no miraculous interpofition took place in the prefent inftance. This would not weigh in the lealt if we were affured by the fcriptures of the reality of that interpofition; but it- weighs very much againft all prefumptive arguments for it. However, though revelation is filent on this head, yet there are fome arguments in favour of the theory of the divine origin of alphabetical writing, which it will be defirable to confider. After ftating thefe and the anfwers which occur to obviate or leffen the difficulties they prefent, we fhall point out what appears the moft probable account of the tranition of hieroglyphics to letters.
rit. Alphahetical writing may be traced to one fource. Now if it were an invention of man, efpecially if it be a fimple invention (as it mult be thewn to have been, in order to give any plaufibility to the hypothefis), there is no reafon why it fhould not have been an independent invention.

Two anfwers may be given to this argument. I. If we examine the alphabets of Afia, we fhall find it difficult to admit that they may be traced to one fource; there is fo great a degree of diflimalarity among them, that it requires Itronger evidence than any we have yet feen to prove it. When, however, we contider the clanges that we know have actually taken place in the fame character, we may admit the poffibility of the orginal identity, and perhaps other circumftances may induce us to admit its probability; but this probability camot, we apprehend, become fo great as to give any force to the argument in queftion. But even admitting its certainty, we obferve, (2) that this can only prove the high antiquity of the invention. That it originated before mankind were much feparated from each
otker;

## I.ANGUAGE.

other; and that the ground-work being laid by thofe who had made the greatelt advances in cultivation, was built upon by thofe people who afterwards penctrated to a diftant part of the continent.

But it is urged, in the fecond place, that we have not only no infitance of independent difcovery, but have cven an example of a nation, which had no communication with the original inventors, remaining in total ignorance of it, and employing a procedure which now incapacitates them for the reception of alphabetical writing: and the force of this objention is materially increafed by the circumplance, that their writing, equally with the alphabetical, originated in hierorghphics, aid actually went through the fame flages, viz. from the fimple picture to the arbitrary mark.

This lingular procedure of the Chinefe, which certainly prefents a difficulty againtt the theory of the human origin of alphabetical writing, may probably be obviated by the four following coniderations: (1) The written language of China was cultivated nore for the purpofes of philoophy than of common life. Their combinations were founded on their philofophy; and it probably would not have been in their power to have carricd thele combinations into the oral language of the vulgar. A complete nomenclature of chemiitry has been introduced, founded on the precailing theory of chemiltry. This is univerfally received, wherever the new fyitem is embraced; but it would have been impoflible for the philofophers, who invented this beautiful fpecimen of philofophical language, to have induced the illiterate of a whole nation to change their language, or adopt a new one, however expreffive and correct. The philofophers of China might indeed have formed an oral language upon their characters; but the genius of the Chinefe feems rather to direct them to ftudy than to converfation, and abitract philofophy is better taught to the ftudious by written than by oral communication. Befides, (2) the fpoken language of China did not favour the plan of making their writing reprefentatives of found; for their words being all monofyllabic, and not very numerous, there would not be the fame neceffity for attention to elementary founds: and what is more important, they did not vary the articulation, but the tone, in order to exprefs a variation of meaning. It appears to us, that alphabetical writing could not, from the very nature of their fpoken language, have originated among the Chinefe: and to thefe confiderations we may add, (3) that the empire of China, with its dependencies, was fo extenfive, that there mult be a very great variety in the Chinefe dialects; and this would contribute to increafe the attention of their literati to the written language, fince this (as we have fren it actually is) might be undertood independently of their fpoken words. ( 4 ) If we admit the very probable hypothefis of De Guignes, that the Chinefe characters were brought from Egypt, and that they had originally no connection whatever with the fpoken language of the country into which they were introduced,--that, in fact, they were applied to denote names different from thofe with which they had before been connected,--we fhall perceive at once the reafon why, originally, the combinations of the characters were not attended with fimilar combinations of found. After this, there is no difficulty in admitting that the written muit continue independent of the fpoken language, eipecially among people fo little addicted to innovation as the Chinefe appear to be.

It is urged, in the third place, that the invention of writing is, by many of the ancients, afcribed to the gods; and that Pliny, in particular, exprefsly fays that the ufe of letiers was eternal.

To this it is replied, that the ancients univerfally afcribed
to the gods all inventions of which they knew nat the origin : and that as for Pliny, he exprefsly fays elfewhere, that the Phonicians were famed for the invention of letters. The moll that this argument can prove is the antiquity, but not the divine origin, of this invention.

Such appear to be the principal arguments from fact, in favour of the divine origin of alphabetical writing. There are fome arguments a priori, which remain to be confidered: thefe are, firl, the difficulty of the invention in any flage of human progrefs; and, fecondly, its antiquity, which very much increafes the improbability of its human origin.

Fir/l, With refpect to the difficulty of the invention, it is obferved, that we are to fuppofe that the inventors decompofed the founds of words, not only into fyllables, but into letters; obferving the component parts of fyllables, and denoting thefe parts by appropriate marks; and ufing marks for thefe elementary founds in the vifible reprefentation of other words, into which thofe founds were found to enter. This distinction of the articulate founds of man, tracing them through all their various combinations, and expreffing them by a few fimple marks, whofe combinations may exprefs every polfible combination of found, appears to fuppofe a habit of patient experiment, of difcriminating examination, and of generalization, which ill accords with the uncultivated flate of the human intellect in the early periods of fociety. But, fecondly, when we confider the antiquity of the invention, when we are forced to carry it fo far back as to have been in a ftate of perfection as early as the time of Mofes, this difficulty appears infuperable. We muft admit, it is urged, that men, in the earlieit ages, ftepped at once from a tedious and awkward, frequently unintelligible, method of communication, to a method which anfiwers every purpofe of communication, in the fhorteft way; and that, unlike all other inventions, it was brought at once to fuch a flate of perfection, that no furceeding alphabet has any real fuperiority over the ancient Hebrew.
This objection againt the human origin of letters is more weighty in appearance than in reality. With refpect to the difficulty of the invention, the objection lofes all its force, as foon as a fimple and eafy procedure, fuch as might be adopted in the circumflances of the cafe, can be pointed out. To obviate the difficulty arifing from the apparent perfocion of the original invention, we may obferve, (1) that if the perfection of an alphabet couffits in its capability of exprefling all the founds of fpoken language, there is no known alphabet which is perfect. Every letter fhould exprefs only one defnite found, and avery kiown found fhould have a correfponding letter. We do not mean that it is necelfary that the alphabet of one language fhould be capable of expreffing all the founds of another, but of its own. Now we have no inftance of this among living languages; and we cannot, therefore, fuppofe that it was the cafe in any former language. But even admitting this, we may obferve, (2) that no known alphabet, however ancient, is in the Itate of its original invention. Cadmus, who was born in the Eaft, carried with him into Greece only fixteen letters; the leaft copiois alphabers we are acquainted with have twenty-two. It is not in the leaft probable that Cadm:1s would introduce fewer than he poffeffed: it is more probable that he introduced more, to exprefs founds of which he had no reprefentation, but which were found among the Aborigines of Greece.
We have faid, that if a procedure can be pointed out, fimple as the intellect of the inventors of language, and capable of eafy introduction in the early periods of mental culture, all arguments à priori fall to the ground. It has generally been fuppofed of late that alphabetical writing was

## LANGUAGE.

formed from hieroglyphics: it appears nearly certain that it was fo; but the tranfition was never, we apprehend, explained with probability before the time of De Guignes. His hypothefis appears to have been unobferved by fubfequent writers, who have attempted to trace the tranfition; and the only fatisfactory flatement which we have noticed in our own language is in a paper in the Irifh Philofophical Tranfactions, by Dr. Hearney, who advances one im. portant ftep, by fuppofing that letters originally reprefented fyllables. Dr. Hearney, however, fpeaks of the human nind as accuflomed to analylis, when the tranfition tnok place; and fupports his hypothefis on the fubject with arguments which appear little conclufive.
"Perhaps," fays De Guignes, " we have done too much honour to the inventor of letters (whoever he was), in fuppofing that he diffected the woice into two parts, and invented marks of two kinds, fome to exprefs confonants, the others vowels. It is more natural to fuppofe that the hieroglyphical writing was abridged by little and little, by fuppreffing a great number of figures; and that thofe which they adopted preferved always the founds which they had before; that they read them as they had read hieroglyphics; that they were always words, but very fimple, and words whofe bafe was a fingle confonant; that finally reduced into a regular order, (which we call the alphabetical,) they were regarded as confonants, capable of being differently modified by a fimple vowel found."

Our ideas on the tranfition from hieroglyphics to letters, (derived in a great degree from De Guignes,) may be thus Itated:-The hieroglyphics, with their exactnefs of delineation, loft their original fignificancy, independent of Spoken language. This mult firf be the cafe with werds of the molt frequent recurrence, and which entered moft into combination with other words. Having become fimple denotements of found, they were employed to exprefs their refpective founds in combination of other monofyllabic words, which in like manner had loft their original fignificancy. Hence, by degrees, they would become reprefentative of the component parts of all words into which their refpective founds entered. They were always words, but very fimple, confilting only of a confonant and a vowel. Variation in the pronunciation of the vowel would occur in diferent dialects: and herce thefe marks would gradually be regarded as confonants, capable of being differently modified by fimple vocal founds. Letters, at firl monofyllabic words, then became marks for the component parts, or fyllables of diffyllabic or polyfyllabic words; and then for the unchangeable part of thofe fyllables, that is, for confonants. In the moft ancient itate of the oriental languages, vowel founds had no difinct marks; in the latter, marks were joined to the confonants, to exprefs the different founds with which the radical confonant was invelted. Among the weftern nations, a different procedure was adopted. In fome cafes, they ufed the marks which they had received from the oriental nations, for an a/pirate and vozvel, to denote the vorwel itflf; and having once commenced the ufe of diftinct marks for vowels, the procedure was continued, and new marks adapted to exprefs noticed variations of vocal founds.

In fupport of this hypothefis, may be adduced the following obfervations:

Ift. We have feen that hieroglyphics did become fignificant of fornds: and that words originally fignificant of one clafs of ideas being applied to a fecond, loft their connection with the former, and became directly fignificant of the latter.
2. We have reafon to believe that words were originally Vol. XX.
monofyllabic in thofe nations whore alphabetical writing was invented, and that the combiration of old founds, or the ufe of them uncompounded, to exprefonew ideas, was the mode employed to extend the capabilitics of their Language. Hence the fanse word would frequently occur in combination, and though its different Ggnilications muf originally have been reprefented by diferent hieroglyphics, get as thefe lolt their figuiiticancy, they would catily liecome as crevolive in their meaning as the formens the melelves. And it in otvious that the moft fimple of thofe hierortyphics which were ufed for the fame found, would be employed to reprefent the found.
3. It has been fhewn to be highly probathle that originally every confonant had its vowel found. I ence all fyllablea might be reprefented by two, or at moft, three European letters. This circumfance would matcrially diminifh the varieties of fyllabic founds.
4. The probability of the theory advanced depends greatly upun the hypothefis that originally letters were fyllabic. The following facts appear to prove this. The ancient oriental alphabets had no denotements for vowels; and even if this be difputed, it mult be admitted that they had many words into which none of the fuppofed rowel marks entered. The Ethiopian alphabet is entirely fyllabic. The fimple letters denote a confonant and a flort $a$, and marks were added to them to denote other vowels, where ufed. What is doubly fingular and important, they have in many cafes added merks to thefe fyllabic characters, to denote that they have no vowel helonging to them. In the Coptic and Arabic, there are fyllabic characters. The alphabets of the ealtern A fiatics are principally fyllabic, fome with ä, others with ŏ joined to a confonant. Thefe circumftances render very probable the account here given of the trantition from hieruglyphics to letters. The following obfervations more directly tend to afcertain its high probability.
5. The letters of fome of the ancient alphabets have fo great a refemblance to the hieroglyphical characters, indeed are fuch exact tranferipts of them, that a fimple infpection is fufficient to convince us that hieroglyphics were the origin of letters, and this pcint is almoit univerfally admitted. This however proves little as to the nature of the invention of alphabetical writing, except that it was fubiequent to the ufe of hieroglyphics.. But,
6. Thefe characters in many inflances retained their original fignificancy, which proves them to have been, as De Guignes fuppofes, denotements for words. We mult not expect to find this fignificancy in all words of which they form component parts; but in fuch only in who?e vilible reprefentation the original hieroglyphic formed a component part. Now we muft obferse, firft, that the names of feveral of the oriental letters are tifl by themfelves fignificant, and that fome of thefe letters are fimilar to the Chinefe clefs which have the fame fignification. Thus the Hebrew ', yod, fignifies the band. Its form in fome alphabets refembles the Chinefe character for Band. The 7, daleth, of the Hebrews, Phœnicians, and Ethiopians, fignifics a gate, and the aftion of opening. The hieroglyphic which among the ancient Chinefe reprefented a gate, is exactly fimilay to this letter. The פ, phi, of the Hebrews, and of the Ethiopians, lignifies the mouth. The Chinefe charaders for the mouth all refemble it. The y', ain, fignifies the eye. The Phoenicians and Chinefe employed the outline of the eye as a denotement of the object. The $\mathcal{E}^{\prime}$, $\operatorname{Bin}$, in Hebrew figuifies the feeth, and its figure is ftill found among the Chincfe, with the fame fignification. The $\%$, mem, fignifies zuater. The correfponding Samaritan and Ethiopian characters have a clear refemblance to the Chinefe hieroglyphic for water. Laftly, the $\mathbf{N}^{\circ}$, aleph, (originally perhaps fignifying ox figniN n

## LANGUAGE.

fies unily, the aition of conduging, pre-eminense. The Phocnician form of this letter exactly reprefents the Chinefe character for one, and every ation ly which we are at the bead of others. But thefe letiers are not only fignificant by themfclves, but fecondly in combinations. "Thus, was expreffed by the monafyllable yat, ye, or yo; to this another monofyllabke, which had equally a figmification relative to the figure being added, formed a word of two fyllables. For inftance, jollead of the prefent denomination of 7 , daleth, we may reafonably fuppofe its original found to have been $d c_{0}$. The word T', yada, hiernglyphically reprefented by a sate and a Fond, is fuund in the Hebrew with a fignibication derived from that of the letters compoling it ; to cig? cult, (as we might fay, bourd him so the door,) io extond. Add to this the word I", ain, (originally, probably, founded ho, which firnilies the eye, and we have yodulo, which fould lignify to ofen the cyes, to catcud the ciecue, \&c. and metaphoricaliy, to hrice:, to urderfland; and in fact this is the fignification of $y\urcorner$, in Hebrew. But this is not all, for exactly the fame procedure has been adopted by the Chinefe. Kiz, which fignifies to examine, is compofed of three radical characters, of whach the firt lignifies the kank, the fecond a oote, the third the eyce So alfo Kiul is compofed of threc charaters, one dignifying the teeth, the other two, gate or opening, which figmilies to break througy, to make a great opening. In Hebrew, Mave is Gmilarly compoled, and lignifies to plunder, to lay seafle.-Tchi is a large collexitan of cuater. It was compofed of the characturs for hand and suater. The fame compound was formed among the Hebrews, and ire, yam, lignilies a criat colluciton of cuater, or otbe fica. In Arabic the letters then, i. e. earth, and mim, i. e. weater, form the word thene, and fignify a floorl. The Hebrew then is compofed of the thet or carth, and the niun, which fignaifics misn, i. c. man of the earth, and further, to form, to crotate. In both thefe inflances the Chinefe corretpond in thair combinations with the alphabetical writung.-Many other inttances might be brought. We will adduce one, to which there is no correfponding combination in the Chineele lunguage. $A b$ or $H a b a$ fignifies fattber; the component parts of it tignify principal of the boulf.

The papers of $D e$ Guignes, to which we are very greatly indelted on this fubject, are to be found in Memoires de 1'Acadimie des Inferiptions et des Belles Lettres, vol. 34, \&c. Seè̀ ifhadet, Hieroglyfincs, Letters, Words, and Wramse.

Lavgiace, Siracure of, comprehends the nature and arrangement of the different parts of fpeech. See each under its proper head. (See alfo Gramamr.) No grammatical rules, however, have fuficient authority to controul the firm and ettablifhed ufage of language. Elablinhed cuftom, fays Blair (Lectures, vol. i.), both in fpeaking and writing, is the flardard to which we mult at laft refort, for determining every controverted point in language and tyle. But it will not follow from this, that grammatical rulcs are fuperfeded as ufelefs. In every language, which has been in any degree cultivated, there prevails a certain ftructure and analogy of parts which is underitood to give foundation to the molk reputable ufage of fpeech; and which, in all cafes, where ufage is loofe or dubious, pofteffes confiderable authority. In every language, there are rules of fyntax which mult be invilably obferved by all who would either write or lpeak with ary propricty. For fyntax is no other than that arrangcanent of words in a fentence, which renders the meaning of each word, and the relation of all the words to one another, moof clear and intelligible. See Syntax.

Ufage and cuftom, fays F. Buffier, are the rule of a lanGuage ; and thefe hold their empire indenendent of reafon,
or any other caufe: nor has reafon any thing to do in lan. guage, unlefs to fludy or teach it, fuch as it is. Here then commences grammar ; a jult plan of which fuppofes a language already introduced by ufe, and, without pretending to alter or amend a tittle, only furnifhes reffections, called rulis, to which the manmers of fpeaking ufed in that langraage may be reduced; which affemblage of refections is what we call the grammar of that language. This remark may obviate an abufe introduced among grammarians, who are ever crying out, "Ulage is, in this point, oppolite to grammar; or the language here frces itfelf from the rules of grammar, \&cz.'

It is chance then to which we owe ufage, and ufage that makes the rules and neafures of language. Ulage, indeed, is fomewhat dubious, and may be divided into good and bad. If it be afked, wherein the difference between thefe lies? it is in this: that the one is better ellablifhed, or authorized, than the other ; and if it be afked, wherein that difference of authority confifts? it is anfwered, that in dead languages, that which makes the good ufage is the writings of the belt authors in that language: and if it be farther queftioned, which are the belt? thofe are allowed fuch, who wrote when the ftate was in its greateit glory. Thus the age of Auguttus, being the moft diftinguifhed by great men, who then flourifhed, we call that good Latin which is conformable to the manners of fpeaking uled by authors, who wrote within fifty years before, and lifty after, the reign of that emperor. As to living languages; the good ufage, or mode, is that which obtains among the molt eminent perfons, whether as to quality and authority, or as to learning and the reputation of writing well.

With this view it is, that M. Vaugelas defines ufage of a language, the manner of fpeaking ufed by the foundeft or beft part of the court, conformable to the manner of writing among the beft part of the authors of the time. But this definition, how judicious foever, may occafion infinite doubt ; for which is to be deemed the beft part of the court, and of the writers? Each party, doubtlefs, thinks itfelf the beft. F. Buffer, therefore, very juftly, inflead of the belt past, fubfitutes the greatelt part, which brings the matter nearer to a certainty: the moft numerous part being fomething fixed and palpable; whereas the moft found part may be infenfible or arbitrary. There is found a conftant refemblance between the genius or natural complexion of each people, and the language they fpeak. Thus the Greeks, a polite, but voluptuous nation, had a language perfectly fuitable, full of delicacy and fiveetuefs. The Romans, who feemed only born to command, had a language noble, nervous, and anguit: and their defcendants, the Italians, are funk into foftnefs and effeminacy, which is as vifible in their language. as in their manners. The language of the Spaniards is full of that gravity and haughtinefs of air which make the diftinguifhing character of that people.

The French, who have great vivacity, have a language that runs extremely brifk and lively. And the Engliih, who are naturaily tho::ghtful, and ufe few words, have a language more concife and fententious, though far from being deficient in refpect of copioufnefs.

Languages, the Diverfity of, is generally allowed to have taken its rife from the confulion at the building of the tower of Babel. See Confusion of Tongues, and Dispensions of ATanlind.

As to the point of antiquity and priority among languages, that has been extremely controverted. Herodotus tells us, that in the difpute between the Egyptians and Phrygians about the antiquity of their languages, Pfammetichus, king of Egypt, ordered two childres to be brought up, wish

## LANGUAGE.

exprefs prohibition not to have one word pronounced before them, but to leave nature to fpeak of herfolf; and the firtt word they fooke happened to be beccos, which, in the Phrygian language, figuities bread. The Egyptians, however, were not convinced with this proos. The Arabs difpute the point of antiquity with the Hebrews; but the Jews, jealous, even to excefs, of the honour of their nation, pofitively infit on it, that the Hebrew tongue, fuch as it is found in the Holy Scriptures, is the primitive lenguage, and that fpoken by the firft man. For the arguments alleged in favour of this opinion, fee Hebrew Langruge.

Of all the oriental languages, except the Hebrew, the Syriac has had the greater number of advocates, efpecially anong the caltern authors. 'They have alleged, that a dialect of this language was fpoken in Mefopotamia, Chaldra, and Affyria, where mankind firt fettled after the flood, and where, it is prefumed, the language of Noah and his fons remained: to which argument they add, that the names of perfons and places mentioned by Mofes are eafily derived from that language. Belides thofe kindred languages, which are commonly called the oriental tongues, the Armenian, the Celtic, and the Coptic, pleading the antiquity of their nations; and the Armenians, that the ark firft relled in their comntry: the Greek, on account of its great extent and copioufnefs, the Teutonic, from which fome have pretended to derive even the Hebrew itfelf, and the Chinefe, have afpired to preference, in point of antiquity.

The pretenfions of the Chinefe, in particular, have been fupported not only from the great antiquity of that nation, their carly acquaintance with arts and fciences, and their having preferved themfelves fo many ages from any confiderable mixture or intercourfe with other nations; but alfo from the fingularity of the tongue itfelf, which confilts of few words, all monofyllables, and is molt fimple in its conftruction, having no variety of declenfions, conjugations, or grammatical rules. Befides, it is urged, that the Chinefe are the polterity of Noah, and that Fohi, the firlt king of China, was Noah.

Mr. Webb, an ingenious writer in the reign of Charles II., Arenuouly maintains that this is the only original language, and that they now talk in China the language of Paradife.

Others maintain, that the language fpoken by Adam is loft ; and that the Hebrew, Chaldee, and Arabic, are only dialects of the original tongue. So far are they from yiving the priority to the Hebrew, that they maintain Abraham fpoke Chaldee before he paffed the Euphrates; and that he firlt learned the Hebrew in the land of Canaan; fo that this was not a fpecial language confecrated to the people of God, but was originally the language of the Canaanites.
M. Le Clerc is of opinion, the Hebrew is far inferior to the Greek, both in copioufnefs, elegance, and perficuity ; it is dry, and dettitute of ornaments, infomuch that, wanting expreffions to vary the phrafe, the fame periods are perpetually returning. The rabbins, converting its poverty into an excellence, fay, it is fo pure and chafte, that it has no proper names for the parts of generation, nor for thofe by which the excrements are difcharged. See Hprrew.
The Arabic is held the molt copious of all languages. Sec the Preliminary Difcourfe to Sale's Koran.

Lancuage, Euphony of, for Singing. It feems as if the rocal mulic of every country depended on the purity of the rowels, neat articulation of the confonants, and eafy utter.
ance of the words of which a language is compofed; ant there can be doubt but that the dialect which has the greateit number of open vowels mixed with its conforants, is 1 : moft fivourable for vocal purpofes. 'The tones of voice cant only be heard with purity and clearnefs by the affifance of vonch: as the words, zaculs and wiace, are equally derived from ooculis, which implies a found, a mefloal tor, woeal lody, or modulation. Aud it is mot only from the geters facility with which the fyilables of a lampare can be wi:tered with neatnefs and articulation that it is remetreil tavourable to the finger, bat from the number of areal herminations, or words ending with vowels, which aliow the voice to expand, and finifh a mufical plirafe with cafe and purity:
It is generally allowed that the French lariguage is vafat, the German suthurel, and the Eng-linh filitating, and loaded with confonants, nafal fyllables ending with nag, and other harfh and mute terminations. We have, indeed, filed cai the Saxon roughnefs in words where ghoccur: as congh, trough, laugh, ploush, through, cirht, ficight, cnoryb, àe. which ufed to be pronounced in the Tentonic manner, and which are fill guttural words in Scotland, and fome parts of England.
But befides the obfructions which the roice meets with in its paffage, from clafhing conforants in the middie of words, we have a greater number of terms that end with abfolute mute and abrupt confonants, than either the Feench or Germans: fuch are thofe which terminate in $b, d, g, k$, or hard $c, p$, and $t$. And it is nut eafy to defend our language from the biffing of which it is accufed by forcigners, on account of the frequent ufe of the letter $s$ at the end of words, and the great number of words which terminate with a double s. For though the plural number of French nouns is diltinguifhed in writing by an $s$, as well as the Englifh, yet the final $s$ is never pronounced. The German plurals too are terminated by the letter $n$ : as Laus, Vaufen; Arafs, Arafin; pferd, pferden; \&x, in the fame manner as houfe ufed to be baufen in the plural, bofe, hofen; and as the fubitantive $0 x$ ftll has oxen in the plural. And the letter $n$ being a liquid, renders the words which it terminates lefs difficult to utter, as well as lefs offentive to the ear, than the letter $s$, with which we have more words begin and end than with any other letter in the alphabet. Indeed, modern refinements or corruptions in pronouncing our language have greatly augmented the fibilation with which we are jufly charged, by changing the $(t b$ and atb of verbs into is and as; and faying givers for giveth, has for bath, \&c.
The learned Dr. Wallis, a profound nufician, in his treatife "De Loquela," prefixed to his Grammar of the Englifh T'Iongue, has confidered with great exactnefs the accurate formation of all founds in fpecaking, to which few have attended before; but with refpect to finging, the work is Atill to be donc.

Dr. Holder, who was a very learned mufician and a compofer, though he has admirably analy fed the principles of pronunciation, and defcribed the organs of utterance, with refpect to colloquial language (Elements of Speech; an Eflay of Inquiry into the natural Production of Letters, 1669), has not pointed out the means by which the mufical voice in articulating words is affilted or impeded in its formation and delivery, or the caufes of its arriving at the ear with more or lefs clearnefs and purity. It was a fubject that did not immediately concern the purport of this excellent effay, which was written with the benevolent intention of affifing perfons born deaf and dumb to comprehend the fpeech of others by the eye, from its effect on the external organs; and, therefore, the omiffion of fuch enNiz
